Herbs, subshrubs, or shrubs, rarely trees or climbers, bisexual, monoecious, or sometimes dioecious, many with laticiferous cells or canals and/or resinous ducts. Leaves often in a basal rosette; cauline leaves usually alternate, more rarely (in China) opposite or whorled, sessile or petiolate, without stipules; petiole sometimes auriculate at base; leaf blade entire to variously lobed or divided. Florets bisexual (perfect), female (pistillate), or functionally male (functionally staminate), solitary or few to many enclosed in an involucre of 1- to many-seriate phyllaries (involucral bracts) to form a capitulum; calyculus of outer bracts sometimes present and often differing markedly from phyllaries. Capitula solitary or few to many arranged in variously formed synflorescences, homogamous or heterogamous, discoid, disciform, radiate, subradiate, radiant, or ligulate; receptacle usually flattened, sometimes slightly concave or convex, rarely conical, smooth or alveolate, paleate (scaly) or epaleate, with bristles, scales, hairs, or naked. Corolla (3–) 5-merous, gamopetalous, tubular or tubular-filiform, and regular, bilabiate, radiate, or ligulate. Stamens (4 or) 5, inserted within corolla tube; filaments adnate to proximal part of corolla; anthers basifixed or dorsifixed, usually coalescent into a tube, base caudate or not, apex with (rarely without) a sterile, ovate or lanceolate appendage; pollen grains usually tricolporate, echinate or sometimes lophate or spinulate, often caveate. Style apically bifid (rarely entire); style branches variously shaped, with or without an apical appendage, hairs, or papillae. Ovary inferior, 1-loculed; ovule 1, basal, anatropous. Fruit an achene (cypsela). Pappus consisting of 1 to many rows of scales or bristles, or absent. Seed erect; endosperm scanty; embryo straight.

Between 1,600 and 1,700 genera and ca. 24,000 species: cosmopolitan (except Antarctica); 15 tribes (one introduced), 248 genera (18 endemic, 49 introduced), and 2,336 species (1,145 endemic, 109 introduced) in China.

In addition, extensive contributions to the glossary were received from John L. Strother, University of California, 1001 Valley Life Sciences Building #2465, Berkeley, California 94720-2465, U.S.A.

Taxonomic discussion on the Asteraceae is included under the relevant tribes. The following notes apply to the whole family. Modes of reproduction in the Chinese Asteraceae are known only fragmentarily. As regards the world diversity of the family, only about 12% of genera have been studied using cytoembryology to identify the reproduction system. In 3%, agamospermy was found to occur. Probably the most common reproduction system is allogamy with a sporophytic self-incompatibility; occasional selfing is also possible (stigma ageing or mentor effect). More or less obligate autogamy is relatively rare. Other uncommon reproduction systems include gynodioecy, a very rare dioecy (with heterogametic females). Asexual reproduction is a widespread phenomenon in the Asteraceae, with a wide range of mechanisms. In addition to the rare adventitious embryony, there are common types of autonomous apomixis, agamospermy (apospory, diplospory) associated with various forms of embryogenesis (parthenogenesis, apogamy). All the types of reproduction are to be considered in the evaluation of population variation and for taxonomic conclusions because the prevailing type of reproduction substantially influences the variation limits of taxa.

Glossary of botanical terms used in the Asteraceae

Accepted terms are indicated by **boldface**. Within the definitions, *italics* (when not names of genera) indicate terms that are defined in this glossary.

achene – the fruit of Asteraceae; a usually dry, indehiscent, 1-locular, 1-seeded fruit derived from a 2-carpellate, inferior ovary. Some authors prefer to use the term cypsela for the fruit of Asteraceae and restrict the term achene to a dry, 1-seeded fruit derived from a 1-carpellate, superior ovary (e.g., in *Ranunculus* in Ranunculaceae).

alveolate – honeycombed; usually referring to a \pm pitted *receptacle*, in which the pits or sockets may be round or \pm polygonal in cross section, socket margins may be entire, erose, fimbriate, or lacerate; cf. *foveolate*.

anther appendage – sterile tissue extending distally beyond pollen sacs as a continuation of an anther connective.

anther collar – see *antheropodium*.

antheropodium (plural **antheropodia**) – literally “anther foot”; a region of usually thick-walled cells in a staminal filament just proximal to its anther; the collar may be *balusterform* (as in *Senecio*), i.e., proximally with enlarged cells, or straight and (semi)cylindric and made up of uniformly sized cells (as in *Ligularia* and *Parasenecio*).

anther tails – sterile tissue extending from the base of a pollen sac; anther tails may be simple or \pm branched and often have a characteristic form within taxa; some tribes of Asteraceae characteristically have tailed (also called caudate) anthers.

anther tube – in Asteraceae, the five anthers are joined laterally into a tube through which the style emerges.

antrorse – directed toward the apex; lateral elements of *barbellate* or *plumose* awns or bristles of a *pappus* may be described as antrorse; cf. *retorse*.

apical anther appendage – see *anther appendage*.

apical plate – the apical *achene* area on the periphery of which the *pappus* is inserted; sometimes also called pappus disk.

apical rim – a \pm salient ring outside the *pappus* insertion, surrounding the *apical plate* (characteristic of Cardueae).

aristate scale – see *pappus*.

attachment scar – the area near the base of the *achene* where it was attached to the *receptacle*.

awn – see *pappus*.

balusterform – referring to an *antheropodium* that is proximally markedly dilated with enlarged cells (as in some Senecioneae).

barbellate (diminutive **barbellulate**) – usually refers to a *pappus* awn or bristle with lengths of lateral elements (free cell ends, usually called barbs) less than or subequaling the diameter of the shaft of the awn or bristle; see also *plumose* and *scabrid*.

basal anther appendages – see *anther tails*.

beak – see *rostrum*.

bilabiate corolla – a corolla with 2 lips, usually an outer lip with 3 lobes or teeth and an inner lip with 2 often linear lobes (e.g., in some Mutisieae).

bisexual floret (sometimes referred to as hermaphroditic floret or perfect floret) – florets possessing both an anther cylinder and a style, usually both fertile although in some taxa florets may be *functionally male* or *female*.

bristle – see *pappus*.

calathium or *calathidium* (plural *calathia* or *calathidia*) – see *capitulum*.

calcarate anthers – anthers with the filaments inserted \pm abaxially on the connective, distal to (above) the bases of the paired pollen sacs (e.g., in *Vernonia*).

calycular bracts – the individual bracts making up the *calyculus*.

calyculate – bearing a *calyculus*.

calyculus (plural **calyculi**) – collectively, 1 or more bracts or bracteoles subtending an *involucre*, usually readily distinguished from the *phyllaries* (e.g., in *Senecio* and *Taraxacum*).

capitulescence – see *synflorescence*.

capitulum (plural **capitula**) – the inflorescence in Asteraceae and certain other families; sometimes called a head; a capitulum comprises an *involucre* of *phyllaries* (sometimes subtended by a *calyculus*), a *receptacle*, and (1–)5–100(–1000 or more) *florets*; the florets are borne on the face of the receptacle.

carpopodium (plural **carpopodia**) – literally “fruit foot”; the basal, sterile portion of an *achene* at its point of attachment to a *receptacle*; carpopodia are sometimes diagnostic in shape and cellular form (e.g., in some Eupatorieae) and sometimes negligible or essentially absent.

caudate anthers – tailed anthers; see *anther tails*.

chaff – *paleae*; see *receptacle*.

compressed achene – usually, cross sections of *achenes* are \pm circular or polygonal and isodiametric; sometimes, achenes are compressed or \pm flattened either (1) laterally with the longer dimension of the cross section of each achene parallel to a radius of the *capitulum* (as in *Helianthus*) or (2) dorsiventrally with the longer dimension of the cross section of each achene perpendicular to a radius of the capitulum (as in *Coreopsis*).

corolla limb – in a *disk floret*, the corolla limb is the portion of the corolla distal to the insertion of the staminal filaments (i.e., corolla limb = *corolla throat* + *corolla lobes* of a *disk corolla*); in a *ligulate floret*, the corolla limb is called a *ligule*; in a *ray floret*, it is called a *lamina*.

corolla lobes – the lobes of a corolla.

corolla throat – usually, throat refers to the portion of a corolla distal to insertion of staminal filaments (i.e., distal to the *corolla tube*) and proximal to the *corolla lobes*; the throat may be gradually or abruptly ampliate (enlarged) relative to the tube.

corolla tube – usually, the portion of a corolla proximal to insertion of the staminal filaments; also, the \pm cylindric portion of a corolla proximal to the \pm flat *corolla limb* in a *ligulate floret* or a *ray floret*.

corona – a crown-shaped *pappus*; or, in Anthemideae (which lack a true pappus), the apex of the *achene* may be produced into an entire to deeply divided, crown-shaped, sometimes pappuslike structure.

cypsela (plural *cypselae*) – see *achene*.

disk corolla – corolla of a *disk floret*.

disk florets – central *florets* of a *disciform capitulum*, *radiant capitulum*, or *radiate capitulum*, or all florets of a *discoïd capitulum*; disk florets usually have actinomorphic corollas; disk florets may be *bisexual* (most common), *functionally male* (moderately common), or *female* (relatively rare, e.g., in *Antennaria*, and in *Cavea* when dioecious).

disciform capitulum – a *heterogamous capitulum* with actinomorphic corollas in all *florets*, with *marginal florets* that are *female* or *neuter* (and usually with \pm attenuate to filiform corollas), and with central florets usually *bisexual*, sometimes *functionally male*. By tradition, both the marginal, female florets and the central, bisexual or functionally male florets in disciform capitula have been referred to as *disk florets*.

discoïd capitulum – a *homogamous capitulum* with actinomorphic corollas in all *florets* (similar in *marginal* and central florets) and all florets either *bisexual* or *functionally male* or *female*.

distant – in reference to Asteraceae, the opposite of *imbricate*, in an *involucre* where the *phyllaries* do not overlap but are clearly in more than one series.

ecalcarate anther – anthers not *calcarate*.

ecalyculate – lacking a *calyculus*.

ecaudent anthers – anthers not caudate or tailed; see *anther tails*.

endothecial tissue – wall structure of pollen sacs with cell thickenings; the endothecium is radial if the wall thickenings are restricted to vertical cell walls (e.g., in *Senecio*), and polarized if restricted to horizontal walls (e.g., in *Ligularia*); intermediate types occur (e.g., in some *Sinosenecio*).

epaleaceous – see *epaleate*.

epaleate – lacking *paleae*; see *receptacle*.

epappose – lacking a *pappus*.

female floret (sometimes referred to as pistillate floret) – describes a *floret* with a fertile, functional ovary and style (i.e., capable of producing a viable seed) and lacking stamens.

filament collar – see *antheropodium*.

filiform floret – a *marginal floret* of a *disciform capitulum* or sometimes a *discoïd capitulum*; filiform florets are *female*, always without staminodes, and have narrowly tubular corollas apically subtruncate, or with 2 or 3 minute teeth or a minute *lamina*.

floret – an individual flower in a *capitulum*.

foveolate – shallowly pitted; cf. *alveolate*.

functionally male floret (sometimes referred to as functionally staminate floret) – a *floret* that has fertile anthers and a sterile ovary, i.e., a floret producing functional pollen and not capable of producing a viable seed; styles of functionally male florets usually are not branched and usually lack stigmatic papillae. Although strictly correct, the word “functionally” is often omitted.

gland-dotted – surfaces of Asteraceae, especially leaves and *phyllaries*, sometimes bear subsessile, sessile, or sunken, multicellular glandular hairs; such surfaces have been described as gland-dotted, glandular punctate, punctate, or punctate glandular; here, such surfaces are described as gland-dotted.

glandular punctate – see *gland-dotted*.

glomerule – a condensed, usually \pm globose cluster of *capitula* (e.g., in *Eremanthus* Lessing, not in China, and *Gamochaeta*); cf. *pseudocephalum*.

head – see *capitulum*.

hermaphroditic floret – see *bisexual floret*.

heterogamous capitulum – a *capitulum* with *florets* of two or more sexual forms.

homogamous capitulum – a *capitulum* with all *florets* of one sexual form, usually all *bisexual*, all *functionally male*, or all *female*.

imbricate – partially and \pm regularly overlapping, as shingles (tiles) of a roof; *phyllaries* of an *involucre* are often imbricate.

inflorescence – in Asteraceae, the primary inflorescence is a *capitulum*; in the sense of a compound inflorescence with multiple capitula, see *synflorescence*.

involucral bracts – see *phyllaries*.

involucre – *phyllaries* collectively; an involucre is the bracts or bracteoles borne at the periphery of a *receptacle*, exterior to the *florets* of a *capitulum*.

lamina (plural **laminae**) – in *ray florets*, the \pm flat, \pm strap-shaped *corolla limb* of the zygomorphic corolla; a lamina usually has 2 or 3 apical lobes or teeth; it is sometimes referred to as a ray and, incorrectly, as a *ligule*.

ligulate capitulum – a *capitulum* with all *florets* *bisexual* and *ligulate*; the *corolla limb* is called a *ligule*, is \pm flat and \pm strap-shaped, and is apically 5-lobed or 5-toothed; ligulate capitula are characteristic of Cichorieae.

ligulate floret – a floret in which the *corolla limb* is zygomorphic, \pm flat, and \pm strap-shaped with 5 apical lobes or teeth; the \pm flat corolla limb of a *ray floret* has been called a *ligule*, whereas here it is called a *lamina*.

ligule – the \pm flat, \pm strap-shaped *corolla limb* of a *ligulate floret*.

male floret – see *functionally male floret*.

marginal florets – the single or multiple series of *florets* around the edge of a *capitulum* and surrounding the central *disk florets*; marginal florets may be (but are not necessarily) *ray florets*.

neuter floret – describes a *ray floret* that lacks a style.

palea (plural **paleae**) – bracts borne on a *receptacle* of a *capitulum*; usually, each palea subtends an individual *floret*; paleae are usually herbaceous, membranous, or scarious and may be persistent, \pm caducous, or shed together with *achenes*; paleae have been called receptacular bracts or receptacular paleae; scales of the *pappus* also have been called paleae.

paleaceous – *palea*-like; for the sense of bearing paleae, see *paleate*.

paleate – bearing paleae; see *receptacle*.

pappose – bearing a *pappus*.

pappus (plural **pappi**) – collectively, awns and/or bristles and/or scales corresponding to a calyx borne apically on ovaries (ultimately *achenes*) of Asteraceae. A pappus may be \pm persistent or \pm caducous; when persistent it is sometimes involved in dispersal of achenes. A pappus may include more than one kind of element (e.g., awns, bristles, and/or scales); the elements may be distinct or \pm connate and may occur in 1–5 or more series. Scales that are very narrow may be only arbitrarily distinguishable from awns or bristles. The distinction between awns and bristles is also sometimes arbitrary. Generally, cross sections of bristles and awns are \pm circular or polygonal and have the longer diameter no more than $3 \times$ the shorter diameter. Pappus elements with \pm flat cross sections (i.e., longer diameter of cross section more than $3 \times$ the shorter diameter) are called scales, regardless of relative lengths of the elements. As used here, subulate scale means much the same as flattened bristle. Bristles may be relatively pliable to relatively stiff. Bristles with diameters less than ca. 50 μm are usually called capillary or fine bristles; bristles with diameters greater than ca. 50 μm are usually called coarse bristles. Rigid pappus elements with \pm circular or polygonal, isodiametric cross sections greater than 100 μm in diameter are usually called awns. Awns and/or bristles may be *barbellate*, *barbellulate*, or *plumose*. A pappus scale may terminate in one or more bristlelike or awnlike appendages; such scales are said to be aristate.

pappus disk – see *apical plate*.

pedicel – strictly referable to the stalk of an individual *floret*, such as may be found in many species of *Cotula*.

peduncle – a stalk (stem) supporting a single *capitulum*.

perfect floret – see *bisexual floret*.

peripheral florets – see *marginal florets*.

phyllaries (singular **phyllary**) – the bracts or bracteoles borne at periphery of a *receptacle*, exterior to the *florets* of a *capitulum*, collectively an *involucre*; in fruit, phyllaries are sometimes shed together with *achenes* (e.g., in *Acanthospermum*, *Parthenium*, and *Xanthium*).

pistillate floret – see *female floret*.

plumose – featherlike or bearing feathers; in reference to Asteraceae, plumose usually refers to a *pappus* bristle with lengths of lateral elements 1–3 or more \times the diameter of the shaft of the bristle; see also *barbellate* and *scabrid*.

pseudobilabiate corolla – a corolla with a 4-lobed outer (abaxial) lip and a simple (not lobed) inner (adaxial) lip (e.g., in *Barnadesia* Mutis ex Linnaeus f., not in China).

pseudocephalum (plural **pseudocephalia**) – literally “false head”; an aggregation of *capitula* into a secondary, capitulum-like *synflorescence* (e.g., in *Echinops*, *Elephantopus*, and *Sphaeranthus*); cf. *glomerule*.

punctate – see *gland-dotted*.

punctate glandular – see *gland-dotted*.

radiant capitulum – a *heterogamous capitulum* with *marginal florets* usually *neuter* (sometimes *female*) with corollas usually 5-lobed, notably enlarged (relative to corollas of central florets), and actinomorphic to \pm zygomorphic (e.g., in *Centaurea* s.l.) and with central florets usually *bisexual* with 5-lobed, actinomorphic corollas.

radiate capitulum – a *heterogamous capitulum* with marginal *ray florets* and central *disk florets*.

ray – see *lamina*.

ray corolla – the corolla of a *ray floret*.

ray florets – in a *radiate capitulum*, the *marginal florets* that are *neuter*, *female*, or *styliferous* and *sterile* with zygomorphic corollas. The *corolla limb* of a *ray corolla* is called a *lamina* and is \pm flat, \pm strap-shaped, and (0–)2- or 3(or 4)-lobed or -toothed; it has been called a *ligule*, but here *ligule* is used for the corolla limb of a *ligulate floret*.

receptacle (adjective **receptacular**) – in reference to Asteraceae, the portion of a *capitulum* that bears *phyllaries* peripherally and *florets* on its face; transition from apex of *peduncle* to receptacle is imperceptible and the distinction is arbitrary; faces of receptacles may be concave, flat, convex, conical, or cylindric and may be *paleate* or *epaleate* (epaleate receptacles are sometimes described as naked). Paleate receptacles are sometimes said to be chaffy and the *paleae*, collectively, are sometimes called chaff. Epaleate receptacles may bear \pm subulate enations (e.g., in *Grindelia*) or bristles or subulate to linear scales (e.g., in some Cardueae) or hairs (e.g., in some Anthemideae) among florets, or epaleate receptacles may be \pm *foveolate* with margins of sockets notably lacerate; such epaleate receptacles may be mistaken for paleate receptacles.

retorse – directed toward the base; lateral elements of *barbellate* or *plumose* awns or bristles of a *pappus* may be described as retorse; cf. *antrorse*.

rostrate – bearing a *rostrum*.

rostrum (plural **rostra**) – a distal, attenuated portion of an *achene* (e.g., in *Taraxacum*).

scabrid – used to describe capillary *pappus* bristles with lateral extensions that are shorter than those in *barbellate* bristles; see also *plumose*.

scale – see *pappus*.

scape – properly, a leafless and simple flowering stem of a plant that has leaves in basal rosettes; the *peduncle* of some Asteraceae (e.g., in *Taraxacum*) is sometimes called a scape.

scapiform – resembling a *scape*.

scrobiculate – refers to a *receptacle* covered with low mounds of tissue with furrows between, the top of each mound occupied by the remains of the vascular bundle.

seta (plural **setae**) – a bristle or bristlelike structure; with reference to Asteraceae, setae are usually elements of a *pappus*.

setiferous – bearing *setae*.

setula (plural **setulae**) – diminutive of *seta* (*setae*); small hairs usually on an *achene*, including *twin hairs*.

setuliferous – bearing *setulae*.

squamella (plural **squamellae**) – a relatively small scale; scales of a *pappus* are sometimes called squamellae.

staminate floret – see *functionally male floret*.

sterome – a central, ± hardened portion of a *phyllary*; individual steromes may be undivided or divided into two lobes (e.g., in Gnaphalieae).

stigmatic area – area of a *style branch* covered with stigmatic papillae, present as areas covering the inside of the style branch or separated into two marginal bands that may sometimes fuse toward the apex of the style branch.

style arm – see *style branch*.

style branch – in reference to Asteraceae, one of the two branches of a style; usually, each style branch bears stigmatic papillae on the inner (adaxial) face, at least proximally; in *functionally male florets*, styles are usually not branched and usually lack stigmatic papillae.

style branch appendage – see *style branch tip*.

style branch tip – the portion of a *style branch* beyond the *stigmatic area* (sometimes termed style branch appendage); the forms of style branch tips are sometimes characteristic of tribes or subtribes.

styliferous and sterile – describes a *ray floret* that has a style but is seed-sterile, i.e., it has an infertile ovary, unable to produce a seed.

stylopodium (plural **stylopodia**) – literally “style foot”; usually, a nectary at the base of a style.

subimbricate – less than *imbricate*; weakly overlapping.

subinvolucral bracts – individual bracts surrounding or below an *involucre*, sometimes subtending individual *peduncles*, e.g., in *Mikania*.

subplumose – less than *plumose*.

subradiate capitulum – a *heterogamous capitulum* with the *ray florets* not exceeding the *phyllaries*.

sweeping hairs – dorsal projections from the abaxial side of the *style branches*. Their function is to collect pollen from the pollen sacs as the style grows up through the *anther tube*; the distribution and shape of sweeping hairs are often taxonomically useful.

syncalathium (plural *syncalathia*) – see *synflorescence*.

synflorescence – a compound inflorescence; any arrangement of multiple *capitula* on a capitulum-bearing shoot; a synflorescence can be corymbiform, paniculiform, racemiform, spiciform, etc., or capitulum-like; see also *glomerule* and *pseudocephalum*.

twin hairs – translation of the German *Zwillingshaare*, sometimes referred to as duplex hairs although usually 3-celled (2 parallel cells plus 1 smaller basal cell); twin hairs are often found on *achenes* of Asteraceae and are sometimes called *setulae*.

umbo – a ± conical or polyhedral projection or boss; in some Asteraceae, a usually waxy structure associated with a *pappus* (e.g., in *Jurinea*).

umbonate – bearing an *umbo*.

xylopodium (plural **xylopodia**) – literally, “wood foot”; a ± woody, subterranean caudex or rootstock that is derived from the hypocotyl and roots.

Systematic list of tribes, subdivisions of tribes, and genera

● Indicates endemic genus

1. Mutisieae (p. 9)

1. ● *Nouelia*
2. *Leucomeris*
3. *Adenocaulon*
4. *Leibnitzia*
5. *Gerbera*
6. *Piloselloides*

Key to tribes

- 1a. Capitula of 2 kinds, either with only functionally male florets or with only female florets; flowering not precocious.
 - 2a. Plants monoecious, with male and female capitula on same plant 14. Heliantheae (p. 852)
 - 2b. Plants dioecious, with male and female capitula on different plants.
 - 3a. Leaves spiny 3. Carlineae (*Tugarinovia*; p. 39)
 - 3b. Leaves not spiny.
 - 4a. Shrubs 1. Mutisieae (*Myriopsis*, rarely *Pertya*; p. 9)
 - 4b. Herbs.
 - 5a. Phyllaries papery; female florets filiform 10. Gnaphalieae (*Antennaria*; p. 774)
 - 5b. Phyllaries herbaceous; female florets tubular, apically 3- or 4-lobed 246. *Cavea* (p. 892)
- 1b. Capitula all alike, homogamous or heterogamous, rarely plants subdioecious and then flowering precocious.
 - 6a. Fertile achenes with conspicuous stipitate glands 1. Mutisieae (*Adenocaulon*; p. 9)
 - 6b. Fertile achenes without conspicuous stipitate glands.
 - 7a. Capitula homogamous and all florets ligulate, i.e., corollas with an expanded abaxial, apically 5-toothed, 5-lobed, or 5-cleft limb; latex (milky juice) present 5. Cichorieae (p. 195)
 - 7b. Capitula heterogamous, or if homogamous then corollas tubular and 5-lobed or zygomorphic and pseudoligulate (5-lobed with one deeper cleft or sinus); plants without or rarely with latex.
 - 8a. Capitula homogamous; corollas pseudoligulate, 5-lobed and zygomorphic.
 - 9a. Capitula in bracteate glomerules; phyllaries 8, decussate; style branches long 6. Vernonieae (*Elephantopus*, *Pseudelephantopus*; p. 354)
 - 9b. Capitula not in bracteate glomerules; phyllaries not decussate; style branches very short or scarcely bilobed 1. Mutisieae (*Ainsliaea*, *Pertya*; p. 9)
 - 8b. Capitula heterogamous (marginal florets with a strap-shaped, entire or 2–4-toothed or 2–4-lobed outer limb) or homogamous and corollas 3–5-lobed, actinomorphic.
 - 10a. Capitula with all or some florets bilabiate or pseudobilabiate (slightly zygomorphic) 1. Mutisieae (*Gerbera*, *Leibnitzia*, *Nouelia*, *Piloselloides*; p. 9)
 - 10b. Capitula lacking bilabiate florets.
 - 11a. Capitula each with only 1 floret, aggregated into a terminal globose pseudocephalium; leaves spiny 2. Echinopeae (p. 33)
 - 11b. Capitula with more than 1 floret, or if with only 1 floret then leaves not spiny.
 - 12a. Leaves at least below synflorescence opposite or mostly so.
 - 13a. Style branch tips longer than stigmatic lines, prominent; capitula discoid; corollas never yellow 15. Eupatorieae (p. 879)
 - 13b. Style branch tips shorter than stigmatic lines, or absent; capitula radiate, disciform, or discoid; corollas often yellow 14. Heliantheae (p. 852)
 - 12b. Leaves all alternate.
 - 14a. Style shaft and branches glabrous 1. Mutisieae (*Leucomeris*; p. 9)
 - 14b. Style shaft glabrous or with hairs or evident papillae in distal part and/or style branches with hairs or evident papillae abaxially or apically or on an apical appendage.
 - 15a. Disk corollas 3- or 4-merous.
 - 16a. Receptacle with scales 248. *Symphylocarpus* (p. 893)
 - 16b. Receptacle without scales.
 - 17a. Achenes dorsiventrally compressed, elliptic in cross section 9. Anthemideae (p. 653)
 - 17b. Achenes subterete, broadly ribbed 247. *Centipeda* (p. 892)
 - 15b. Disk corollas or all corollas 5-merous.
 - 18a. Style shaft with a papillose-pilose thickening below branches; leaves spiny, at margin finely serrulate-spinulose, or not spiny.
 - 19a. Achene densely hairy, capitula homogamous, plants biennial or perennial, and leaves never grasslike; pappus inserted directly on upper edge of achene, not surrounded by a rim 3. Carlineae (p. 39)
 - 19b. Achene glabrous or subglabrous, rarely densely hairy but then capitula radiant, plants annual, or leaves grasslike; pappus insertion surrounded by a \pm conspicuous rim or crown 4. Cardueae (p. 42)
 - 18b. Style shaft without a papillose-pilose thickening below branches; leaves neither spiny nor at margin finely serrulate-spinulose.

- 20a. Achenes large, heteromorphic, outer cymbiform or curved, inner strongly curved to circular; receptacle epaleate; pappus absent 11. Calenduleae (p. 819)
- 20b. Achenes small, columnar or compressed, straight or only slightly curved, homomorphic or only slightly heteromorphic, if large then receptacle paleate; pappus present or absent.
 - 21a. Phyllaries rather dry, either with distinct scarious margin or papery, brownish, yellowish, or whitish, never herbaceous and green throughout.
 - 22a. Anthers rounded at base; phyllaries with distinct pale or brownish scarious margin 9. Anthemideae (p. 653)
 - 22b. Anthers tailed at base; phyllaries papery, whitish, brownish, or yellowish, especially in distal part 10. Gnaphalieae (p. 774)
 - 21b. Phyllaries herbaceous, all or at least outer ones green throughout, except at very apex.
 - 23a. Style branches long, slender, subulate, without an apical appendage, hairy abaxially and with stigmatic papillae over entire adaxial surface; capitula homogamous 6. Vernonieae (p. 354)
 - 23b. Style branches not with above combination of characters; capitula homogamous or heterogamous.
 - 24a. Receptacle paleate.
 - 25a. Achenes with a carbonized layer in pericarp, thereby black or streaked with black 14. Heliantheae (p. 852)
 - 25b. Achenes without a carbonized layer in pericarp, thereby usually not black.
 - 26a. Phyllaries linear 12. Inuleae (*Bupthalmum*; p. 820)
 - 26b. Phyllaries broadly elliptic to oblanceolate 13. Athroismeae (p. 851)
 - 24b. Receptacle epaleate.
 - 27a. Style branches terminating in a triangular to subulate appendage distal to stigmatic lines.
 - 28a. Phyllaries uniseriate, but sometimes with an outer series of much shorter bracts (calyculus); involucre cylindric 7. Senecioneae (p. 371)
 - 28b. Phyllaries 2- to several seriate, if subuniseriate then involucre saucer-shaped to subglobose 8. Astereae (p. 545)
 - 27b. Style branches without an apical appendage distal to stigmatic lines, apically rounded or truncate.
 - 29a. Phyllaries uniseriate, but sometimes with an outer series of much smaller bracts (calyculus); capitula never aggregated into a compact synflorescence 7. Senecioneae (p. 371)
 - 29b. Phyllaries 2- or 3-seriate or imbricate in several series; capitula sometimes aggregated into a compact synflorescence.
 - 30a. Corolla bearing numerous robust uniseriate multicellular hairs 246. *Cavea* (p. 892)
 - 30b. Corolla without such hairs.
 - 31a. Stigmatic papillae confined to 2 submarginal lines often confluent at apex 12. Inuleae (p. 820)
 - 31b. Stigmatic papillae covering entire adaxial surface of style branches 7. Senecioneae (*Doronicum*; p. 371)

8. Tribe ASTEREAE

紫菀族 zǐ wān zú

Chen Yilin (陈艺林 Chen Yi-ling), Chen Yousheng (陈又生); Luc Brouillet, John C. Semple

Herbs, perennial, sometimes annual or biennial, subshrubs, or shrubs, sometimes lianas [or trees]. Leaves usually alternate, simple, margin entire, serrate, dentate, or pinnatisect, rarely pinnately lobed. Capitula radiate, sometimes disciform or rarely discoid. Phyllaries many, 1–5-seriate, imbricate or \pm equal, herbaceous, membranous or subleathery, margins \pm narrowly scarious. Receptacles flat or convex, sometimes hemispheric or conic, or rarely cup-shaped, alveolate or smooth, epaleate or rarely paleate. Ray florets 1 to numerous, 1(–3)-seriate, female, laminate or finely subulate, lamina yellow, rarely orange or reddish to brownish, or white to pink, blue, or purple, apex sometimes 2- or 3-toothed, sometimes multiseriate, with reduced lamina or elaminate, reduced to tube; disk florets bisexual or functionally male, yellow or rarely white, limb cylindric, funnelform, or campanulate; anther base obtuse, rarely caudate, apical appendage ovate to lanceolate; style branches with 2 adaxial stigmatic lines, apical appendages lanceolate to triangular, abaxially pilose, adaxially glabrous. Achenes cylindric, oblong, obovoid, or oblanceoloid, not blackened, usually ribbed or veined. Pappus 1–4-seriate, of barbed or barbellate, rarely long-barbed, fine or coarse bristles, sometimes of setae or scales (all or outermost series), or absent.

About 225 genera and 3,100 species: worldwide, especially in temperate areas of both hemispheres; 30 genera (three endemic, two introduced) and 237 species (112 endemic, 13 introduced) in China; one additional species (*Conyza stricta*) is of uncertain position.

- 1a. Capitula disciform or discoid.
 - 2a. Capitula globose to rounded or oblong; involucre patelliform or hemispheric; receptacles globose to hemispheric or obconic, often swollen, or cup- or funnel-shaped peripherally, convex centrally, rarely flat or convex (*Thespis*); pappus absent or coroniform, rarely of 6–13 short, coarse bristles (*Thespis*); herbs annual, rarely perennial.
 - 3a. Marginal floret corolla minutely tubular or absent; pappus of 6–13 short, coarse bristles; receptacles flat or convex; leaves unlobed 120. *Thespis*
 - 3b. Marginal floret corolla with filiform tube and/or lamina present; pappus absent or coroniform; receptacles globose to hemispheric or obconic, often swollen, or cup- or funnel-shaped peripherally, convex centrally; leaves often lyrate lobed or lobed, sometimes unlobed.
 - 4a. Herbs prostrate; involucre patelliform.
 - 5a. Marginal female florets cylindric-linear, funnel-shaped, or ovoid to urceolate, 2- or 3-lobed; disk florets functionally male; synflorescences racemiform or paniculiform, rarely solitary capitula 116. *Dichrocephala*
 - 5b. Marginal female florets tubular, outer 2-lobed, inner 3- or 4-lobed; disk florets bisexual; synflorescences solitary capitula or laxly corymbiform 118. *Grangea*
 - 4b. Herbs erect; involucre hemispheric.
 - 6a. Leaves pinnatifid or pinnatisect; receptacles cup-shaped or funnel-shaped peripherally (female), slightly convex centrally (disk); marginal female floret lamina none (outer) or short, narrowly funnelform (inner), 2-lobed, purple; disk florets 5-lobed; achenes oblong to \pm fusiform, not ribbed 117. *Cyathocline*
 - 6b. Leaves sometimes lyrate, sometimes lobed, or not lobed; receptacles convex, hemispheric or globose; ray floret lamina small, rounded, ovate or linear, white to purplish; disk florets 4-lobed; achenes narrowly obovoid, 2-ribbed 119. *Myriactis*
 - 2b. Capitula cup-shaped; involucre hemispheric or campanulate to turbinate or cylindric; receptacles flat or \pm convex, or hemispheric-flattened or hemispheric-conic to lenticular-knobby; pappus of bristles (usually numerous, usually long); herbs perennial or annual, sometimes woody vines.
 - 7a. Capitula discoid.
 - 8a. Achenes obovoid; leaves eglandular (or sometimes stipitate glandular); capitula solitary at ends of branches, sometimes forming open paniculate-corymbiform synflorescences; disk floret lobes unequal 139. *Aster*
 - 8b. Achenes oblong or lanceolate; leaves gland-dotted or not; capitula in dense or loose corymbiform synflorescences, rarely solitary; disk floret lobes equal.
 - 9a. Involucre broadly obconic to campanulate or hemispheric, phyllaries 1–3-veined; leaves sometimes 3-veined; rhizomes robust 125. *Galatella*
 - 9b. Involucre shortly cylindric or sometimes obconic, phyllary midvein \pm distinct; leaves 1-veined; rhizomes slender 126. *Crinitina*
 - 7b. Capitula disciform.
 - 10a. Woody vines, climbing; achenes angled, 3-ribbed 122. *Microglossa*
 - 10b. Herbs perennial or annual, climbing or erect; achenes compressed, flattened or cylindric, 2–4- or more ribbed or many veined (if 3-ribbed and angled then usually on ray only and disk achenes 2-ribbed).
 - 11a. Capitula solitary or 2–4-fascicled at ends of branches, shortly pedunculate or sessile; disk corolla lobes unequal, outer 2 longer; herbs perennial, climbing or erect 134. *Heteroplexis*

- 11b. Capitula terminal, solitary or few, or in racemiform, paniculiform, or corymbiform
synflorescences, pedunculate; disk corolla lobes equal; herbs perennial or annual, erect.
- 12a. Herbs annual, eglandular, glabrous (leaf margin ciliate) 144. *Symphotrichum*
- 12b. Herbs annual or perennial, glandular (sometimes eglandular), hairy.
- 13a. Involucres urceolate or subcylindric 141. *Erigeron*
- 13b. Involucres campanulate to hemispheric-campanulate.
- 14a. Disk florets functionally male (sterile); phyllaries 2- or 3-seriate 135. *Psychrogeton*
- 14b. Disk florets bisexual (fertile); phyllaries 3- or 4-seriate.
- 15a. Phyllaries subequal; disk floret limb shortly funnelform; achenes oblanceolate,
flattened 136. *Neobrachyactis*
- 15b. Phyllaries imbricate (unequal); disk floret limb funnelform; achenes oblong, compressed.
- 16a. Female florets elaminate; pappus 1-seriate; synflorescences corymbiform, sometimes
glomerate, glomerate-paniculiform, or paniculiform 121. *Eschenbachia*
- 16b. Female florets laminate, lamina short, filiform; pappus \pm 2-seriate, outer very short,
slender; synflorescences densely compound-corymbiform (see species incertae sedis
after *Eschenbachia*) *Conyza stricta*
- 1b. Capitula radiate.
- 17a. Ray floret lamina yellow, orange, red, or brownish.
- 18a. Small shrubs; pappus 3-seriate, outermost of 6 broad scales, inner (absent in disk florets) of flattened
bristles, innermost of strongly clavate bristles; leaf blade pinnatilobed; receptacles fimbriate 133. *Formania*
- 18b. Herbs perennial, sometimes biennial or annual, or subshrubs; pappus 1–3-seriate, outer few short bristles
or scales, inner series of bristles, innermost sometimes \pm clavate, or only short scales; leaf blade
subpinnatifid or unlobed; receptacles naked.
- 19a. Disk florets functionally male (sterile).
- 20a. Capitula \pm large; phyllaries unequal to equal; herbage sometimes or partly long white lanate or
cottony; achenes 8–10-veined; pappus bristles long barbellate 115. *Nannoglottis*
- 20b. Capitula medium-sized to small; phyllaries imbricate; herbage white tomentose to lanate, sessile
to short-stipitate glandular; achenes 2-ribbed; pappus bristles barbellate 135. *Psychrogeton*
- 19b. Disk florets bisexual (fertile).
- 21a. Plants resinous; phyllaries looped or hooked; pappus of few deciduous scales or awns 143. *Grindelia*
- 21b. Plants not resinous; phyllaries \pm appressed; pappus 1–3-seriate, outer few short bristles or scales,
inner series of bristles.
- 22a. Capitula numerous in terminal racemiform, paniculiform, or corymbose-paniculiform
synflorescences; achenes obconic to cylindric, sometimes \pm compressed, 8–10-veined 140. *Solidago*
- 22b. Capitula solitary; achenes oblong, compressed, 2(–4)-veined 141. *Erigeron*
- 17b. Ray floret lamina white, pink, purple, or blue.
- 23a. Pappus absent (that of disk sometimes 1-seriate short scales in *Aster*).
- 24a. Herbs scapiform, leaves basal, sometimes rosulate.
- 25a. Phyllaries leaflike; receptacles swollen or conic; involucres hemispheric or broadly campanulate; ray
florets 1-seriate; disk florets bisexual (fertile), numerous; achenes not beaked, strigillose 123. *Bellis*
- 25b. Phyllaries membranous; receptacles flat or convex; involucres campanulate; ray florets 3- or
4-seriate; disk florets functionally male (sterile), few; achenes shortly beaked, apically glandular 130. *Lagenophora*
- 24b. Herbs erect, leaves basal (often withered at anthesis) and cauline.
- 26a. Herbs biennial (winter annual); ray florets 3; disk florets few, functionally male (sterile); disk
achene pappus absent; ray achenes 3-ribbed 137. *Sheareria*
- 26b. Herbs perennial; ray florets numerous; disk florets numerous, bisexual (fertile); disk achene pappus
absent or 1-seriate short scales; achenes 2–5- or more ribbed 139. *Aster*
- 23b. Pappus present (rarely absent on ray achene only in *Erigeron*).
- 27a. Pappus 1-seriate, of caducous, barbellate, spiniform bristles; disk florets functionally male (sterile);
achenes 3-ribbed, slightly winged 131. *Calotis*
- 27b. Pappus 1–4-seriate, of persistent (deciduous in *Callistephus*) barbellate bristles; disk florets bisexual
(fertile); achenes 2- to many ribbed, not winged.
- 28a. Outer phyllaries large, leaflike, inner scarious; pappus 3-seriate, outermost of persistent, short scales,
inner 2 of deciduous bristles 132. *Callistephus*
- 28b. Outer phyllaries leaflike (not large) or membranous, inner membranous; pappus 1–4-seriate,
outermost of short setae or sometimes scales, inner of persistent (sometimes deciduous) bristles.
- 29a. Ray florets sterile; achene ribs indistinct; leaf blades often gland-dotted 125. *Galatella*
- 29b. Ray florets female, fertile; achene ribs distinct; leaf blades eglandular or sessile or stipitate glandular
(not gland-dotted).

- 30a. Subshrubs, strongly branched; leaf margins often revolute; phyllaries leathery 127. *Asterothamnus*
- 30b. Herbs perennial, biennial, or annual; leaf margins flat (rarely revolute); phyllaries membranous or leaflike.
- 31a. Pappus conspicuously elongating after anthesis; herbs annual 124. *Tripolium*
- 31b. Pappus not elongating after anthesis; herbs perennial, sometimes annual or biennial.
- 32a. Leaves basal, linear; achenes slightly veined, densely sericeous, eglandular; capitula solitary 128. *Arctogeron*
- 32b. Leaves basal and cauline (sometimes reduced, then basal not linear); achenes ribbed or veined, glabrous or sparsely to densely strigillose, glandular or eglandular; capitula in synflorescences or solitary.
- 33a. Achenes 7–10-veined; stems ascending, villous, eglandular 142. *Eurybia*
- 33b. Achenes 2–6-ribbed or -veined; stems usually erect, sometimes prostrate, glabrous or hairy, glandular or eglandular.
- 34a. Disk corollas \pm zygomorphic (1 lobe deeper).
- 35a. Herbs perennial, caespitose; basal leaves numerous (persistent); receptacle shallowly alveolate, naked 138. *Rhinactinidia*
- 35b. Herbs perennial, biennial, or annual, not caespitose, or rarely shrubs; basal leaves withered by anthesis; receptacle alveolate, fimbriate 139. *Aster*
- 34b. Disk corollas actinomorphic.
- 36a. Capitula small, numerous in dense corymbiform synflorescences; stems densely glandular; disk corolla limb shortly funnelform; achenes ovoid 129. *Turczaninovia*
- 36b. Capitula small or medium-sized, solitary or few to numerous in corymbiform, racemiform, or paniculiform synflorescences; stems \pm glandular or eglandular; disk corolla limb cylindric to funnelform or campanulate; achenes oblong or obovoid to oblanceoloid.
- 37a. Disk floret limb cylindric to narrowly funnelform; phyllary midvein reddish or orange 141. *Erigeron*
- 37b. Disk floret limb campanulate to funnelform; phyllary midvein not reddish or orange.
- 38a. Herbs perennial, sometimes annual, biennial, or shrubs, glandular or eglandular, glabrous or hairy; involucre hemispheric to campanulate, sometimes obconic; capitula solitary or in corymbiform, sometimes paniculiform synflorescences; achenes oblong or obovoid, compressed, 2–4(–7)-ribbed, glandular or eglandular 139. *Aster*
- 38b. Herbs perennial or annual, eglandular, glabrous (except distally in lines); involucre campanulate or cylindric; capitula in paniculiform synflorescences; achenes oblanceoloid, \pm compressed, 2–6-veined, eglandular 144. *Symphotrichum*

115. NANNOGLOTTIS Maximowicz, Bull. Acad. Imp. Sci. Saint-Pétersbourg 27: 480. 1882.

毛冠菊属 mao guan ju shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Stereosanthus Franchet; *Vierhapperia* Handel-Mazzetti.

Herbs, perennial, rarely subshrubs; rhizome woody; herbage sometimes or partly long white lanate or cottony, stipitate glandular. Leaves alternate, basal and lower cauline long or shortly petiolate, blade lanceolate, ovate-lanceolate, oblong, orbicular, or cordate, margin coarsely serrate, mid and upper cauline sessile, often decurrent. Capitula \pm large, few to numerous in corymbiform synflorescences, rarely solitary, radiate. Involucre hemispheric or cup-shaped; phyllaries 2–4-seriate, unequal to equal, herbaceous, rarely papery, multiveined, margins of inner narrowly scarious, outer glandular or long hairy. Receptacles flat or slightly convex, \pm alveolate, naked. Ray florets outer with lamina yellow, reddish, or brownish, surpassing or \pm equaling phyllaries, inner 2- or 3-seriate, rarely few or absent, tubular, elaminate, shorter than styles; disk functionally male, yellow, narrowly funnelform, 5-lobed, lobes lanceolate to linear-lanceolate, often glandular; anther bases obtuse or acute; style branches of ray florets linear-lanceolate, long, of disk \pm appressed together, lanceolate, \pm short, densely hairy (outer), without receptive papillae. Achenes brown, oblong, sparsely strigose, pale 8–10-veined. Pappus of few short, thin bristles (sometimes absent), and many long, coarse or thin, long-barbellate bristles, those of disk sometimes few, short, thin.

Nine species: Bhutan, China, India, Nepal; nine species (six endemic) in China.

J. Q. Liu et al. (Molec. Phylogen. Evol. 23: 307–325. 2002) produced a molecular phylogeny of *Nannoglottis*, showing it is one of the earliest diverging lineages of Astereae. *Nannoglottis ravida* is the earliest diverging member of the genus and has been segregated under *N.* sect. *Monocephala* T. G. Gao & Y. L. Chen from all other species of the genus.

- 1a. Subshrubs; capitula solitary; ray florets yellow; leaves abaxially densely cottony 1. *N. ravida*
 1b. Perennial herbs; capitula numerous in corymbiform synflorescences; ray florets yellow, brownish, or reddish;
 leaves abaxially \pm densely cottony or arachnoid, or glandular.
 2a. Ray florets brownish or reddish, lamina slightly exceeding involucre.
 3a. Basal leaves cordate, long winged petiolate 9. *N. yunnanensis*
 3b. Basal leaves ovate-lanceolate, attenuate at base.
 4a. Mid cauline leaves base abruptly narrowed into short, broadly winged petiole, margin
 denticulate, abaxially stipitate glandular 8. *N. hieraciophylla*
 4b. Mid cauline leaves base attenuate, margin dentate, abaxially stipitate glandular, sparsely
 arachnoid 7. *N. carpesioides*
 2b. Ray florets yellow, lamina distinctly exceeding involucre.
 5a. Basal leaves abaxially densely lanate (glands not visible), sometimes arachnoid.
 6a. Basal leaves long petiolate, cordate to orbicular or broadly ovate, margin shallowly dentate, teeth
 obtuse or acute, mid cauline abruptly smaller; phyllaries lanceolate 2. *N. delavayi*
 6b. Basal leaves shortly petiolate, ovate to lanceolate, margin irregularly denticulate to dentate,
 mid cauline developed; phyllaries ovate to lanceolate-ovate 5. *N. latisquama*
 5b. Basal leaves abaxially glandular or also arachnoid.
 7a. Phyllaries papery, 3- or 4-seriate, unequal, outer shorter than inner 3. *N. gynura*
 7b. Phyllaries herbaceous, 2- or 3-seriate, equal or subequal.
 8a. Basal leaves attenuate at base, decurrent on stem, usually sessile 4. *N. hookeri*
 8b. Basal leaves abruptly narrowed, long petiolate 6. *N. macrocarpa*

1. *Nannoglottis ravida* (C. Winkler) Y. L. Chen, Kew Bull. 39: 432. 1984.

青海毛冠菊 qing hai mao guan ju

Senecio ravidus C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 4. 1893; *Nannoglottis qinghaiensis* Y. Ling & Y. L. Chen.

Subshrubs; rhizome thickened, woody, multibranched. Stems erect, 12–20 cm tall, pubescent with white cottony hairs and glandular hairs, later glabrescent. Leaves: basal oblanceolate or spatulate-oblong, 4–5 \times ca. 1 cm; mid cauline petiole to 5 cm, winged, blade oblong or elliptic, 4–11 \times 0.5–2.5 cm, abaxially densely cottony, adaxially green, arachnoid or glabrous, base attenuate, margin repand-dentate or shallowly lobed, apex obtuse or rounded. Capitula solitary. Involucre hemispheric, 13–15 mm in diam.; phyllaries 2- or 3-seriate, linear-lanceolate, 9–11 \times 1–1.5 mm, abaxially white cottony and glandular, apex often reflexed, acuminate. Ray florets yellow, lamina linear, ca. 10 \times 1 mm; tubular florets fine, ca. 4 mm, apically finely hairy; disk florets yellow, 5–6 mm, lobes glandular. Achenes oblong, appressed hairy, finely ribbed. Pappus of white bristles 5–6 mm. Fl. and fr. Jul–Aug.

• Rocky mountains, shady slopes, thickets, meadows; 3700–4100 m. S Qinghai (Chindu), Xizang.

2. *Nannoglottis delavayi* (Franchet) Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 10: 98. 1965.

厚毛毛冠菊 hou mao mao guan ju

Stereosanthus delavayi Franchet, J. Bot. (Morot) 10: 385. 1896.

Herbs, perennial; rhizome woody. Stems erect, 35–80 cm tall, arachnoid and sparsely villous, stipitate glandular, densely so above. Leaves: basal and lower cauline petiole long, 6–20 cm, blade cordate to orbicular or broadly ovate, 6–19.5 \times 5–16.5 cm, abaxially densely arachnoid-tomentose, adaxially

arachnoid or glabrate, short-stipitate glandular, base cordate or abruptly attenuate, margin shallowly dentate, long-stipitate glandular, teeth obtuse or acute, mucronate, apex obtuse, mucronate; mid and upper cauline sessile, \pm decurrent, abruptly smaller, decreasing upward, lanceolate, sometimes \pm clasping. Capitula 3–18 in corymbiform synflorescences. Involucre hemispheric, 1.5–2 cm in diam.; phyllaries 3- or 4-seriate, lanceolate, subequal, abaxially sometimes sparsely to \pm densely arachnoid, densely long-stipitate glandular, papery, margin long-stipitate glandular, sparsely arachnoid, moderately so apically, that of inner sometimes narrowly scarious, apex long acuminate. Ray florets yellow, lamina narrowly oblong, 9–15 \times 1–3 mm, distinctly exceeding involucre; inner tubular 1- or 2-seriate, 2–4 mm, truncate, fimbriate; disk florets yellow, lobes \pm glandular. Achenes narrowly oblong, 3–4 mm, strigose, 8–10-ribbed. Pappus of yellowish bristles 3–4 mm, some shorter and thinner, those of disk fewer, thinner. Fl. Jun–Sep.

• *Pinus* or *Quercus* forests; 2600–3600 m. SW Sichuan, NW Yunnan.

3. *Nannoglottis gynura* (C. Winkler) Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 10: 97. 1965.

狭舌毛冠菊 xia she mao guan ju

Senecio gynura C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 14: 157. 1895; *Nannoglottis souliei* (Franchet) Y. Ling & Y. L. Chen; *Stereosanthus gynura* (C. Winkler) Handel-Mazzetti; *S. hieraciifolius* Diels; *S. souliei* Franchet.

Herbs, perennial; rhizome thick, woody. Stems erect, 17–100 cm tall, sparsely (to moderately above) stipitate glandular, sparsely and irregularly arachnoid (more regularly so above), or glabrate. Leaves: basal and lower cauline petiole relatively short, 3–8 cm, narrowly winged, blade obovate or elliptic, 6–20 \times 2.5–6 cm, surfaces sparsely to moderately short-stipitate glandular, abaxial midvein sparsely arachnoid, base attenuate, margin irregularly, shallowly dentate to serrate, teeth mucronulate, apex obtuse or acute; mid cauline narrowly elliptic to lanceo-

late, base auriculate-clasping; upper cauline reduced upward, entire. Capitula (5–)10–27 in corymbiform synflorescences. Involucre 2–3.5 cm in diam.; phyllaries 3- or 4-seriate, linear-lanceolate, unequal, outer shorter than inner, papery, surfaces densely short-stipitate glandular, \pm arachnoid, margin apically densely arachnoid ciliate, that of inner narrowly to moderately scarious, apex acuminate to caudate, tip often dark. Ray florets yellow, lamina narrowly oblong, $9-13 \times 1.8-2.5$ mm, distinctly exceeding involucre; inner tubular 2- or 3-seriate, yellow, 2–4 mm, obliquely truncate; disk florets numerous, 4–4.5 mm, lobes glandular (mostly at apex). Achenes brown, narrowly oblong, 4–6 mm, sparsely to moderately strigose, particularly distally, pale 8–10-veined. Pappus of white or whitish bristles 4–5.5 mm, those of disk fewer. Fl. Jul–Aug.

Pinus or *Picea* forests, thickets, gullies, grasslands on slopes; 3400–4000 m. Qinghai, Sichuan, Xizang, Yunnan [Nepal].

4. *Nannoglottis hookeri* (C. B. Clarke ex J. D. Hooker) Kitamura, Acta Phytotax. Geobot. 31: 50. 1980.

虎克毛冠菊 hu ke mao guan ju

Doronicum hookeri C. B. Clarke ex J. D. Hooker, Fl. Brit. India 3: 332. 1881.

Herbs, perennial; rhizome woody. Stems erect, 10–85 cm tall, simple, often weakly lanate at first, stipitate glandular above. Leaves sessile or lowest winged petiolate, petiole to ca. 10 cm, blade lanceolate to oblanceolate, $7-22 \times 1-8$ cm, surfaces lanate or glabrescent, stipitate glandular, base attenuate, decurrent on stem, margin denticulate to sharply toothed, apex acute. Capitula 2–7 in corymbiform-cymose synflorescences. Involucre \pm hemispheric, 15–20 mm in diam.; phyllaries 2- or 3-seriate, subequal, lanceolate, $10-15 \times 1-4$ mm, sparsely arachnoid and stipitate glandular, apex acuminate. Ray florets yellow, tube 2.3–4.5 mm, hairy above, lamina $8-13 \times 1.7-3.3$ mm, distinctly exceeding involucre; inner tubular 1- or 2-seriate, 2–3.5 mm, puberulent above; disk florets yellow, funnelform, 4–4.5 mm, lobes sparsely glandular. Achenes oblong, 4–5 mm, strigose distally. Pappus of white or brownish bristles 4–5 mm. Fl. Jun–Aug.

Pinus forests, sometimes among shrubs; 3400–4100 m. S Xizang (Yadong) [Bhutan, India (Sikkim), Nepal].

5. *Nannoglottis latisquama* Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 10: 98. 1965.

宽苞毛冠菊 kuan bao mao guan ju

Stereosanthus yunnanensis Franchet, J. Bot. (Morot) 10: 385. 1896.

Herbs, perennial; rhizome thick. Stems solitary, erect, 12–70 cm, simple, \pm densely white arachnoid and villous, long-stipitate glandular (notably above), partly glabrescent. Leaves: basal and lowest cauline petiole short, winged, blade ovate to lanceolate, sometimes obovate to oblanceolate, $4-20 \times 3-17$ cm, abaxially densely lanate to arachnoid, adaxially arachnoid, short-stipitate glandular, base attenuate, decurrent on stem, margin irregularly denticulate to dentate, apex obtuse or rounded, mucronate; mid cauline several, oblong, lanceolate, or ovate, sometimes obovate, apex obtuse or acute; upper cauline gradu-

ally reduced, surfaces white arachnoid-lanate or arachnoid, abaxially more densely so, adaxially \pm glabrescent. Capitula (1 or) 2–14, in corymbiform synflorescences, rarely solitary. Involucre hemispheric, 1.5–3.5 cm; phyllaries 3- or 4-seriate, subequal, herbaceous (inner papery), ovate to lanceolate-ovate, $13-18 \times 2-5$ mm, sometimes sparsely to densely white arachnoid, densely stipitate glandular, margin villous, long-stipitate glandular, distally moderately arachnoid ciliate, apex long acuminate. Ray florets yellow, oblong, $9-18 \times 2-4$ mm, distinctly exceeding involucre; inner tubular 2- or 3-seriate, 1.8–3.5 mm, truncate; disk florets yellow, tubular, 4–5.3 mm, lobes glandular. Achenes oblong, 4–4.5 mm, moderately strigose, 10-ribbed (sterile disk ovary glabrous or sparsely strigose distally). Pappus of straw-colored, coarse bristles 4–5 mm, plus some short, thin bristles, those of disk lacking or few and thin. Fl. Apr–Sep.

• *Pinus*, *Abies*, or mixed forests, thickets, grasslands, alpine meadows; 3200–3900 m. S and W Sichuan, NW Yunnan.

6. *Nannoglottis macrocarpa* Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 10: 99. 1965.

大果毛冠菊 da guo mao guan ju

Herbs, perennial; rhizome ascending, woody. Stems erect, 30–100 cm tall, white lanate and sparsely villous, long-stipitate glandular. Leaves: basal long petiolate, blade ovate to ovate-lanceolate, $6-25 \times 3-11$ cm, abaxially stipitate glandular, adaxially sparsely arachnoid, very sparsely villous, stipitate glandular, margin coarsely dentate, apex obtuse; cauline sessile, lower ovate or elliptic, $15-20 \times 8-18$ cm, apex obtuse to acute; mid cauline up to 25, elliptic, 8–10 cm, base decurrent, apex acute; upper cauline ovate to ovate-lanceolate, base cordate, auriculate-clasping, apex acuminate. Capitula 3–20, in corymbiform-cymose synflorescences. Involucre hemispheric, 2–2.5 cm in diam.; phyllaries 2- or 3-seriate, subequal or outer slightly longer, lanceolate to linear-lanceolate, ca. $12 \times 2-2.5$ mm, herbaceous, abaxially short-stipitate glandular, margin apically lanate-ciliate. Ray florets yellow, lamina $6-8 \times 0.6-1.3$ mm, distinctly exceeding involucre; inner tubular 1- or 2-seriate, yellow; disk florets yellow, funnelform, 4–4.5 mm, lobes ca. 1.5 mm, short-stipitate glandular outside. Achenes oblong, 6–7 mm, \pm densely strigose, 10–12-ribbed. Pappus of white to yellowish, coarse, unequal bristles 4–5 mm. Fl. Jul–Aug.

Forests, grasslands; 3500–3700 m. E Xizang (Bomi, Qamdo) [Nepal].

7. *Nannoglottis carpesioides* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 481. 1882.

毛冠菊 mao guan ju

Herbs, perennial; rhizome woody. Stems erect, 60–100 cm tall, sparsely arachnoid-tomentose, long-stipitate glandular, more densely so above. Leaves: basal and lower cauline dense, petiole to 10 cm, winged, blade oblong or obovate-oblanceolate, $10-33 \times 6-16$ cm, abaxially sparsely arachnoid, stipitate glandular, veins long villous to arachnoid, adaxially stipitate glandular, sparsely arachnoid or not, base attenuate, often decurrent on stem, margin coarsely dentate to serrate, apex acuminate; mid cauline ovate to ovate-lanceolate, abaxially stipitate

glandular, sparsely arachnoid, base attenuate, margin coarsely dentate; upper cauline reduced gradually, finely dentate. Capitula 3–12 in loose racemiform or corymbiform synflorescences. Involucre hemispheric, 1.5–2.5 cm in diam.; phyllaries 2- or 3-seriate, subequal or outer slightly longer, lanceolate to oblong-lanceolate, 9–12 mm, papery, \pm densely stipitate glandular, sometimes base sparsely arachnoid, margin stipitate glandular, of inner narrowly scarious, apex acute to acuminate. Ray florets brownish, lamina oblong, 1.9–4 \times 1.1–1.7 mm, slightly exceeding involucre, abaxially sparsely stipitate glandular; inner tubular 1- or 2-seriate; disk florets yellowish, tubular, lobes glandular at apex. Achenes oblong, 4.5–5 mm, strigose, 8–10-ribbed. Pappus of dirty white, coarse bristles, those of disk few, short. Fl. Jun–Jul.

• Forests on slopes, meadows, pastures; 2000–3400 m. Gansu, Qinghai, Shaanxi, Yunnan.

8. *Nannoglottis hieraciophylla* (Handel-Mazzetti) Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 10: 101. 1965 [*“hieraciophylla”*].

玉龙毛冠菊 yu long mao guan ju

Vierhapperia hieraciophylla Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 629. 1937 [*“hieraciophylla”*].

Herbs, perennial; rhizome woody. Stems erect, 38–90 cm tall. Leaves: basal short, winged petiolate, blade ovate or oblong, 12–22 \times 3.8–9 cm, abaxially stipitate glandular, base attenuate, margin dentate, villosulous; mid cauline broadly winged, shortly petiolate, blade abaxially stipitate glandular, sparsely villous on midvein, adaxially stipitate glandular, sparsely villosulous, base abruptly narrowed, margin denticulate; upper cauline sessile. Capitula 2–7, in corymbose synflorescences. Phyllaries 2–4-seriate, subequal, linear-lanceolate. Ray florets purplish-reddish, lamina 0.6–4 \times 0.4–1.2 mm; inner tubular 1-seriate, filiform, sometimes unstable; disk florets numerous, yellowish, 4–5 mm, lobes glandular at apex. Achenes oblong, pilose, 8–10-ribbed. Pappus of few white bristles 3–4 mm. Fl. Jun–Sep.

• *Picea* forests or thickets; 3400–3800 m. NW Yunnan (Lijiang, Zhongdian).

9. *Nannoglottis yunnanensis* (Handel-Mazzetti) Handel-Mazzetti, Symb. Sin. 7: 1116. 1936 [*“yuennanensis”*].

云南毛冠菊 yun nan mao guan ju

Nannoglottis carpesioides Maximowicz var. *yunnanensis* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 57: 175. 1920 [*“Yüannanensis”*].

Herbs, perennial; rhizome thick, woody. Stems erect, solitary, 55–200 cm tall, white long villous below, sparsely to moderately (more densely under capitula) white arachnoid, densely long-stipitate glandular above. Leaves: basal long winged petiolate, withered and fallen at anthesis, blade cordate; lower cauline petiole 6–16 cm, broadly winged, blade subcordate, broadly ovate, ovate, or subelliptic, 9–25 \times 4.5–18 cm, abaxially arachnoid, sessile glandular or short-stipitate glandular, adaxially scabrous to glabrate, base broadly cuneate, truncate, or slightly cordate, decurrent on stem, margin irregularly dentate, apex obtuse, rounded, or acute, mucronulate; upper cauline gradually diminished, uppermost sessile, auriculate. Capitula 3–10 in corymbiform-cymose synflorescences. Involucre hemispheric, 1.7–2.5 cm in diam.; phyllaries 2- or 3-seriate, subequal, lanceolate or linear-lanceolate, 8–13 \times 1.5–2 mm, abaxially densely short-stipitate glandular, sparsely arachnoid at base, margin arachnoid ciliate (more densely so apically), of inner narrowly scarious, apex acuminate. Ray florets brownish, lamina linear-lanceolate to triangular, 0.5–3 mm, slightly exceeding involucre, gradually reduced inward to inner tubular florets; inner tubular 2–4-seriate, 1–2 mm, obliquely truncate; disk florets numerous, yellowish, 2–5 mm, deeply lobed, lobes sparsely glandular. Achenes straw-colored, narrowly oblong, 3–4 mm, strigose, 8–10-ribbed, (sterile ovary of disk florets glabrous or sparsely strigose apically). Pappus of straw-colored bristles 3–4 mm, those of disk few, unequal. Fl. Jun–Jul.

• *Picea* forests, open pastures; 2900–4000 m. W Sichuan, NW Yunnan (Zhongdian).

116. *DICHROCEPHALA* L'Héritier ex Candolle, Arch. Bot. (Paris) 2: 517. 1833.

鱼眼草属 yu yan cao shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual, prostrate. Leaves alternate, lyrate or entire. Capitula small, disciform, orbicular or oblong, in racemiform or paniculiform synflorescences, rarely solitary. Involucre patelliform; phyllaries 2- or 3-seriate, margins narrowly scarious, fimbriate. Receptacle globose or obconic, swollen, alveolate, naked. Florets fertile; marginal female many seriate, white or yellow, without tube, lamina narrowly cylindric, funnel-shaped, campanulate, or ovoid to urceolate, 2- or 3-lobed; disk florets bisexual, yellow or reddish, tube short, limb narrowly campanulate, 4- or 5-lobed; anther base obtuse; style branch tips lanceolate. Achenes obovoid, compressed, glabrous, sometimes basally and apically glandular, green apically, margins strongly 2-ribbed, of female florets sometimes faintly so. Pappus absent, of disk florets \pm coroniform, sometimes with 1 or 2 short setae.

Four species: Africa, tropical Asia; three species in China.

- 1a. Corolla of female florets shortly funnel-shaped or campanulate; phyllaries \pm puberulent; receptacle distinctly swollen, obconic, apex acute 1. *D. chrysanthemifolia*
- 1b. Corolla of female florets cylindric or ovoid to urceolate; phyllaries glabrous; receptacle globose, apex flat.
 - 2a. Female floret corolla narrowly cylindric; leaves lyrate pinnatifid, base attenuate into winged petiole ... 2. *D. integrifolia*
 - 2b. Female floret corolla ovoid or urceolate; leaves usually pinnate, rarely lyrate pinnatifid, base expanded, auriculate-clasping, sessile 3. *D. benthamii*

1. *Dichrocephala chrysanthemifolia* (Blume) Candolle, Arch. Bot. (Paris) 2: 518. 1833.

菊叶鱼眼草 ju ye yu yan cao

Cotula chrysanthemifolia Blume, Bijdr. 918. 1826; *Dichrocephala abyssinica* Schultz Bipontinus ex Hochstetter; *D. grangeifolia* Candolle.

Herbs, annual, branched. Stems and branches rigid, white tomentulose, pubescent, or hispidulous, long-stipitate glandular, branches ascending, spreading or apically oblique. Leaves oblong or obovate, 3–5 × 0.8–2 cm, pinnatifid, pinnatifid, or pinnatilobate, surfaces ± densely white strigose and puberulent, sparsely glandular, base expanded, auriculate-clasping; lateral lobes 2- or 3-paired, oblong, lanceolate, or triangular-lanceolate, margin 1- or 2-serrulate on one or both sides, or entire; lobes of lower leaves relatively small, of middle large, of upper gradually smaller, uppermost linear, entire or with 1- or 2-paired teeth. Capitula globose or oblong, ca. 7 mm in diam., solitary in upper leaf axil and in subracemiform synflorescences; peduncles ca. 5 cm, densely puberulent or puberulent-tomentose; bracts 1–3, linear or lanceolate. Phyllaries 1- or 2-seriate, slightly unequal, ca. 1.5 mm, margin white scarious, ± puberulent. Receptacles obconic, distinctly swollen, 5–6 mm in fruit, apex acute. Marginal female florets many seriate, purple, corolla shortly funnel-shaped or campanulate, ca. 0.7 mm, deeply 3–5-lobed, lobes sometimes sparsely glandular; disk florets functionally male, few, ca. 1 mm, limb funnelform, 4- or 5-lobed, externally sparsely viscid-glandular, pilose. Achenes straw-colored, oblanceoloid, compressed, apically ± glandular. Pappus absent or of disk florets with 1 or 2 bristles.

Grasslands on slopes, roadsides; ca. 2900 m. Xizang, Yunnan [Bhutan, India, Indonesia, Japan, Malaysia, Myanmar, Nepal, New Guinea, Philippines; Africa, Australia].

If varieties were recognized, the variety present in Asia would be *Dichrocephala chrysanthemifolia* var. *chrysanthemifolia*.

2. *Dichrocephala integrifolia* (Linnaeus f.) Kuntze, Revis. Gen. Pl. 1: 333. 1891.

鱼眼草 yu yan cao

Hippia integrifolia Linnaeus f., Suppl. Pl. 389. 1782; *Cotula bicolor* Roth; *C. latifolia* Persoon, nom. illeg. superfl.; *Dichrocephala auriculata* (Thunberg) Druce; *D. bicolor* (Roth) Schlechtendal; *D. latifolia* Candolle, nom. illeg. superfl.; *Ethulia auriculata* Thunberg; *Grangea latifolia* Lamarck ex Poirét, nom. illeg. superfl.

Herbs, annual. Stems erect, 12–55 cm tall, robust, rarely slender, simple or branched from base, branches ascending, stems and branches sparsely to moderately white villous or pubescent. Leaves: petiole 1–3.5 cm, narrowly winged, base clasping, blade ovate, elliptic, or lanceolate, surfaces sparsely to moderately strigose, margin coarsely doubly serrate or incised,

villous-ciliate, base attenuate; mid cauline 3–12 × 2–4.5 cm, lyrate pinnatilobate, terminal lobe large, lateral lobes 1- or 2-paired; upper or lower often simple and gradually smaller. Capitula globose, 3–5 mm in diam., 5–26 in terminal paniculiform synflorescences; peduncles slender, to 3 cm. Phyllaries 2-seriate, unequal, oblong or oblong-lanceolate, 1–1.5 mm, membranous, margin scarious, fimbriate. Receptacle globose, apex flat. Marginal female florets many seriate, white, sometimes turning purplish, corolla narrowly cylindric, 0.4–0.5 mm, usually 2-lobed; disk florets few, ca. 0.5 mm, tube short, limb narrowly campanulate to funnelform, 4- or 5-lobed, sessile glandular. Achenes straw-colored, obovate, compressed, glabrous, sparsely glandular apically and/or basally. Pappus absent, or of disk florets sometimes with 1 or 2 bristles. Fl. and fr. year-round.

Slopes, shaded valleys, forests on slopes, watersides, meadows on clay, wastelands, roadsides, trailsides; 200–2000 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, New Guinea, Philippines, Thailand, Vietnam; tropical Africa, SW Asia (Iran); introduced in SW Asia (Azerbaijan, Georgia, Turkey), Australia, and Pacific islands].

This is a medicinal plant, used for dyspepsia, indigestion, as an antiphlogistic, and as an antiemetic.

3. *Dichrocephala benthamii* C. B. Clarke, Compos. Ind. 36. 1876.

小鱼眼草 xiao yu yan cao

Dichrocephala amphiloba H. Léveillé & Vaniot; *D. bodinieri* Vaniot.

Herbs, annual, 6.5–35 cm tall. Stems solitary or fascicled, robust, rarely slender, branched, sparsely to densely white villous or pubescent. Leaves sessile, blade ovate, obovate-oblong-spatulate, or oblong, surfaces sparsely villous, sometimes glabrescent or glabrate, veins densely villous-ciliate; mid cauline 3–6 × 1.5–3 cm, pinnate, rarely lyrate-pinnatilobate, sometimes unlobed, lateral lobes 1–3-paired, spatulate or broadly spatulate, base auriculate-clasping, margin coarsely crenate-serrate, densely or sparsely white shortly hairy. Capitula globose, 3–5 mm in diam., few or numerous in lax to dense corymbiform or paniculate-corymbiform synflorescences; peduncles slightly robust, puberulent or glabrate. Phyllaries 2- or 3-seriate, oblong, 1–1.5 mm, margin denticulate. Receptacle globose, apex flat. Marginal female florets many seriate, white, corolla ovoid or urceolate, 0.5–0.7 mm, 2- or 3-lobed; disk florets few, yellow-green, 0.8–0.9 mm, tube very short, limb funnelform, 4- or 5-lobed. Achenes straw-colored, obovoid, compressed, glabrous. Pappus absent, or of disk florets sometimes with 1 or 2 fine bristles. Fl. and fr. year-round.

Grasslands in valleys, riverbanks, fields, wastelands, roadsides; 700–3200 m. Gansu, Guangxi, Guizhou, Hubei, Sichuan, Xizang, Yunnan [Bhutan, Cambodia, India, Laos, Nepal, Vietnam].

117. CYATHOCLINE Cassini, Ann. Sci. Nat. (Paris) 17: 419. 1829.

杯菊属 bei ju shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual [or perennial]. Leaves alternate, pinnatifid or pinnatisect. Capitula small, globose, disciform, in corymbiform-

paniculiform or nearly racemiform synflorescences. Receptacles cup-shaped or funnel-shaped peripherally (bearing marginal florets), slightly convex centrally (bearing disk florets), non-alveolate, naked. Involucre hemispheric; phyllaries 2- or 3-seriate, subequal, oblong to lanceolate, margin scarious. Marginal florets female, fertile, many seriate, purple, tube filiform, lamina none (outer) to short, narrowly funnelform (inner), 2-lobed; disk florets bisexual, usually functionally male, few, limb funnelform, 5-lobed; anther base truncate, appendages triangular; style branch tips linear-lanceolate, of disk florets simple or cleft. Achenes minute, oblong to \pm fusiform, slightly flattened, not ribbed, apex \pm coroniform. Pappus absent.

Three species: tropical Asia; one species in China.

1. *Cyathocline purpurea* (Buchanan-Hamilton ex D. Don) Kuntze, Revis. Gen. Pl. 1: 333. 1891.

杯菊 bei ju

Tanacetum purpureum Buchanan-Hamilton ex D. Don, Prodr. Fl. Nepal. 181. 1825; *Cyathocline lyrata* Cassini; *C. stricta* Candolle; *Dichrocephala minutifolia* Vaniot.

Herbs, annual, 10–36+ cm tall. Stems erect, often branched from base, branches ascending, reddish purple or red tinged, villous, short-stipitate glandular, more densely so upward. Leaves: basal and lower cauline often deciduous by flowering, petiolate; mid cauline sessile, blade ovate or obovate, 2.5–12 cm, reduced distally, pinnatisect or pinnatifid, abaxially sparsely villous particularly along midvein, stipitate glandular, adaxially sparsely villous or glabrate, sparsely glandular, base expanded auriculate-clasping, segments opposite or oblique, interspersed with triangular lobes along rachis, larger and terminal segments

\pm lobed, margin spinose-serrate, \pm stipitate glandular. Capitula small, numerous or few in often dense terminal corymbiform or corymbiform-paniculiform synflorescences; peduncles densely white villous, \pm densely stipitate glandular. Involucre hemispheric, ca. 2 mm in diam.; phyllaries 2- or 3-seriate, subequal, membranous, abaxially sparsely white villous or glabrous, sometimes sparsely glandular (mostly distally), margin hyaline, scarious, \pm fimbriate, ciliate, apex acuminate, purple. Marginal female florets purple, tube filiform and short, limb narrowly funnelform, 2-lobed; disk florets 7–11, purple or lobes purple, tube cylindric, 0.6–0.8 mm, limb funnelform, ca. 1.6 mm, lobes triangular. Achenes oblong to fusiform. Fl. and fr. nearly year-round.

Forests, grasslands on slopes, ravines, watersides, roadsides, fields; 100–2000 m. Guangdong, Guangxi, Guizhou, Sichuan, Yunnan [Bangladesh, Bhutan, Cambodia, India, Laos, Myanmar, Nepal, Thailand, Vietnam].

118. GRANGEA Adanson, Fam. Pl. 2: 121. 1763.

田基黄属 tian ji huang shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual [or perennial], often prostrate. Leaves alternate, oblong-obovate to spatulate, lyrate-pinnatifid or serrate-dentate. Capitula disciform, globose, solitary or in laxly corymbiform synflorescences. Involucre patelliform; phyllaries 2- or 3-seriate, slightly unequal, herbaceous, inner series scarious at apex. Receptacle swollen, hemispheric or obconic, naked. Florets yellow. Marginal florets female, 1- to many seriate, corolla tubular, of outer usually 2-lobed, of inner 3- or 4-lobed; disk florets bisexual, fertile, limb narrowly campanulate, 4- or 5-lobed; anther base obtuse, apical appendage lanceolate; style branches truncate, obtuse or with triangular appendage, sometimes simple. Achenes compressed or subcylindric, apex truncate, often ringed. Pappus absent.

Nine species: tropical and subtropical Africa and Asia; one species in China.

1. *Grangea maderaspatana* (Linnaeus) Poiret, Encycl. Suppl. 2: 825. 1812.

田基黄 tian ji huang

Artemisia maderaspatana Linnaeus, Sp. Pl. 2: 849. 1753; *Cotula sphaeranthus* Link; *Grangea procumbens* Candolle; *G. sphaeranthus* (Link) K. Koch.

Herbs, annual, (5–)10–30 cm tall. Stems slender, usually procumbent, branched, white villous or glabrescent in lower part by anthesis. Leaves usually obovate, oblanceolate, or obspatulate, 3.5–7.5 \times 1.5–2.5 cm, surfaces white villous, glandular; basal sessile, blade pandurate or lyrate-lobate, to ca. 10 \times 4 cm, base usually auriculate, terminal lobe obovate or suborbicular, margin coarsely dentate, lateral lobes 2–5-paired; upper gradually smaller. Capitula terminal, solitary, rarely paired, 8–10 mm in diam. Involucre hemispheric; phyllaries 2- or 3-seri-

ate, outer series lanceolate-ovate, 4–8 mm, outer surface villous, margin fimbriate, ciliate, apex acute to obtuse, inner series oblanceolate or obovate, clawed, obtuse. Receptacles hemispheric. Florets sparsely glandular; marginal female florets yellow, 2–6-seriate, corolla filiform, ca. 1 mm, shortly 2- or 4-lobed; disk florets shortly cylindric campanulate, ca. 1.5 mm, lobes ovate. Achenes compressed, glabrous, glandular, \pm thickly 2-ribbed, apex truncate, with a thickened, toothed ring. Pappus absent. Fl. and fr. Jan–Aug.

Riverbanks, watersides, rice paddies, sandy areas, meadows, open forests, thickets; below 100–1000 m. Guangdong, Guangxi, Hainan, Taiwan, S Yunnan [Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, Pakistan, Sri Lanka, Thailand, Vietnam; tropical Africa].

The leaves are used medicinally as a stomachic, an antitussive, and for regulating menses.

119. MYRIACTIS Lessing, Linnaea 6: 127. 1831.

粘冠草属 nian guan cao shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual or perennial, herbage villous, long-stipitate glandular. Leaves alternate, basal and/or cauline, winged petiolate or sessile, blade oblanceolate-oblong to spatulate, sometimes lyrate, sometimes lobed, base clasping, margin \pm coarsely dentate or serrate. Capitula small, heterogamous, solitary or numerous in lax corymbose-paniculiform synflorescences; peduncle long. Involucre hemispheric; phyllaries 2- or 3-seriate, subequal, papery, margin scarious, hyaline, \pm fimbriate. Receptacles convex, hemispheric or globose, not alveolate, naked. Ray florets fertile, 2–5- or more seriate, tube short, lamina white to purplish, small, orbicular, ovate, or linear; disk florets functionally male, limb narrowly funnelform to campanulate, 4-lobed, lobes lanceolate; anther base obtuse; (disk) style branches appressed, without stigmatic lines, appendages lanceolate, abaxially hairy. Achenes narrowly obovoid, compressed, margin 2-ribbed, apex with short viscid collar (of ray florets), glabrous, \pm glandular. Pappus absent.

About 12–16 species: tropical Africa and Asia; five species (one endemic) in China.

- 1a. Ray florets 5- or more seriate, lamina orbicular or ovate.
 - 2a. Leaves simple, sometimes lower lobed or parted, lateral lobes 1- or 2-paired 1. *M. nepalensis*
 - 2b. Leaves lyrate-pinnatifid or lobed or pinnatisect, or sometimes lower leaves orbicular, simple 2. *M. humilis*
- 1b. Ray florets (1 or) 2- or 3-seriate, lamina linear.
 - 3a. Mid cauline leaves narrowly to broadly ovate 3. *M. wightii*
 - 3b. Mid cauline leaves lanceolate, elliptic, or elliptic-lanceolate to oblanceolate.
 - 4a. Leaves serrate, parted or lobed, but not pinnatifid 4. *M. wallichii*
 - 4b. Leaves pinnatifid, sometimes lyrate 5. *M. delavayi*

1. *Myriactis nepalensis* Lessing, Linnaea 6: 128. 1831.

圆舌粘冠草 yuan she nian guan cao

Dichrocephala leveillei Vaniot.

Herbs, perennial, usually robust, 15–100 cm tall; rhizomes short, procumbent. Stems erect, often branched from middle or base, branches ascending, glabrous or sparsely villous. Leaves: basal and lower cauline winged petiolate, petiole to 10 cm, blade simple, large, ovate-elliptic, sometimes lobed or parted, lateral lobes 1- or 2(or 3)-paired, petiole base sheathing; mid cauline elliptic to ovate, 4–10 \times 2.5–4.5 cm, margin coarsely serrate or crenate, base decurrent into broad, winged petioles (lower) or sessile (upper), petiole base or blade base \pm auriculate-clasping; upper gradually smaller, sessile, elliptic, oblanceolate, or lanceolate, surfaces sparsely villosulous particularly on veins, more moderately so adaxially, base \pm auriculate-clasping. Capitula globose or hemispheric, 0.7–1.5 cm in diam., solitary or numerous in laxly corymbose-paniculiform synflorescences. Phyllaries 2- or 3-seriate, lanceolate, abaxially villosulous. Ray florets 8- or more seriate, lamina orbicular or ovate, 0.6–0.8 mm, apex rounded or emarginate; disk floret limb broadly funnelform, 1.2–1.3 mm, villosulous, 4-lobed. Achenes straw-colored, 1.6–2.1 mm, faces sometimes 1-veined, apical collar viscid, dark. Fl. and fr. Apr–Nov.

Forests, forest margins, thicket margins, slopes, wet areas on grassy-shrubby disturbed slopes, steep moist slopes, meadows, open and moist or humid areas along streamsides, ravines, roadsides; 700–3700 m. Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Sichuan, Xizang, Yunnan [Bhutan, India, Myanmar, Nepal, Pakistan, Vietnam].

2. *Myriactis humilis* Merrill, Philipp. J. Sci. 1(Suppl. 3): 244. 1906.

台湾粘冠草 tai wan nian guan cao

Myriactis bipinnatisecta Kitamura; *M. formosana* Kita-

mura; *M. humilis* var. *bipinnatisecta* (Kitamura) S. S. Ying; *M. longipedunculata* Hayata; *M. longipedunculata* var. *bipinnatisecta* (Kitamura) Kitamura; *M. longipedunculata* var. *formosana* (Kitamura) Kitamura.

Herbs, perennial, 10–35 cm tall; rhizomes short, oblique. Stems solitary or to 3, erect, branched, branches ascending, or simple, scapiform, glabrous or \pm puberulent. Leaves usually crowded in lower part (basal and lower cauline), petiole 2.5–4 cm, winged, blade elliptic, spatulate, or ovate, 2–3(–7) \times 1–2(–4) cm, lyrate-pinnatifid, pinnatifid, or lyrate-bipinnatisect, or simple and \pm orbicular to spatulate, surfaces sparsely to moderately strigose to glabrate, base auriculate-clasping, lateral lobes 2- or 3-paired, oblong to ovate or obovate, margin entire or 1-serrate on one side, terminal lobe large, broadly ovate to orbicular or oblong, margin coarsely serrate or lobed-serrate; upper cauline few, winged petiolate, blade oblanceolate-oblong or oblanceolate, pinnatifid, base auriculate-clasping, terminal lobe obtriangular or lanceolate; uppermost sessile, simple, blade narrowly oblong, entire or few toothed. Capitula hemispheric, 6–9 mm in diam., few (usually 3 or 4), solitary at ends of stems and branches or in open paniculate-corymbiform synflorescences; peduncle 1–12 cm. Phyllaries 2-seriate, subequal, oblong or narrowly oblong with narrow scarious margin, outer series pulverous-puberulent. Ray florets 8- or more seriate, tube and abaxial lamina hairy, lamina orbicular, apex emarginate or rounded; disk florets funnelform, 1–1.4 mm, limb base hairy, 4-lobed. Achenes brown, 1.6–2 mm, glabrous. Fl. and fr. May–Oct.

• Moist and humid places on shady slopes, roadsides; 1700–3000 m. Taiwan.

3. *Myriactis wightii* Candolle in Wight, Contr. Bot. India, 10. 1834.

粘冠草 nian guan cao

Myriactis javanica Candolle; *M. wightii* var. *cordata* Y. Ling & C. Shih.

Herbs, annual, 20–90 cm tall. Stems erect, usually branched from middle, rarely proximally, or simple, subscapose, branches ascending or spreading, densely to sparsely villous or glabrate in lower part. Leaves often with axillary branches or fascicled; lower blade ovate, or sometimes lyrate-pinnatilobate, terminal lobe ovate; mid cauline petiole ± broadly winged, blade broadly to narrowly ovate, 5–8 × 3–6 cm, rarely lyrate-pinnatilobate, terminal lobe same shape as blade, surfaces villous to strigose-villous or villous only along veins, base clasping or auriculate-clasping, margin deeply crenate or serrate or incised-serrate, entire in uppermost leaves or lateral lobes. Capitula few or numerous in terminal, laxly corymbiform or paniculate-corymbiform and lateral, laxly racemiform synflorescences; peduncle 0.4–5 cm. Involucre hemispheric, ca. 1.2 cm in diam. (in fruit); phyllaries 2(or 3)-seriate, subequal, narrowly oblong to lanceolate, 3–4 mm, abaxially sparsely villous to glabrate, apex fimbriate-lacerate. Ray florets 2-seriate, tube ca. 0.4 mm, glandular, lamina linear, 0.8–1 × 0.1–0.2 mm, apex obtuse, sometimes 2-lobed; disk florets tube cylindric, ca. 0.4 mm, limb campanulate, 0.8–1 mm, 5-lobed, glabrous or base of limb barely glandular. Achenes greenish to pale brown, 1.5–2.5 mm. Fl. and fr. Jul–Nov.

Forests on slopes, mixed forests, grasslands, streamsides; 1900–3600 m. Guizhou, Sichuan, Xizang, Yunnan [India, Indonesia, Nepal, Sri Lanka, Vietnam].

Myriactis wightii var. *cordata* (FRPS 74: 355. 1985), defined on the basis of mid cauline leaf bases, does not appear to warrant recognition.

4. *Myriactis wallichii* Lessing, Linnaea 6: 129. 1831.

狐狸草 hu li cao

Herbs, annual, 15–60 cm tall. Stems erect, often many branched from base or middle, branches ascending, spreading, long, white strigillose, sparsely villosulous, or glabrate. Leaves: petiole narrowly winged, base slightly expanded or auriculate-clasping, blade surfaces sparsely white strigillose, sometimes glabrate, base abruptly attenuate to rounded, margin serrate, repand-dentate, or entire; mid cauline blade narrowly elliptic-lanceolate or narrowly elliptic, 4–4.6 × 2–3 cm, uppermost similar or sublinear. Capitula hemispheric, ca. 1 cm in diam. (in

fruit), numerous in laxly corymbiform or subcorymbiform synflorescences, those of lower branches in paniculate-corymbiform or racemiform synflorescences; peduncle short and slender. Phyllaries 2-seriate, subequal, oblong or oblanceolate, 3–4 mm, sometimes sparsely pubescent at base. Ray florets 2- or 3-seriate, white becoming pink, lamina linear; disk florets yellow to yellow-green, limb campanulate. Achenes ca. 3.5 mm, shortly beaked, apically with a viscid secretion. Fl. Aug–Oct.

Grasslands, forests on slopes; 2600–3600 m. Guizhou, Hunan, Sichuan, Xizang, Yunnan [Afghanistan, Bhutan, India, Indonesia, Myanmar, Nepal, Pakistan, Thailand, Vietnam; SW Asia (Caucasus, Iran)].

5. *Myriactis delavayi* Gagnepain, Bull. Soc. Bot. France 68: 122. 1921.

羽裂粘冠草 yu lie nian guan cao

Herbs, perennial, 18–50 cm tall; rhizomes usually curved. Stems erect, sometimes ascending, branched from middle or sometimes simple, branches ascending, spreading, long, glabrous or sparsely strigillose. Leaves: petiole narrowly winged, base expanded and clasping, blade surfaces glabrate or sparsely strigillose along veins, margin sometimes sparsely strigillose-ciliate; basal and lower cauline blade oblanceolate, lyrate or pinnatipartite; mid cauline blade homomorphic, oblanceolate to narrowly oblanceolate, 4–7 × 1–3.5 cm, pinnatipartite, lateral lobes 1- or 2-paired, terminal lobe large, elliptic or long elliptic to ovate, margin serrate (often entire on lobes), mucronulate; upper blade narrowly oblanceolate or narrowly elliptic to (uppermost) linear, pinnatifid or pinnatilobate, to (uppermost) serrate or entire. Capitula hemispheric, 6–8 mm in diam. (in fruit), few in lax racemiform synflorescences (terminal seeming subcorymbiform). Phyllaries 3-seriate, subequal, lanceolate or oblong to oblanceolate (inner), 3–4 mm, outer externally strigillose. Ray florets 2- or 3-seriate, tube 0.7–0.8 mm, glandular, lamina linear, 1.15–1.25 × 0.3–0.5 mm, apex rounded, entire; disk floret functionally male, tube 0.2–0.3 mm, limb campanulate, 1.1–1.3 mm, upper tube and limb base glandular, 4(or 5)-lobed, lobes lanceolate, 0.75–0.8 mm. Achenes olive to pale brown, oblanceolate, compressed, 1.8–2.5 mm, short collar viscid. Fl. and fr. Aug–Sep.

Grasslands, forests on slopes; 2700–3000 m. Sichuan, Yunnan [Vietnam].

120. *THESPIS* Candolle, Arch. Bot. (Paris) 2: 517. 1833.

歧伞菊属 qi san ju shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual, dwarf, glabrous. Stems ascending to spreading, multibranched. Leaves alternate, simple, serrate or entire. Capitula disciform, small, globose, several, fascicled in divaricately branched corymbiform synflorescences, sessile or shortly pedunculate. Involucre hemispheric; phyllaries 2-seriate, herbaceous, subequal, broad, obtuse, margin scarious, 3-veined, usually slightly shorter than disk. Receptacle flat or convex, glabrous, with fine processes. Florets yellow; female fertile, multiseriate, corolla minutely tubular or lacking, glandular; disk florets functionally male, few, sterile, corolla tubular, tube short, limb funnelform, 4-lobed, lobe margins thickened, sometimes glandular; anther base obtuse, auriculate; style branches short, appressed. Achenes slightly compressed, small, minutely glandular or sparsely scabridulous, veined. Pappus of 6–13 short barbellate bristles in 1 series, of disk florets thin or absent.

Three species: SE Asia; one species in China.

1. *Thespis divaricata* Candolle, Arch. Bot. (Paris) 2: 517. 1833.

歧伞菊 *qi san ju*

Herbs, annual, 4–23 cm tall; root fusiform. Stems ascending, branched at base, sparsely pilose to glabrate. Leaves winged petiolate, blade obovate-lanceolate to obovate-spatulate, 1–2.5 × 0.5–1.5 cm, surfaces sparsely hispidulous on veins or glabrate, lateral veins 2–4-paired, base attenuate, margin coarsely serrate or entire, apex acuminate. Capitula 2–3 mm in diam., usually 5–10 fascicled. Involucre hemispheric; phyllaries

2-seriate, ovate-oblong, 1.5–2 mm, glabrous, margin entire, 3-veined. Female florets multiseriate, usually without corolla; disk florets few, corolla 1–1.1 mm. Achenes oblong-fusiform, slightly compressed, 0.7–0.8 mm, scabridulous, multiveined. Pappus of 8–13 pinkish bristles 0.44–0.54 mm, slightly shorter than styles in female florets, in disk florets of 6–8 white, smooth bristles ± equalling tube.

Field margins, roadsides; below 100–1000 m. Guangdong, S Yunnan (Xishuangbanna) [Bangladesh, Cambodia, India, Laos, Myanmar, Nepal, Thailand, Vietnam].

121. *ESCHENBACHIA* Moench, Methodus, 573. 1794.

白酒草属 *bai jiu cao shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Dimorphanthus Cassini; *Edemias* Rafinesque.

Herbs, annual, biennial, or perennial. Stems erect, simple or branched, hirsute or strigose. Leaves alternate, margin entire, serrulate to coarsely serrate, pinnatifid, or pinnatifid. Capitula disciform, few to numerous, in corymbiform, sometimes glomerate, glomerate-paniculiform, or paniculiform synflorescences, rarely cymiform, rarely solitary. Involucre campanulate to hemispheric-campanulate; phyllaries 3- or 4-seriate, imbricate, obovate to ovate-lanceolate, lanceolate, linear-lanceolate, or linear, membranous, green ± widely along midvein, margin and apex scarious. Receptacles hemispheric-flattened, hemispheric-conic to lenticular-knobby, alveolate (central part bearing disk florets distinctly with wider alveolae), fimbriate. Florets fertile. Ray florets female, numerous, white, corolla reduced to filiform tube, elaminate, ca. 1/2 as long as style; disk florets bisexual, few to numerous, yellow or yellowish, limb funnelform, lobes 5; anther base obtuse; style branch tip short. Achenes oblong or lanceolate, compressed, ± strigillose, sometimes glandular, margin 2-ribbed. Pappus white to yellowish white or cinnamon to ± reddish, 1-seriate, sometimes basally connate in a ring, often deciduous, of subequal, fine, barbellulate bristles.

Number of species uncertain: Africa, S Asia; six species (three endemic) in China.

The genus *Conyza* Lessing, nom. cons., to which African and Asian species have been traditionally referred, is an American taxon that is phylogenetically nested within *Erigeron*, where it is treated here (only introduced species are in China). African and Asian species, however, do not belong to the North American clade but to the unrelated subtribe Grangeinae of the Astereae (Brouillet et al. in Funk et al., Syst. Evol. Biogeogr. Compositae, 589–629. 2009), an African group that repeatedly dispersed to S Asia. *Eschenbachia* is typified by *E. globosa* Moench, nom. illeg. superfl., based on *Erigeron aegyptiacus* Linnaeus. *Eschenbachia aegyptiaca* is part of the African subtribe Grangeinae (J. S. Strijk, pers. comm.). Most native Chinese species previously treated under *Conyza* appear assignable to *Eschenbachia* (except for *C. stricta*, species incertae sedis). The description of the genus given here is based solely on the species present in China.

1a. Leaves pinnatifid or pinnatifid.

2a. Mid leaves pinnatifid, petiole base subclasping; capitula 12–15 mm in diam., in dense corymbiform

synflorescences 1. *E. aegyptiaca*

2b. Mid leaves pinnatifid, petiole base not clasping; capitula 6–10 mm in diam., in short, narrow,

paniculiform synflorescences 2. *E. blinii*

1b. Leaves coarsely serrate or serrulate.

3a. Annual or biennial herbs, taproot fusiform.

4a. Stems densely villous, densely short-stipitate viscid glandular; mid cauline leaves shortly petiolate or subsessile, not clasping; capitula 3.1–7.9 mm in diam., in broadly paniculiform synflorescences; ray

florets 1/5 or less as long as style 3. *E. leucantha*

4b. Stems scabrous (below) to villous, eglandular; mid cauline leaves sessile, base subclasping; capitula

7.5–11 mm in diam., in glomerate or dense corymbiform synflorescences; ray florets 1/2 or less as

long as style 4. *E. japonica*

3b. Perennial herbs, rhizome or caudex woody.

5a. Capitula 4–5 mm in diam.; phyllary margin narrowly scarious; cauline leaves oblong-lanceolate to

lanceolate, coarsely serrate; disk floret lobes glandular 5. *E. perennis*

5b. Capitula 6–7 mm in diam.; phyllary margin ± broadly scarious; cauline leaves linear-oblong to

linear, sparsely serrulate or subentire; disk floret lobes hairy at apex 6. *E. muliensis*

1. *Eschenbachia aegyptiaca* (Linnaeus) Brouillet, **comb. nov.**

埃及白酒草 ai ji bai jiu cao

Basionym: *Erigeron aegyptiacus* Linnaeus, Syst. Nat., ed. 12, 2: 549; Mant. Pl. 1: 112. 1767 [*"aegyptiacum"*]; *Conyza aegyptiaca* (Linnaeus) Aiton; *E. hispidus* Candolle; *Eschenbachia globosa* Moench, nom. illeg. superfl.

Herbs, annual, 20–100 cm tall; taproot woody, fibrous rooted. Stems erect, branched from base or middle, branches ascending, striate, densely white long hirsute, stipitate glandular. Leaves: lower withered at anthesis; mid sessile, blade narrowly oblong to oblanceolate, 4.5–9.5 × 1.4–3 cm, surfaces densely hirsute, densely stipitate glandular, veins slightly prominent, base subclasping, margin pinnatilobed, lobes in 6 or 7 pairs, narrowly oblong, apex obtuse, terminal lobe larger, apiculate; upper oblanceolate, gradually reduced, pinnatilobed; uppermost lanceolate or linear-lanceolate, serrate only at base. Capitula 12–15 mm in diam., 2–4 in dense corymbiform synflorescences; peduncles slender, 1.5–4.5 cm, densely strigose-villose. Involucre hemispheric-campanulate, ca. 8 × 15 mm; phyllaries 3- or 4-seriate, linear, abaxially villous, margin scarious, apex acuminate, slightly reflexed, outer ca. 3 mm. Ray florets reduced to tube, filiform, 2–3.7 mm, ca. 1/2 as long as style, apex puberulent; disk florets 25–33, funnelform, 4.3–4.5 mm, tube ca. 2.7 mm, hairy above, limb 1.5–1.8 mm, lobes 0.5–0.6 mm, apex hairy. Achenes straw-colored, oblong or oblanceolate, compressed, 0.8–1.1 mm, sparsely strigillose, sometimes 1 additional rib on one face. Pappus 1-seriate, basally connate in a ring, sometimes deciduous, dirty white, of 10–16 fragile bristles, 5–6 mm.

Seasides, riverbanks. Fujian, Guangdong, Taiwan [Afghanistan, Bangladesh, India, Japan, Malaysia, Myanmar, Pakistan, Vietnam; Africa, SW Asia (Iran), Australia].

2. *Eschenbachia blinii* (H. Léveillé) Brouillet, **comb. nov.**

熊胆草 xiong dan cao

Basionym: *Conyza blinii* H. Léveillé, Repert. Spec. Nov. Regni Veg. 8: 452. 1910; *C. dunniana* H. Léveillé; *C. pinnatifida* Franchet (1896) and Dunn (1903), not (Thunberg) Lessing (1832), nor Buchanan-Hamilton ex Roxburgh (1832).

Herbs, annual, 40–90(–100) cm tall; taproot simple or rarely branched, fibrous rooted. Stems erect, simple or branched, branches ascending, striate, white long hirsute, densely long-stipitate glandular, densely leafy. Leaves: surfaces long hirsute and densely long-stipitate glandular, blade pinnatifid, rarely pinnatilobed, lobes in 3–6 pairs, linear, linear-lanceolate, or linear-oblanceolate, asymmetric, margin entire or sparsely coarsely serrate, apex acute, terminal lobe large, obovate-lanceolate, sparsely serrate; lower leaves petiolate, often withered at anthesis, sometimes marcescent; mid and upper sessile, ovate or ovate-oblong, 4–7.5(–10) × 2.5–3(–4) cm, base attenuate, not clasping. Capitula 6–10 mm in diam., in short, narrow, paniculiform synflorescences; peduncles densely hirsute, stipitate glandular. Involucre hemispheric-campanulate, ca. 6 × 10 mm; phyllaries 3- or 4-seriate, linear-lanceolate, abaxially hispid-villose, ± densely stipitate glandular, apex acuminate, outer ca. 3.5 mm, inner 6–7 mm, apex reddish purple, scarious, slightly reflexed.

Florets yellow. Ray florets reduced to tube, filiform, 2–2.5 mm, almost 1/2 as long as style, sparsely puberulent above or glabrous; disk florets 40–50, 4–4.5 mm, tube ± puberulent, limb funnelform, lobes lanceolate. Achenes oblong to oblanceolate, compressed, 0.8–1 mm, strigose. Pappus 1-seriate, basally connate in a ring, sometimes deciduous, white to yellowish white or cinnamon, bristles slightly longer than disk corollas.

• Grasslands on slopes, around boulders in karst formations, open places, roadsides; 1800–2600 m. Guizhou, Sichuan, Yunnan.

3. *Eschenbachia leucantha* (D. Don) Brouillet, **comb. nov.**

粘毛白酒草 nian mao bai jiu cao

Basionym: *Erigeron leucanthus* D. Don, Prodr. Fl. Nepal. 171. 1825 [*"leucanthum"*]; *Blumea conyzoides* H. Léveillé & Vaniot; *Conyza leucantha* (D. Don) Ludlow & P. H. Raven; *C. viscidula* Wallich ex Candolle; *Vernonia ampla* Vaniot (1903), not O. Hoffmann (1901).

Herbs, annual, 40–200 cm tall, sometimes bushy; taproot fusiform, woody, fibrous rooted. Stems erect, branched, upper branches divaricate, striate, densely villous, densely short-stipitate viscid glandular, densely leafy. Leaves: lower withered and fallen at anthesis; mid cauline shortly petiolate or sessile, not clasping, blade elliptic-oblong to ovate or lanceolate, 7–14 × 2.5–3.5 cm, surfaces ± densely sessile glandular, abaxially villosulous, adaxially scabrous, lateral veins 4–6-paired, abaxially prominent, base cuneate to attenuate, margin serrate to serrulate, teeth mucronulate, apex acuminate; upper blade lanceolate, reduced upward; uppermost (on synflorescence branches) sessile, 3–5 cm, margin entire or serrulate. Capitula 3.1–7.9 mm in diam., numerous, in broadly glomerate-paniculiform synflorescences; peduncles slender, 3–9 mm, densely long-stipitate glandular and/or villous. Involucre campanulate, 3.1–4 × 3.5–6.2 mm; phyllaries 3- or 4-seriate, outer green, linear-lanceolate, short, abaxially ± densely stipitate glandular and/or villous, margin sometimes narrowly scarious, apex acuminate, inner linear-lanceolate to linear-oblong, green along midvein, margin scarious, sometimes purplish, apex acuminate, often purplish. Ray florets white, reduced to tube, filiform, 0.3–0.65 mm, 1/5 or less as long as pinkish style, lacerate at apex, glabrous; disk florets 6–9, yellow becoming reddish, funnelform, 3.5–4.1 mm, tube ca. 2.2 mm, sparsely hairy above, limb ca. 3.9 mm, lobes lanceolate, ca. 0.6 mm. Achenes straw-colored to pale brown, lanceolate, compressed, 0.4–0.6 mm, sparsely strigillose. Pappus 1-seriate, basally connate in a ring, deciduous, yellowish or cinnamon to pale reddish, bristles 10–15, 3.5–4.5 mm. Fl. Sep–Dec.

Open slopes, ravines, field margins, dry margins of woods, thickets, roadsides, wastelands; 200–1800 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Taiwan, Yunnan [Bangladesh, Bhutan, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Philippines, Nepal, Thailand, Vietnam; Australia].

4. *Eschenbachia japonica* (Thunberg) J. Koster, *Blumea* 7: 290. 1952.

白酒草 bai jiu cao

Erigeron japonicus Thunberg in Murray, Syst. Veg., ed.

14, 754. 1784 ["japonicum"]; *Blumea globata* Vaniot; *B. subcapitata* Matsumura & Hayata (1908), not Candolle (1836); *Conyza asteroides* Wallich ex Candolle (1836), not Linnaeus (1753); *C. japonica* (Thunberg) Lessing; *C. multicaulis* Candolle; *C. stricta* Wallich ex Candolle (1836), not Willdenow (1803); *C. veronicifolia* Wallich ex Candolle.

Herbs, annual or biennial, (15–)20–45+ cm tall; taproot simple, fusiform. Stems erect, branched from base or middle, sometimes simple, branches ascending or spreading, striate, white scabrous (below) to villous, more densely so upward, sometimes ± glabrescent below, eglandular. Leaves usually crowded in lower part, basal in rosette, shortly to long petiolate, petiole ± narrowly winged, blade elliptic or obovate to spatulate, 6–7 cm, base attenuate to rounded, apex rounded to obtuse; lower long petiolate, petiole often broadly winged upward, blade oblong or elliptic-oblong or oblanceolate, 3–13 cm, surfaces white villous, lateral veins 4- or 5-paired, abaxially prominent, base cuneate or attenuate, margin ± coarsely serrate, teeth mucronulate, strigose, apex rounded to obtuse or acute; mid dispersed, sessile, blade oblanceolate-oblong or oblong-lanceolate to lanceolate, 3.5–5 × 0.5–1.5 cm, base rounded, subclasping, margin serrate to serrulate, apex obtuse to acute; upper reduced, blade lanceolate or linear-lanceolate, surfaces strigose, eglandular, adaxially scabrous (and sometimes also abaxially), margin entire to sparsely serrulate. Capitula numerous, 7.5–11 mm in diam., usually crowded in glomerate or dense corymbiform synflorescences; peduncles slender, 4–6 mm, densely villous. Involucre campanulate to hemispheric-campanulate, 4–5.5 × 7.5–10 mm; phyllaries 3- or 4-seriate, abaxially villous, outer shorter, obovate to ovate-lanceolate, 2–2.9 mm, apex obtuse, inner lanceolate to linear, 3.8–5 mm, margin ± widely scarious, erose, often ± purplish (notably apically), apex acute or acuminate. Ray florets white becoming purplish, corolla filiform, 1.1–2 mm, 1/2 or less as long as style, apically ciliate; disk florets 15 or 16, pale yellow becoming reddish, 4–4.1 mm, tube ca. 2.25 mm, hairy distally, limb ca. 1.75 mm, lobes lanceolate, ca. 0.5 mm, apically hairy. Achenes straw-colored to pale brown, oblong, 1–1.2 mm, sparsely strigillose. Pappus basally connate in a ring, deciduous, pinkish white or cinnamon to reddish, bristles 10–14, 3.3–4.5 mm. Fl. Mar–Sep.

Forest margins, grassy slopes, dry meadows, exposed slopes, field margins, roadsides, gardens; 400–2500 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Afghanistan, Bhutan, India, Japan, Malaysia, Myanmar, Nepal, Pakistan, Thailand, Vietnam].

5. *Eschenbachia perennis* (Handel-Mazzetti) Brouillet, *comb. nov.*

宿根白酒草 *su gen bai jiu cao*

Basionym: *Conyza perennis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 630. 1937.

Herbs, perennial, 25–40 cm tall, collar surrounded by marcescent leaf bases; rhizomes thick, woody, erect or ascending. Stems solitary, erect, simple, striate, white hirsute, often also

strigillose. Leaves: basal rosulate, present at anthesis; basal and lower petiolate, petiole narrowly winged, usually 1/2 as long as blade, densely hirsute and hirsute-ciliate, petiole base clasping or subclasping, blade ovate or elliptic-ovate to lanceolate or oblanceolate, 5–9 × 1.5–2.5 cm, surfaces sparsely hirsute, base attenuate, margin coarsely serrate, hirsute-ciliate, lateral veins 3- or 4-paired, apex acute to obtuse; upper shortly petiolate or sessile, blade oblong-lanceolate to lanceolate, gradually reduced; uppermost base almost rounded, margin entire, apex acuminate. Capitula 4–5 mm in diam., numerous, usually in dense cymiform or partly glomerate synflorescences; peduncles 5–6 mm; bracteole 1, lanceolate, villous to strigillose or glabrate. Involucre campanulate, ca. 4 mm in diam.; phyllaries 3-seriate, lanceolate to linear-lanceolate, outer ca. 1/2 as long as inner, abaxially strigillose, margin narrowly scarious, sometimes erose-fimbriate apically, apex acuminate, inner 2.5–3.5 mm. Ray floret corolla reduced to tube, filiform, 1–1.5 mm, ca. 1/2 as long as style, apex hairy; disk florets ca. 23, ca. 3 mm, lobes lanceolate, glandular. Achenes oblong, ca. 0.7 mm, sparsely pilose to glabrate. Pappus white, almost equaling disk corollas. Fl. Feb–Apr.

• Thickets on sandy ground by riverbanks; ca. 1600 m. SW Guizhou, S Yunnan.

6. *Eschenbachia muliensis* (Y. L. Chen) Brouillet, *comb. nov.*

木里白酒草 *mu li bai jiu cao*

Basionym: *Conyza muliensis* Y. L. Chen, Fl. Reipubl. Popularis Sin. 74: 361. 1985.

Herbs, perennial, 3–21 cm tall, sometimes caespitose, collar surrounded by leaf base remains; caudex woody, ascending, branched, taprooted. Stems solitary or 2–4, slender, erect, simple, gray-white long strigose. Leaves: surfaces moderately long strigose, glabrescent, margin often serrulate distally, teeth mucronulate, rarely entire, strigose-ciliate; basal in rosette, present at anthesis, long petiolate, petiole narrowly winged, petiole base widened, clasping, blade oblanceolate to spatulate, 2–5 × 0.3–0.5 cm, base cuneate-attenuate, apex obtuse to acute, mucronate; cauline scattered, lowest petiolate, upper sessile or subsessile, not clasping, lower blade linear-oblanceolate to linear, 2–3.5 × 0.1–0.3 cm, base attenuate, margin sparsely serrulate or subentire, apex acute; upper blade gradually reduced, linear, margin entire or with 1 or 2 inconspicuous teeth. Capitula 6–7 mm in diam., usually 3–6 in corymbiform synflorescences, rarely solitary; peduncles slender, 3–8 mm. Involucre campanulate, ca. 4 × 6–8 mm; phyllaries 3-seriate, narrowly oblong or lanceolate, abaxially sparsely strigose, margin ± broadly scarious, erose-lacerate, apex acuminate or ± obtuse, outer ca. 1/2 as long as inner. Ray floret corolla reduced to tube, filiform, 1–1.2 mm, ca. 1/2 as long as style, apex hairy; disk florets 13–23, yellowish, narrowly funnelform, 2.5–3 mm, tube 1–1.5 mm, lobes lanceolate, ca. 0.5 mm, apex hairy. Achenes oblong, 1–1.2 mm, sparsely strigose, glandular. Pappus dirty to pinkish white, bristles ca. 10, 2.5–3.2 mm. Fl. Jun.

• Sandy riverbanks; ca. 2200 m. SW Sichuan (Muli).

Species incertae sedis

Conyza stricta Willdenow, Sp. Pl. 3: 1922. 1803.

劲直白酒草 jìn zhí bái jiǔ cǎo

Herbs, annual, woody taprooted, and fibrous rooted. Stems erect, 30–65 cm tall, finely striate, multibranched from base or middle, branches slender, strict, densely grayish scabrous, ± densely sessile or short-stipitate glandular, densely leafy. Basal leaves fallen at anthesis; lower and mid cauline petiole narrowly winged, base subclasping, blade obovate, sometimes oblanceolate, 3–5.5 × 0.5–1.3 cm, surfaces densely grayish scabrous, densely sessile or short-stipitate glandular, lateral veins 3- or 4-paired, abaxially distinct, base cuneate or attenuate, margin coarsely serrate or pinnatilobate, mucronulate, rarely entire, apex obtuse, mucronate, or apiculate; mid upper sessile, linear-ob lanceolate, 1.2–2 × 0.2–0.4 cm, 1-veined, margin entire, sometimes 3-fid; uppermost gradually reduced, linear. Capitula (2–)3 mm in diam., numerous, in dense compound-corymbose synflorescences; peduncles 2–4 mm, densely villous-scabrous. Receptacle convex, ± alveolate, not fimbriate. Involucre campanulate, 2–2.5 mm in diam.; phyllaries 3-seriate, linear-lanceolate, margin narrowly scarious, entire, apex acuminate, outer green, ca. 1.6 mm, villous-scabrous, sessile glandular, inner green along midvein, 1.5–4 mm, apex ± reflexed. Florets yellow, fertile. Ray florets female, 1.1–1.7 mm, tube sparsely hairy, lamina white, linear, 0.4–0.46 mm, sometimes 2- or 3-lacerate, ± equaling or sometimes shorter than style; disk florets 4 or 5(–7), bisexual, narrowly funnelform, 1.6–2.1 mm, tube 0.8–1.4 mm, sparsely hairy, limb 0.7–0.9 mm, lobes 0.3–0.5 mm, lanceolate, glandular, sometimes eglandular. Achenes narrowly ovate, 0.3–0.65 mm, sparsely strigose, margin slightly 2-ribbed. Pappus orangish, ± 2-seriate, outer very short, thin, inner of 12–15 barbellate bristles 1–1.9 mm, almost equaling disk corollas. Fl. (Aug–)Sep–Nov.

Grasslands on slopes, field margins; 1100–2600 m. Hainan, Sichuan, S Xizang, Yunnan [Afghanistan, Bhutan, India, Myanmar, Nepal, Pakistan, Thailand, Vietnam; E Africa].

Conyza stricta belongs to the polyphyletic African conyzas. In

phylogenies (J. S. Strijk, pers. comm.), it is distinct from the species here placed in *Eschenbachia*, close to the African genus *Nidorella* Cassini. It is yet unclear whether it belongs there or in a new, separate genus. It does not belong in *Conyza* s.s., a synonym of *Erigeron*.

- 1a. Lower leaf margin coarsely serrate, rarely entire; upper leaves gradually reduced var. *stricta*
- 1b. Lower leaf margin deeply repand-pinnatilobate, lobes 2-paired, oblong-ob lanceolate or cuneate, margin entire, terminal lobe larger; upper leaves and those on branches 3-fid var. *pinnatifida*

Conyza stricta var. *stricta*

劲直白酒草(原变种) jìn zhí bái jiǔ cǎo (yuan bian zhong)

Stems 30–65 cm tall, branched. Lower leaf margin coarsely serrate, rarely entire; upper leaves gradually reduced, simple. Fl. Sep–Nov.

Grasslands on slopes, field margins; 1100–2300 m. Hainan, Sichuan, Yunnan [Bhutan, India, Myanmar, Nepal, Thailand, Vietnam; E Africa].

Conyza stricta var. *pinnatifida* Kitamura in H. Hara, Fl. E. Himalaya, 337. 1966.

羽裂白酒草 yǔ liè bái jiǔ cǎo

Erigeron pinnatifidus D. Don, Prodr. Fl. Nepal. 172. 1825, not Thunberg (1800); *Conyza absinthifolia* Candolle; *C. mairei* H. Léveillé; *C. pinnatifida* Buchanan-Hamilton ex Roxburgh (Oct–Dec 1832), not (Thunberg) Lessing (Jul–Aug 1832), nor Franchet (1896), nor Dunn (1903); *E. trisulcus* D. Don.

Stems 30–45 cm tall, usually branched from middle or base, rarely simple. Lower leaf margin deeply repand-pinnatilobate, lobes 2-paired, oblong-ob lanceolate or cuneate, margin entire, terminal lobe larger; upper leaves and those on branches 3-fid. Fl. Aug–Nov.

Grasslands on slopes; 1800–2600 m. Sichuan, S Xizang, Yunnan [Afghanistan, Bhutan, India, Myanmar, Nepal, Pakistan].

122. MICROGLOSSA Candolle, Prodr. 5: 320. 1836.

小舌菊属 xiǎo shé jǔ shù

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Vines [or subshrubs], woody, climbing [or erect]. Leaves alternate, petiolate, blade ovate, margin entire or crenulate. Capitula disciform, small, numerous, in crowded compound-corymbiform synflorescences. Involucre campanulate; phyllaries multiseriate, imbricate, oblong-lanceolate or linear, scabrid, apex obtuse, outer shorter. Receptacles convex [or flat], alveolate, naked, glabrous. Florets fertile; ray florets numerous, lamina white, filiform, shorter than style; disk florets bisexual, yellow, limb narrowly funnelform, 3–5-lobed; anther base obtuse; style branch tips lanceolate. Achenes obovoid, strigillose, margin angled, 3-ribbed. Pappus reddish to cinnamon, of numerous 1–3-seriate, ± equal, barbellate bristles.

About ten species: Africa, Asia; one species in China.

1. Microglossa pyrifolia (Lamarck) Kuntze, Revis. Gen. Pl. 1: 353. 1891.

小舌菊 xiǎo shé jǔ

Conyza pyrifolia Lamarck, Encycl. 2: 89. 1786; *C. syringi-*

folia Meyen & Walpers; *Erigeron pyrifolius* (Lamarck) Benth.; *Microglossa volubilis* Candolle.

Vines, woody, 0.7–3 m tall, climbing. Stems divaricately branched, striate, villosulous, densely minutely stipitate glan-

dular, glabrescent. Leaves abaxially pale green, adaxially green, ovate, 5–10 × 2.5–4 cm, abaxially densely stipitate glandular, veins densely ferruginous villosulous, adaxially scabrid, base attenuate, margin undulate, crenulate, ciliate, veins pronounced, apex acuminate, mucronate. Capitula 5–6 mm in diam., numerous in axillary or terminal, dense compound-corymbiform synflorescences. Involucre campanulate; phyllaries 4- or 5-seriate, membranous, midvein brown, apex obtuse, ± erose, outer ovate-lanceolate, 0.7–2 mm, abaxially sparsely villosulous, stipitate glandular, midvein pronounced, distally enlarged, middle and inner linear-lanceolate, 2–5 mm, margin hyaline, midvein thin, glabrous, middle sometimes ± stipitate glandular, inner eglandular. Receptacles convex. Ray florets numerous,

lamina filiform, ca. 1 mm; disk florets yellow, ca. 5 mm, tube and limb base hairy, limb funnelform, ca. 2.5 mm, lobes 5, linear-triangular, ca. 1 mm. Achenes obovoid, slightly compressed, ca. 1 mm, 3- or 4-ribbed, sometimes veined, sparsely strigillose, stipitate glandular apically. Pappus 2- or 3-seriate, of cinnamon to reddish or white, thin bristles, outer 0–2, ca. 1 mm, inner ca. 4 mm, tapering, innermost 4.2–4.5 mm, slightly clavate. Fl. and fr. year-round.

Thickets on slopes, open forests, forest margins, stream banks, wastelands, edges of bamboo plantations; sea level to 1800 m. Guangdong, Guangxi, Guizhou, Hainan, Taiwan, Yunnan [Bangladesh, Bhutan, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, Philippines, N Thailand, Vietnam; Africa].

123. *BELLIS* Linnaeus, Sp. Pl. 2: 886. 1753.

雏菊属 *chu ju shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Herbs, annual or perennial, scapose, caespitose, or stem rarely branched. Leaves rosulate, blade spatulate or oblanceolate, entire or repand-dentate. Capitula radiate, often solitary, heterogamous, pedunculate or scapose. Involucre hemispheric or broadly campanulate; phyllaries 2-seriate, unequal to subequal, leaflike. Receptacle swollen or conic, naked. Ray florets 1-seriate, white, often tinged purplish crimson, apically entire; disk florets numerous, yellow, fertile; style branch tips short, triangular. Achenes obovoid, compressed, 2-ribbed, beakless. Pappus absent or rarely of few, very short, basally connate bristles.

Eight species: Asia, Europe; one species (introduced) in China.

1. *Bellis perennis* Linnaeus, Sp. Pl. 2: 886. 1753.

雏菊 *chu ju*

Herbs, perennial or annual, scapose, 10–25 cm tall; scape sparsely villosulous, strigose, sparsely, minutely stipitate glandular distally (near capitulum). Leaves basal, rosulate, petiole long, winged, blade spatulate, 2–6 × 0.9–2.8 cm, base attenuate, margin serrate to crenate, apex obtuse, sometimes retuse, mucronulate. Capitula terminal, solitary. Involucre hemispheric or broadly campanulate, 5–6 mm; phyllaries 2-seriate, subequal,

oblanceolate, leaflike, surfaces sparsely villous, margin narrowly scarios, sparsely ciliate, midvein thin, translucent, apex obtuse, scarios, ciliate. Ray florets white or pinkish, lamina ca. 10 × 1 mm; disk florets yellow, ca. 2 mm, limb campanulate, ca. 1.5 mm, sparsely hairy proximally, lobes erect, triangular, ca. 0.5 mm, eglandular. Achenes strigillose. Pappus absent.

Ravines. Sichuan [native to N Africa (Morocco), SW Asia, and Europe; widely introduced and naturalized elsewhere].

An ornamental, this species is widely cultivated in gardens and parks.

124. *TRIPOLIUM* Nees, Gen. Sp. Aster. 10, 152. 1832.

碱菀属 *jian wan shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Herbs, annual. Stems erect. Leaves alternate, entire or sparsely serrate. Capitula radiate, in corymbiform synflorescences. Involucre cylindric-campanulate; phyllaries 2- or 3-seriate, outer shorter, loosely imbricate, fleshy becoming membranous when dry, 3- or more veined, margins scarios. Receptacle ± flat, alveolate, alveola margin crenulate, naked. Florets fertile. Ray florets female, 1-seriate, lamina bluish white to bluish violet or pinkish; disk florets bisexual, numerous, yellow, narrowly funnelform, 5-lobed; anther base obtuse; style branch tips lanceolate. Achenes monomorphic, narrowly oblong, compressed, glabrous or sparsely strigose, margin 2-ribbed, faces 1-veined. Pappus in 3 or 4+ series, of white to dirty white or pinkish to reddish, thin, barbellate bristles, conspicuously elongating after anthesis, becoming 2 × as long as involucre.

One species: N Africa, Asia, Europe.

1. *Tripodium pannonicum* (Jacquin) Dobroczejewa in Visjulina, Fl. URSR 11: 63. 1962.

碱菀 *jian wan*

Aster pannonicus Jacquin, Hort. Bot. Vindob. 1: 3. 1770;

A. macrolophus H. Léveillé & Vaniot; *A. maritimus* Lamarck; *A. palustris* Lamarck; *A. papposissimus* H. Léveillé; *A. salinus* Schrader; *A. tripodium* Linnaeus; *A. tripodium* subsp. *pannonicus* (Jacquin) Soó; *Tripodium pannonicum* subsp. *maritimum* Holub, nom. illeg. superfl.; *T. pannonicum* subsp. *tripodium*

(Linnaeus) Greuter; *T. vulgare* Nees, nom. illeg. superfl.

Herbs, annual. Stems hollow, striate, erect, 25–50(–80) cm tall, solitary or several and caespitose, branched sometimes from base, sometimes only above, branches often spreading, glabrous. Leaves fleshy, glabrous, basal withered at anthesis; lower cauline linear or oblong-lanceolate, 5–10 × 0.3–1.2 cm, margin entire or slightly crenulate, apex acute; mid sessile, narrowed; upper reduced. Capitula numerous, in paniculate-corymbiform synflorescences, long pedunculate. Involucre 4–7 mm in diam.; phyllaries green, glabrous, margin often purplish,

outer ovate to lanceolate, 2.5–5 mm, apex obtuse to acute, inner narrowly oblong, 7–8 mm. Ray florets 13–25, lamina 10–12 × 1–2 mm, glabrous; disk florets 19–22, 8–9 mm, lobes lanceolate, 1.5–2 mm, glabrous. Achenes compressed, 2.5–3 mm. Fl. and fr. Aug–Dec.

Salt marshes, salt marsh meadows, moist meadows, open sandy areas, littoral areas, riversides; sea level to 2500 m. Gansu, Hebei, Heilongjiang, Hunan, Jiangsu, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Xinjiang, Zhejiang [Japan, Kazakhstan, Korea, Kyrgyzstan, Mongolia, Russia (Far East, Siberia), Tajikistan, Turkmenistan, Uzbekistan; N Africa, SW Asia, Europe].

125. GALATELLA Cassini in F. Cuvier, Dict. Sci. Nat. 37: 463, 488. 1825.

乳菀属 ru wan shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Aster subg. *Galatea* Cassini, Bull. Sci. Soc. Philom. Paris 1818: 165. 1818; *Crinitaria* Cassini.

Herbs, perennial; rhizome robust. Stems erect or ascending, usually branched above, rarely simple. Leaves sessile, blade oblong or lanceolate to linear, often gland-dotted, lower 3-veined, mid and upper 1-veined, margin entire, often recurved. Capitula radiate, sometimes discoid, small or medium-sized, in corymbiform synflorescences, rarely solitary. Involucre obconic or campanulate to almost hemispheric; phyllaries 3–5-seriate, greenish or green along midvein, imbricate, membranous, glabrous or puberulent, 1–3-veined, margin usually scarious, outer lanceolate to lanceolate-ovate, apex acute, innermost oblong to oblong-lanceolate, margin more widely scarious, rounded or ± obtuse, apex sometimes acute. Receptacles slightly convex, alveolate, fimbriate. Ray florets sterile, without style, 5–20 in 1 series, rarely absent, lamina pinkish or bluish violet; disk florets bisexual, fertile, 5–60(–100), yellow, sometimes becoming pinkish violet, usually 1.5–2 × involucre length, limb funnelform, lobes 5, lanceolate or oblong-lanceolate; anther base obtuse, apical appendage lanceolate; style branch tip lanceolate or triangular. Achenes lanceolate or oblong, ± flattened, strigose, ribbed. Pappus 2(or 3)-seriate, of whitish, sometimes purplish tinged, unequal, ± stiff, barbellate bristles longer than achene, apex acute to ± clavate.

About 40–50 species: C and S Europe to NE Asia; 11 species in China.

The genus *Crinitaria*, often considered distinct (see *Crinitina* below), is typified by *Chrysocoma biflora* Linnaeus, a species that belongs to *Galatella* (Soják, Zprávy Krajsk. Vlastiv. Muz. Olomouci 215: 1–2. 1982).

- 1a. Leaves not gland-dotted, lower 3-veined, mid and upper 1-veined, or all 1-veined; plants glabrous, glabrate, or sparsely to ± densely arachnoid.
 - 2a. Ray florets absent; leaves linear, 1-veined, upper setiform; phyllaries abaxially shortly arachnoid (partly glabrescent) 11. *G. scoparia*
 - 2b. Ray florets present; leaves lanceolate to oblanceolate or linear-lanceolate, usually 3-veined, upper (sometimes some mid) linear; phyllaries abaxially glabrate or glabrous.
 - 3a. Lower and mid leaves lanceolate to oblanceolate or linear-lanceolate 9. *G. hauptii*
 - 3b. Lower and mid leaves linear-lanceolate.
 - 4a. Involucre subhemispheric; ray florets 15–20, light bluish violet; pappus brownish to pinkish 8. *G. tianschanica*
 - 4b. Involucre broadly obconic; ray florets 10–15, pinkish violet; pappus yellowish 10. *G. angustissima*
- 1b. Leaves gland-dotted on both surfaces or adaxially, sometimes inconspicuously so, lower and mid 3-veined, or mid and upper 1-veined; plants shortly papilliform hairy or glabrate.
 - 5a. Ray florets absent (rarely 1–4).
 - 6a. Leaves oblong-lanceolate or lanceolate to linear-lanceolate, lower and mid 3-veined; capitula numerous in corymbiform synflorescences 6. *G. biflora*
 - 6b. Leaves linear or linear-lanceolate, lower 3-veined, mid 1-veined; capitula solitary or 2 or 3 in corymbiform synflorescences 7. *G. regelii*
 - 5b. Ray florets 4–20, rarely absent.
 - 7a. Ray florets 4–10, disk florets 10–15.
 - 8a. Capitula numerous, usually in dense synflorescences; phyllaries 3-veined, rarely 1-veined, abaxially glabrate 4. *G. punctata*
 - 8b. Capitula few, in loose synflorescences; phyllaries usually 1-veined, rarely partly 3-veined, abaxially ± shortly arachnoid 5. *G. fastigiiformis*
 - 7b. Ray florets 8–15, disk florets 24–50.

- 9a. Leaf apex acuminate to long acuminate; plants 20–100 cm tall 3. *G. dahurica*
 9b. Leaf apex shortly acuminate; plants 20–60 cm tall.
 10a. Pappus white, entirely or partly tinged pinkish violet; involucre broadly obconic or subhemispheric, 6–8 × 9–12 mm; phyllaries abaxially glabrate 1. *G. chromopappa*
 10b. Pappus yellowish; involucre campanulate to hemispheric, 4–5 × 7–8 mm; phyllaries abaxially usually shortly arachnoid 2. *G. altaica*

1. *Galatella chromopappa* Novopokrovsky, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 7. 124. 1948.

紫缨乳菀 *zi ying ru wan*

Herbs, perennial, 25–60 cm tall, shortly papilliform hairy. Stems solitary or numerous, ascending or sometimes erect, sparsely shortly arachnoid, ± scabrous (base of hairs), sparsely sessile glandular. Leaves crowded, lower withered at anthesis, mid sessile, lanceolate or linear-lanceolate, (2–)3–4 × 0.3–0.4 cm, surfaces (rarely only adaxial) gland-dotted, shortly papilliform hairy, ± shortly arachnoid (glabrescent), 3-veined, lateral veins sometimes distinct only near base, base cuneate, margin flat, scabrous, apex shortly acuminate, rarely long acuminate; upper (in synflorescence) reduced, linear-lanceolate or linear, ca. 1 × 0.1–0.15 cm, 1-veined. Capitula 3–6 in dense or slightly loose corymbiform synflorescences, rarely solitary, 12–18 mm in diam. Involucre broadly obconic to subhemispheric, 6–8 × 9–12 mm; phyllaries 3- or 4-seriate, membranous, greenish, sometimes pinkish violet at apex, margin scarious, erose-fimbriate, shortly arachnoid ciliate, abaxial surface glabrate or sparsely shortly arachnoid, 3-veined (outer 1-veined), rarely partly 1-veined, outer ovate-lanceolate, apex acute, inner larger, oblong or lanceolate-oblong, apex obtuse or acute. Ray florets 8–12, pinkish (or ?bluish) violet, lamina 12–16 mm; disk florets 35–60, pale yellow becoming pinkish, 7–8 mm, limb narrowly funnelform, lobes lanceolate to oblong-lanceolate. Achenes oblong, 4–5 mm, densely white strigose. Pappus white, entirely or partly tinged pinkish violet, 7–8 mm. Fl. Jul–Sep.

Mountain steppes, grasslands on slopes; ca. 2000 m. W Xinjiang [Kazakhstan, Russia, Uzbekistan].

Koroljuk (in Krasnoborov, Fl. Siberia 13: 39–43. 2007) does not mention *Galatella chromopappa* for Siberia (Russia). Its status may need to be assessed.

2. *Galatella altaica* Tzvelev, Fl. URSS 25: 582. 1959.

阿尔泰乳菀 *a er tai ru wan*

Galatella bipunctata Novopokrovsky, p.p.

Herbs, perennial, 20–60 cm tall, abundantly shortly papilliform hairy, ± scabrous, sparsely shortly arachnoid, at least often in upper part. Stems solitary or several, erect or ascending. Leaves dense, spreading or ascending, sessile, oblong or lanceolate-oblong to linear-lanceolate, 4–6 × 0.5–0.8 cm, surfaces (rarely only adaxial) gland-dotted, scabrous and/or arachnoid, 3-veined, base cuneate, apex shortly acuminate; upper (in synflorescences) reduced. Capitula 7–10, in corymbiform synflorescences, rarely solitary, 13–20 mm in diam. Involucre broadly campanulate to hemispheric, 4–5 × 7–8 mm; phyllaries 3- or 4-seriate, yellow-green, 1-veined or inconspicuously 3-veined, abaxially ± shortly arachnoid to glabrate, margin narrowly scarious, erose, shortly arachnoid ciliate, outer

ovate-lanceolate, apex acute, innermost larger, oblong, margin narrowly scarious, apex rounded to obtuse or acute. Ray florets 8–15, pinkish violet, lamina 15–18 mm; disk florets 25–50, pale yellow, 6–7 mm, limb funnelform, lobes oblong-lanceolate. Achenes oblong, 2.5–3 mm, densely strigose. Pappus yellowish, 6–7 mm. Fl. Jul–Sep.

Forest margins, stony slopes; ca. 1800 m. N Xinjiang [Mongolia, Russia; C Asia].

3. *Galatella dahurica* Candolle, Prodr. 5: 256. 1836.

兴安乳菀 *xing an ru wan*

Aster dahuricus (Candolle) Benth. ex Baker; *A. dahuricus* subsp. *yamatsutanus* (Kitagawa) Kitagawa; *A. yamatsutanus* Kitagawa; *Galatella macrosciadia* Gandoger; *G. songorica* Novopokrovsky; *G. songorica* var. *angustifolia* Novopokrovsky; *G. songorica* var. *discoidea* Y. Ling & Y. L. Chen; *G. songorica* var. *latifolia* Y. Ling & Y. L. Chen; *G. tarbagatensis* Novopokrovsky.

Herbs, perennial, 20–100 cm tall, densely shortly papilliform hairy, glabrate in lower part; rhizome long, slender, or thick. Stems solitary or several, erect or ascending, purplish at base, branched upward, branches slender, ascending, sometimes sparsely sessile glandular. Leaves dense, lower often withered at anthesis, mid sessile, blade oblong or oblong-lanceolate to linear-lanceolate or linear, (3–)4–5.5(–7) × 0.1–1.4 cm, both surfaces or only adaxially gland-dotted, 1- or 3-veined, base attenuate, margin scarious, apex acuminate to long acuminate; upper blade linear-lanceolate to linear, ± reduced upward, 3-veined (lateral 2 sometimes faint), sometimes 1-veined. Capitula numerous, in dense to lax corymbiform synflorescences, rarely solitary, (3–)10–15 × (5–)15–25 mm; peduncles slender; bracts 1 or 2, linear, densely papillose. Involucre broadly campanulate or broadly obconic to subhemispheric, 3–6 × 5–10 mm; phyllaries 3- or 4-seriate, yellow-green, imbricate, abaxially papillose to glabrate or glabrous, membranous, margin fimbriate, villous-ciliate, back sometimes rounded, outer short, green area wide, lanceolate to ovate-lanceolate, 1-veined, margin leafy textured, apex acute, innermost larger, oblong to oblong-lanceolate, usually 3-veined, margin scarious, apex rounded to obtuse or sometimes acute, sometimes pinkish tinged. Ray florets 10–20, pinkish or pale violet, tube ca. 2 mm, lamina 10–16 × 1.5–3 mm, glabrous; disk florets 20–40(–80), pale yellow, sometimes becoming purplish tinged, 6–8 mm, limb funnelform, lobes lanceolate. Achenes lanceolate or oblong, 2–4 mm, ± densely strigose. Pappus whitish or dirty white to yellowish, 5–8 mm. Fl. Jul–Sep.

Meadows, grasslands on slopes, dry mountain slopes, stony slopes, forest margins, roadsides; 500–3900 m. Heilongjiang, Jilin, Liaoning, Nei Mongol, Xinjiang [Kazakhstan, Mongolia, Russia (Far East, Siberia), Uzbekistan].

Y. Ling and Y. L. Chen (FRPS 74: 269. 1985) regarded *Galatella songorica* as distinct from *G. macroscladia* based on the more numerous capitula with smaller, differently shaped phyllaries, and on distribution. Such differences may be the result of phenotypic plasticity, a trade-off between the number and size of capitula in different ecological conditions, such as higher elevations. On the other hand, Koroljuk (in Krasnoborov, Fl. Siberia 13: 39–43. 2007) reduced *G. songorica* and *G. macroscladia* to synonyms of *G. dahurica*. Measurements among these taxa overlap significantly, and we are recognizing a single entity, as does Koroljuk.

Y. Ling and Y. L. Chen (loc. cit.: 269, 360–361) recognized four, mostly rare, varieties in *Galatella songorica*: *G. songorica* var. *songorica*, *G. songorica* var. *discoidea*, *G. songorica* var. *angustifolia*, and *G. songorica* var. *latifolia*. The type of *G. songorica* var. *discoidea* is a specimen with immature, unopened capitula, and it is impossible to determine whether or not they are discoid; the distinguishing features are all based on the capitula, and the variety does not appear to warrant recognition. *Galatella songorica* var. *angustifolia* and *G. songorica* var. *latifolia* are both based on leaf width, a plastic character. The type (and single specimen seen) of *G. songorica* var. *latifolia* is from moister places, and this may be responsible for the slightly greater width of leaves. Both of these varieties appear to represent extremes of leaf variation and hardly appear to warrant recognition, at least until more material is collected and a morphometric study is done.

4. *Galatella punctata* (Waldstein & Kitaibel) Nees, Gen. Sp. Aster. 161. 1832.

乳菀 ru wan

Aster punctatus Waldstein & Kitaibel, Descr. Icon. Pl. Hung. 2: t. 109. 1805; *Galatella punctata* (Waldstein & Kitaibel) Cassini ex Lessing; *Galatella acutisquama* Novopokrovsky; *G. acutisquamoides* Novopokrovsky; *G. densiflora* (Avé-Lallemant) Novopokrovsky; *G. ledebouriana* Novopokrovsky; *G. punctata* var. *densiflora* Avé-Lallemant; *G. rossica* Novopokrovsky var. *densiflora* (Avé-Lallemant) Novopokrovsky.

Herbs, perennial, 28–80 cm tall, papilliform hairy, sparsely scabridulous, thinly shortly arachnoid; rhizome thick. Stems numerous, rarely solitary, erect. Leaves dense, sessile, blade lanceolate-oblong or linear-lanceolate to linear, adaxially or rarely both surfaces gland-dotted, base cuneate, 3-veined, apex long acuminate, mucronate; lower withered after anthesis; mid blade 4–6(–8) × 0.3–0.6 cm; upper reduced, blade linear, 5–10 mm. Capitula numerous, in dense, rarely slightly loose, corymbiform synflorescences, 7–12 × 8–12 mm. Involucre broadly obconic to campanulate, 3–5 × 4–6 mm; phyllaries 3- or 4-seriate, pale green, abaxially glabrate, margin narrowly to ± broadly scarious, erose-fimbriate, 3-veined, rarely partly 1-veined, outer small, ovate-lanceolate, apex acute, inner larger, oblong, apex obtuse or acuminate. Ray florets 5–10, pinkish violet, lamina 10–12 × ca. 2 mm; disk florets 10–15, pale yellow, sometimes pinkish violet tinged, 5–6 mm, limb funnel-form, lobes long, oblong-lanceolate. Achenes oblong, 3.5–4 mm, densely white strigose. Pappus brownish, 5–6 mm. Fl. Jul–Sep.

Grasslands on slopes, flood meadows; ca. 1700 m. N Xinjiang [Kazakhstan, Russia (Siberia); SW Asia, Europe].

5. *Galatella fastigiiformis* Novopokrovsky, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 7: 128. 1948.

Herbs, perennial, 25–45 cm tall, ± sparsely to densely shortly arachnoid-tomentose, partly glabrescent; rhizome

woody. Stems numerous, rarely solitary, erect or ascending. Leaves sessile, grayish green, linear, $2-4 \times 0.1-0.2$ mm, not gland-dotted, subleathery, 1-veined, base tapered, margin strongly revolute, apex acute, arched, mucronate; lowest caducous, blades linear, sometimes 3-veined (lateral veins inconspicuous); upper (in synflorescences) reduced, almost setiform. Capitula 3–5 in loose, often irregularly corymbiform synflorescences, $12-17 \times \text{ca. } 17$ mm. Involucre broadly obconic, $10-15 \times 10-18$ mm; phyllaries 4–6-seriate, light green, grayish,

subleathery, abaxially shortly arachnoid, partly glabrescent, margin narrowly scarious, erose-fimbriate, shortly arachnoid ciliate, 1-veined, outer small, ovate or ovate-lanceolate, apex acute, inner larger, oblong, apex usually rounded to obtuse. Disk florets 14–20, pale yellow, 6.5–8 mm, limb narrowly funnelliform, lobes oblong-lanceolate. Achenes oblong, 4–6 mm, densely white strigose. Pappus brownish, 6–7 mm. Fl. Jul–Sep.

Dry steppes, slopes, gravel. N Xinjiang [Kazakhstan, Russia].

126. CRINITINA Soják, Zprávy Krajsk. Vlastiv. Muz. Olomouci 215: 1. 1982.

麻菀属 *ma wan shu*

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Linosyris Cassini (1825), not Ludwig (1757).

Herbs, perennial; rhizomes slender and long, nodose. Stems several or solitary, erect or ascending, usually branched above. Leaves alternate, sessile, oblong to narrowly linear, gland-dotted or not, sometimes obscurely so, 1-veined, margin entire. Capitula discoid, numerous, in dense or loose, corymbiform synflorescences, rarely solitary. Involucre shortly cylindric or obconic; phyllaries 3- to multiseriate, imbricate, greenish, glabrate or glabrescent, subleathery or membranous, margin usually narrowly scarious, midvein \pm distinct, outer either much shorter or almost equaling length of inner but narrower, ovate, inner oblong, apex obtuse or \pm acute. Receptacles slightly convex, irregularly alveolate. Disk florets fertile, bisexual, yellow, 5–40, usually exceeding involucre in length, lobes 5, lanceolate; anther base obtuse, apical appendage lanceolate; style branch tips ovate-lanceolate. Achenes oblong, abaxially \pm flattened, long strigose, margin 1- or 2-ribbed. Pappus 2-seriate, of whitish or brownish, barbellate bristles, exceeding achenes.

About five species: mostly in steppe and forest-steppe zones of Europe and Asia; two species in China.

Current phylogenetic data are insufficient to determine whether *Crinitina* is sister to *Galatella*, paraphyletic to it, or derived from within it (in the latter two cases, it could be merged under *Galatella* as is sometimes done).

- 1a. Plants sparsely arachnoid, glabrescent; leaves linear to linear-oblongate or oblong-linear, gland-dotted 1. *C. tatarica*
 1b. Plants gray tomentose; leaves oblong to linear-oblong, obscurely gland-dotted 2. *C. villosa*

1. *Crinitina tatarica* (Lessing) Soják, Zprávy Krajsk. Vlastiv. Muz. Olomouci 215: 2. 1982.

新疆麻菀 *xin jiang ma wan*

Chrysocoma tatarica Lessing, Linnaea 9: 186. 1834; *Crinitaria tatarica* (Lessing) Soják; *Linosyris tatarica* (Lessing) C. A. Meyer.

Herbs, perennial, \pm caespitose, 10–35 cm tall, sparsely arachnoid, glabrescent. Stems several, erect or ascending. Leaves linear to linear-oblongate or oblong-linear, $1-3 \times 0.15-0.4$ cm, both surfaces or only adaxially gland-dotted, scabrous, subleathery, 1-veined, base gradually attenuate to cuneate, apex obtuse, sometimes mucronate; upper reduced. Capitula numerous, in dense corymbiform synflorescences (bracts grading into phyllaries), 8–10 mm. Involucre shortly cylindric or obconic, 3.5–5 mm; phyllaries 3- or 4-seriate, yellowish green, abaxially sparsely arachnoid to glabrate, thinly leathery, margin arachnoid, outer short, ovate, 1–3-veined, apex obtuse or acute, inner larger, oblong, 3–5-veined, margin broadly scarious, erose, apex obtuse. Disk florets 5–10, pale yellow, tubular, 5–6 mm. Achenes oblong, 3–4 mm, densely strigose. Pappus brownish, 5–6 mm. Fl. Jul–Sep.

Salt marshes, steppes, dry stony slopes; 700–1200 m. N Xinjiang [Kazakhstan, Russia (W Siberia); Europe].

2. *Crinitina villosa* (Linnaeus) Soják, Zprávy Krajsk. Vlastiv. Muz. Olomouci 215: 2. 1982.

灰毛麻菀 *hui mao ma wan*

Chrysocoma villosa Linnaeus, Sp. Pl. 2: 841. 1753; *Crinitaria villosa* (Linnaeus) Cassini; *Galatella villosa* (Linnaeus) H. G. Reichenbach; *Linosyris villosa* (Linnaeus) Candolle.

Herbs, perennial, often densely caespitose, 15–35 cm tall, gray tomentose. Stems usually numerous, erect, simple. Leaves oblong to linear-oblong or oblanceolate, obscurely gland-dotted, base gradually attenuate, apex acute to obtuse, mucronate; upper very reduced. Capitula numerous, in dense corymbiform synflorescences, 8–12 mm. Involucre shortly cylindric or obconic, 6–9 mm; phyllaries sparsely grayish tomentose, glabrescent, subleathery, margin arachnoid ciliate, outer short, ovate, 1–3-veined, apex obtuse or acute, inner oblong, obtuse, larger, 3–5-veined. Disk florets 5–10, yellow, funnel-shaped, ca. 6.5 mm. Achenes 3–4 mm, densely strigose. Pappus whitish, sometimes brownish tinged, 6–9 mm. Fl. Jul–Sep.

Salt marshes, steppes, stony slopes. N Xinjiang [Kazakhstan, Russia (European part, W Siberia); SW Asia, E Europe (Ukraine)].

127. ASTEROTHAMNUS Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 331. 1950.

紫菀木属 *zi wan mu shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Subshrubs; rhizome woody. Stems numerous, erect or ascending, strongly branched, white to gray tomentose or arachnoid or villosulous to villous or villosulous-tomentose. Leaves sessile, small, crowded, subleathery, margin often revolute, 1-veined. Capitula radiate or sometimes discoid, solitary at ends of stems or branches or 3–5 in corymbiform synflorescences. Involucre broadly campanulate or subhemispheric; phyllaries 3- or 4-seriate, imbricate, usually unequal, often apically purple tinged, leathery, margin broad, scarious, erose, whitish, midvein distinct, brownish or reddish, apex acute. Receptacles \pm flat, alveolate, irregularly denticulate. Florets fertile. Ray florets female, blue, light violet, or whitish pink; disk florets bisexual, yellow, turning pink, limb funnelform to narrowly campanulate, 5-lobed, lobes lanceolate; anther base obtuse, appendage lanceolate; style branch tips triangular. Achenes oblanceoloid, \pm compressed, 2- or 3-ribbed, \pm densely strigose. Pappus white, yellowish, reddish, or dirty white, barbellate, equaling disk corollas, in 3 or 4 series, outermost few, short, thin, outer and inner long, acute, innermost few, \pm slightly clavate.

About seven species: C Asia; five species in China.

- 1a. Leaves 1–2 mm wide, linear or linear-oblong.
 - 2a. Stems branched throughout, densely white or cinnamon villosulous; leaves linear, 10–15(–20) \times 1–1.5 mm; capitula usually radiate, sometimes discoid, peduncles slender; phyllary apex greenish or white, rarely purplish 2. *A. fruticosus*
 - 2b. Stems branched in lower part only, gray-white tomentulose; leaves linear-oblong to linear, (8–)12–15 \times 1.5–2 mm; capitula radiate, peduncles rather thick; phyllary apex purplish red 3. *A. centralasiaticus*
- 1b. Leaves 2–4 mm wide, oblong to oblong-lanceolate or oblong-ob lanceolate.
 - 3a. Leaves oblong-ob lanceolate, 6–8 \times 2–3(–4) mm, apex shortly acuminate; bark at stem base reddish brown 1. *A. alyssoides*
 - 3b. Leaves oblong or oblong-lanceolate to oblong-ob lanceolate, 10–25 \times 2–4 mm, apex obtuse to \pm acute, mucronate; bark at stem base yellow-brown.
 - 4a. Leaves 10–12(–20) mm; phyllaries densely gray-white cottony, apex shortly acuminate to \pm obtuse 4. *A. mollisculus*
 - 4b. Leaves 15–25 mm; phyllaries gray-white tomentulose, apex acuminate 5. *A. poliifolius*

1. *Asterothamnus alyssoides* (Turczaninow) Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 336. 1950.

紫菀木 *zi wan mu*

Aster alyssoides Turczaninow, Bull. Soc. Imp. Naturalistes Moscou 5: 198. 1832; *Kalimeris alyssoides* Candolle.

Low subshrubs, 8–15(–20) cm, white arachnoid-tomentulose. Stems branched from base, branches slender and short, lower part woody, bark reddish brown, herbaceous above, white arachnoid-tomentose, glabrescent. Leaves oblong-ob lanceolate, 6–8 \times 2–3(–4) mm, surfaces white arachnoid-tomentose, adaxially apically \pm glabrescent, 1-veined, base attenuate, margin often revolute, apex shortly acuminate. Capitula radiate, solitary at ends of stems or in corymbiform synflorescences. Involucre campanulate, 6–7 \times 12–13 mm; phyllaries 3-seriate, arachnoid-tomentose, margin broadly scarious, erose fimbriate, apex acute to obtuse, outer short, ovate-lanceolate, mid and inner oblong to oblong-ob lanceolate. Ray florets 6–9, lamina spreading, bluish, ca. 8 \times 1 mm; disk florets ca. 12, yellow, 5–6 mm, limb funnel-shaped. Achenes ca. 3 mm, densely long strigose. Pappus white, ca. 5 mm.

Sandy and dry lands. Nei Mongol [S Mongolia].

2. *Asterothamnus fruticosus* (C. Winkler) Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 337. 1950.

灌木紫菀木 *guan mu zi wan mu*

Kalimeris fruticosa C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 9: 419. 1886.

Subshrubs, densely leaved. Stems branched throughout, lower part woody, bark tan-colored to gray, upper part herbaceous, gray-green, densely white or cinnamon villosulous, \pm glabrescent near base, distally sometimes \pm densely stipitate glandular. Leaves linear, 10–15(–20) \times 1–1.5 mm, reduced in size distally, surfaces arachnoid-tomentulose, densely so abaxially, sometimes adaxially glabrate, margin strongly revolute. Capitula usually radiate or sometimes discoid, in loose corymbiform synflorescences or solitary at ends of branches, 8–10 mm; peduncles slender, straight or \pm curved; bracts small, linear, upper phyllary-like. Involucre campanulate, 5–7 \times 8–10 mm; phyllaries 3- or 4-seriate, imbricate, glabrate or sparsely to moderately villous (particularly at base) to arachnoid, \pm stipitate glandular, membranous, outer and mid smaller, ovate-lanceolate, inner oblong, margin broadly scarious, glandular and sparsely villous-ciliate or eciliate, apex acuminate, green or white, rarely \pm purplish red. Ray florets 7–10, purplish to lavender, tube 2–3.1 mm, tube and lamina base hairy, lamina spreading, 6–10 \times 0.8–1.3 mm; disk florets 15–18, 4–5 mm, tube 2–2.2 mm, hairy, limb funnelform, 2.5–3.5 mm. Achenes (2–)3.5–4 mm, sericeous, glandular (not visible at maturity). Pappus yellowish white. Fl. and fr. Jun–Sep.

Gritty-stony foothills, stony riverbeds, sandy or rocky shrubby-grassy deserts; 1000–1600 m. Gansu, Xinjiang [Kazakhstan, Russia].

3. *Asterothamnus centraliasiatricus* Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 338. 1950 [*“centrali-asiaticus”*].

中亚紫菀木 zhong ya zi wan mu

Aster alyssoides Turczaninow var. *achnolepis* Handel-Mazzetti.

Subshrubs 20–40 cm; rhizome thick. Stems numerous, erect or ascending, many branched in lower part, finely striate, woody at base, bark reddish brown, gray-white tomentulose, \pm glabrescent, upper part herbaceous, gray-white villous, \pm glabrescent, glandular distally. Leaves crowded, ascending or erect, linear-oblong to linear, (8–)12–15 \times 1.5–2 mm, abaxially densely gray-white villous, adaxially gray-green, moderately to sparsely villous, base attenuate, margin revolute, apex acute. Capitula radiate, 8–10 \times ca. 10 mm, in loose corymbiform synflorescences or solitary at ends of branches; peduncles rather thick, straight or curved; bracts small, linear. Involucre broadly campanulate, 6–7 \times ca. 9 mm; phyllaries 3- or 4-seriate, imbricate, white villous to arachnoid, glandular at least distally, margin broadly scarious, erose, apex acuminate to acute or \pm obtuse, usually purplish red, outer short, ovate or lanceolate, inner oblong. Ray florets 7–13, tube ca. 2.9 mm, glabrous, lamina pale purple to pale lilac, 10–12 \times 1.2–2.7 mm; disk florets 11–19(–26), yellow turning reddish, ca. 5 mm, tube 1.8–2.5 mm, tube and limb base sparsely hairy, limb narrowly campanulate to funnelform, ca. 2.7 mm. Achenes straw-colored, 3–3.5 mm, white strigose. Pappus white or pale cinnamon. Fl. and fr. Jul–Sep.

Meadows, gritty-stony foothills, stony riverbeds, open sand dunes, deserts, grasslands; 1300–3400 m. Gansu, Nei Mongol, Ningxia, Qinghai, SE Xinjiang [S Mongolia].

Three varieties have been recognized, but morphological differences appear to be tenuous or the result of phenotypic plasticity. A thorough study is needed before recognition of these varieties is warranted. The varieties are *Asterothamnus centraliasiatricus* var. *centraliasiatricus*, *A. centraliasiatricus* var. *procerior* Novopokrovsky (Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 340. 1950), and *A. centraliasiatricus* var. *potaninii* (Novopokrovsky) Y. Ling & Y. L. Chen (Fl. Reipubl. Popularis Sin. 74: 263. 1985; *Asterothamnus potaninii* Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 341. 1950, “*Potanini*”). The main distinguishing characters given in descriptions were number of capitula in synflorescences (loose corymbiform in var. *centraliasiatricus* vs. 2 or 3 capitula in loose synflorescences in var. *procerior* and var. *potaninii*) and the degree of vestiture (gray-white tomentulose and glabrescent in var. *centraliasiatricus* vs. permanently, densely gray-white tomentose in var. *procerior*; var. *potaninii* not mentioned). The typical variety is reported

throughout the range of the species; *A. centraliasiatricus* var. *procerior* is reported from W Gansu, N Qinghai, and SE Xinjiang; and *A. centraliasiatricus* var. *potaninii* is reported from E Gansu and Ningxia.

4. *Asterothamnus molliusculus* Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 342. 1950.

软叶紫菀木 ruan ye zi wan mu

Subshrubs, (25–)30–40 cm tall. Stems erect or ascending, many branched, woody in lower part, bark yellow-brown, densely gray-white tomentose, \pm glabrescent, current-year branches slender, spreading, ascending or \pm curved, gray-white arachnoid-lanate. Leaves oblong or oblong-lanceolate, 10–12(–20) \times ca. 3 mm, abaxially white arachnoid-lanate, adaxially shortly arachnoid, \pm soft, base cuneate, margin revolute, apex obtuse to \pm acute, mucronate. Capitula radiate, large, usually 1–3 in corymbiform synflorescences at ends of branches; peduncle short. Involucre broadly campanulate, ca. 8 \times 8 mm; phyllaries 3- or 4-seriate, densely gray-white cottony, margin broadly scarious, erose, ciliate, apex shortly acuminate or \pm obtuse, outer shorter, oblong or lanceolate, inner oblong. Ray florets 8, lamina spreading, (whitish pink or pale purple?) yellowish when dry, oblong, ca. 10 \times 2.5–3 mm; disk florets 12, yellow, ca. 5 mm, limb narrowly campanulate. Achenes ca. 3.5 mm, moderately to densely strigose. Pappus whitish. Fl. Aug.

Meadows. Nei Mongol [Mongolia].

5. *Asterothamnus poliifolius* Novopokrovsky, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 13: 343. 1950.

毛叶紫菀木 mao ye zi wan mu

Subshrubs. Stems erect or ascending, many branched, woody in lower part, bark yellow-brown, herbaceous in upper part, \pm densely arachnoid-tomentose, \pm glabrescent. Leaves oblong or oblong-lanceolate to oblong-oblancheolate, 15–25 \times 2–4 mm, surfaces gray-white arachnoid-tomentose, adaxially \pm glabrescent, midvein conspicuous, margin revolute, apex acute or \pm obtuse, mucronate. Capitula radiate, large, in corymbiform synflorescences; peduncle short. Involucre broadly campanulate, 6–7 \times 8–9 mm; phyllaries 3-seriate, gray-white tomentulose, margin broadly scarious, apex acuminate, purplish at middle and apex, outer short, ovate or ovate-lanceolate, inner lanceolate or oblong. Ray florets 6 or 7, lamina spreading, pale purple, oblong, ca. 8 \times 3 mm; disk florets 12–15, yellow becoming \pm pale purple, ca. 5 mm, limb funnel-shaped. Achenes 4–4.6 mm, densely strigose. Pappus white or yellowish brown. Fl. Sep. $2n = 18$.

Grasslands; 1000–1900 m. Xinjiang [Mongolia, Russia (Tuva)].

128. ARCTOGERON Candolle, Prodr. 5: 260. 1836.

莎菀属 suo wan shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, perennial, mat-forming, scapiform; caudex branched; taproot thick. Leaves linear, base marcescent. Capitula radiate, solitary on scapes. Involucre campanulate; phyllaries 3- or 4-seriate, imbricate, narrowly lanceolate, membranous, acuminate, abaxially rounded, 1-veined, green along vein, often purplish apically, white toward margin, margins scarious, hyaline, erose. Receptacle flat, \pm alveolate. Florets fertile. Ray florets white or pinkish white, twice as long as involucre, lamina ovate-oblong; disk florets

bisexual, yellow, cylindric-campanulate, 5-lobed, lobes triangular; anther base obtuse, apical appendage lanceolate; style branch tips lanceolate. Achenes oblong, slightly compressed, densely silvery sericeous, slightly veined. Pappus 3- or 4-seriate, of white to yellowish white barbellate bristles, some outer shorter and thinner.

One species: NE China, Mongolia, Russia (Far East).

1. *Arctogeron gramineum* (Linnaeus) Candolle, Prodr. 5: 261. 1836.

莎菀 suǒ wān

Erigeron gramineus Linnaeus, Sp. Pl. 2: 864. 1753; *Aster gramineus* (Linnaeus) Komarov.

Herbs, perennial; caudex branches ascending, thickly covered with marcescent leaf bases. Flowering scapes 2–5 (or 6), 0.5–1 cm (to 7+ cm in fruit). Leaves erect, linear, 1–10 cm ×

0.4–0.6 mm, surfaces glabrous (or sometimes ± arachnoid-pubescent?), rigid, 1-veined, base sheathing, margin recurved, roughly scabrous-ciliate. Capitula solitary on scapes, 1–2 cm in diam. Phyllaries densely villous, inner slightly longer, sometimes pinkish tipped. Ray florets lamina ca. 6×2 mm, pale; disk florets 3–6 mm, tube 1–2.5 mm, limb 2–3.5 mm, lobes ca. 0.5 mm. Achenes ca. 3 mm. Pappus inner bristles equaling disk corollas.

Dry mountain slopes or stony slopes. Heilongjiang, Nei Mongol [Kazakhstan, Mongolia, Russia (Far East)].

129. **TURCZANINOVIA** Candolle, Prodr. 5: 257. 1836.

女菀属 nǚ wān shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, perennial; rootstock short and thick. Leaves alternate, linear-lanceolate. Capitula radiate, small, numerous, in dense corymbiform synflorescences. Involucre cylindric-campanulate; phyllaries 3- or 4-seriate, imbricate, shorter than disk florets, membranous, midvein green, margin scarious, apex obtuse to acute. Receptacle alveolate, margin lacerate. Ray florets female, 1-seriate, usually 7–10, white, lamina elliptic; disk florets several, bisexual, partly sterile, corolla yellow, limb shortly campanulate, lobes 5, lanceolate; anther base obtuse; style branch tips lanceolate or sometimes style undeveloped. Achenes dark brownish black or reddish, ovoid, weakly compressed, densely strigose, margins finely 2-ribbed. Pappus 2-seriate, of numerous dirty white, barbellate bristles, thin, subequal.

One species: China, Japan, Korea, Mongolia, Russia (Far East).

1. *Turczaninovia fastigiata* (Fischer) Candolle, Prodr. 5: 258. 1836.

女菀 nǚ wān

Aster fastigiatus Fischer, Mém. Soc. Imp. Naturalistes Moscou 3: 74. 1812; *A. flabellum* Vaniot; *A. micranthus* Vaniot & H. Léveillé; *A. micranthus* var. *achilleiformis* H. Léveillé; *Kalimeris japonica* Schultz Bipontinus.

Herbs, perennial. Stems erect, 30–80 (–100) cm tall, glabrous below, sparsely strigose to densely strigose-tomentose upward. Lower leaves withered at anthesis, shortly petiolate, blade linear-lanceolate, 3–12 × 0.3–1.5 cm, abaxially gray-green, densely strigose-tomentulose, densely glandular, 3-veined, veins prominent, adaxially glabrous, base cuneate, margin entire, revolute, scabrous, apex acuminate; mid and upper gradually reduced upward, lanceolate or linear-lanceolate. Capi-

tula small, 5–7 mm, numerous in terminal, dense, corymbiform synflorescences; peduncles slender; bracts 2 or 3, sometimes grading into phyllaries. Involucre cylindric-campanulate or campanulate; phyllaries: outer series oblong, 1–1.5 mm, ± densely puberulent, apex obtuse, inner oblanceolate-oblong, green at apex and along midrib. Ray florets tube 1–2 mm, lamina narrowly oblong to narrowly elliptic, 2–3.5 × 1–1.5 mm; disk florets 3–4 mm, tube 1–1.5 mm, limb 1–3 mm, lobes recurved. Achenes straw-colored to reddish, oblong, ca. 1 mm, densely strigose, glabrescent. Pappus 2–3 mm, equaling or shorter than disk corolla. Fl. and fr. Aug–Oct.

Dry slopes, moist grassy meadows on riverbanks, roadsides; near sea level to 500 m. Anhui, Gansu, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan, Zhejiang [Japan, Korea, Mongolia, Russia (Far East)].

130. **LAGENOPHORA** Cassini, Bull. Sci. Soc. Philom. Paris 1816: 199. 1816

[“*Lagenifera*”], nom. cons.

瓶头草属 píng tóu cǎo shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual [or perennial], scapiform. Leaves basal [or rarely cauline]. Capitula small, radiate or disciform, solitary, usually pedunculate or on scape, scape bracteate (bracts reduced). Involucre campanulate; phyllaries 2–4-seriate, unequal, membranous, 1-veined (midvein orangish). Receptacles flat or convex, not alveolate, naked. Ray florets female, 1–4-seriate, white to purple; disk florets few, usually sterile, functionally male, yellow, limb campanulate, 4- or 5-lobed; anther base obtuse; style branch tip lanceolate

or triangular. Achenes obovate to oblanceolate, flattened, \pm glandular apically, margin 2-ribbed, apex rimmed, shortly beaked or not. Pappus absent.

Eighteen species: SE Asia, Australia, New Zealand, South America; one species in China.

1. *Lagenophora stipitata* (Labillardière) Druce, Rep. Bot. Soc. Exch. Club Brit. Isles 4: 630. 1917.

瓶头草 ping tou cao

Bellis stipitata Labillardière, Nov. Holl. Pl. 2: 55. 1806;
Lagenophora billardierei Cassini.

Herbs, annual, 3.5–12 cm tall. Leaves rosulate, persistent, petiole short, blade obovate to broadly spatulate, 1.2–3 \times 0.7–1.3 cm, surfaces sparsely to moderately villosulous, base attenuate, margin repand-dentate, teeth mucronulate, villosulous, apex rounded to obtuse; scape bracts (leaves) 1 or 2, linear, 1–

1.5 \times 3–5 mm. Capitula 4–7(–9) mm in diam., solitary. Involucre campanulate, ca. 2.5 \times 3–5 mm; phyllaries 3- or 4-seriate, margin narrowly scarious, hyaline, entire, apex acute to obtuse, purple tinged, outer oblanceolate, ca. 1 mm, mid oblanceolate or narrowly elliptic, ca. 2 mm, inner linear-lanceolate. Ray florets 3- or 4-seriate, purplish, lamina linear, 1.5–2.5 \times ca. 0.5 mm, enrolled by anthesis; disk florets 1.2–1.5 mm, tube 0.3–0.5 mm, limb shortly funnelform, 0.5–1 mm, 4- or 5-lobed, lobes deltate to triangular. Achenes asymmetrically oblanceolate, flattened, 2.5–3.5 mm, apex and beak glandular. Fl. and fr. Sep.

Forest margins, grasslands on slopes; 1700–1800 m. Fujian, Guangdong, Guangxi, Taiwan [India, Indonesia, Vietnam; Australia].

131. *CALOTIS* R. Brown, Bot. Reg. 6: t. 504. 1820.

刺冠菊属 ci guan ju shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, annual or perennial, or rarely subshrubs. Leaves alternate, entire or \pm dissected. Capitula small, radiate or disciform, solitary or in open corymbiform synflorescences, pedunculate or sessile. Involucre hemispheric or broadly campanulate; phyllaries 3-seriate, unequal or subequal, margins scarious. Receptacle convex, not alveolate, naked. Ray florets female, 1- to many seriate, white, pink, violet, or purple; disk florets usually functionally male, limb funnelform, 5-lobed; anthers obtuse, entire; style branches linear, appendages short, obtuse. Achenes of ray florets obovoid to oblong, sometimes compressed, glabrous or strigillose, often winged. Pappus of (1 or) 2 to many awns, spreading, spiniform, shortly barbellate, elongating after flowering, sometimes with 2 to many scales, rarely of barbellate bristles or absent.

About 28–30 species: mainly in Australia, few species in SE Asia; one species (endemic) in China.

1. *Calotis caespitosa* C. C. Chang, Sunyatsenia 3: 280. 1937.

刺冠菊 ci guan ju

Herbs, annual, 10–15 cm tall; taproot \pm woody. Stems erect or ascending, ramified; branches slender, glabrous. Leaves cauline, sessile, blade linear-oblanceolate, 5–25 \times 0.5–1.5 mm, gradually reduced distally, surfaces glabrous, base cuneate, margin entire, apex obtuse to acute, tip knobby. Capitula terminal, solitary. Involucre hemispheric, 1–1.5 mm; phyllaries 3-seriate, subequal, linear-lanceolate, 1–1.5 mm, surfaces glabrous, eglan-

dular, midvein prominent, translucent, margin sparsely ciliate. Ray florets 20–38, 1-seriate, lamina white, 0.9–1.5 \times 0.3–0.4 mm, glabrous, eglandular; disk florets yellow, 1.3–1.4 mm, limb 0.8–0.9 mm, lobes erect, triangular, 0.3–0.5 mm, glabrous, eglandular. Achenes (ray) obovoid, \pm trigonous, 0.8–1 mm, distally strigillose, ribs 3, 2 marginal slightly winged. Pappus of caducous, spiniform, barbellate bristles. Fl. and fr. Sep–Nov.

• Dry sandy and grassy areas by sea beaches; near sea level. Hainan.

132. *CALLISTEPHUS* Cassini in F. Cuvier, Dict. Sci. Nat. 37: 491. 1825, nom. cons.

翠菊属 cui ju shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Callistemma Cassini.

Herbs, annual or biennial. Leaves alternate, cauline, margin serrate or lobed. Capitula large, radiate, solitary, terminal on stem and at branch ends. Involucre hemispheric; phyllaries 2- or 3-seriate, imbricate, outer series large, leaflike, inner shorter, scarious. Receptacles flat or subconvex, alveolate, short paleae sometimes present. Ray florets 1- or 2-seriate, lamina usually red-purple, entire or shallowly 2-toothed at apex; disk florets bisexual, numerous, yellow, limb campanulate, shallowly 5-lobed; anther base obtuse, entire; style branches flattened, appendages triangular-lanceolate. Achenes oblanceoloid, slightly compressed, strigillose, sparsely, minutely stipitate glandular, 2-ribbed, 1 vein per side. Pappus 3-seriate, outer of persistent, short scales, inner 2 of deciduous, long, barbellate bristles.

One species: China, Japan, Korea, also widely cultivated.

1. *Callistephus chinensis* (Linnaeus) Nees, Gen. Sp. Aster. 222. 1832.

翠菊 *cui ju*

Aster chinensis Linnaeus, Sp. Pl. 2: 877. 1753; *Callistemma chinense* (Linnaeus) Skeels; *C. hortense* Cassini; *Diplopappus chinensis* (Linnaeus) Lessing.

Herbs, 20–100 cm tall. Stems erect, single, simple or sparingly branched, branches ascending, sometimes reddish, sparsely to moderately villous, sometimes sparsely to moderately minutely stipitate glandular. Leaves: lower withered by anthesis or persistent, gradually reduced distally; lower petiolate (to 1.2 cm), blade spatulate, ca. 0.9 cm; mid narrowly winged petiolate (2–4 cm, margin villosulous), blade ovate to lanceolate or oblanceolate, 2.5–6.5 × 2–4 cm, strigillose, abaxially sparsely pilosulose, midvein sparsely villosulous, adaxially glabrous, eglandular, base cuneate or attenuate-rounded, margin irregularly, coarsely serrate, teeth mucronulate, sometimes entire (distalmost), apex acuminate, mucronulate. Involucre 10–

15+ mm; phyllaries subequal, oblanceolate, apex obtuse, outer series 10–30 × 2–6 mm, glabrous, midvein ciliate proximally, margin white ciliate, apex mucronulate, inner series 10–30 × 2–6 mm, glabrous, eglandular, scarious, multiveined, veins translucent, proximally prominent, margin hyaline, erose, purple-tinged, apex erose. Ray florets 16–40+, lamina red, pink, blue, purple, violet, lilac, or white, 15–35 × 2–8 mm, tube sparsely strigillose, sparsely, minutely stipitate glandular apically; disk florets yellow, 4.5–5 mm, tube and limb base sparsely strigillose, limb 3.6–4 mm, lobes spreading, narrowly triangular, 1.2–1.3 mm, sparsely minutely stipitate glandular. Achenes mottled purple, grayish with age, 3–3.5 mm. Pappus: outer scales, reddish, ca. 0.1 mm, inner bristles white, ca. 4 mm, acute, innermost bristles 4.5–4.8 mm, weakly clavate. Fl. and fr. May–Oct.

Grasslands on slopes, stream banks, shady places or open forests, roadsides; 300–2700 m. Gansu, Hebei, Heilongjiang, Henan, Jiangsu, Jilin, Liaoning, Nei Mongol, Shandong, Shanxi, Sichuan, Xinjiang, Yunnan [Japan, Korea].

An ornamental plant, this species is widely cultivated worldwide.

133. **FORMANIA** W. W. Smith & J. Small, Trans. & Proc. Bot. Soc. Edinburgh 28: 91. 1922.

复芒菊属 *fu mang ju shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Small shrubs. Leaves alternate, petiolate, leathery, pinnatilobed. Capitula radiate, terminal, in corymbiform synflorescences, pedunculate. Involucre cylindric; phyllaries 4-seriate, unequal, oblong or lanceolate-oblong, scarious, green distally. Receptacles flat, fimbriate. Ray florets female, 1-seriate, lamina pale yellow; disk florets bisexual, yellow, limb funnelform, 5-lobed; anther base sagittate with short, acute auricles at base, apical appendage long acute; style branch tip lanceolate. Achenes obovoid, strigillose, sparsely stipitate glandular, 3-ribbed. Pappus 3-seriate, outermost of 6 broad scales 1.5–2 mm, inner of 0 (disk) or 1 (ray) series of ± flattened, barbellate bristles ca. 3 mm, innermost of 3–5 strongly clavate bristles 3.8–4.2 mm (equaling base of disk corolla lobes).

• One species: China.

1. *Formania mekongensis* W. W. Smith & J. Small, Trans. & Proc. Bot. Soc. Edinburgh 28: 92. 1922.

复芒菊 *fu mang ju*

Shrubs, 30–100 cm tall. Branchlets gray-brown, villosulous, minutely stipitate glandular when young. Leaves narrowly winged petiolate (to 0.5–0.8 cm), blade ovate to obovate, 3–5-lobed, 1.2–2 × 0.5–2 cm, surfaces glabrous, minutely stipitate glandular in pits, viscid, base attenuate, margin irregularly serrate, teeth spinulose, remotely scabridulous. Capitula 2–12, ca. 7 mm; peduncle 1–10 mm, glabrous, densely stipitate glandu-

lar; bracts sometimes present. Involucre 5–6 mm; phyllaries: base hardened, surfaces glabrous, stipitate glandular, resinous, outer lanceolate-oblong, 1.5–2 × ca. 1 mm, distally leaflike, margin narrowly scarious, sparsely ciliate, apex acute, inner oblong, 3–5.5 × 1.2–1.5 mm, margin broadly scarious, hyaline, white ciliate, apex obtuse, tip reddish. Ray florets ca. 10, lamina 2.5–3 × ca. 0.7 mm; disk florets ca. 8, 4–4.2 mm, limb ca. 3 mm, lobes spreading, triangular, ca. 0.8 mm. Achenes (immature) ca. 2 mm.

• Dry rocky slopes, rock walls; ca. 3000 m. W Sichuan (Batang), NW Yunnan.

134. **HETEROPLEXIS** C. C. Chang, Sunyatsenia 3: 266. 1937.

异裂菊属 *yi lie ju shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Herbs, perennial, climbing or erect. Leaves alternate, cauline, shortly petiolate, margin entire or serrulate, pinnately veined. Capitula disciform, solitary or 2–4-fascicled at ends of branches, shortly pedunculate or sessile. Involucre cylindric or cylindric-campanulate; phyllaries numerous, 5- or 6-seriate, imbricate, ovate to ovate-oblong. Receptacles flat, alveolate, glabrous. Florets fertile. Ray florets female, 1-seriate, 4–7, lamina fine, apex 3-toothed; disk florets bisexual, 4–6, yellow, limb narrowly campanulate, lobes 5, unequal, outer 2 longer; stamens 5, exserted; anther base obtuse; style branch tip triangular. Achenes oblong or oblong-obovoid, sparsely strigillose; achenes of ray florets slightly compressed, angled adaxially, slightly convex abaxially, 1-ribbed on both sides; achenes of disk florets 2-ribbed on both sides. Pappus 1-seriate, of yellowish white, subequal, barbellate bristles.

• Three species: China.

One of us (Brouillet) has not seen specimens of this genus.

- 1a. Stems and branches densely gray puberulent, eglandular; leaves lanceolate to oblong-lanceolate, adaxially scabrous, abaxially densely white villous 3. *H. sericophylla*
 1b. Stems and branches gray hairy and glandular; leaves lanceolate-elliptic or oblong-lanceolate or lanceolate, both surfaces scabrous, abaxially glandular.
 2a. Involucre 5–5.6 × 3–4 mm; ray florets ca. 7, disk florets ca. 3; abaxial leaf surface glandular 1. *H. vernonioides*
 2b. Involucre ca. 4 × 2–3 mm; ray and disk florets 4; both leaf surfaces densely glandular 2. *H. microcephala*

1. *Heteroplexis vernonioides* C. C. Chang, Sunyatsenia 3: 267. 1937.

异裂菊 yi lie ju

Herbs climbing. Stems olive, corymbosely branched above, branches spreading, lower to 16 cm, striate, gray puberulent, glandular. Leaves: petiole 3–5 mm, blade abaxially pale green, adaxially green, lanceolate-elliptic, 8–9 × 2–2.5 cm, surfaces scabrous, abaxially glandular, distal half hard papery, lateral veins distinct, connected toward margin, base cuneate, margin all or above middle sparsely serrulate, densely scabrous, apex acute; upper blade oblong, elliptic-oblong, or narrowly ovate, ca. 2 × 0.9 cm, base cuneate, margin entire, apex acute or slightly obtuse; uppermost subsessile, small. Capitula solitary or 2- or 3-fascicled; peduncles absent or to 6 mm; bracts ovate-lanceolate. Involucre 5–5.6 × 3–4 mm; phyllaries 5- or 6-seriate, outer ovate, obtuse, abaxial surface and margin sparsely pubescent, often glandular. Ray florets ca. 7; disk florets ca. 3, yellow, 4.5–5 mm, lobes incurved, outer 2 ca. 1.6 mm, inner ca. 1 mm. Achenes ca. 1.5 mm. Pappus ca. 4.3 mm. Fl. Oct.

- Limestone rocky sides in valleys. Guangxi (Jinxian).

2. *Heteroplexis microcephala* Y. L. Chen, Guihaia 5: 339. 1985.

小花异裂菊 xiao hua yi lie ju

Herbs, perennial, erect, 50–70 cm tall. Stems with short or long branches above, striate, densely gray appressed hispidulous, glandular. Leaves: petiole 2–3 mm, blade abaxially pale, adaxially dark green, thickly papery; mid cauline oblong-lanceolate or lanceolate, 5–10 × 1.5–2 cm, surfaces sparsely scabrous, densely glandular, lateral veins 5- or 6-paired, distinct abaxially, base cuneate, margin entire or rarely denticulate, apex acuminate, mucronulate; upper and on branches subsessile, small, ovate-lanceolate. Capitula solitary in leaf axils or 2–4

in racemose-corymbiform synflorescences; peduncles 4–8 mm, densely shortly appressed hairy; bracts 1 or 2(or 3), linear-lanceolate. Involucre cylindric or subcylindric, ca. 4 × 2–3 mm; phyllaries 4- or 5-seriate, scarious, outer ovate, 1–1.5 mm, slightly acute, inner oblong, 4–5 mm, obtuse, inconspicuously 1-veined, apex and margin puberulent. Ray florets 4, tube 2–2.5 mm, lamina fine, ca. 0.5 mm wide, shorter than style; disk florets 4, tube ca. 1.5 mm, glabrous, lobes linear-lanceolate, outer ca. 2 mm, inner 1–1.5 mm, apex puberulent. Achenes oblong, ca. 1 mm. Pappus ca. 4 mm. Fl. Jul–Dec.

- Limestone rocky slopes; ca. 300 m. Guangxi (Yangzhou).

3. *Heteroplexis sericophylla* Y. L. Chen, Fl. Reipubl. Popularis Sin. 74: 361. 1985.

绢叶异裂菊 juan ye yi lie ju

Herbs, erect. Stems gray-brown, simple or branched, striate, densely gray puberulent, eglandular. Leaves: petiole 2–3 mm, blade hard papery; mid cauline lanceolate to oblong-lanceolate, 11–14 × 2–2.5 cm, abaxially gray-green, densely white villous, adaxially green, strigose, lateral veins indistinct, base cuneate, margin entire or above middle ± sparsely serrulate, teeth mucronate, apex acuminate or long acuminate; upper subsessile, narrowly lanceolate, 6.5–10 × 1–1.8 cm, margin entire, apex acuminate; uppermost reduced, linear-lanceolate. Capitula solitary or 2- or 3-fascicled in leaf axils of short branches and in corymbiform synflorescences, shortly pedunculate or sessile; bracts linear-lanceolate. Involucre cylindric-campanulate, 3–4 × ca. 3 mm; phyllaries 5-seriate, obtuse, outer ovate, 1.5–1.8 mm, inner oblong, ca. 4 mm, white villous, margin ciliate, 1-veined. Ray florets 6 or 7, 1-seriate, lamina fine, ca. 0.5 mm; disk florets 5 or 6, 3.7–4 mm, lobes lanceolate, apex white puberulent. Achenes oblong, ca. 1.3 mm, 2-ribbed on both sides. Pappus ca. 3.5 mm. Fl. Sep–Oct.

- Open forests on hills; ca. 400 m. Guangxi.

135. PSYCHROGETON Boissier, Fl. Orient. 3: 156. 1875.

寒蓬属 han peng shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Herbs, perennial, annual, or biennial; rhizome usually thickly woody, sometimes thin and ± woody, stem base sheathed in marcescent leaf remains, rarely biennial or annual. Stems usually short, rarely tall, ± scapiform, sometimes branched, leafy. Leaves alternate, basal petiolate or subpetiolate, blade green or grayish, lanceolate, oblanceolate, obovate, or spatulate, white tomentose to lanate, often sessile or short-stipitate glandular, margin entire, coarsely serrate, or sometimes subpinnatifid, cauline leaves few, reduced, entire or dentate. Capitula solitary or few, terminal, rarely in racemiform or corymbiform synflorescences. Involucre campanulate; phyllaries 2- or 3-seriate, imbricate or ± equal, membranous, outer green distally, inner green along midvein, margin scarious. Ray florets fertile, many, white, yellow, or reddish, reduced to tube and elaminate or laminate, exceeding or shorter than style, entire or 2- or 3-lobed; disk florets functionally male, few or numerous, concolorous with ray florets, 5-lobed; anther base obtuse, appendages lanceolate; ray floret style linear, disk floret style lanceolate, branches fused. Achenes of ray florets obovoid or

narrowly oblong to oblanceoloid, compressed, \pm strigose, marginally 2-ribbed, of disk florets linear, sterile. Pappus 1- or 2-seriate, outer of few short, thin bristles, inner of long, unequal, barbellate bristles, acute or slightly clavate, equaling disk florets.

About 20 species: C and SW Asia; two species in China.

- 1a. Perennial herbs; stems 3–19 cm tall, simple, sparsely to densely lanate; capitula solitary, 1.5–2.4 cm in diam.; female florets laminate, golden yellow 1. *P. poncinsii*
 1b. Annual or biennial herbs; stems to 55 cm tall, branched, densely villous-pilose; capitula numerous, 0.7–1 cm in diam., in corymbose-paniculiform synflorescences; female florets filiform, white 2. *P. nigromontanus*

1. *Psychogeton poncinsii* (Franchet) Y. Ling & Y. L. Chen,
 Acta Phytotax. Sin. 11: 427. 1973.

藏寒蓬 zang han peng

Aster poncinsii Franchet, Bull. Mus. Hist. Nat. (Paris) 2: 345. 1896; *Erigeron poncinsii* (Franchet) Botschantzev; *Psychogeton andryaloides* (Candolle) Novopokrovsky ex Krascheninnikov var. *poncinsii* (Franchet) Grierson.

Herbs, perennial, 3–19 cm tall; rhizome thickly woody, branched. Stems scapiform, erect or ascending, simple, densely to sparsely lanate, partly glabrescent, sessile or short-stipitate glandular. Leaves: surfaces sparsely or densely lanate to tomentose, short-stipitate or sessile glandular; basal petiolate, blade oblanceolate to obovate or spatulate, 1–6 \times 0.3–1.5 cm, margin remotely coarsely serrate or slightly repand, rarely entire, apex acute to obtuse; cauline 3–5, sessile or shortly petiolate, blade oblanceolate to linear. Capitula 1.5–2.4 cm in diam., solitary. Phyllaries 2- or 3-seriate, linear-lanceolate to linear-oblanceolate, outer partly green or gray-green, abaxially densely to sparsely white tomentose or lanate, apex acute to acuminate, inner 6.5–8 \times ca. 1 mm. Ray florets 4.4–5.4 mm, longer than pappus, tube 2.9–3.6 mm, sparsely hairy, lamina golden yellow, becoming reddish or purplish after anthesis, narrowly obovate to oblanceolate, 1.3–3.5 \times 0.7–1.2 mm, apex 3-denticulate; disk florets narrowly funnelform, appressed hairy, tube 1.7–1.8 mm, limb 3–3.5 mm, lobes 0.3–0.5 mm. Achenes (ray florets) brown, ribs straw-colored, narrowly oblong to oblanceoloid, 3.6–3.8 mm, \pm densely strigose. Pappus 2-seriate, yellowish white, 2.6–4.6 mm.

Valleys; 3000–4600 m. Xinjiang, W Xizang [Afghanistan, India, Pakistan, Russia, Tajikistan; SW Asia (Iran)].

2. *Psychogeton nigromontanus* (Boissier & Buhse) Grierson,
 Notes Roy. Bot. Gard. Edinburgh 27: 144. 1967.

黑山寒蓬 hei shan han peng

Erigeron nigromontanus Boissier & Buhse, Nouv. Mém. Soc. Imp. Naturalistes Moscou 12: 114. 1860; *Brachyactis iliensis* Ruprecht; *Conyza iliensis* Trautvetter; *E. kazakhstanicus* Sergievskaya.

Herbs, annual or biennial, 1–55 cm tall or more; taproots vertical or ascending. Stems erect, branched above, densely leafy, grayish, densely villous-pilose, short-stipitate glandular. Leaves densely villous-pilose, short-stipitate glandular, basal withered at anthesis, petiolate, petiole base clasping, blade spatulate to oblong; lower cauline long petiolate, blade obovate to oblanceolate, ca. 8 \times 2.5 cm, base attenuate, margin entire or remotely serrulate, apex acute; mid cauline blade oblanceolate to lanceolate, ca. 3 \times 0.75 cm, margin entire or remotely 1- or 2-serrulate per side; upper on branches reduced. Capitula 0.7–1 cm wide, usually numerous, in corymbose-paniculiform synflorescences; peduncles thin, 0.5–1 cm. Involucre campanulate; phyllaries subequal, 2- or 3-seriate, green along midvein, lanceolate to linear-lanceolate, ca. 4 \times 0.5 mm, abaxially densely villous-pilose, short-stipitate glandular, margin scarious, apex acuminate. Female florets numerous, filiform, 1.75–2 mm, hairy, lamina \pm obliquely cut; disk florets 6–12, ca. 3.5 mm, funnelform, lobes lanceolate, apex hairy. Achenes tan, oblanceoloid, ca. 2 \times 0.5 mm, strigose. Pappus 1-seriate, sometimes also short outer series present, very short, of 20–24 barbellate bristles, 3–4.5 mm. Fl. Jul–Sep.

Subalpine meadows; 1200–1500 m. N Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan; SW Asia (Caucasus, Iran, Iraq, Turkey)].

136. *NEOBRACHYACTIS* Brouillet, gen. nov.

短星菊属 duan xing ju shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Type: *Neobrachyactis roylei* (Candolle) Brouillet.

Herbae annuae vel perennes, stipitato-glandulosae; caules erecti vel ascendentes, simplices vel ramosi. Folia alterna, basalia et caulina, ad marginem serrata vel interdum integra. Capitula disciformia vel radiata, in synflorescentias racemo-paniculiformes disposita, raro ad foliorum superiorum axillas solitaria vel aggregata; involucrem hemisphaericum vel campanulatum; phyllaria 2- ad 4-seriata, subaequalia, lineari-lanceolata vel lineari-oblonga, membranacea vel exteriora foliacea, ad marginem scariosa, glandulosa; receptaculum planum, infirme alveolatum, nudum. Flosculi omnes fertiles; flosculi radii feminei, numerosi, biseriati, tubulosi vel breviter laminati, albi vel caeruleo-virescentes; flosculi disci bisexuales, minus numerosi, lutei vel incolorati, limbo breviter infundibuliformi, superne 5-lobato, lobis ovatis, antheris ad basin obtusatae, appendice apicali lanceolata, styli ramorum appendicibus triangulo-lanceolata. Achaenia oblanceolata, compressa, strigosa, ad marginem 2-costata; pappus biseriatus, setis exterioribus paucibus, brevibus, gracilibus, interioribus numerosis, luteis usque cinnamomeis, barbellatis, ad apicem acutis interdum leniter clavatis.

Herbs, annual or perennial. Stems erect to ascending or sometimes procumbent, often branching from base, stipitate glandular. Leaves basal and cauline, blade obovate to oblong-obovate or oblong-lanceolate, margin serrate or sometimes entire, \pm densely glandular. Capitula radiate or disciform, in racemose-paniculiform synflorescences, rarely solitary or crowded in upper leaf axils. Involucre hemispheric or campanulate; phyllaries 2–4-seriate, subequal, membranous, outer leaflike, linear-oblong or linear-lanceolate, stipitate glandular, margins villous-ciliate, outer green except white margin, margin of inner narrowly scarious, erose, \pm ciliate. Receptacles flat, weakly alveolate, glabrous. Florets fertile. Ray florets numerous, 2-seriate, white or bluish, reduced to tube or shortly laminate, tube shorter than style, apex ciliate, lamina, if present, filiform, exceeding style; disk florets bisexual, less numerous, yellow or uncolored, shorter than to \pm equaling pappus, limb shortly funnelform, 5-lobed, lobes ovate, short; anther base obtuse, apical appendage lanceolate; style branch tips triangular-lanceolate. Achenes oblanceolate, flattened, long strigose, marginally 2-ribbed. Pappus 2-seriate, outer of few short, thin bristles, inner of numerous yellowish to cinnamon, barbellate bristles, apex acute or sometimes slightly clavate.

Three species: C, N, and S Asia; three species in China.

The genus *Neobrachyactis* is distinct from *Brachyactis* s.s., the type of which, *B. ciliata* (Ledebour) Ledebour (*Erigeron ciliatus* Ledebour), belongs to the North American genus *Symphotrichum*. The notably glandular herbage and the compressed, 2-ribbed achenes clearly distinguish the species of *Neobrachyactis* from *S. ciliatum*.

- 1a. Perennial herbs; upper leaves sessile, subclasping at base, shortly decurrent on stems; capitula solitary or 3 or 4 crowded at ends of stems and branches; phyllaries longer than disk florets; ray florets longer than disk florets, lamina bluish, exceeding style 1. *N. anomala*
- 1b. Annual herbs; upper leaves sessile or shortly petiolate, not decurrent; capitula \pm numerous, in racemiform or racemose-paniculiform synflorescences; phyllaries shorter than disk florets; ray florets shorter than disk florets, lamina white, shorter than style, or tube apex obliquely lobed, elaminate.
 - 2a. Stems moderately to densely stipitate glandular and sparsely villous; capitula 1–1.2 cm in diam., numerous, in racemiform or racemose-paniculiform synflorescences; phyllaries green, ca. 1/3 shorter than disk florets, outer shorter than inner, \pm villous and densely short-stipitate glandular 2. *N. roylei*
 - 2b. Stems densely brown glandular; capitula 1.5–2 cm in diam., few, in racemiform synflorescences; phyllaries dark brown, slightly shorter than disk florets, outer often longer than inner, densely brown glandular 3. *N. pubescens*

1. *Neobrachyactis anomala* (Candolle) Brouillet, **comb. nov.**

香短星菊 xiang duan xing ju

Basionym: *Erigeron anomalus* Candolle, Prodr. 5: 293. 1836 [“*anomalum*”]; *Aster menthodus* (Benth) Govaerts; *Brachyactis anomala* (Candolle) Kitamura; *B. indica* C. B. Clarke; *B. menthodora* Benth.

Herbs, perennial, 60–95 cm tall, with sweet menthol odor. Stems erect, rigid, tinged pinkish violet, shortly branched, long-stipitate glandular. Leaves crowded, surfaces densely stipitate glandular, veins sparsely villous; basal and lower cauline long petiolate, basal fallen at anthesis, obovate or oblong-lanceolate, 1.5–5 \times 0.5–1.5 cm, margin serrate, apex acute or arcuate; upper sessile, gradually reduced, base subclasping, decurrent, \pm rounded. Capitula radiate, solitary or 3 or 4 crowded at ends of stems or branches, 1–1.5 cm in diam.; peduncles 5–10 mm. Involucre hemispheric-campanulate; phyllaries 2- or 3-seriate, membranous, outer often 1 or 2, leaflike, green along midvein, inner linear or linear-lanceolate, 6–7 mm, sparsely villous, sparsely stipitate glandular, margin narrowly scarious, apex acute or acuminate, pinkish violet, equaling or longer than disk florets. Florets fertile. Ray florets numerous, \pm 2-seriate, 5–6 mm, lamina bluish, longer than style, narrow, apex 3-toothed; disk florets ca. 5 mm, tube and limb base often hairy, limb funnelform, lobes lanceolate, glabrous. Achenes brown, oblanceolate, compressed, 3–3.5 mm, sparsely strigose. Pappus pinkish to brownish, 2-seriate, outer bristles short, inner unequal, longer than achene, barbellate. Fl. and fr. May–Sep.

Alpine thicket margins, grasslands on slopes; 3300–4000 m. S Xizang (Nyalam to Yadong) [Bhutan, India, Nepal].

2. *Neobrachyactis roylei* (Candolle) Brouillet, **comb. nov.**

新疆短星菊 xi jiang duan xing ju

Basionym: *Conyza roylei* Candolle, Prodr. 5: 381. 1836; *Brachyactis roylei* (Candolle) Wendelbo; *B. umbrosa* (Karelin & Kirilov) Benth; *C. umbrosa* Karelin & Kirilov; *Erigeron umbrosus* (Karelin & Kirilov) Boissier.

Herbs, annual, 3–35 cm tall. Stems erect or ascending, sometimes procumbent, green or tinged pinkish, branched from base or upper part, densely leafy, densely stipitate glandular, densely hirsute-villous. Leaves: surfaces \pm densely stipitate glandular, hirsute-villous; basal withered and fallen at anthesis, long petiolate, blade obovate or obovate-oblong, 0.5–4 \times 0.3–1.5 cm, base cuneate to attenuate, margin coarsely serrate, apex obtuse or arched; cauline shortly petiolate, blade obovate, base attenuate to cuneate; upper reduced, margin coarsely serrate or subentire. Capitula numerous, in racemiform or racemose-paniculiform synflorescences, 1–1.2 cm in diam. Involucre campanulate; phyllaries 3- or 4-seriate, membranous, linear-lanceolate, shorter than or equaling disk florets, abaxially densely stipitate glandular, sparsely villous, margin narrowly scarious, outer shorter than inner, 5–7 \times 0.6–1 mm. Ray florets numerous, reduced to tube, white, 2.2–2.6 mm, sparsely hairy above, apex oblique, ciliate, or sometimes laminate; disk florets yellow, 3.5–3.6 mm, tube 2.4–2.8 mm, limb shortly funnelform, upper tube and limb hairy, lobes ovate, 0.25–0.4 mm. Achenes lanceolate, compressed, 1.8–2.2 mm, strigose. Pappus yellowish to cinnamon, 2-seriate, 3.6–3.9 mm, inner \pm equaling disk corolla. Fl. and fr. Jul–Sep.

Among rocks and shrubs; 1800–4300 m. N Xinjiang, N and W Xizang [Afghanistan, India, Kazakhstan, Nepal, Pakistan, Russia, Uzbekistan; SW Asia (Iran)].

3. *Neobrachyactis pubescens* (Candolle) Brouillet, comb. nov.

腺毛短星菊 xian mao duan xing ju

Basionym: *Conyza pubescens* Candolle, Prodr. 5: 381. 1836; *Brachyactis pubescens* (Candolle) Aitchison & C. B. Clarke; *B. robusta* Benth.

Herbs, annual, 4–20 cm tall. Stems erect or ascending, branched, densely leafy, densely brownish yellow stipitate glandular. Leaves: surfaces densely glandular, basal withered and fallen at anthesis, shortly petiolate, blade obovate or oblong-obovate, 1–4 × 0.5–1.5 cm, base cuneate, margin sparsely

roughly serrate, apex obtuse or arched; upper subsessile, reduced, margin almost entire or sparsely serrate. Capitula few, in racemiform synflorescences, 1.5–2 cm in diam.; peduncles thick, 1–1.8 cm. Involucre hemispheric; phyllaries 2- or 3-seriate, dark brownish, oblong or oblong-lanceolate, slightly shorter than disk florets, abaxially densely brown glandular, apex acute or acuminate, outer often longer than inner, 5–7 × 1–1.2 mm. Ray florets numerous, white, finely tubular, together with style 4–4.5 mm, apex obliquely lobed or finely laminate, upper tube puberulent; disk florets uncolored, 4–4.5 mm, lobes short, upper tube and lobe apex puberulent. Achenes oblong, ca. 2 mm, compressed, strigillose. Pappus dirty white, 2-seriate, outer bristles short, inner ± equaling disk corolla. Fl. and fr. Jul–Oct.

Mountain slopes; ca. 5200 m. W Xizang [Afghanistan, India, Nepal, Pakistan].

137. SHEARERIA S. Moore, J. Bot. 13: 227. 1875.

虾须草属 xia xu cao shu

Chen Yousheng (陈又生); Luc Brouillet

Herbs, biennial (or winter annual). Stems erect to ascending. Leaves basal 1st year, cauline 2nd year, alternate, margin entire. Capitula radiate, small, terminal or axillary. Involucre campanulate; phyllaries 2-seriate, unequal, ovate, outer 2 oblong, smaller. Receptacles flat, epaleate. Ray florets female, white or pinkish, lamina elliptic-oblong, entire or 3-toothed; disk florets functionally male (ovary sterile), yellow, limb campanulate, (4 or) 5 (or 6)-lobed; anther base obtuse; style undivided, lanceolate. Achenes oblanceoloid to obovoid, 3-ribbed. Pappus absent.

• One species: China.

1. *Sheareria nana* S. Moore, J. Bot. 13: 227. 1875.

虾须草 xia xu cao

Sheareria leshanensis Z. Y. Zhu; *S. polii* Franchet.

Herbs, biennial (or winter annual), 10–100 cm tall, taprooted. Stems ramified. Leaves shortly petiolate (lower) or sessile, blade lanceolate to oblanceolate, 4–50 × 1.3–6 mm, surfaces glabrous, eglandular or sometimes sparsely minutely stipitate glandular on abaxial base of petiole, margin sparsely ciliate, apex acute to obtuse, mucronulate; upper smaller, bract-like. Capitula 2–2.2 mm; peduncles 3–5 mm. Phyllaries 4 or 5, green, surfaces glabrous or sparsely strigillose, eglandular, mar-

gin scarious, ciliate, apex obtuse. Ray florets 3 or 4, tube ca. 1 mm, minutely stipitate glandular, lamina white or pinkish tipped, ca. 2 × 1–1.2 mm, becoming coiled; disk florets functionally male, 2 or 3, yellow, 1.5–2 mm, tube 0.5–0.6 mm, limb ca. 1.2 mm, lobes spreading to recurved, triangular, ca. 0.4 mm, tube, limb, and lobe base glabrous, minutely stipitate glandular. Achenes brown, 3.5–4 mm, 3-ribbed, ribs narrow, minutely stipitate glandular. Fl. Apr–Nov, fr. Oct–Nov.

• Fields, moist grasslands, sandy stream banks; sea level to 700 m. Anhui, Guangdong, Guizhou, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Sichuan, Yunnan, Zhejiang.

Fruit of ray florets develop while disk florets are opening.

138. RHINACTINIDIA Novopokrovsky, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 7: 114, 134. 1948.

岩菀属 yan wan shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Rhinactina Lessing, Linnaea 6: 119. 1831, not Willdenow (1807); *Borkonstia* Ignatov, nom. illeg. superfl.; *Krylovia* Schischkin, nom. illeg. superfl.

Herbs, perennial, caespitose; rhizomes thick, woody, caudices many branched, clad with marcescent petiole bases. Stems erect, branched or simple, densely curved-strigose. Leaves: basal numerous, petiolate, blade obovate, oblanceolate, or oblong-obovate, 3-veined, margin entire or sparsely serrate, base attenuate, cauline shortly petiolate or sessile, obovate-oblong or oblanceolate, rarely linear, densely curved-strigose, sessile glandular, solitary at ends of branches or several in racemiform synflorescences. Involucre broadly campanulate or subhemispheric; phyllaries 3- or 4-seriate, imbricate, green distally, becoming yellow-brown, oblong or lanceolate, sparsely strigose, subleathery, back rounded, margin scarious, sometimes ciliate, apex obtuse or ± acute, outer shorter. Receptacles slightly convex, irregularly, shallowly alveolate, naked. Florets numerous, fertile. Ray florets pale purple, 2 × longer than disk florets; disk florets bisexual, numerous, yellow or purplish, ± zygomorphic, upper tube and limb base hairy, limb

campanulate, lobes 5, lanceolate, 1 inner longer; anther appendage triangular to lanceolate, base acuminate; style appendages triangular. Achenes brown, oblanceolate, 2-ribbed, strigose, 1-ringed at base. Pappus 3-seriate, of white or dirty white, barbellate bristles, outer short, inner acute, innermost tip \pm clavate, nearly equaling disk corollas.

Four species: C and N Asia; two species in China.

- 1a. Basal leaves spatulate to obovate or oblanceolate, 2.5–4.5 cm, apex obtuse or rounded; capitula several at ends of stems and branches; plants to 25 cm tall 1. *R. limoniifolia*
 1b. Basal leaves oblong-obovate, less than ca. 2.5 cm, apex acute or somewhat acute; capitula solitary at ends of stems; plants less than ca. 10 cm tall 2. *R. eremophila*

1. *Rhinactinidia limoniifolia* (Lessing) Novopokrovsky ex Botschantzev, *Novosti Sist. Vyssh. Rast.* 23: 179. 1986.

岩菀 *yan wan*

Rhinactina limoniifolia Lessing, *Linnaea* 6: 119. 1831; *Aster limoniifolius* (Lessing) B. Fedtschenko (1915), not Greene (1900); *A. obovatus* C. A. Meyer (1833), not (Nuttall) Elliott (1823); *Borkonstia limoniifolia* (Lessing) Ignatov; *Krylovia limoniifolia* (Lessing) Schischkin.

Herbs, perennial, subscapiform. Stems several, ascending, simple, 3–20(–25) cm, \pm densely strigose. Leaves: basal many, rosulate, petiole equaling blade or shorter, base expanded, blade spatulate to obovate or oblanceolate, 2.5–4.5 \times 1–2 cm, surfaces strigose, usually 1-veined, rarely inconspicuously 3-veined, base attenuate, clasping, margin entire or sparsely serrulate, apex acute or \pm obtuse, rarely rounded; cauline few, shortly petiolate or sessile, blade narrowly oblong or oblanceolate to lanceolate-linear, base cuneate, apex acute to obtuse. Capitula solitary at ends of stems or branches, 1.5–2 cm in diam. Involucre subhemispheric to broadly campanulate, 5–6(–7) \times 8–10 mm; phyllaries 3-seriate, \pm leathery, margin narrowly scarious, erose to fimbriate, sometimes ciliate, apex acuminate, sometimes acute, outer shorter, green, lanceolate, sparsely scabrous, mid and inner oblong, scabrous or glabrous in lower half. Ray florets lamina light violet, (10–)13–15 \times ca. 2 mm; disk florets yellow, 4.5–6 mm, lobes lanceolate. Achenes ca. 4 mm, densely strigose. Fl. and fr. Jun–Aug.

Rocky or grassy slopes; 1200–3500 m. NW and W Xizang [Kazakhstan, Mongolia, Russia (W Siberia), Uzbekistan].

2. *Rhinactinidia eremophila* (Bunge) Novopokrovsky ex Botschantzev, *Novosti Sist. Vyssh. Rast.* 23: 180. 1986.

沙生岩菀 *sha sheng yan wan*

Aster eremophilus Bunge, *Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans* 2: 599. 1835; *A. uniflorus* (Bunge ex Candolle) B. Fedtschenko (1915), not Moench (1794), nor Michaux (1803), nor (Hooker) Kuntze (1891), nor (Linnaeus) E. H. L. Krause (1905); *Borkonstia eremophila* (Bunge) Ignatov; *Krylovia eremophila* (Bunge) Schischkin; *Rhinactina uniflora* Bunge ex Candolle.

Herbs, perennial, scapiform. Stems several, simple, 3–8(–10) cm, \pm densely strigose. Leaves: basal many, rosulate, petiole equal to blade or shorter, base expanded, clasping, blade oblong-obovate to oblanceolate, 1.5–4 \times 0.3–0.8 cm, surfaces densely strigose, usually 1-veined, rarely inconspicuously 3-veined, base attenuate, margin entire or sparsely serrulate, apex acute or \pm obtuse, rarely rounded; cauline few, sessile, reduced, narrowly oblong or linear, base cuneate, apex obtuse. Capitula solitary at ends of stems, 1.5–2 cm in diam. Involucre subhemispheric, 5–6 \times ca. 10 mm; phyllaries 3-seriate, leathery, margin narrowly scarious, erose, sometimes ciliate, apex acuminate, outer shorter, lanceolate, \pm densely strigose, mid and inner oblong, strigose or almost glabrous in lower half. Ray florets lamina light violet, 13–15 \times ca. 2 mm; disk florets yellow, 4.5–5.5 mm, lobes lanceolate. Achenes ca. 4 mm, densely strigose. Fl. Jun–Jul.

Steppes and dry pebbly slopes; 1800–2700 m. C and N Xinjiang [Kazakhstan, Mongolia, Russia (Altai, W Siberia)].

139. *ASTER* Linnaeus, *Sp. Pl.* 2: 872. 1753.

紫菀属 *zi wan shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet, John C. Semple

Herbs, perennial, rarely annual or biennial, subshrubs or shrubs, generally rhizomatous, sometimes somewhat woody. Stems erect, sometimes decumbent to ascending, or procumbent. Leaves alternate, rarely opposite, sessile or petiolate, obovate to elliptic-ovate, ovate, or lanceolate, margin entire, serrate, or coarsely dentate, sometimes pinnatifid. Capitula solitary or in corymbiform or sometimes paniculiform synflorescences, radiate, rarely discoid. Involucres hemispheric, campanulate, or obconic; phyllaries 2–5-seriate, imbricate or equal, linear-lanceolate, herbaceous or membranous, margin scarious (at least inner), apex sometimes purplish. Receptacles flat or convex to conic, alveolate, sometimes lacerate, epaleate. Ray florets female, fertile or rarely sterile, 1- or 2-seriate, rarely absent, white, pink, purple, or blue, apex inconspicuously 2- or 3-denticulate; disk florets numerous, bisexual, fertile, yellow or purple-brown, limb campanulate, 5-lobed, lobes equal or unequal (1 lobe deeper and corolla zygomorphic). Anther base obtuse; style branch tip lanceolate or triangular. Achenes oblong, obovoid, or oblanceoloid, compressed or subconvex, rarely 3- or 4-angled, margin 2(–6)-ribbed, glabrous or strigose, eglandular or glandular. Pappus 1–4-seriate, persistent or rarely caducous, sometimes absent, white, brownish, or reddish, outer series of short slender bristles or scales, inner series of numerous subequal, barbellate or barbellulate bristles, apex acute or sometimes innermost clavate, sometimes of free short bristles or scales or connate scales and inner bristles absent, sometimes ray pappus absent and disk present.

About 152 species: Asia, Europe, North America; 123 species (82 endemic) in China.

The circumscription of *Aster* adopted here corresponds to that used in recent Asian floras (Ito & Soejima in Iwatsuki et al., Fl. Japan 3b: 59–73. 1995; Soejima & C. I. Peng, Fl. Taiwan, ed. 2, 4: 848–868. 1998), which excludes North American segregates such as *Doellingeria* Nees, s.s., *Eurybia*, and *Symphyotrichum* (Nesom, Phytologia 77: 141–297. 1994; Semple & Chmielewski, Fl. N. Amer. 20: 43–46. 2006; Brouillet, Fl. N. Amer. 20: 365–382. 2006; Brouillet et al., Fl. N. Amer. 20: 465–539. 2006), while including genera such as the Asian members of *Doellingeria* (sensu Nesom, loc. cit.) (*A. sect. Teretiachaenium*), *Kalimeris* (*A. sect. Asteromoea*), *Heteropappus* (*A. sect. Pseudocalimeris*), and *Miyamayomena* and *Rhynchospermum* (both included within *A. sect. Aster*). Such delimitation is supported by recent molecular phylogenetic analyses of tribe Astereae, summarized in Brouillet et al. (in Funk et al., Syst. Evol. Biogeogr. Compositae, 589–629. 2009). Other genera that might probably be considered part of *Aster* are *Sheareria*, which Gao et al. (Taxon 58: 769–780. 2009) placed close to *Kalimeris* and *Heteropappus* but those were placed within the *Aster* complex as described here in a more recent analysis of Iranian Astereae involving more members of the genus (F. Jafari, pers. comm.), and *Rhinactinidia*, a possible sister of *A. sect. Pseudocalimeris* (F. Jafari, pers. comm.). This last relationship would be supported by the fact that these two groups share unequal disk corolla lobes, a rare feature in the tribe. Other genera may be involved here, but this is still unclear. The current concept excludes African *Aster* species, which belong to a distinct, African clade (Brouillet et al., loc. cit. 2009)

An alternate classification that would retain all segregate genera as distinct would recognize *Heteropappus*, *Kalimeris*, *Rhinactinidia* (though one could defend including them in *Heteropappus*), *Sheareria*, and *Aster* s.s. (still including *Miyamayomena* and *Rhynchospermum*) and would impose the creation of new genera for *A. sect. Teretiachaenium* and *A. sect. Ageratoides* (unless one prefers a strongly paraphyletic, not to say polyphyletic, *Aster*).

Nesom (loc. cit.) underlined the distinction of the shrubby species of *Aster* ser. *Albescentes* Y. Ling, noting their isolation among Old World asters. He concluded that the segregation of the series at generic rank would be justifiable. Two of us (Brouillet and Semple) agree with this hypothesis, but, currently, phylogenetic data are insufficient to place this group within the phylogeny of the tribe Astereae. Therefore, we treat it here as an incertae sedis group within *Aster* for the time being. One of us (Chen) considers that *A. ser. Albescentes* should be recognized as a section; however, the combination at that rank is not formally proposed here because not all the present authors agree.

Aster filipes J. Q. Fu (Bull. Bot. Res., Harbin 3(1): 118. 1983), described from Gansu, and *A. langaoensis* J. Q. Fu (loc. cit.), described from Shaanxi, could not be treated here because no material was seen by the present authors.

- 1a. Shrubs, many branched; leaves cauline, margins revolute or flat; phyllaries keeled 1. Incertae sedis group
- 1b. Herbs perennial, rarely annual or biennial, sometimes subshrubs (rarely becoming shrubs), simple or ± branched; leaves basal (withered or present at anthesis) and cauline (sometimes reduced), margins flat; phyllaries usually not keeled.
 - 2a. Ray florets 5–9, white; achenes obovoid, terete or slightly compressed 2. *A. sect. Teretiachaenium*
 - 2b. Ray florets 10–40, white, pink, blue, or purple; achenes obovoid, oblong, or oblanceoid, compressed or flattened, sometimes 3- or 4-angled.
 - 3a. Leaves 3-veined basally or below middle, margins coarsely serrate to serrate, sometimes serrulate; capitula campanulate; pappus of numerous bristles, outer series of short bristles 3. *A. sect. Ageratoides*
 - 3b. Leaves usually 1-veined, margins entire, serrate, or dentate, sometimes pinnatifid or pinnatilobate; capitula hemispheric, campanulate, obconic, or cylindric; pappus of few to many bristles, inner bristles sometimes absent, outer series of short bristles or scales, sometimes pappus absent.
 - 4a. Pappus 1-seriate, of few (outer) short bristles or scales, persistent or deciduous, sometimes absent; achenes compressed or sometimes triangular; leaf margins entire, dentate, or serrate, or pinnatifid or pinnatilobate 4. *A. sect. Asteromoea*
 - 4b. Pappus 1–4-seriate, usually of few to numerous long bristles and outer short bristles or scales, rarely deciduous or absent; achenes compressed; leaf margins entire, crenate, or serrate.
 - 5a. Disk corolla lobes unequal (1 lobe more deeply cut); herbs perennial, biennial, or annual; synflorescences corymbose-paniculiform or solitary at ends of branches; achenes compressed or flattened; ray pappus of few short bristles or scales, sometimes absent, disk pappus present, of long bristles and outer short bristles or scales 5. *A. sect. Pseudocalimeris*
 - 5b. Disk corolla lobes equal; herbs perennial; synflorescences corymbiform or solitary at ends of stems, rarely solitary at ends of branches; achenes ± compressed, sometimes 3- or 4-angled; ray and disk pappus present, sometimes absent in both or deciduous, outer series of short bristles, rarely of scales.
 - 6a. Basal leaves usually withered at anthesis, cauline leaves developed; capitula corymbiform, numerous, rarely few, rarely solitary at ends of branches or in axils, rarely terminal; phyllaries unequal, sometimes subequal, membranous, upper part sometimes leaflike; herbs erect, sometimes branched, sometimes subshrubs 6. *A. sect. Aster*
 - 6b. Basal leaves persistent at anthesis, usually in rosette, cauline reduced; capitula solitary, terminal, or 2 or 3 in corymbiform synflorescences; phyllaries subequal, leaflike or upper part leaflike; herbs usually scapiform 7. *A. sect. Alpigeni*

1. *Incertae sedis* group

Shrubs, erect, procumbent or ascending, many branched. Leaves cauline; blade ovate, ovate-lanceolate, elliptic, or oblong-lanceolate to oblanceolate, 1- or 3-veined, margin revolute or flat, entire or minutely to coarsely serrate. Capitula radiate, terminal or axillary on short branches, in corymbiform synflorescences or solitary at ends of stems or branches. Involucres campanulate; phyllaries 3–5-seriate, unequal, membranous or subleathery, tip sometimes leaflike, keeled, margin narrowly scarious. Receptacles flat or convex. Ray florets 1-seriate, 10–30, white, pink, or purple; disk floret limb narrowly campanulate, lobes equal. Achenes obovoid, oblong, or cylindric, \pm compressed, 2–8-veined or -ribbed. Pappus of ray and disk florets 3-seriate, of numerous persistent, free bristles, innermost series clavate, outermost series of short bristles or scales.

Eight species: Asia; eight species (seven endemic) in China.

- 1a. Capitula on short axillary branches.
 - 2a. Capitula 3–10, in corymbiform synflorescences; leaves ovate to elliptic-lanceolate, triplinerved 2. *A. nitidus*
 - 2b. Capitula solitary at ends of second-year axillary branches; leaves oblanceolate, pinnately veined 1. *A. hersileoides*
- 1b. Capitula terminal at ends of stems and lateral branches.
 - 3a. Leaves linear 8. *A. lavandulifolius*
 - 3b. Leaves ovate, ovate-lanceolate, elliptic, oblong, oblong-lanceolate, or oblanceolate.
 - 4a. Capitula in corymbiform synflorescences or solitary at ends of lateral branches.
 - 5a. Leaves adaxially arachnoid or glabrate, abaxially white tomentose, margin entire or 1- or 2-serrate-spinose; capitula 1–3 on branches 6. *A. hypoleucus*
 - 5b. Leaves adaxially verruculose, abaxially with white arachnoid hairs, margin entire; capitula 3–20 in corymbiform synflorescences 7. *A. polius*
 - 4b. Capitula in terminal compound corymbiform synflorescences.
 - 6a. Pappus straw-colored, sometimes purplish; leaf margin entire or remotely serrulate to coarsely serrate, adaxial surface eglandular or rarely sparsely glandular 3. *A. albescens*
 - 6b. Pappus dirty white; leaf margin entire, adaxial surface \pm glandular.
 - 7a. Leaves (4–)6–9 cm, both surfaces sparsely strigillose, glabrate, or glabrous, abaxially glossy between minor veins 4. *A. fulgidulus*
 - 7b. Leaves 1–4 cm, adaxially moderately scabridulous, abaxially gray-white arachnoid-tomentose or cottony 5. *A. argyropholis*

1. *Aster hersileoides* C. K. Schneider in Sargent, Pl. Wilson. 3: 460. 1917.

横斜紫菀 *heng xie zi wan*

Shrubs, 60–120 cm tall. Stems many branched; old branches erect, procumbent or ascending, bark gray-brown, branched, striate; second-year branches yellow-brown, leaf scars and axillary buds prominent; current-year branches densely leafy, purple-red, slender, young branches hairy in decurrent lines below leaves. Leaves sessile, green, oblanceolate, 1–3 \times 0.2–0.7 cm, thin, glabrous except midvein hairy, more densely so adaxially, midvein abaxially prominent, venation pinnate, base attenuate, margin entire, flat, strigose-ciliate, apex obtuse or rounded to acute, mucronulate. Capitula at ends of second-year axillary branches, solitary, 2.5–3 cm in diam.; peduncles slender, 4–5.5 cm, distally hairy, subtended by small leaves; bracts scattered, linear. Involucres campanulate, 5–6 mm; phyllaries 3-seriate, unequal, distally green, linear-lanceolate, midvein distally swollen and translucent, apex acuminate; outer series of phyllaries 2–3 \times ca. 0.6 mm, margin narrowly scarious, glabrous or sparsely hairy; inner 2 series of phyllaries subequal, 4–5.5 \times ca. 1 mm, margin scarious, erose, ciliate, sometimes tips purplish, midvein translucent, dark bordered. Ray florets 25–30, green-purple, lamina 9–10 \times 2–2.5 mm, glabrous, eglandular; disk florets yellow, ca. 5 mm, limb narrowly campanulate, ca. 3.5 mm, proximally sparsely hairy, eglandular, lobes spreading to recurved, triangular, ca. 1 mm. Achenes

obovoid, 2–3 mm, densely strigillose, 2–4-veined, veins concolorous. Pappus 3-seriate, white; outer bristles slender, 0.5–1 mm; inner bristles unequal, 3.5–4 mm, acute or innermost \pm clavate. Fl. and fr. Apr–Jul.

• Dry slopes on hills, rocky walls; 1300–2800 m. W Sichuan (Maowen).

2. *Aster nitidus* C. C. Chang, Bull. Fan Mem. Inst. Biol., Bot. 6: 47. 1935.

亮叶紫菀 *liang ye zi wan*

Shrubs, 50–150 cm tall. Stems many branched; old branches ascending, bark reddish- to gray-brown, branched, striate; second- and third-year branches purple-brown or ferruginous, leaf scars and axillary buds prominent; current-year branches densely leafy, reddish, moderately strigose. Leaves gradually smaller distally, shortly petiolate (petiole 1.5–3 mm); blade dark green, shiny (more so adaxially), ovate to elliptic-lanceolate, 2.5–7 \times 0.5–1.6 cm, subleathery, glabrous except adaxial veins hispidulous proximally, midvein abaxially prominent, triplinerved, base cuneate, margin revolute, entire, strigose-ciliate, apex acute, mucronulate. Capitula at ends of second-year axillary branches, 3–10 in corymbiform synflorescences, 2.5–3 cm in diam.; peduncles slender, 2.5–4 cm, with small basal leaves and scattered, linear bracts, strigose (dark crosswalls), distally denser. Involucres campanulate, 6–7 \times 7–8 mm; phyllaries 3-seriate, unequal, linear-lanceolate, midvein

distally not swollen, translucent, apex acuminate; outer phyllaries 4–5 × ca. 0.5 mm, distally green, sparsely hairy proximally, margin narrowly scarious; inner phyllaries subequal, 5–6 × ca. 1 mm, margin scarious, erose, distally green, sometimes tips purplish, midvein translucent, dark bordered. Ray florets 23–30, purple, tube sparsely hairy, lamina ca. 13 × 1–2 mm, glabrous, eglandular; disk florets yellow, 5–6 mm, tube apex and proximal limb sparsely hairy, limb narrowly campanulate, 3.5–4 mm, proximally hairy, eglandular, lobes spreading to recurved, triangular, ca. 1.5 mm. Achenes obovoid, 2–3 mm, sparsely strigillose, darkly 4-veined. Pappus 3-seriate, dirty white; outer slender bristles 0.5–1 mm; inner bristles unequal, 3.5–4 mm, acute or sometimes innermost ± clavate. Fl. Feb–May.

• Forests on hills, streamside rocks; 500–1100 m. Guizhou, Sichuan.

3. *Aster albescens* (Candolle) Wallich ex Handel-Mazzetti, *Acta Horti Gothob.* 12: 205. 1938.

小舌紫菀 xiao she zi wan

Amphirhapis albescens Candolle, *Prodr.* 5: 343. 1836; *Microglossa albescens* (Candolle) C. B. Clarke.

Shrubs, 30–400 cm tall. Stems many branched, erect; old branches brownish, ascending; current-year branches yellow-brown, densely or laxly leafy, sometimes villosulous to tomentulose, and sometimes sparsely, minutely stipitate glandular. Leaves reduced distally, sessile; blade narrowly to broadly lanceolate, ovate, elliptic, or oblong-lanceolate, (2–)3–17(–20) × (0.5–)1–3(–12.5) cm, abaxially glabrous or sparsely to densely appressed villosulous to tomentulose, eglandular or sometimes sparsely to densely minutely stipitate glandular, adaxially glabrous or scabridulous to scabrous, eglandular or rarely sparsely minutely stipitate glandular, veins (both surfaces) sparsely to moderately villosulous and usually sparsely minutely stipitate glandular, subpapery, midvein and pinnate lateral veins abaxially prominent, base cuneate or attenuate, margin flat to revolute, entire or remotely serrulate to coarsely serrate, teeth mucronulate, apex acute to acuminate, mucronulate. Capitula 5–50 (per branch) in terminal compound corymbiform synflorescences, ca. 0.7 cm in diam.; peduncles slender, 5–10 mm, bracts subulate, moderately villosulous to densely tomentulose (hairs white or light brown), sparsely to moderately minutely stipitate glandular. Involucre campanulate, 4–7 × 4–7 mm; phyllaries 4- or 5-seriate, unequal; outer phyllaries distally green, sometimes tip purplish, ovate to lanceolate, 1–2.5 mm, abaxially glabrous or sparsely villosulous to tomentulose, sometimes minutely stipitate glandular, margin narrowly scarious, erose, distally ciliate; inner phyllaries distally or only tip reddish purple, lanceolate to linear-lanceolate, 3–5 × 0.5–1 mm, margin broadly scarious, erose, distally ciliate, midvein distally swollen, translucent, apex acute. Ray florets 10–25, white, pink, or purple, tube hairy above, lamina 2–7 × 0.5–1.2 mm, glabrous, eglandular; disk florets yellow, sometimes becoming purplish, 4–6 mm, limb narrowly campanulate, 2.5–3.5 mm, base sparsely to moderately hairy, lobes spreading to reflexed, triangular, 1–2 mm, glabrous, eglandular or glandular. Achenes obovoid, 2–2.7 mm, sparsely to moderately strigillose, 4–8-veined. Pappus 3-

seriate, straw-colored, sometimes purplish; outer bristles slender, 0.2–1 mm; inner bristles 2–4.5 mm, acute; innermost bristles 3–6 mm, clavate. Fl. Jun–Sep, fr. Aug–Oct.

Margins of deciduous or coniferous forests and thickets, open or grazed meadows, shrublands, seepage or damp areas, streamsides, ditch or field margins, disturbed areas and cut or disturbed forests, hills to alpine regions; 500–4100 m. Gansu, Guizhou, Hubei, S Shaanxi, Sichuan, Xizang, Yunnan [Bhutan, N India, Kashmir, Myanmar, Nepal].

Leaf shape, size, and indumentum are variable in this species; thus, many ± distinct varieties were described, some of which do not appear to warrant recognition. Some varieties are said to be closer to or intermediate between other species. A biosystematic and molecular phylogenetic study of this complex is required. Although not formally recognized here, the varieties are listed below with their main features and comments.

Aster albescens* var. *albescens

小舌紫菀(原变种) xiao she zi wan (yuan bian zhong)

Aster cabulicus Lindley; *A. ferrugineus* Edgeworth (1846), not H. L. Wendland (1819); *A. ignoratus* Kunth & C. D. Bouché; *Homostylium cabulicum* (Lindley) Nees; *Microglossa cabulica* (Lindley) C. B. Clarke; *M. griffithii* C. B. Clarke; *M. salicifolia* Diels.

Leaf blade narrowly to broadly lanceolate, 5–12 × 1–12.5 cm, abaxially gray-white appressed tomentulose, margin flat, entire. Outer phyllaries ovate, abaxial surface sparsely hairy or glabrate.

500–3000 m. Gansu, Guizhou, W Hubei, S Sichuan, E and N Xizang, NW Yunnan [S and W Himalayan region].

This variety is common.

Aster albescens* var. *discolor Y. Ling, *Fl. Reipubl. Popularis Sin.* 74: 358. 1985.

白背小舌紫菀 bai bei xiao she zi wan

Leaves elliptic-lanceolate, 2–3.5 × 0.5–1 cm, abaxially white appressed tomentose, adaxially glabrous. Outer phyllaries ovate, puberulent or glabrate.

• About 2400 m. Sichuan (Songpan).

This variety is similar to *Aster argyropholis*. It may be intermediate between *A. argyropholis* and *A. polius*.

Aster albescens* var. *glabratus (Diels) Boufford & Y. S. Chen, *Harvard Pap. Bot.* 14: 43. 2009.

无毛小舌紫菀 wu mao xiao she zi wan

Aster harrowianus Diels var. *glabratus* Diels, *Notes Roy. Bot. Gard. Edinburgh* 5: 184. 1912; *A. albescens* var. *levissimus* Handel-Mazzetti.

Leaves narrowly to broadly lanceolate, 5–12 cm, both surfaces glabrous, sometimes young leaves abaxially sparsely tomentose on midvein only. Outer phyllaries ovate to lanceolate, glabrous.

• 800–3000 m. Hubei, W Sichuan, N Yunnan.

The leaves are similar in shape to those of *Aster albescens* var. *albescens* but are often shorter and narrower.

Aster albescens var. **glandulosus** Handel-Mazzetti, J. Bot. 76: 284. 1938.

腺点小舌紫菀 xian dian xiao she zi wan

Leaves ovate or ovate to oblong-lanceolate, $4-10 \times 1-2.5$ cm, abaxially brown hairy on veins, densely glandular.

1900–3900 m. SW and W Sichuan, E and S Xizang, NW Yunnan [India].

Aster albescens var. **gracilior** (Handel-Mazzetti) Handel-Mazzetti, Acta Horti Gothob. 12: 206. 1938.

狭叶小舌紫菀 xia ye xiao she zi wan

Aster limprichtii Diels var. *gracilior* Handel-Mazzetti, Symb. Sin. 7: 1093. 1936; *A. harrowianus* Diels.

Leaves elliptic-lanceolate, $7-20 \times 1-5$ cm, abaxially densely white or gray-white tomentose or cottony, base attenuate, apex acuminate. Outer phyllaries oblong or lanceolate.

• Gansu, S Shaanxi, S and W Sichuan, NW Yunnan.

Aster albescens var. **limprichtii** (Diels) Handel-Mazzetti, Acta Horti Gothob. 12: 206. 1938.

楠叶小舌紫菀 tuo ye xiao she zi wan

Aster limprichtii Diels, Repert. Spec. Nov. Regni Veg. Beih. 12: 503. 1922.

Leaves elliptic or oblong, $3-7 \times 1-3$ cm, abaxially densely white or gray-white tomentose or cottony, base broadly cuneate or rounded. Outer phyllaries ovate, sparsely tomentose.

• 2400–3100 m. W Gansu, NW and W Sichuan.

Aster albescens var. **megaphyllus** Y. Ling, Fl. Reipubl. Popularis Sin. 74: 358. 1985.

大叶小舌紫菀 da ye xiao she zi wan

Stems yellow-brown pilose and white arachnoid. Leaves elliptic or ovate-lanceolate, $10-15 \times 5-7$ cm, abaxially arachnoid pilose, reticulate veins prominent, adaxially sparsely pilose, midvein white villous, base rounded or broadly cuneate, margin subentire, apex acute or subrounded. Outer phyllaries ovate, sparsely puberulent.

• Sichuan (Maowen).

Aster albescens var. **pilosus** Handel-Mazzetti, Acta Horti Gothob. 12: 207. 1938.

长毛小舌紫菀 chang mao xiao she zi wan

Leaves oblong-lanceolate, $4-9 \times 1-2$ cm, abaxially on midvein or totally white pilose, adaxially sparsely hispidulous, flat. Outer phyllaries sparsely hairy. Achenes densely pilose.

• Common; 2800–4000 m. W Sichuan, E Xizang, NW Yunnan.

Aster albescens var. **rugosus** Y. Ling, Fl. Reipubl. Popularis Sin. 74: 358. 1985.

糙毛小舌紫菀 cao mao xiao she zi wan

Leaves oblong-lanceolate, adaxially hispidulous, reticulate veins prominent, areoles of reticulate veins with foamy process.

• W Sichuan, NW Yunnan.

Aster albescens var. **salignus** (Franchet) Handel-Mazzetti, Acta Horti Gothob. 12: 207. 1938.

柳叶小舌紫菀 liu ye xiao she zi wan

Inula cuspidata C. B. Clarke var. *saligna* Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 10: 37. 1887; *Aster harrowianus* Diels var. *glabratus* Diels, p.p.

Leaves elliptic-lanceolate, $7-17 \times 1.5-4.5$ cm, abaxially brown pubescent on veins or sometimes totally, glandular, base attenuate, apex acuminate. Outer phyllaries narrowly lanceolate, puberulent.

1900–3900 m. Sichuan, NW and W Yunnan [N India].

4. Aster fulgidulus Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 110. 1964.

辉叶紫菀 hui ye zi wan

Shrubs, 1.2–2 m tall. Stems brown strigose-villous, stipitate glandular. Leaves: (basal leaves not seen); cauline leaves: petiole ca. 5 mm; blade ovate, $(4-6-9 \times (2-2.5-4.5$ cm, abaxially sparsely strigillose, glossy between minor veins, sparsely minutely glandular, adaxially glabrous or glabrate, sparsely minutely glandular, midvein sparsely strigillose, pinnately veined, base rounded, margin entire, revolute, sparsely scabrous, apex acute, sometimes acuminate. Capitula numerous, in terminal corymbiform synflorescences, 0.7–0.8 cm. Phyllaries 3- or 4-seriate, unequal, $1.6-3.2 \times 0.7-0.8$ mm, membranous, slightly keeled, margin scarious, erose-fimbriate, viscid-glandular, apex acute or acuminate, purple, ciliate. Ray florets ca. 16, purplish, tube 2.4–3.5 mm, hairy above, lamina ca. $5 \times 1.5-1.8$ mm; disk florets yellow (but externally \pm purplish), 4–5.2 mm, tube 1.4–1.8 mm, tube and limb base hairy, limb narrowly campanulate, lobes oblong-lanceolate, 0.8–1 mm. Achenes oblong, \pm compressed, ca. 2.2 mm, 4-ribbed, strigose. Pappus 3-seriate, dirty white; outer bristles ca. 1 mm; inner bristles 3.5–3.7 mm, acute; innermost bristles 3.9–4.4 mm, clavate.

• 2200–3000 m. SE Xizang (Bomi).

According to one collector, the ray florets were stated as yellow but externally somewhat purple when dry, while another collector reported them as purplish.

5. Aster argyropholis Handel-Mazzetti, Acta Horti Gothob. 12: 208. 1938.

银鳞紫菀 yin lin zi wan

Shrubs, 100–200 cm tall. Stems multibranched; old branches gray-brown or reddish brown, shallowly striate, leaf scars and axillary buds prominent; current-year branches short, slender, densely leafy, white tomentose. Leaves petiolate (petiole 1–3 mm); blade abaxially \pm white, adaxially green, elliptic, oblong, or lanceolate-ovate, $1-4 \times 0.5-1.5$ cm, subleathery, abaxially gray-white arachnoid-tomentose or cottony, adaxially moderately scabridulous, minutely glandular, resin-dotted, scabrous, midvein abaxially prominent, lateral veins apparent, pinnate, 4–6 pairs, base cuneate, margin revolute, entire, subundulate, apex acute to obtuse, mucronulate. Capitula 4–20, in corymbiform synflorescences terminal on axillary branches, 1.5–2 cm in diam.; peduncles slender, 0.5–5 mm, densely to-

mentose, minutely glandular; bracts linear. Involucres campanulate, 4–6 mm; phyllaries 4- or 5-seriate, unequal; outer phyllaries broadly lanceolate, 1.5–2 × ca. 0.5 mm, abaxially sparsely tomentulose proximally to glabrate, margin narrowly scarious, erose, ciliate, midvein pronounced, swollen; middle phyllaries lanceolate, 3.5–4 × 1–1.2 mm; inner phyllaries linear-lanceolate, 4–5 × 0.5–0.6 mm, margin scarious, erose, ciliate, apex acute, green or purple-red. Ray florets 15–20, white, tube sparsely hairy, lamina ca. 4 × 1.5 mm, glabrous, eglandular; disk florets yellow, 4.5–5 mm, tube sparsely hairy distally, limb narrowly campanulate, ca. 2.5 mm, sparsely glandular, lobes reflexed, triangular, 1–1.2 mm. Achenes reddish brown, cylindric, 2–2.7 mm (?immature), strigillose, translucent 6-veined. Pappus 3-seriate, dirty white; outer bristles few, slender, 0.3–0.6 mm; inner bristles ca. 2.5 mm, acute; innermost bristles ca. 4.5 mm, clavate. Fl. May–Oct, fr. Aug–Oct.

• Alpine and subalpine slopes, forests, grasslands, riverbanks; 2000–2800 m. Sichuan, Xizang, NW Yunnan.

- 1a. Involucre 5–6 mm, phyllaries 5-seriate; leaves abaxially sparsely tomentose, secondary veins abaxially prominent ... 5c. var. *paradoxus*
- 1b. Involucre 4–5 mm, phyllaries 4-seriate; leaves abaxially densely tomentulose or cottony, secondary veins abaxially not prominent.
 - 2a. Leaf apex acute or abruptly acute, rarely rounded, abaxial surface and peduncles densely tomentulose 5a. var. *argyropholis*
 - 2b. Leaf apex obtuse or rounded, abaxial surface and peduncles densely white cottony 5b. var. *niveus*

5a. *Aster argyropholis* var. *argyropholis*

银鳞紫苑(原变种) yin lin zi wan (yuan bian zhong)

Leaves abaxially densely tomentulose, secondary veins abaxially not prominent, apex acute or abruptly acute, rarely rounded. Peduncles densely tomentulose. Involucres 4–5 mm; phyllaries 4-seriate.

• W Sichuan, Xizang.

This variety is common.

5b. *Aster argyropholis* var. *niveus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 358. 1985.

白雪银鳞紫苑 bai xue yin lin zi wan

Leaves abaxially densely white cottony, secondary veins abaxially not prominent, apex obtuse or rounded. Peduncles densely white cottony. Involucres 4–5 mm; phyllaries 4-seriate.

• SW Sichuan (Yanyuan), NW Yunnan (Lijiang).

5c. *Aster argyropholis* var. *paradoxus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 358. 1985 [“*paradoxa*”].

奇形银鳞紫苑 qi xing yin lin zi wan

Leaves abaxially sparsely tomentose, secondary veins abaxially prominent. Involucre 5–6 mm; phyllaries 5-seriate.

• NC Sichuan (Barkam).

6. *Aster hypoleucus* Handel-Mazzetti, J. Bot. 76: 285. 1938.

白背紫苑 bai bei zi wan

Shrubs, ca. 15 cm tall; stems fascicled. Stems numerous, densely branched; current-year branches simple or divaricately branched, erect, slender, strict, angled, white tomentose, densely leafy, terminal branches and peduncles hard and persistent by anthesis. Leaves suberect, shortly petiolate; blade adaxially dark green, elliptic or oblanceolate, 5–15 × 2–3.5 mm, leathery, abaxially white tomentose, adaxially arachnoid or glabrate, base attenuate, margin strongly revolute, entire or 1- or 2-serrate-spinose, apex acute or obtuse, spinose. Capitula 1–3 terminal on lateral branches; peduncles 2–3 cm; bracts minute, linear-lanceolate, membranous. Involucres campanulate, 4–5 mm in diam.; phyllaries 4-seriate, imbricate, subleathery, apex reddish purple; outer phyllaries lanceolate-ovate, short, apex acute; inner phyllaries linear-lanceolate, ca. 5 × 0.6 mm, 4–5 × as long as outer phyllaries, margin narrowly scarious, erose, villosulous-ciliate. Ray florets ca. 13, white when dry, tube ca. 2.2 mm, hairy, lamina ca. 4.5 × 1 mm; disk florets yellow, ca. 3.8 mm, tube 1–1.1 mm, limb narrowly funnelform, tube and limb base hairy, lobes lanceolate, ca. 1 mm, glabrous. Achenes tan, narrowly obovoid, slightly compressed, trigonous, ca. 1.6 mm (immature), silky, pale 3-ribbed. Pappus 3-seriate, whitish; outermost bristles ca. 0.5 mm; outer bristles slender, ca. 1.2 mm; inner bristles acute, 2.5–3.5 mm. Fl. Jul.

• 3000–3700 m. S Xizang (Zangbo valley).

7. *Aster polius* C. K. Schneider in Sargent, Pl. Wilson. 3: 459. 1917 [“*polia*”].

灰毛紫苑 hui mao zi wan

Shrubs, 0.6–1.2 m tall. Stems erect, multibranched; old branches erect, bark grayish brown, branched, striate; current- and second-year branches red-purple, leaf scars and axillary buds prominent, moderately to densely curly hairy, glabrescent. Leaves petiolate (petiole 1–2 mm); blade adaxially green, narrowly ovate to elliptic, 1.5–3.5 × 0.6–1.4 cm, subleathery, abaxially white tomentose, adaxially scabridulous, base cuneate, margin strongly revolute, entire, finely ciliate, apex obtuse or acute, mucronulate. Capitula terminal on current-year branches, 3–20 in corymbiform synflorescences, up to ca. 1.5 cm in diam.; peduncles slender, 5–11 mm; bracts linear, moderately tomentulose, sparsely minutely stipitate glandular. Involucres campanulate, 4–5 mm; phyllaries 3-seriate, unequal, apically green, abaxially glabrous, sparsely minutely stipitate glandular, midvein slightly swollen, distally translucent, apex acute, purplish tipped; outer phyllaries ovate, ca. 1 mm, margin narrowly scarious, erose, ciliate; inner phyllaries unequal, lanceolate, 3–4 × ca. 1 mm, margin scarious, erose, sometimes ciliate. Ray florets 8–10, white, tinged red, tube sparsely hairy, lamina 4–5 × ca. 1.5 mm, glabrous, eglandular; disk florets yellow, ca. 3.5 mm, limb narrowly campanulate, 1.5–2 mm, sparsely minutely hairy basally, eglandular, lobes spreading or recurved, narrowly triangular, 1–1.2 mm. Achenes obovoid, (immature) ca. 2 mm, sparsely strigillose, darkly 2–6-veined. Pappus 3-seriate, straw-colored; outer series of scales 0.5–0.7 mm; inner bristles ca. 2.5 mm, acute; innermost bristles 3–3.5 mm, clavate. Fl. Jul.

• Open shrubs; 2000–2700 m. W Sichuan (Maowen, Xiaojin).

8. *Aster lavandulifolius* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 609. 1937.

线叶紫菀 xian ye zi wan

Shrubs, 60–100 cm tall. Stems multibranched, old branches ascending, bark brown, branched, shallowly striate, leaf scars and axillary buds prominent; current-year branches slender, yellow-brown, densely leafy, white tomentulose. Leaves sessile, adaxially green, linear, $1-4(-5) \times 0.1-0.3(-0.5)$ cm, subleathery, abaxially gray-white tomentose, adaxially rugose, very sparsely scabrous, resinous, midvein pronounced, venation pinnate, base long cuneate, margin entire, strongly recurved, apex acute, mucronulate; upper leaves smaller. Capitula 3–50 or more in \pm densely corymbiform synflorescences, terminal on current-year branches or 3–5 at ends of lateral branches, ca. 8 mm in diam.; peduncles slender, 2–6 mm, tomentulose; bracts subulate. Involucres narrowly campanulate, 5–6 mm; phyllaries 4- or 5-seriate, unequal; outer phyllaries ovate, 1–2 mm, sparsely tomentose, resinous, margin narrowly scarious, keeled, midvein apically swollen, translucent, apex acute; inner phyllaries lan-

ceolate, $4-5 \times 0.7-0.9$ mm, margin narrowly scarious, erose, ciliate, midvein apically very swollen, apex obtuse to acute. Ray florets 5–7, white, tube sparsely hairy distally, lamina $2.5-3 \times 0.5-0.8$ mm, glabrous, eglandular; disk florets yellow, $3.5-4$ mm, limb narrowly campanulate, ca. 3 mm, very sparsely hairy proximally, lobes spreading, narrowly triangular, 1.2–1.5 mm. Achenes cylindric, ca. 2.5 mm, moderately strigose, yellowish 6–8-ribbed. Pappus 3-seriate, straw-colored, of sparsely barbel-lulate bristles; outer bristles 0.5–0.7 mm; inner bristles 2–3 mm, acute; innermost bristles ca. 4 mm, clavate. Fl. Jun, fr. Jun–Sep.

• Subalpine stony slopes or riverbanks; 2000–2900 m. SW and W Sichuan, Yunnan.

Aster lavandulifolius differs from other *Aster* species by its linear leaves and cylindric achenes.

Aster motuoensis Y. L. Chen (Bull. Bot. Res., Harbin 8(3): 12. 1988), described from SE Xizang (Médog) as being close to *A. lavandulifolius*, differs from the latter in its notably reticulately veined, oblong to oblong-lanceolate leaves, narrowly cylindric involucres, and 4–6 ray florets. Further study is required to ascertain its status.

2. *Aster* sect. *Teretiachaenium* Kitamura, Mem. Coll. Sci. Kyoto Imp. Univ., Ser. B, Biol. 8: 357. 1937.

东风菜组 dong feng cai zu

Herbs, perennial, usually simple, erect. Leaves basal (withered at anthesis) and cauline; blade ovate or elliptic-ovate, margin flat, serrate, rarely subentire, 1-veined. Capitula radiate, terminal, corymbiform or paniculiform. Involucres campanulate to broadly campanulate; phyllaries 3-seriate, unequal or subequal, not keeled, margin scarious. Receptacles flat or convex. Ray florets 1-seriate, 4–9, white; disk floret limb campanulate, lobes equal. Achenes obovoid, \pm compressed, 2–7-ribbed. Pappus of ray and disk florets 3- or 4-seriate, of numerous persistent, free bristles, innermost \pm clavate, outermost of short bristles.

Seven species: E Asia; two species (one endemic) in China.

- 1a. Phyllaries unequal, narrowly herbaceous on back, margin broadly membranous; pappus of many bristles as long as disk florets; achenes glabrous 9. *A. scaber*
 1b. Phyllaries subequal, sometimes outer series herbaceous and green, inner series with membranous margins only; pappus of few bristles much shorter than corolla tube; achenes sparsely strigose 10. *A. marchandii*

9. *Aster scaber* Thunberg in Murray, Syst. Veg., ed. 14, 763. 1784.

东风菜 dong feng cai

Aster komarovii H. Léveillé; *Biotia corymbosa* (Aiton) Candolle var. *discolor* (Maximowicz) Regel; *B. discolor* Maximowicz; *Doellingeria scabra* (Thunberg) Nees.

Herbs, perennial, 70–150 cm tall; rhizome short, thickened. Stems erect, glabrous. Leaves reduced upward, abaxially pale green, flat, 3- or 5-veined, margin and both surfaces scabrous, abaxially less so, eglandular; basal leaves withered by anthesis, petiole 10–15 cm, blade ovate, $9-15 \times 6-15$ cm, base cordate, margin serrate, teeth mucronate, apex acute; middle cauline leaves shortly petiolate, petiole broadly winged; blade ovate to narrowly ovate, base truncate to rounded; upper cauline leaves broadly winged shortly petiolate to sessile, lanceolate. Capitula in corymbiform synflorescences, 1.8–2.4 cm in diam.; peduncles 6–30 mm, sparsely to moderately scabridulous, eglandular or stipitate glandular, bracts linear. Involucre campanulate, 5–6 mm in diam.; phyllaries 3-seriate, strongly unequal, green area narrow; outer phyllaries ca. $1.5 \times 1-1.5$ mm, abaxially glabrous, base of outer thickened, margin broadly scarious, sometimes purplish apically, ciliate, apex ob-

tuse, sometimes acute. Ray florets 4–9, white, 6–10 mm, tube 3–3.5 mm, lamina abaxially glabrous, eglandular; disk florets $4.5-5$ mm, limb abruptly enlarged, campanulate, ca. 3 mm, sparsely shortly hairy at tube-limb junction, lobes spreading, triangular, 1.5–2 mm. Achenes obovoid, sometimes slightly compressed, 3–4 mm, glabrous, 3–7-ribbed. Pappus of many sordid-white, barbellate bristles, 3.5–4.2 mm (slightly shorter than disk florets); outer bristles short (50% or less of inner length), slender; inner bristles length 80–90% of innermost bristles, tapering; innermost bristles longest, clavate. Fl. Jun–Oct, fr. Aug–Oct. $2n = 18$.

Open slopes in valleys, grasslands, thickets, very common; below 2000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan, Zhejiang [Japan, Korea, Russia (Far East)].

This plant is used medicinally for treating bites from venomous snakes.

10. *Aster marchandii* H. Léveillé, Repert. Spec. Nov. Regni Veg. 11: 306. 1912.

短冠东风菜 duan guan dong feng cai

Herbs, perennial, 0.6–2 m tall; rhizomes robust. Stems erect, sparsely to moderately puberulent. Leaves reduced upward, abaxially pale green, both surfaces scabrous, eglandular, slightly rugose, 3- or 5-veined, margin scabrous; basal leaves withered by anthesis, petiole 9–17 cm, blade ovate, 7–13 × 7–11.5 cm, base cordate, margin serrate, teeth mucronate, apex acute to subrounded; middle cauline leaves narrowly winged petiolate, broadly ovate to ovate, base truncate; upper cauline leaves winged shortly petiolate, ovate, base cuneate, decurrent. Capitula in corymbiform synflorescences, 2.5–4 cm in diam.; peduncles 10–50 mm, glabrate to densely puberulent, eglandular or stipitate glandular; bracts linear. Involucres broadly campanulate, 6–8 mm in diam.; phyllaries 3-seriate, subequal, lanceolate-oblong; outer phyllaries 3–3.5 × 1–1.5 mm, abaxially glabrous or glabrate, apex rounded or obtuse, rarely margin ciliate; outer phyllaries green, herbaceous, base thickened,

margin very narrowly scarious; inner phyllaries herbaceous, margin narrowly scarious; innermost phyllaries scarious. Ray florets 9–19, white, 5–7 mm, tube ca. 3 mm, lamina oblong-linear, abaxially glabrous, eglandular; disk florets 4.5–5 mm, limb abruptly enlarged, campanulate, ca. 2.5 mm, lobes spreading, triangular, ca. 2 mm, glabrous, eglandular. Achenes obovoid, slightly compressed, 2.5–3 mm, sparsely strigose to glabrate, 2–6-ribbed. Pappus 3-seriate, of few bristles, sordid white, 0.3–1.5 mm; outer bristles few, short, slender; inner bristles unequal, tapering; innermost bristles longest, sometimes weakly clavate. Fl. Aug–Sep, fr. Sep–Oct.

• Valleys, streamsides, fields, roadsides; 300–1400 m. Fujian, Guangdong, Guangxi, Guizhou, Hubei, Jiangxi, Sichuan, Zhejiang.

The roots, leaves, and flowering capitula of *Aster marchandii* are used medicinally.

3. *Aster* sect. *Ageratoides* (Kitamura) G. L. Nesom, *Phytologia* 77: 247. 1994.

三脉叶紫菀组 *san mai ye zi wan zu*

Aster subsect. *Ageratoides* Kitamura, *J. Jap. Bot.* 12: 535. 1936.

Herbs, perennial, usually simple, erect. Leaves basal (withered at anthesis) and cauline; blade spatulate or ovate to narrowly ovate or lanceolate, margin flat, coarsely serrate to serrate, sometimes serrulate, 3-veined at base or below middle. Capitula radiate, terminal, paniculate-corymbiform to corymbiform. Involucres campanulate; phyllaries 3- or 4-seriate, unequal, not keeled, margin scarious. Receptacles flat or ± convex. Ray florets 1-seriate, 10–20, pale purple, lavender, or white; disk floret limb campanulate, lobes equal. Achenes obovoid to oblanceoloid, ± compressed, 3- or 4-ribbed (ray) or 2- or 3-ribbed (disk). Pappus of ray and disk florets 3-seriate, of numerous persistent, free bristles, innermost series clavate, outermost series of short bristles.

About eight species: E Asia; one species in China.

11. *Aster trinervius* Roxburgh ex D. Don, *Prodr. Fl. Nepal* 177. 1825.

三基脉紫菀 *san ji mai zi wan*

Herbs, perennial, 25–205 cm tall; rhizomes thick. Stems erect, simple or sometimes branched, reddish striate, glabrous or villosulous to strigillose, sometimes glabrescent, eglandular or minutely stipitate glandular. Leaves cauline; middle cauline leaves usually largest, abaxially pale green, adaxially green, sometimes shiny, thinly or thickly papery to subleathery, abaxially villosulous, sparsely scabridulous, or glabrous, minutely stipitate glandular or eglandular, veins densely villosulous to sparsely strigose or glabrate, adaxially ± densely scabridulous, eglandular or sometimes ± minutely stipitate glandular, resinous, margin serrate to coarsely serrate, sometimes serrulate, ciliate, often prominently abaxially 3-veined at base or above (triplinerved), apex obtuse to acute or acuminate, mucronate; lowest leaves withered by anthesis, long narrowly winged petiolate (petiole to 6 cm); blade spatulate or ovate to narrowly lanceolate, 0.5–15(–17) × 0.3–5.5 cm, base attenuate; lower to upper cauline leaves shortly petiolate, ovate- or lanceolate-paniculate to lanceolate, 4.5–15 × 1.2–5 cm, base attenuate to rounded; synflorescence leaves shortly petiolate, ovate to linear-lanceolate, 1–8 × 0.2–3 cm, base cuneate to ± rounded. Capitula 7–100 or more florets in terminal paniculate-corymbiform to corymbiform synflorescences, 1.5–2 cm in diam.; peduncles 5–30 mm, strigillose, minutely stipitate glandular; bracts linear to lanceolate, entire. Involucres campanulate, 3–7

× 4–15 mm; phyllaries 3- or 4-seriate, unequal, apically green, sometimes ± purplish, abaxially glabrate to villosulous (on green part), apically sometimes minutely stipitate glandular, base hardened, margin scarious, erose, sometimes purplish, ciliate, midvein more pronounced distally, ± translucent, apex rounded to acute, erose, ciliate; outer phyllaries ovate to lanceolate, 2–2.5 × 0.5–1 mm, leaflike or distally leaflike; inner phyllaries oblong, 3–6 mm. Ray florets 6–15, purple, lavender, reddish, or white, tube ca. 2 mm, lamina 7–11 × 1.5–3 mm, glabrous, eglandular; disk florets yellow, 4–6.5 mm, tube base flared, limb campanulate, 2.2–4 mm, base sparsely strigillose, lobes spreading, narrowly triangular, 1.3–2 mm, glabrous, sparsely to moderately minutely stipitate glandular. Achenes gray-brown, oblanceolate to obovoid, slightly compressed, 2–2.5 mm, sparsely to moderately strigillose, minutely stipitate glandular or eglandular, 2- or 3-ribbed. Pappus 3-seriate, whitish or ± reddish, of slender, barbellate bristles; outermost bristles few, 0.2–0.3 mm; inner bristles 3–5 mm, tapering; innermost bristles 4.5–6 mm, clavate. Fl. and fr. Jul–Dec.

Forests, forest margins, thickets, wet places in valleys; 100–3400 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Bhutan, NE India, Japan, Korea, N Myanmar, Nepal, E Russia, N Thailand, Vietnam].

Y. Ling and Y. L. Chen (in *FRPS* 74: 159–167. 1985) segregated *Aster trinervius* from *A. ageratoides* (see key to subspecies below). Grierson (*Notes Roy. Bot. Gard. Edinburgh* 26: 67–163. 1964), how-

ever, mentioning that there are intermediate forms between the two taxa, treated *A. ageratoides* as a subspecies of *A. trinervius*. Although the name of the former has been used in E Asia for a long time and there are many described varieties, differences between the two species do not appear to warrant species-level segregation at the present time.

Aster trinervius subsp. *ageratoides* is widely distributed and polymorphic. Kitamura (Mem. Coll. Sci. Kyoto Imp. Univ., Ser. B, Biol. 13: 327–377. 1937) and Handel-Mazzetti (Acta Horti Gothob. 12: 203–226. 1938) divided it into many varieties or subspecies (of *A. ageratoides*). The indumentum, leaf shape, capitula, and shape and size of the involucre are variable and often overlapping, however, and differences between some varieties are not clear. A thorough biosystematic and molecular phylogenetic investigation of the whole complex in Asia would be needed to identify entities that are worth recognition, as was done for Japanese members of the complex (e.g., Ito & Soejima in Iwatsuki et al., Fl. Japan 3b: 59–73. 1995), particularly in view of the possibility of hybridization among entities and with species of *A. sect. Pseudocalimeris*. Therefore, varieties usually recognized under *A. ageratoides* are here listed under *A. trinervius* subsp. *ageratoides*, with their main characteristics. It should be noted that some taxa listed here as varieties are recognized as species by Ito and Soejima (loc. cit.).

- 1a. Leaves subleathery (thick), 3-veined at base, base subrounded; involucre 8–15 mm in diam. 11a. subsp. *trinervius*
- 1b. Leaves papery (thin), sometimes rather thick, 3-veined above base (triplinerved), base attenuate; involucre 4–10 mm in diam. 11b. subsp. *ageratoides*

11a. *Aster trinervius* subsp. *trinervius*

三基脉紫菀(原亚种) san ji mai zi wan (yuan ya zhong)

Aster ageratoides Turczaninow subsp. *trinervius* (Roxburgh ex D. Don) Kitamura; *A. ageratoides* var. *trinervius* (Roxburgh ex D. Don) Handel-Mazzetti; *A. scabridus* C. B. Clarke; *Diplopappus asperimus* (Nees) Candellet; *Galatella asperima* Nees.

Stems erect, 60–205 cm tall, thick, branched, strigose. Leaves subleathery (thick), sometimes thin; blade ovate-lanceolate, abaxially strigillose or glabrate, glandular, adaxially strigose, 3-veined at base, conspicuously reticulate veined, base subrounded. Involucres 8–15 mm in diam.; phyllary apex green, sometimes tinged red. Ray florets white.

Pinus forests; ca. 3100 m. S Xizang [Bhutan, NE India, N Myanmar, Nepal, N Thailand].

Under *Aster trinervius* subsp. *trinervius* only var. *trinervius* occurs in China.

11b. *Aster trinervius* subsp. *ageratoides* (Turczaninow) Grieson, Notes Roy. Bot. Gard. Edinburgh 26: 102. 1964.

三脉紫菀 san mai zi wan

Aster ageratoides Turczaninow, Bull. Soc. Imp. Naturalistes Moscou 10(7): 154. 1837.

Stems erect, 40–100 cm tall, slender or thick, branched, strigose. Leaves papery (thin, sometimes rather thick); blade broadly ovate, elliptic, or oblong-lanceolate, abaxially puberulent, veins strigose, adaxially strigose, often glandular, or both surfaces tomentulose, 3-veined above base (triplinerved), base

attenuate. Involucres 4–10 mm in diam.; phyllary apex green or purple-brown. Ray florets purple, reddish, or white.

Forests, forest margins, thickets, wet places in valleys; 100–3400 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Bhutan, NE India, Japan, Korea, N Myanmar, Nepal, E Russia, N Thailand, Vietnam].

Some of the varieties listed here under *Aster trinervius* subsp. *ageratoides* have available names under *A. trinervius*, while others do not. In view of the fact that all of the varieties have names under *A. ageratoides*, those names are used here in preference to publishing new combinations, pending the necessary thorough investigation mentioned above.

Aster ageratoides var. *ageratoides*

三脉紫菀(原变种) san mai zi wan (yuan bian zhong)

Aster adustus (Maximowicz) Koidzumi ex Nakai; *A. ageratoides* f. *adustus* (Maximowicz) Zdorovjeva; *A. ageratoides* var. *adustus* Maximowicz; *A. quelpaertensis* H. Léveillé & Vaniot; *A. trinervius* Roxburgh ex D. Don var. *adustus* (Maximowicz) Franchet & Savatier; *A. trinervius* var. *potaninii* Diels; *A. trinervius* var. *rosthornii* Diels.

Leaves oblong-lanceolate or narrowly lanceolate, thin, adaxially densely strigose, abaxially sparsely hairy or glabrous, veins ± hairy, slightly glandular, margin coarsely serrate. Involucres 5–7 × 6–10 mm, apex purple-brown. Ray florets purple or red.

S Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, E Qinghai, Shaanxi, Shandong, Shanxi, W Sichuan, NW Yunnan [Korea, Russia (E Siberia)].

Aster ageratoides var. *firmus* (Diels) Handel-Mazzetti, Acta Horti Gothob. 12: 215. 1938.

坚叶三脉紫菀 jian ye san mai zi wan

Aster trinervius var. *firmus* Diels, Bot. Jahrb. Syst. 29: 610. 1901 [*“firma”*].

Leaves ovate or oblong-lanceolate, thickly papery, abaxially long rough hairy on veins, veins conspicuously reticulate, adaxially densely strigose, glabrescent, often lucid, areoles foamy. Ray florets white or tinged red.

N Anhui, W Hunan, S Shaanxi, Sichuan, N Yunnan [S Himalayan region].

Aster ageratoides var. *gerlachii* (Hance) C. C. Chang ex Y. Ling, Fl. Reipubl. Popularis Sin. 74: 163. 1985.

狭叶三脉紫菀 xia ye san mai zi wan

Aster gerlachii Hance, J. Bot. 18: 262. 1880; *A. curvatus* Vaniot.

Stems strigose in upper part. Leaves linear-lanceolate, 5–8 × 0.7–1 cm, abaxially subglabrous, adaxially sparsely rough hairy, base attenuate, margin shallowly serrate, apex acuminate. Phyllary apex green. Ray florets white. $2n = 36^*$.

• Guangdong, Guizhou, Hubei.

Aster ageratoides var. **holophyllus** Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 144. 1859.

异叶三脉紫菀 yì yè sān mài zǐ wān

Aster nigrescens Vaniot.

Stems multibranched. Middle leaves oblong-lanceolate, margin roughly serrate, upper leaves smaller, margin often entire. Phyllaries narrow, apex green, often ?brown mucronate.

• S Gansu, Hebei, NW Hubei, Shaanxi, Shanxi, Sichuan, N Yunnan.

Aster ageratoides var. **lasiocladus** (Hayata) Handel-Mazzetti, Acta Horti Gothob. 12: 215. 1938.

毛枝三脉紫菀 máo zhī sān mài zǐ wān

Aster lasiocladus Hayata, Icon. Pl. Formosan. 8: 49. 1919; *A. ageratoides* subsp. *lasiocladus* (Hayata) Kitamura; *A. trinervius* var. *lasiocladus* (Hayata) Yamamoto.

Stems yellow-brown or gray tomentose. Leaves oblong-lanceolate, often smaller, 4–8 × 1–3 cm, thick, adaxially densely strigose, or densely tomentose, veins often rough hairy, margin shallowly dentate, apex obtuse or acute. Phyllaries thick, densely tomentose. Ray florets white.

• Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangxi, Taiwan, SE Yunnan.

This variety is easy to distinguish from other varieties of *Aster trinervius* subsp. *ageratoides* and appears closer to *A. trinervius* subsp. *trinervius*, but the latter has thicker leaves and is more densely tomentose.

This plant is used medicinally for treating common colds and headaches, osteodynia, and snakebites.

Aster ageratoides var. **laticorymbus** (Vaniot) Handel-Mazzetti, Acta Horti Gothob. 12: 214. 1938.

宽伞三脉紫菀 kuān sān sān mài zǐ wān

Aster laticorymbus Vaniot, Bull. Acad. Int. Géogr. Bot. 12: 494. 1903.

Stems multibranched. Middle leaves oblong-lanceolate or ovate-lanceolate, abaxially often glabrescent, base attenuate, margin with 7- or 8-paired serrae, upper leaves ovate or lanceolate, small, margin entire or toothed. Phyllaries narrow, apex green. Ray florets often white. $2n = 18^*$, 36^* , 54^* .

• Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan.

Aster ageratoides var. **leiophyllus** (Franchet & Savatier) Y. Ling, Fl. Reipubl. Popularis Sin. 74: 164. 1985.

光叶三脉紫菀 guāng yè sān mài zǐ wān

Aster leiophyllus Franchet & Savatier, Enum. Pl. Jap. 1: 223. 1875; *A. ageratoides* f. *leucanthus* Kitamura; *A. ageratoides* subsp. *leiophyllus* (Franchet & Savatier) Kitamura.

Leaves oblong-lanceolate, abaxially with short rough hairs on veins, adaxially ± strigose, base abruptly narrowed, sessile or shortly petiolate, margin densely acute-serrate, apex long

acuminate. Capitula small, slender pedunculate. Involucre obconic when dry, ca. 4 × 5–6 mm; phyllary apex obtuse, apically brown. Ray florets white. Pappus white or red-brown. $2n = 18$, $18+1-3B$, 27, 34, $36+0-4B$, 37, 54, 81.

Taiwan [Japan].

Aster ageratoides var. **micranthus** Y. Ling, Fl. Reipubl. Popularis Sin. 74: 356. 1985.

小花三脉紫菀 xiǎo huā sān mài zǐ wān

Stems 60–100 cm tall, slender, multibranched. Leaves linear-lanceolate, thinly papery, subglabrous on both surfaces, areoles adaxially ± foamy; middle leaves 6–17 × 0.4–1.5 cm, margin sparsely shallowly toothed or subentire. Capitula small, in axillary and terminal corymbs; peduncle slender. Involucre 3–4 × 4–5 mm; phyllaries thin, apex purple-brown or green. Ray florets white, linear, 4–5 mm; disk florets and pappus ca. 4 mm. $2n = 18^*$.

• Forests, thickets. Sichuan.

Aster ageratoides var. **oophyllus** Y. Ling, Fl. Reipubl. Popularis Sin. 74: 161. 1985.

卵叶三脉紫菀 luǎn yè sān mài zǐ wān

Aster blinii H. Léveillé, Repert. Spec. Nov. Regni Veg. 13: 344. 1914.

Leaves ovate and ovate-lanceolate, rather thick, abaxially sparsely hairy, adaxially strigose, margin shallowly serrate. Phyllaries reddish at apex. Ray florets reddish or white.

• Hubei, Shaanxi, Sichuan, Yunnan; rarely seen in N China.

Y. Ling published *Aster ageratoides* var. *oophyllus* as a “nom. nov.” based on *A. ageratoides* var. *ovatus* (Franchet & Savatier) Handel-Mazzetti, but he explicitly excluded the basionym (and thereby the type) of the latter name, i.e., *A. trinervius* var. *ovatus* Franchet & Savatier. Ling did not indicate a type for *A. ageratoides* var. *oophyllus*, which cannot, therefore, be validly published as the name of a new taxon; however, he cited *A. blinii* in synonymy with a full and direct reference to its author and place of valid publication, hence var. *oophyllus* was validly published as a replacement name based on *A. blinii*.

Aster ageratoides var. **pendulus** W. P. Li & G. X. Chen, Acta Phytotax. Sin. 44: 349. 2006.

垂茎三脉紫菀 chuí jīng sān mài zǐ wān

Stems pendent, multibranched. Basal and lower cauline leaves abaxially very often purple. Cauline leaves linear-lanceolate, adaxially often hispid, base attenuate, margin with ca. 4-paired serrae. Phyllaries 1.25–1.75 mm wide, apex green. Ray florets white. $2n = 60-92^*$.

• N Hunan (Shimen: Huping Shan).

Aster ageratoides var. **pilosus** (Diels) Handel-Mazzetti, Acta Horti Gothob. 12: 214. 1938.

长毛三脉紫菀 cháng máo sān mài zǐ wān

Aster trinervius var. *pilosus* Diels, Bot. Jahrb. Syst. 29: 610. 1901 [*“pilosa”*].

Leaves ovate or oblong-lanceolate, rather thick, abaxially densely shortly hairy, glandular, adaxially shortly strigillose, adaxially on veins and stems spreading white or gray long hairy, hairs ca. 1 mm, base gradually or abruptly attenuate, margin shallowly serrate. Phyllaries purple-brown at apex.

• W Hubei, S Shaanxi, C and E Sichuan.

Aster ageratoides var. **scaberulus** (Miquel) Y. Ling, Fl. Rei. publ. Popularis Sin. 74: 162. 1985.

微糙三脉紫菀 wei cao san mai zi wan

Aster scaberulus Miquel, J. Bot. Néerl. 1: 100. 1861; *A. trinervius* f. *pubescens* Kuntze.

Leaves usually ovate or ovate-lanceolate, thicker, abaxially densely puberulent, densely glandular, veins often villous, or glabrescent, adaxially densely strigose, base gradually or abruptly attenuate into narrowly winged or unwinged short petiole, margin shallowly 6–9-serrate. Involucres 5–7 × 6–10 mm; phyllary apex green. Ray florets white or tinged red.

Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangsu, Jiangxi, E Sichuan, Yunnan, Zhejiang [Vietnam].

4. *Aster* sect. *Asteromoea* (Blume) Makino, Bot. Mag. (Tokyo) 12: 60. 1898.

马兰组 ma lan zu

Asteromoea Blume, Bijdr. 901. 1826; *Aster* subg. *Kalimeris* Cassini; *Hisutsua* Candolle; *Kalimeris* (Cassini) Cassini; *Martinia* Vaniot (1903), not Crié (1889) [fossil].

Herbs, perennial, usually simple, erect. Leaves basal (withered at anthesis) and cauline; blade cordate, broadly ovate, ovate, oblanceolate to oblong, or linear, margin flat, entire, dentate, serrate, or pinnatifid, sometimes pinnatifid, 1-veined. Capitula radiate, terminal, in corymbiform synflorescences or solitary at ends of branches. Involucres hemispheric; phyllaries 3- or 4-seriate, unequal, not keeled, margin scarious. Receptacles ± conic or ± convex. Ray florets 1-seriate, 10–27, purple, lilac, blue, pink, or white; disk floret limb campanulate, lobes equal. Achenes obovoid to cylindric, ± compressed or sometimes triangular, 2–4-ribbed. Pappus of ray and disk florets 1-seriate, of persistent or deciduous, free (or rarely basally connate) short bristles or scales.

About ten species: C, E, and SE Asia, Himalayan region, E Russia; seven species (three endemic) in China.

The taxonomy of this group generally follows Gu and Hoch (Ann. Missouri Bot. Gard. 84: 762–814. 1997), except for treating the species in *Aster* sect. *Asteromoea* instead of *Kalimeris*.

- 1a. Leaves broadly ovate to cordate, margin dentate 18. *A. longipetiolatus*
- 1b. Leaves oblong, ovate, or linear, margin entire, dentate, or pinnatifid.
 - 2a. Phyllaries subleathery, with scarious margins, apically rounded or obtuse, green or reddish purple; achenes 2.5–3.5 mm, sparsely long hairy; pappus 0.7–1.5(–2) mm.
 - 3a. Involucre 10–12 mm in diam., phyllaries narrow and small, 4–5 mm; leaves incised-dentate or sometimes pinnatifid 15. *A. incisus*
 - 3b. Involucre 10–15 mm in diam., phyllaries broader, 5–7 × 2–3 mm.
 - 4a. Leaves entire or pinnatifid, or shallowly dentate, leathery 16. *A. lautureanus*
 - 4b. Leaves pinnatifid, submembranous 17. *A. mongolicus*
 - 2b. Phyllaries herbaceous in upper part, apically slightly acute; achenes 1.5–2.5 mm, glandular and puberulent in upper part; pappus 0.1–0.8 mm.
 - 5a. Leaves linear-lanceolate, oblong, or lanceolate, entire or minutely 1–3-denticulate 14. *A. pekinensis*
 - 5b. Leaves obovate-oblong or oblanceolate, dentate or pinnately lobed, often entire in upper part.
 - 6a. Leaves thinner, sparsely puberulent or subglabrous; achenes 1.5–2 mm; pappus 0.1–0.3 mm; leaf margin more variable 12. *A. indicus*
 - 6b. Leaves thicker, densely velutinous; achenes 2.5–2.7 mm; pappus ca. 0.3 mm; leaf margin toothed in 1 or 2 pairs or subentire 13. *A. shimadae*

12. *Aster indicus* Linnaeus, Sp. Pl. 2: 876. 1753.

马兰 ma lan

Herbs, perennial, 30–70 cm tall; rhizome stoloniferous, sometimes with vertical roots. Stems erect, puberulent above, branched from upper or lower part. Basal leaves withered by anthesis; cauline leaves long winged petiolate, obovate or oblanceolate to obovate-oblong or oblong, 3–6(–10) × 0.8–2(–5) cm, sparsely to densely puberulent or glabrous, sometimes sparsely glandular, base attenuate, margin serrate or pinnately lobed, apex obtuse or acute; upper leaves sessile, small, slightly thin, base abruptly attenuate, margin entire and hispidulous, midvein abaxially prominent. Capitula 8–120 in corymbiform synflorescences. Involucres hemispheric, 0.4–0.5 × 0.6–0.9 cm;

phyllaries 3- or 4-seriate, unequal; outer phyllaries oblanceolate, 1.6–3.7(–4) mm; inner phyllaries oblong to obovate or spatulate, 2.5–7.5 mm, abaxially sparsely puberulent, leaflike above, margin scarious, ciliate, apex obtuse or sometimes acute. Receptacle conic. Ray florets 1-seriate, 15–20, tube 1.5–1.7 mm, lamina purplish, ca. 10 × 1.5–2 mm; disk florets ca. 3.5 mm, tube ca. 1.5 mm, densely puberulent. Achenes brown, obovoid-oblong, compressed, 1.5–2 × ca. 1 mm, marginally thickly ribbed, apically glandular and puberulent. Pappus 0.1–0.8 mm, subequal, easily deciduous. Fl. and fr. May–Nov.

Forest margins, grasslands, riverbanks, field margins, roadsides, protected shaded habitats; sea level to 3900 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Ningxia, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan,

Yunnan, Zhejiang [India, Japan, Korea, ?Laos, Malaysia, N Myanmar, E Russia, N Thailand, N Vietnam].

Aster indicus has been referred to the American genus *Boltonia* L'Héritier, but it differs from it in having achenes without long hairs at the top of the marginal ribs and ray floret achenes often thickly 3-ribbed and triangular.

This species is used medicinally to promote digestion and relieve dyspepsia, promote diuresis, dissipate blood stasis, eliminate toxins, and stop bleeding. The young leaves are usually used as a vegetable in the East.

- 1a. Leaf surfaces glabrous or sparsely puberulent, eglandular 12a. var. *indicus*
- 1b. Leaf surfaces sparsely to densely puberulent, sparsely glandular.
 - 2a. Cauline leaves lanceolate to oblong, sparsely puberulent; rhizomes 0.5–1(–3.5) cm 12b. var. *stenolepis*
 - 2b. Cauline leaves obovate to oblong, densely puberulent; rhizomes 5–15 cm 12c. var. *collinus*

12a. *Aster indicus* var. *indicus*

马兰(原变种) ma lan (yuan bian zhong)

Aster cantoniensis (Loureiro) Courtois; *A. ursinus* H. Léveillé (1913), not E. S. Burgess (1903); *A. yangtzensis* Migo; *Asteromoea cantoniensis* (Loureiro) Matsumura; *A. indica* (Linnaeus) Blume; *Boltonia cantoniensis* (Loureiro) Franchet & Savatier; *B. indica* (Linnaeus) Benth; *B. indica* var. *rivularis* Hance; *Hisutsua cantoniensis* (Loureiro) Candolle; *H. serrata* Hooker & Arnott; *Kalimeris indica* (Linnaeus) Schultz Bipontinus; *K. indica* var. *polymorpha* (Vaniot) Kitamura; *K. indica* var. *stenophylla* Kitamura; *K. lancifolia* J. Q. Fu; *Martinia polymorpha* Vaniot; *Matricaria cantoniensis* Loureiro.

Rhizomes 0.5–18 cm. Cauline leaves oblong, oblanceolate, elliptic, or obovate, glabrous or sparsely puberulent, eglandular. Phyllaries obovate-oblong. Fl. Jun–Nov.

Forest margins, grasslands, riverbanks, field margins, roadsides, very common; sea level to 3900 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Ningxia, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Yunnan, Zhejiang [India, S Japan, Korea, ?Laos, Malaysia, N Myanmar, E Russia, N Thailand, N Vietnam].

The young rosettes are used in salads; the leaves are used as folk medicine.

12b. *Aster indicus* var. *stenolepis* (Handel-Mazzetti) Soejima & Igari, Acta Phytotax. Geobot. 58: 98. 2007.

狭苞马兰 xia bao ma lan

Asteromoea indica var. *stenolepis* Handel-Mazzetti, Acta Horti Gothob. 12: 225. 1938; *Kalimeris indica* subsp. *stenolepis* (Handel-Mazzetti) H. Y. Gu; *K. indica* var. *stenolepis* (Handel-Mazzetti) Kitamura.

Rhizomes 0.5–1(–3.5) cm. Cauline leaves lanceolate to oblong, sparsely puberulent, sparsely glandular.

- Protected shaded habitats; 200–3000 m. Anhui, Fujian, Gansu,

Guangdong, Henan, Hubei, Hunan, Jiangsu, Jiangxi, SW Shaanxi, E Sichuan, Zhejiang.

12c. *Aster indicus* var. *collinus* (Hance) Soejima & Igari, Acta Phytotax. Geobot. 58: 98. 2007.

Rhizomes 5–15 cm. Cauline leaves obovate to oblong, densely puberulent, sparsely glandular. Fl. May–Nov.

- Roadsides, crop field margins; 200–1700 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangxi, Yunnan.

13. *Aster shimadae* (Kitamura) Nemoto, Fl. Jap. Suppl. 740. 1936 [“*shimadai*”].

毡毛马兰 zhan mao ma lan

Asteromoea shimadae Kitamura, Acta Phytotax. Geobot. 2: 37. 1933 [“*Shimadai*”]; *Aster indicus* Linnaeus var. *laureanus* (Yamamoto) Yamamoto; *Asteromoea indica* (Linnaeus) Blume var. *laureana* Yamamoto; *Kalimeris shimadae* (Kitamura) Kitamura.

Herbs, perennial, (30–)60–200 cm tall, rhizomatous. Stems erect, much branched, densely hispidulous. Leaves thick, densely velutinous, adaxial veins densely hispidulous, margin densely hispidulous-ciliate, 3-veined; lower cauline leaves withered by anthesis; middle cauline leaves subsessile, obovate, oblanceolate, or elliptic, 2.5–4 × 1.2–2 cm, base gradually attenuate, margin shallowly 1- or 2-toothed or entire; upper leaves gradually smaller, oblanceolate or linear. Capitula 20–85 in loose corymbiform synflorescences, 2–2.5 cm in diam. Involucres hemispheric, 6–7 × 8–10 mm; phyllaries 3-seriate, unequal, abaxially densely hairy; outer phyllaries narrowly oblong, 2–3 mm; inner phyllaries oblanceolate-oblong, ca. 5 mm, margin scarious, ciliate, apex leaflike. Ray florets ca. 10, purplish, tube ca. 1.5 mm, hairy, lamina 11–12 × 2–3 mm; disk florets 4–4.5 mm, tube ca. 1.5 mm, hairy. Achenes gray-brown, obovoid, compressed, 2.5–2.7 mm, strigillose, 2-ribbed. Pappus scaly, ferruginous, ca. 0.3 mm, persistent. Fl. and fr. Jun–Nov.

- Forest margins, grassy slopes, dry stony areas, riverbanks; sea level to 2800 m. Anhui, Fujian, Gansu, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Zhejiang.

14. *Aster pekinensis* (Hance) F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 5: 41. 1934.

全叶马兰 quan ye ma lan

Asteromoea pekinensis Hance, Ann. Sci. Nat., Bot., sér. 4, 15: 225. 1861; *Aster franchetianus* H. Léveillé; *A. holophyllus* Hemsley, nom. illeg. superfl.; *A. integrifolius* (Turczaninow ex Candolle) Franchet (1884), not Nuttall (1840); *Asteromoea integrifolia* (Turczaninow ex Candolle) Loesener; *Boltonia integrifolia* (Turczaninow ex Candolle) Benth & J. D. Hooker; *B. pekinensis* (Hance) Hance; *Kalimeris integrifolia* Turczaninow ex Candolle.

Herbs, perennial, (10–)30–140 cm tall; roots erect, fusiform. Stems erect, solitary or several fascicled, hispidulous, fas-

tigately branched from middle part. Leaves gray-green, puberulent-tomentulose, midvein adaxially prominent; lower cauline leaves withered by anthesis; middle leaves dense, sessile, linear-lanceolate, oblanceolate, or oblong, $2.5-4 \times 0.4-0.6$ cm, base gradually attenuate, margin revolute, entire, apex obtuse or acuminate, mucronate; upper leaves small, linear. Capitula in loose corymbiform synflorescences. Involucres hemispheric, ca. $4 \times 7-8$ mm; phyllaries 3-seriate, imbricate, abaxially densely hispidulous, densely glandular; outer phyllaries linear, ca. 1.5 mm; inner phyllaries oblong-lanceolate, ca. 4 mm, acute, leaflike distally. Ray florets 19–29, pale lilac to pale purple, tube ca. 1 mm, hairy, lamina $(5.2-6)-13.5(-15) \times$ ca. 2.5 mm; disk florets 2.1–3.4 mm, tube ca. 1 mm, hairy, lobes unequal. Achenes brownish, obovoid, compressed or sometimes trigonous, $1.8-2 \times$ ca. 1.5 mm, apically puberulent and glandular, 2–4-ribbed. Pappus easily deciduous, brownish, fragile, 0.3–0.5 mm, unequal, sometimes absent. Fl. May–Oct, fr. Jul–Nov.

Forest margins, thickets, mountain slopes, riverbanks, roadsides; sea level to 1600 m. Anhui, Gansu, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan, Yunnan, Zhejiang [Korea, E Russia].

15. *Aster incisus* Fischer, Mém. Soc. Imp. Naturalistes Moscou 3: 76. 1812.

裂叶马兰 lie ye ma lan

Aster incisus var. *australis* Kitagawa; *A. pinnatifidus* Makino f. *robustus* Makino; *Asteromoea incisus* (Fischer) Koidzumi; *Boltonia incisus* (Fischer) Benth; *Grindelia incisus* (Fischer) Sprengel; *Kalimeris incisus* (Fischer) Candolle; *K. incisus* var. *australis* (Kitagawa) Kitagawa; *K. platycephala* Cassini.

Herbs, perennial, 30–120 cm tall, rhizomatous. Stems erect, branched in upper part, sulcate, glabrous or sparsely strigose. Leaves thin; lower cauline leaves withered by anthesis; middle leaves sessile, elliptic-lanceolate or lanceolate, $6-10(-15) \times 1.2-2.5(-4.5)$ cm, abaxially strigose to glabrate, adaxially glabrous or glabrate, base gradually attenuate, margin incised-serrate, sometimes pinnatifid, rarely entire, scabrous, veins prominent, apex acuminate; upper leaves reduced, linear-lanceolate, entire. Capitula 10–55 in open corymbiform synflorescences, 2.5–3.5 cm in diam. Involucres hemispheric, $5-7.5 \times 7-12$ mm; phyllaries 3-seriate, imbricate, oblong-lanceolate, abaxially sparsely strigillose, margin ciliate; outer phyllaries 3–4 mm, acute; inner phyllaries 4–5 mm, margin scarious, purplish, apex obtuse. Ray florets (13–)16–27(–29), pale lilac to bluish purple, tube 1–1.5 mm, lamina $1.5-1.8 \times 0.2-0.25$ cm; disk florets yellow, 3–4 mm, tube 1–1.3 mm, limb campanulate, hairy, lobes triangular, ca. 0.6 mm, glabrous. Achenes brownish, obovoid, compressed, 3–3.5 mm, strigose, margin pale 2-ribbed or sometimes 3-ribbed. Pappus reddish, 0.5–1.2 mm. Fl. and fr. Jun–Oct. $2n = 18$.

Grasslands on slopes, thickets, open places between forests, semi-open second-growth forests, wet grasslands, sometimes roadsides; 400–1000 m. Heilongjiang, Jilin, Liaoning, E Nei Mongol [Japan, Korea, E Russia].

Only *Aster incisus* var. *incisus* occurs in China. The second variety, *A. incisus* var. *macrodon* (Vaniot & H. Léveillé) Soejima & Igari (*A.*

macrodon Vaniot & H. Léveillé; *Kalimeris incisus* subsp. *macrodon* (Vaniot & H. Léveillé) H. Y. Gu), is known only from Korea (Cheju Island).

16. *Aster lautureanus* (Debeaux) Franchet, Mém. Soc. Sci. Nat. Cherbourg 24: 224. 1884.

山马兰 shan ma lan

Herbs, perennial, 50–100 cm tall. Stems erect, solitary or 2- or 3-fascicled, sulcate, branched in upper part, scabrous. Leaves thick or subleathery, sparsely scabrous or glabrous, margin revolute, scabrous; lower cauline leaves withered by anthesis; middle leaves sessile, oblong to broadly oblong or sometimes oblanceolate, $3-6(-9) \times 0.5-2.4$ cm, base gradually attenuate, margin remotely serrate to pinnatifid, sometimes entire, apex acute to obtuse; synflorescence leaves linear-lanceolate to linear, margin entire. Capitula 19–90 in corymbiform synflorescences, 2–3.5 cm in diam. Involucres hemispheric, 10–14 mm in diam.; phyllaries 3-seriate, unequal, apically green, glabrous, margin scabrous; outer phyllaries elliptic, 2.3–4.5 mm, apex acute; inner phyllaries oblanceolate-elliptic, $4.7-6.5(-7.6) \times 1.8-3.2$ mm, obtuse, margin scarious, erose-fimbriate, purplish. Ray florets 13–22, bluish, tube 1.2–1.4 mm, lamina $1.5-2 \times 0.2-0.3$ cm; disk florets yellow, 4–5.8 mm, tube 0.7–1.3 mm, upper tube and limb hairy, limb campanulate, lobes lanceolate, $0.5-1.1(-1.5)$ mm, glabrous. Achenes brownish, obovoid, compressed or sometimes trigonous, $3(-4) \times$ ca. 2 mm, sparsely strigillose, pale 2- or 3-ribbed. Pappus straw-colored or brownish, 0.4–1 mm. Fl. and fr. Jun–Oct.

• Meadows, thickets, mountain slopes, stream banks, ditches, dry roadsides; 100–2200 m. Gansu, Hebei, Heilongjiang, Henan, Jiangsu, Jilin, Liaoning, Ningxia, Shaanxi, Shandong, Shanxi, Zhejiang.

- 1a. Leaves oblong to oblanceolate, 0.5–2 cm wide; disk floret corolla 4.5–5.1 mm 16a. var. *lautureanus*
 1b. Leaves broadly oblong, 1.5–2.4 cm wide; disk floret corolla 5–5.8 mm 16b. var. *mangtaoensis*

16a. *Aster lautureanus* var. *lautureanus*

山马兰(原变种) shan ma lan (yuan bian zhong)

Boltonia lautureana Debeaux, Actes Soc. Linn. Bordeaux 31: 215. 1877; *Asteromoea lautureana* (Debeaux) Handel-Mazetti; *Kalimeris lautureana* (Debeaux) Kitamura.

Leaves oblong to oblanceolate, 0.5–2 cm wide. Disk floret corolla 4.5–5.1 mm. Fl. and fr. Jun–Oct.

• Meadows, thickets, mountain slopes, stream banks, ditches, dry roadsides; 100–2200 m. Gansu, Hebei, Heilongjiang, Henan, Jiangsu, Jilin, Liaoning, Ningxia, Shaanxi, Shandong, Shanxi, Zhejiang.

16b. *Aster lautureanus* var. *mangtaoensis* (Kitagawa) Kitagawa, J. Jap. Bot. 13: 554. 1937.

小龙山马兰 xiao long shan ma lan

Leaves broadly oblong, 1.5–2.4 cm wide. Disk floret corolla 5–5.8 mm. Fl. and fr. Jul–Aug.

- Liaoning (Xiaolongshan Dao).

17. *Aster mongolicus* Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 6: 41. 1883.

蒙古马兰 meng gu ma lan

Aster associatus Kitagawa; *A. associatus* var. *stenolobus* Kitagawa; *A. lautureanus* (Debeaux) Franchet var. *holophyllus* (Maximowicz) F. H. Chen; *A. lautureanus* var. *mongolicus* (Franchet) Kitagawa; *Asteromoea mongolica* (Franchet) Kitamura; *Kalimeris associata* (Kitagawa) Kitagawa; *K. incisa* (Fischer) Candolle var. *holophylla* Maximowicz; *K. mongolica* (Franchet) Kitamura.

Herbs, perennial, 50–122 cm tall. Stems erect, sulcate upward, strigose, branched in upper part. Leaves submembranous; lowermost cauline leaves withered by anthesis; lower and middle leaves: blade oblanceolate to narrowly oblong, 5–9 × 2–4 cm, sparsely hispidulous or glabrate, margin pinnatifid, densely hispidulous; lobes linear-oblong, margin entire, apex obtuse; uppermost leaves linear-lanceolate, 1–2 cm. Capitula 12–45 in corymbiform synflorescences, 2.5–3.5 cm in diam. Involucre hemispheric, 1–1.5 cm in diam.; phyllaries 3- or 4-seriate, unequal, apically green, elliptic to obovate, 5–7 × 3–4 mm, glabrous, margin scarious, white or purplish, lacerate, apex obtuse. Ray florets (11–)14–25, bluish purple, bluish, or white, tube ca. 2 mm, lamina 13.5–25.5 × 2.7–4.8(–5.2) mm; disk florets yellow, 3.5–4.9 mm, tube 0.8–1.6(–1.8) mm, lobes unequal, 0.8–2.1 mm. Achenes straw-colored or brownish, obovoid, compressed or sometimes trigonous, ca. 3.5 × 2.5 mm, sparsely strigillose, rarely apically glandular, yellowish 2- or 3-ribbed. Pappus brownish, unequal, 0.3–1.2 mm. Fl. and fr. Jun–Oct.

Mountain slopes, thickets, semi-open secondary forests, margins of coniferous forests, mixed broad-leaved forests, field margins; sea level to 1300 m. Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol [Korea, E Russia].

18. *Aster longipetiolatus* C. C. Chang, Sunyatsenia 6: 22. 1941.

长柄马兰 chang bing ma lan

Aster trichanthus Handel-Mazzetti; *Kalimeris longipetiolata* (C. C. Chang) Y. Ling.

Herbs, perennial, 50–70 cm tall, rhizomatous. Stems erect, simple, slender, villous. Leaves remote, thin, sparsely hairy, margin, adaxially along veins, and petiole densely villous, basally palmately veined, lateral veins 2- or 3-paired, reticulate veins ± conspicuous; basal leaves withered by anthesis or rarely persistent; lower cauline leaves long petiolate; petiole slender, 12–16 cm; blade broadly ovate, 6–7 × 4–6 cm, base truncate or shallowly cordate, margin coarsely serrate (teeth mucronulate), apex acute or cuspidate; middle leaves shortly petiolate; blade cordate, margin coarsely crenate; upper leaves gradually reduced, small, subentire, grading into linear-lanceolate bracts. Capitula 1 or 2, 3.5–4.5 cm. Phyllaries 2- or 3-seriate, equal, linear-oblongate, 5–6 mm, leaflike, apex acuminate, subulate-mucronate; inner phyllaries leaflike in upper part, hairy, margin scarious, erose. Ray florets ca. 30, bluish, tube ca. 2 mm, sparsely hairy near base, lamina linear, ca. 20 × 1–1.3 mm; disk florets yellow, ca. 3 mm, tube short, glabrous. Achenes (not seen; ovary) cylindric, ± compressed. Pappus dirty white, of scalelike bristles, 0.3–1 mm, unequal. Fl. Jul.

- Brooklet banks, valleys; ca. 2500 m. W Sichuan.

Aster longipetiolatus was not included in the revision of *Kalimeris* by Gu and Hoch (Ann. Missouri Bot. Gard. 84: 762–814. 1997); its affinities require investigation. Specimens were not seen by one of us (Brouillet).

5. *Aster* sect. *Pseudocalimeris* Kitamura, Mem. Coll. Sci. Kyoto Imp. Univ., Ser. B, Biol. 13: 363. 1937.

假马兰组 jia ma lan zu

Heteropappus Lessing.

Herbs, perennial, biennial, or annual, simple or branched, erect, ascending, or decumbent. Leaves basal (withered at anthesis) and cauline; blade linear, oblong-lanceolate, oblanceolate, or spatulate-oblong to spatulate, margin flat, entire or remotely serrate or crenate, 1-veined. Capitula radiate, sometimes discoid, terminal, corymbose-paniculiform or solitary at ends of branches or stems. Involucres hemispheric or patelliform; phyllaries 2- or 3-seriate, subequal (outer sometimes shorter), not keeled, margin sometimes scarious. Receptacles flat. Ray florets 1-seriate, sometimes absent, 15–40, purple, lilac, blue, pink, or white; disk floret limb campanulate, narrowly campanulate, or funnelform, lobes unequal (1 lobe deeper). Achenes obovate or obovoid to obovate-oblong, compressed to flattened, 2-ribbed. Pappus of ray florets sometimes absent or few, short, of disk florets present, 1–3-seriate, persistent or deciduous, inner bristles acute (when present), outer series of free (rarely connate) short scales or bristles.

About 17 species: C and E Asia, E Europe; 12 species (three endemic) in China.

1a. Perennial herbs, rarely biennial; pappus of ray and disk florets identical.

2a. Capitula discoid 23. *A. eligulatus*

2b. Capitula radiate.

3a. Plants 2.5–7 cm, thickly taprooted 22. *A. boweri*

3b. Plants (3.5–)5–60(–100) cm, not taprooted.

4a. Phyllary margin herbaceous or narrowly scarious 20. *A. asagrayi*

4b. Phyllary margin ± broadly scarious (at least inner series).

5a. Phyllary margin broadly scarious; stems erect; ray florets ca. 20 19. *A. altaicus*

5b. Phyllary margin broadly scarious in inner series; stems decumbent to ascending; ray florets (20–)25–35 21. *A. semiprostratus*

- 1b. Annual or biennial herbs, sometimes also perennial (*A. arenarius*); pappus of ray florets usually short, sometimes absent or equaling that of disk.
- 6a. Leaves glabrous or glabrate (margin conspicuously ciliate).
- 7a. Stems erect; cauline leaves glabrate 28. *A. oldhamii*
- 7b. Stems procumbent; cauline leaves glabrous or sometimes sparsely strigose 27. *A. arenarius*
- 6b. Leaves hairy.
- 8a. Plants 8–30 cm tall, branched from base, branches decumbent to ascending 30. *A. gouldii*
- 8b. Plants 10–50(–150) cm tall, branched from middle, branches ascending.
- 9a. Pappus of ray florets long 26. *A. neobiennis*
- 9b. Pappus of ray florets absent or of short bristles (shorter than on disk florets); ray achene narrow, sterile.
- 10a. Capitula 30–50 mm in diam.; middle cauline leaf margin coarsely serrate in upper part or entire 25. *A. meyerendorffii*
- 10b. Capitula 10–25 mm in diam.; middle cauline leaf margin entire or crenate.
- 11a. Ray pappus a crown of scales; cauline leaves oblong-lanceolate or linear, margin entire 24. *A. hispidus*
- 11b. Ray pappus a few short bristles or equaling that of disk; cauline leaves spatulate-oblong, margin crenate 29. *A. crenatifolius*

19. *Aster altaicus* Willdenow, Enum. Pl. 2: 881. 1809.

阿尔泰狗娃花 a er tai gou wa hua

Herbs perennial, roots procumbent or vertical, not tap-rooted. Stems usually many, erect, 10–60(–100) cm, covered with closely-set thin hairs directed upward and often glandular in upper part, branched. Basal leaves withered by anthesis, lower linear or oblong-lanceolate, oblanceolate or subspatulate, 2.5–6(–10) × 0.7–1.5 cm, margin entire or remotely shallowly toothed, upper gradually diminished, both surfaces pubescent, densely minutely glandular, midvein abaxially slightly convex. Capitula radiate, numerous, 2–3.5(–4) cm in diam., solitary and terminal or in corymbose-paniculiform synflorescences. Involucre hemispheric, 0.8–1.8 cm in diam.; phyllaries 2- or 3-seriate, subequal or outer series short, oblong-lanceolate or linear, 4–8 × 0.5–1.8 mm, abaxially or all outer series leaflike, shortly rough pilose, short-stipitate glandular, acuminate, outermost linear and shorter than inner, margin ± broadly scarious. Ray florets ca. 20, bluish purple or lilac, tube 1.5–2.8 mm, hairy, lamina oblong-linear, 10–15 × 1.5–2.5 mm; disk florets yellow, 5–6 mm, tube 1.5–2.2 mm, lobes unequal, 0.6–1 × 1–1.4 mm, hairy. Achenes obovate-oblong, compressed, 2–3 mm, strigose, glandular. Pappus of ray and disk florets identical, sordid white or pale brown, of subequal bristles, 4–6 mm. Fl. and fr. Jul–Sep.

Steppes, meadows, salt marshes, grasslands, open slopes, stony slopes, rock outcrops, seashores, roadsides, sandy places by riverbanks; sea level to 4000 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, W Sichuan, Taiwan, Xinjiang, Xizang, NW Yunnan, Zhejiang [Afghanistan, NW India, Kashmir, Kazakhstan, Korea, Mongolia, Nepal, Pakistan, Russia (Siberia), Turkmenistan, Uzbekistan; SW Asia (Iran)].

- 1a. Inner phyllary margin narrowly scarious 19f. var. *taitoensis*
- 1b. Inner phyllary margin narrowly or broadly scarious.
- 2a. Stems and leaves spreading and coarsely white hairy 19e. var. *hirsutus*
- 2b. Stems and leaves strigose.
- 3a. Plants often gray-white, virgately branched; leaves,

especially upper, adnate to stems or peduncles 19b. var. *canescens*

- 3b. Plants green, procumbent-branched; leaves not always appressed to stems.
- 4a. Stems 10–30 cm tall, usually branched from base, ascending, ± procumbent at base; capitula solitary at ends of branches 19a. var. *altaicus*
- 4b. Stems 20–60 cm tall, branched in upper part or multibranched and short, subequal; capitula in few to multibranched synflorescences.
- 5a. Leaves lanceolate; synflorescences few branched; stems erect 19c. var. *scaber*
- 5b. Leaves linear-lanceolate, narrow; synflorescences multibranched; stems erect or ascending 19d. var. *millefolius*

19a. *Aster altaicus* var. *altaicus*

阿尔泰狗娃花(原变种) a er tai gou wa hua (yuan bian zhong)

Aster gmelinii Tausch; *Heteropappus altaicus* (Willdenow) Novopokrovsky; *Kalimeris altaica* (Willdenow) Nees; *K. altaica* var. *subincana* Avé-Lallemant.

Plants green. Stems ascending or erect, 10–30 cm tall, covered with upwardly curved appressed short hairs, branched from base, with few branches. Leaves spreading, linear-lanceolate or spatulate, 3–7(–10) × 0.2–0.7 cm. Capitula solitary, terminal on branches. Involucre 5–15 mm in diam.; phyllaries with outer margin narrowly scarious, inner margin broadly scarious, glandular, hairy.

Steppes, meadows, salt marshes, stony slopes of lower hills, roadsides, roadsides by riverbanks. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong,

Shanxi, NW Sichuan, Xinjiang, Xizang [Kashmir, Kazakhstan, Mongolia, Russia (Siberia)].

"*Aster angustifolius*" (Royle, Ill. Bot. Himal. Mts. 251, t. 58, f. 1. 1835) belongs here but is a nomen nudum and was therefore not validly published (*Vienna Code*, Art. 32.1(d)).

19b. *Aster altaicus* var. *canescens* (Nees) Sergievskaya in Krylov, Fl. Zapadnoi Sibiri 11: 2664. 1949.

灰白阿尔泰狗娃花 hui bai a er tai gou wa hua

Kalimeris canescens Nees, Gen. Sp. Aster. 229. 1832; *Aster canescens* (Nees) Fisjun (1965), not Pursh (1813); *A. pyropappus* Boissier; *A. spatioides* C. B. Clarke; *Heteropappus alberti* (Regel) Novopokrovsky; *H. altaicus* var. *canescens* (Nees) Koroljuk; *H. canescens* (Nees) Novopokrovsky; *K. alberti* Regel.

Plants gray-white. Stems erect or ascending, 30–60 cm tall, strigillose, glandular, branched from base, virgately branched in upper part. Leaves broadly subspatulate, 0.5–0.6 cm; upper adnate to branches and peduncles, linear, ca. 1 × 0.1–0.2 cm, or oblong-linear. Involucres 0.9–1.1 cm in diam.; outer phyllaries leaflike, inner phyllaries with membranous margin, glandular, puberulent.

Dry stony mountains. N Xinjiang [Afghanistan, NW India, Kazakhstan, Mongolia, Pakistan, Russia (W Siberia), Turkmenistan, Uzbekistan; SW Asia (Iran)].

19c. *Aster altaicus* var. *scaber* (Avé-Lallemant) Handel-Mazzetti, Acta Horti Gothob. 12: 220. 1938.

粗糙阿尔泰狗娃花 cu cao a er tai gou wa hua

Kalimeris altaica var. *scabra* Fischer, C. A. Meyer & Avé-Lallemant, Index Sem. Hort. Petrop. 8: 53. 1842; *Heteropappus altaicus* var. *scaber* (Avé-Lallemant) Wang.

Plants green. Stems erect, 20–60 cm, usually branched from middle, sparsely strigillose. Leaves remote, lanceolate, ca. 3 × 0.4 cm. Capitula in few branched synflorescence.

• Liaoning, Shanxi.

19d. *Aster altaicus* var. *millefolius* (Vaniot) Handel-Mazzetti, Acta Horti Gothob. 12: 220. 1938.

千叶阿尔泰狗娃花 qian ye a er tai gou wa hua

Aster millefolius Vaniot, Bull. Acad. Int. Géogr. Bot. 12: 496. 1903; *Heteropappus altaicus* var. *millefolius* (Vaniot) Grierson & Lauener.

Plants green. Stems erect or ascending, covered with upwardly curved appressed short hairs, glandular, with many subequal and spreading branches. Leaves spreading, linear or linear-lanceolate, 1–2 × 0.1–0.25 cm. Capitula in multibranched, densely leafy synflorescences. Involucres 0.5–8 mm in diam.; phyllaries with narrow or broad margins; outer phyllaries leaflike, hairy or glabrate, glandular. Ray florets 5–6 mm.

• Stony or soil-covered slopes, roadsides, very common. Gansu, Hebei, Heilongjiang, Liaoning, Nei Mongol, Shaanxi, Shanxi.

The stems with many subequal long branches, smaller leaves, and smaller capitula differ significantly from other varieties.

19e. *Aster altaicus* var. *hirsutus* Handel-Mazzetti, Acta Horti Gothob. 12: 221. 1938.

糙毛阿尔泰狗娃花 cao mao a er tai gou wa hua

Heteropappus altaicus var. *hirsutus* (Handel-Mazzetti) Y. Ling.

Plants green. Stems ascending or erect, densely spreading and coarsely white hairy, especially upper part, hairs ca. 1 mm or more, few branched from base. Leaves linear-lanceolate or spatulate, spreading coarsely white hairy. Capitula solitary, terminal on branches. Involucres 5–15 mm in diam.; outer phyllaries with narrowly scarious margin; inner with broadly scarious margin, glandular, coarsely white hairy.

• Grasslands, open slopes; 2200–3500 m. W Sichuan (Garzê, Jinchuan, Kangding), NW Yunnan.

This variety is similar to *Aster altaicus* var. *altaicus* but differs in having stems white hirsute.

19f. *Aster altaicus* var. *taitoensis* Kitamura, Acta Phytotax. Geobot. 1: 289. 1932.

台东阿尔泰狗娃花 tai dong a er tai gou wa hua

Heteropappus altaicus var. *taitoensis* (Kitamura) Y. Ling.

Plants green, ca. 50 cm tall. Stems branched from base, densely spreading and ascending appressed hairy. Lower leaves withered by anthesis, oblanceolate-linear or linear, 3–6 × 0.1–0.2(–0.4) mm, margin entire or remotely toothed; middle leaves 2–3 × ca. 0.1 cm; upper leaves small, similar to phyllaries. Involucres 1.5–1.8 cm in diam.; outer phyllaries leaflike, inner phyllaries with narrowly scarious margin, densely hairy.

• Sandy places by riverbanks. Taiwan (Taidong).

20. *Aster asagrayi* Makino, Bot. Mag. (Tokyo) 22: 157. 1908.

华南狗娃花 hua nan gou wa hua

Kalimeris ciliata A. Gray, Mem. Amer. Acad. Arts, n.s., 6: 394. 1858; *Aster ciliatus* (Turczaninow) Handel-Mazzetti (1937), not Kitamura (1934); *Heteropappus ciliatus* (Turczaninow) Y. Ling; *K. ciliosa* Turczaninow.

Herbs, perennial, 15–35 cm tall, taprooted. Stems ascending or decumbent, few branched in upper part, sterile stems short, sparsely to moderately strigose or glabrate, sometimes minutely short-stipitate glandular. Leaves sessile, glabrous or adaxial veins sparsely strigose, eglandular, margin entire, strigose-ciliate, midvein abaxially slightly prominent; lower cauline leaves withered by anthesis; middle leaves narrowly oblanceolate to oblanceolate or spatulate-oblong, 1.5–2.5 × 0.15–0.4 cm, base gradually attenuate, apex rounded; upper leaves smaller, similar to phyllaries, sparsely scabrous; leaves of sterile stems spatulate, 1–1.5 × 0.3–0.4 cm. Capitula solitary at ends of branches or sometimes in corymbiform synflorescences, 2–2.5 cm in diam. Involucres hemispheric, 0.8–1.2 cm in diam.; phyllaries green, 2-seriate, equal or outer phyllaries shorter, lanceolate to linear-lanceolate, 4–5 × 0.5–0.7 mm, abaxially scabrous, margin herbaceous or narrowly (rarely broadly) scarious, erose, scabrous-ciliate, apex acuminate. Ray florets 1-seriate, 15–20, white or pink, tube 2–2.5 mm, sparsely hairy, lamina 8–10.1 × 0.8–1.2 mm; disk florets yellow, 3.3–4 mm, tube 1–1.7 mm, sparsely hairy, limb campanulate, lobes unequal, 1 deep, 0.7–

1.2 mm, hairy. Achenes brownish, obovate, flattened, 2–2.7 mm, scabrous, apically glandular, 2-ribbed. Pappus ca. 2-seriate, reddish or reddish brown, of unequal bristles 2.5–3.3 mm, acute. Fl. and fr. Jul–Sep. $2n = 18$.

Sandy areas by seashores, sandy meadows, grasslands by riversides; sea level to 100 m. Fujian, Guangdong, Hainan [Japan].

21. *Aster semiprostratus* (Grierson) H. Ikeda, Fl. Mustang [Nepal] 351. 2008.

半卧狗娃花 *ban wo gou wa hua*

Heteropappus semiprostratus Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 151. 1964.

Herbs, perennial, (3.5–)5–15 cm tall, caespitose; rhizome short. Stems and branches decumbent or ascending, branched from base, sometimes with densely leafy undeveloped branches in leaf axils, reddish, long white strigose, sparsely short-stipitate glandular (particularly upward). Leaves linear-oblongate or oblanceolate to spatulate, $1-3.2 \times 0.2-0.4$ cm, \pm densely strigose, with sessile glands, or adaxially sparsely strigose, base attenuate, margin entire, strigose-ciliate, midvein abaxially convex, slightly concave adaxially, sometimes basally 3-veined, apex obtuse to acute, mucronate. Capitula radiate, solitary at ends of stems or branches, or sometimes 2 or 3 in corymbiform synflorescences, 1.5–3 cm in diam. Involucres hemispheric, 1–1.5 cm in diam.; phyllaries 3-seriate, green, lanceolate, $6-8 \times 0.8-1.8$ mm, abaxially strigose, short-stipitate glandular, outer margin leaflike or narrowly scarious, inner phyllaries \pm broadly scarious, erose, scabrous- or glandular ciliate, apex acuminate, often purplish. Ray florets (20–)25–35, blue or purplish, tube 2–2.9 mm, hairy, lamina $1.2-1.5 \times 0.1-0.2$ cm; disk florets yellow, 4–6.3 mm, tube 1.5–2.3 mm, tube and limb sparsely hairy, limb narrowly campanulate, lobes unequal, 1 deep, 5–7.5 mm, hairy. Achenes straw-colored, becoming black mottled or nearly black, obovate, flattened, 1.8–2.5 mm, strigose, apically with sessile glands, margin faintly 2-ribbed, long strigose. Pappus 2- or 3-seriate, reddish to reddish brown, unequal, 4–5 mm. Fl. Jun–Aug.

Dry open stony, gravelly, or sandy slopes, gravelly and sandy open or shrubby floodplains, alpine meadows, rock outcrops; 3200–4600 m. Qinghai, Xizang [Kashmir, Nepal].

22. *Aster boweri* Hemsley, J. Linn. Soc., Bot. 30: 113. 1894 [*"Bowerii"*].

青藏狗娃花 *qing zang gou wa hua*

Aster boweri f. *annuus* Onno; *Heteropappus boweri* (Hemsley) Grierson.

Herbs, biennial or perennial, 2.5–7 cm tall, from caudex, thickly taprooted, sometimes clad with marcescent leaf bases. Stems solitary or 3–6, simple or branched near base, decumbent or ascending, slender, moderately to densely white hispid, more densely so upward, \pm densely stipitate glandular below capitula. Leaves \pm densely strigose or adaxially glabrate, margin entire, strigose-ciliate, basally crowded, shortly winged petiolate or sessile, narrowly oblanceolate to spatulate, $1-3 \times 0.2-0.4$ cm, base clasping, apex acute to obtuse; upper cauline leaves lanceolate to linear, $0.5-0.8 \times$ ca. 0.2 cm. Capitula terminal,

solitary, 25–30 mm in diam. Involucres hemispheric, 1–1.5(–2) cm in diam.; phyllaries 2- or 3-seriate, subequal, linear to linear-lanceolate, abaxially \pm densely strigose to villous-strigose, herbaceous, margin strigose, of inner phyllaries scarious, erose. Ray florets ca. 40, purple, tube 2–3 mm, lamina $9-13 \times 1.5-1.7$ mm; disk florets yellow, 4.5–5 mm, tube ca. 1.5 mm, lobes triangular, hairy, unequal, 4 short, 0.5–0.6 mm, 1 long, 1–1.2 mm. Achenes pale brown and blackish streaked, narrowly obovoid, 2.8–3 mm, sparsely strigose. Pappus brownish, 2- or 3-seriate; outer bristles short, 0.5–0.9 mm; inner bristles 4–5.5 mm. Fl. and fr. Jul–Aug.

• Alpine stony and sandy grounds, alpine meadows, montane river floodplains, field margins; 2200–5200 m. W Gansu, Qinghai, Xizang, Xizang, Yunnan.

23. *Aster eligulatus* (Y. Ling ex Y. L. Chen, S. Yun Liang & K. Y. Pan) Brouillet, Semple & Y. L. Chen, **comb. nov.**

无舌狗娃花 *wu she gou wa hua*

Basionym: *Heteropappus eligulatus* Y. Ling ex Y. L. Chen, S. Yun Liang & K. Y. Pan, Acta Phytotax. Sin. 19: 85. 1981.

Herbs, perennial, 5–15 cm tall; caudex short, from woody taproot. Stems procumbent to ascending, many branched, rigid, green or purple tinged, usually branched from base, white strigose. Leaves sessile, linear, $0.4-2 \times 0.1-0.2(-0.4)$ cm, strigose, midvein slightly raised abaxially, margin entire, strigose, apex obtuse, mucronulate; uppermost leaves small. Capitula discoid, terminal, solitary, 8–13 mm in diam.; phyllaries 2- or 3-seriate, green or purple tinged, lanceolate, $5.5-6.5 \times 1.2-2$ mm, strigose, margin scarious, apex acuminate. Ray florets absent; disk florets yellow, 4.3–5 mm, tube 1–1.3 mm, limb funnelform, glabrous, lobes triangular to lanceolate, unequal, 0.8–1.2 mm, hairy. Achenes pale yellow-brown, obovoid, compressed, ca. 2×1 mm, sericeous, margin 2-ribbed. Pappus pale yellow-brown, 2-seriate, of 35–45 unequal bristles 3–3.5 mm. Fl. and fr. Jul–Sep.

• Stony grounds; 3200–3900 m. Xizang.

Aster eligulatus is similar to *Heteropappus holohermaphroditus* Grierson, described from India, Kashmir, and Pakistan, but differs in having stems branched from the base and capitula terminal, solitary. The differences noted above, however, might stem from phenotypic plasticity: the plants from south of the Himalaya being taller (15–45 cm) and the capitula numerous, borne at the ends of long peduncles. More material and a morphometric study are needed to resolve this issue.

24. *Aster hispidus* Thunberg, Nova Acta Regiae Soc. Sci. Upsal. 4: 39. 1783.

狗娃花 *gou wa hua*

Aster batakenis Hayata; *A. fusanensis* H. Léveillé & Vaniot; *A. hispidus* var. *decipiens* (Maximowicz) Y. Ling; *A. hispidus* var. *heterochaeta* Franchet & Savatier; *A. hispidus* var. *mesochaeta* Franchet & Savatier; *A. hispidus* var. *microphyllus* Pampanini; *A. oldhamii* Hemsley var. *batakenis* (Hayata) Sasaki; *A. omerophyllus* Hayata; *A. rufopappus* Hayata; *Heteropappus decipiens* Maximowicz; *H. hispidus* (Thunberg) Lessing; *H. hispidus* f. *decipiens* (Maximowicz) Komarov; *H. hispidus* var. *decipiens* (Maximowicz) Voroschilov; *H. incisus* Sie-

bold & Zuccarini; *H. pinetorum* Komarov; *Kalimeris hispida* (Thunberg) Nees.

Herbs, annual or biennial, 30–50(–150) cm tall; taproot vertical, fusiform. Stems solitary or sometimes several fascicled, branched, strigose or hispid, glabrescent in lower part. Leaves thin, sparsely strigose or glabrous, margin ciliate, midvein and secondary veins prominent; basal and lower cauline leaves withered by anthesis, long petiolate; blade obovate, 4–13 × 0.5–1.5 cm, attenuate, margin entire or remotely serrate, apex obtuse or rounded; middle leaves oblong-lanceolate or linear, 3–7 × 0.3–1.5 cm, margin often entire; upper leaves reduced in size, linear. Capitula radiate, in broad corymbiform synflorescences, 3–5 cm in diam., long pedunculate. Involucres hemispheric, 7–8 × 10–20 mm; phyllaries 2-seriate, subequal, abaxially strigose, often glandular; outer phyllaries linear-lanceolate, ca. 1 mm wide, leaflike; inner phyllaries rhombic-lanceolate, margin scarious, strigose. Ray florets ca. 30, reddish or white, tube ca. 2 mm, lamina linear-oblong, 12–20 × 2.5–4 mm; disk florets 5–7 mm, tube 1.5–2 mm, lobes unequal, 1–1.5 mm. Achenes obovoid, compressed, 2.5–3 × ca. 1.5 mm, strigose, marginally finely 2-ribbed. Pappus of ray florets a crown of scales ca. 0.5 mm, of disk florets white, later red tinged, bristles nearly equaling corolla. Fl. Jul–Sep, fr. Aug–Oct.

Forest margins, grasslands, roadsides; sea level to 2400 m. Anhui, Fujian, Gansu, Hebei, Heilongjiang, Hubei, Jiangsu, Jiangxi, Jilin, Nei Mongol, Shaanxi, Shandong, Shanxi, N, NE, and NW Sichuan, Taiwan, Zhejiang [Japan, Korea, Mongolia, E Russia].

25. *Aster meyendorffii* (Regel & Maack) Voss, Vilm. Blumen-gärtn., ed. 3, 469. 1894.

砂狗娃花 sha gou wa hua

Galatella meyendorffii Regel & Maack, Mém. Acad. Imp. Sci. Saint Pétersbourg, Sér. 7, 4: 81. 1861; *Aster ciliosus* Kitamura; *A. depauperatus* H. Léveillé & Vaniot (1909), not Fernald (1908); *Heteropappus hispidus* (Thunberg) Lessing var. *longiradiatus* Komarov; *H. magnicalathinus* J. Q. Fu; *H. meyendorffii* (Regel & Maack) Komarov & Alissova-Klobukova; *H. meyendorffii* var. *hirsutus* Y. Ling & W. Wang; *H. tataricus* (Lindley ex Candolle) Tamamschjan var. *hirsutus* (Y. Ling & W. Wang) H. C. Fu.

Herbs, annual, 35–50 cm tall. Stems erect, striate, ± densely strigose or hispid, strigillose, usually branched from middle, branches ascending. Leaves: basal and lower cauline withered by anthesis, long petiolate, ovate or obovate-oblong, 5–6 × 2.5–3.5 cm, 3-veined, base attenuate, margin roughly crenate, apex obtuse or acute; middle cauline leaves sessile, abaxially pale green, adaxially green, narrowly oblong, 6–8 × 1–2 cm, strigose or adaxially glabrate, abaxial veins strigose, midvein and lateral veins slightly conspicuous on both surfaces, base gradually attenuate, margin coarsely serrate in upper part or entire, strigose-ciliate, apex obtuse or acute; upper leaves gradually smaller, lanceolate to linear-lanceolate, 1–1.5 × ca. 0.3 cm, margin entire, 1-veined. Capitula terminal, solitary on branches, 30–50 mm in diam. Involucres hemispheric, 13–18 mm in diam.; phyllaries 2- or 3-seriate, leaflike, linear-lanceolate, 7–8 mm, apex acuminate, hispid, glandular, inner margin scarious in lower part. Ray florets blue-purple, tube ca. 1.8 mm,

lamina linear-oblong, 14–17(–27) × 2–2.5 mm, apex 3-toothed or entire; disk florets yellow, ca. 5 mm, tube 1–1.5 mm, sparsely hairy, lobes unequal, 0.8–1.2 mm. Achenes of ray florets narrow, sterile, of disk oblong-obovate, compressed, densely silky. Pappus of ray florets few, short or sometimes absent, of disk florets reddish to reddish brown, of 25–35 bristles, 2–4.45 mm, unequal. Fl. Aug–Sep.

Sandy riverbanks, sandy hillside forest understories, grasslands on slopes; above 800 m. NE Gansu, Hebei, Heilongjiang, Jilin, Nei Mongol, Shaanxi, Shanxi [Japan, Korea, E Russia].

This species is very decorative due to the presence of numerous large capitula.

26. *Aster neobiennis* Brouillet, Semple & Y. L. Chen, **nom. nov.**

鞑靼狗娃花 da da gou wa hua

Replaced synonym: *Callistephus biennis* Lindley ex Candolle, Prodr. 5: 275. 1836, not *Aster biennis* Nuttall, Gen. N. Amer. Pl. 2: 155. 1818, nom. illeg. superfl. [*Aster canescens* Pursh, Fl. Amer. Sept. 2: 547. 1813]; *A. hispidus* Thunberg var. *sibiricus* (Komarov) Y. Ling; *Heteropappus hispidus* (Thunberg) Lessing var. *sibiricus* Komarov; *H. meyendorffii* (Regel & Maack) Komarov & Alissova-Klobukova var. *tataricus* (Lindley ex Candolle) Y. Ling & W. Wang; *H. tataricus* (Lindley ex Candolle) Tamamschjan; *Kalimeris biennis* (Lindley ex Candolle) Ledebour (1845), not Nees (1832); *K. tatarica* Lindley ex Candolle (1836), not *Aster tataricus* Linnaeus f. (1782).

Herbs, biennial, 20–40 cm tall. Stems erect, usually solitary, rarely 2- or 3-fascicled, branched in upper part, branches ascending, purplish or reddish, strigose to hirsute, glandular or not. Lower cauline leaves deciduous by anthesis; middle leaves lanceolate to linear-lanceolate, sometimes linear, 2–5 × 0.2–0.5 cm, strigose, eglandular or sparsely minutely glandular, margin long strigose-ciliate, apex acuminate; uppermost leaves reduced. Capitula terminal, solitary on branches, forming open corymbiform synflorescences, 25–40 mm in diam. Involucres hemispheric, 1.2–2 cm in diam.; phyllaries linear-lanceolate to lanceolate, 8–11 mm, abaxially strigose, inconspicuously glandular in lower half, margin scarious, ciliate, apex acuminate. Ray florets blue or blue-lilac, tube 2.5–3 mm, sparsely hairy, lamina 14–28 × 2–2.2 mm; disk florets yellow, sparsely hairy (tube and limb), 3.7–5 mm, tube 1.2–1.8 mm, limb narrowly campanulate, lobes lanceolate, unequal, 0.6–0.8(–1.5) mm. Achenes obovoid, (immature) ca. 2 mm, strigillose. Pappus reddish brown to yellowish, of ray and disk florets ± equal, 3–3.5 mm. Fl. Jul–Aug.

Forest understories on sandy hills, sandy riverbanks. Hebei, Nei Mongol, Shanxi [Mongolia, E Russia (E European part, Siberia)].

“*Aster biennis* Ledebour” (in Weinmann, Bot. Gart. Dorpat, Suppl. I, [1]. 1811; Franchet, Mém. Soc. Sci. Nat. Math. Cherbourg 24: 224. 1884) belongs here but is a nomen nudum and was therefore not validly published (*Vienna Code*, Art. 32.1(d)).

27. *Aster arenarius* (Kitamura) Nemoto, Fl. Jap. Suppl. 736. 1937.

普陀狗娃花 pu tuo gou wa hua

Heteropappus arenarius Kitamura, Acta Phytotax. Geobot. 2: 43. 1933; *H. hispidus* (Thunberg) Lessing subsp. *arenarius* (Kitamura) Kitamura.

Herbs, biennial or perennial, 15–70 cm tall; taproot woody. Stems procumbent or ascending, branched from base, sparsely to moderately strigose or glabrate. Leaves: basal petiole 1.5–3 cm; blade spatulate, 3–6 × 1–1.5 cm, thick, glabrate or sparsely villous, base cuneate to attenuate, margin entire or sometimes remotely serrate, scabrous-ciliate, apex rounded to acute; lower and basal cauline leaves withered by anthesis; middle and upper leaves oblanceolate-oblong, 1–2.5 × 0.2–0.6 cm, glabrous or sometimes sparsely strigose, base attenuate, margin scabrous-ciliate, apex rounded to acute. Capitula solitary at ends of branches, 25–30 mm in diam., peduncle apex dilated; bracts leaflike, surrounding capitulum. Involucres patelliform, 1.2–1.5 cm in diam.; phyllaries 2-seriate, lanceolate, 7–8 × 1–1.5 mm, sparsely scabrous or glabrous, margin scabrous-ciliate, apex acuminate. Ray florets bluish or whitish, tube ca. 1.5 mm, lamina linear-oblong, ca. 1.2 × 0.25 mm; disk florets yellow, 4–5 mm, tube 1.3–1.5 mm, limb funnelform, enlarged, sparsely hairy at base, lobes unequal, triangular, ca. 0.7 mm. Achenes yellowish brown, obovoid, compressed, 2.5–3 mm, strigose, 2- or 3-ribbed. Pappus 1-seriate, of ray florets sordid, basally connate scales ca. 1 mm, of disk florets brownish, numerous, rigid bristles 3–4.2 mm.

Sandy seashores; near sea level. Zhejiang (Putuo) [Japan].

28. *Aster oldhamii* Hemsley, J. Linn. Soc., Bot. 23: 414. 1888 [*“Oldhami”*].

台北狗娃花 tai bei gou wa hua

Heteropappus hispidus (Thunberg) Lessing subsp. *oldhamii* (Hemsley) Kitamura; *H. oldhamii* (Hemsley) Kitamura.

Herbs, biennial, 50–60 cm tall, taprooted. Stems erect, sometimes decumbent, branched from lower part; branches ascending, sparsely to moderately (upward) villous-strigose, strigillose, with sessile glands upward. Leaves thick, margin entire, strigose-ciliate; basal leaves rosulate, withered by anthesis; blade spatulate-oblong, 8–15 × 3–6 cm, glabrous or glabrate, base attenuate, apex rounded; cauline leaves spatulate-oblong or narrowly obovate to oblong, 2.5–4.5 × 0.8–1.7 cm, glabrate, base cuneate, margin entire, strigose-ciliate, apex rounded; uppermost leaves remote, oblanceolate, gradually reduced, 0.5–1.2 × 0.2–0.4 cm. Capitula radiate or sometimes discoid, terminal, solitary on branches, forming open panicle-corymbiform synflorescences, ca. 25 mm in diam. Involucres hemispheric, 0.6–1 cm in diam.; phyllaries 2-seriate, subequal, lanceolate to spatulate or oblanceolate (inner), 5–6 mm, ± strigose, margin sometimes partly scarious, strigose-ciliate, apex acute to acuminate. Ray florets sometimes absent, whitish, ca. 10 × 1.3–3 mm, tube 1–1.7 mm, sparsely hairy; disk florets 3–4.5 mm, tube 0.8–1.5 mm, tube and limb hairy, limb narrowly campanulate to campanulate, lobes unequal, 1 longer, 0.4–0.6(–1.3) mm, minutely with sessile glands and/or strigose-hairy. Achenes obovoid to broadly obovoid, compressed, 1.8–2.5 mm, strigose. Pappus of ray florets whitish, lacerate scales 0.4–1(–1.5) mm, of disk florets reddish, stout bristles 1.8–2.5(–3.5) mm.

• Rocky seashores; sea level. N Taiwan (Taibei).

Some individuals of *Aster oldhamii* are without ray florets (capitula discoid) and have been called *Heteropappus oldhamii* f. *discoidus* Kitamura (Mem. Coll. Sci. Kyoto Imp. Univ., Ser. B, Biol. 13: 321. 1937; 盘状台北狗娃花 pan zhuang tai bei gou wa hua).

29. *Aster crenatifolius* Handel-Mazzetti, Symb. Sin. 7: 1092. 1936.

圆齿狗娃花 yuan chi gou wa hua

Aster crenatifolius var. *subracemosus* Handel-Mazzetti; *Heteropappus crenatifolius* (Handel-Mazzetti) Grierson.

Herbs, annual or biennial, 10–60 cm tall, taprooted. Stems erect, solitary, branched only above, sparsely to densely strigose, stipitate glandular upward. Leaves strigose, with sessile glands; basal leaves rosulate, withered by anthesis; cauline leaves remote; lower cauline leaves shortly winged petiolate; blade oblanceolate, oblong, or spatulate, 2–10 × 0.5–1.6 cm, base attenuate to cuneate, margin entire or ± crenate, apex obtuse or rounded; middle leaves sessile, smaller, base sometimes ± rounded, margin often entire; upper leaves small, linear-oblanceolate or -oblong. Capitula solitary, terminal on branches, sometimes forming ± corymbiform synflorescences, 20–25 mm in diam. Involucres hemispheric, 1–1.5 cm in diam.; phyllaries 3-seriate, sometimes purplish tinged, subequal, linear or linear-lanceolate, 5–8 × 0.6–1.5 mm, abaxially sometimes scabrous or sparsely villous, ± stipitate glandular, margin scabrous-ciliate or glandular, outer phyllaries leaflike, inner phyllaries margin scarious. Ray florets 35–40, mauve or blue, tube 1.2–1.8 mm, glabrous or hairy, lamina 8–12 × 1.6–2.4 mm; disk florets yellow, 4.2–4.8 mm, tube 1–2 mm, glabrous or hairy, limb ± narrowly campanulate, lobes lanceolate, unequal, 0.5–1.5 mm, hairy. Achenes pale greenish brown to pale brownish mottled black or black mottled to black, obovoid, 2–2.8 mm, 2-ribbed marginally, sparsely strigose, sparsely apically glandular. Pappus of ray florets often few and short, sometimes absent or equaling that of disk, of disk 2-seriate, straw-colored or brownish, of unequal bristles 2.9–4.2 mm. Fl. and fr. May–Oct.

Open disturbed slopes, pebbly-sandy river floodplains, riverbanks, alpine or montane meadows, *Juniperus* slopes, montane woodlands, fields, roadsides; 1200–4100 m. Gansu, Hebei, Ningxia, Qinghai, Shaanxi, Sichuan, E Xizang, NW Yunnan [Nepal].

30. *Aster gouldii* C. E. C. Fischer, Bull. Misc. Inform. Kew 1938: 286. 1938.

拉萨狗娃花 la sa gou wa hua

Aster crenatifolius Handel-Mazzetti, p.p. quod syn.; *Heteropappus gouldii* (C. E. C. Fischer) Grierson.

Herbs, annual, 8–30 cm tall, spreading, taprooted. Stems branched from base; branches decumbent to ascending, ± densely strigose, stipitate glandular, especially above. Basal leaves withered by anthesis, winged petiolate, base of petiole clasping, blade oblanceolate, base gradually attenuate; cauline leaves sessile or indistinctly petiolate; blade linear, oblong, oblanceolate, or spatulate, 0.7–3.5 × 0.2–0.5 cm, strigose, stipitate glandular, base attenuate, margin entire, strigose-ciliate, apex obtuse or acute. Capitula solitary or few at ends of branches,

1.5–2.5 cm in diam. Involucres hemispheric, 1–1.5 cm in diam.; phyllaries 2- or 3-seriate, green, subequal, linear-lanceolate to lanceolate, 5–7 × 0.8–1.8 mm, herbaceous, abaxially stipitate glandular, sparsely villous-strigose, acuminate, margin glandular, of inner phyllaries scarious, erose. Ray florets 25–40, purplish or bluish, tube 1.5–2.1 mm, tube and lamina base sparsely hairy, lamina 10–11 × 1.2–2 mm; disk florets yellow, 3.5–4 mm, tube 1–1.2 mm, sparsely hairy, limb campanulate, lobes unequal, 4 short, 0.6–0.9 mm, 1 long, 1.1–1.3 mm, glabrous. Achenes of ray florets pale olive green and black mottled to

black, obovoid, ± compressed, 2–2.5 × 1–1.2 mm, strigose, sparsely glandular apically, faintly 2- or 3-ribbed; of disk florets straw-colored, ± black mottled, obovate to oblanceolate, flattened, 2.2–2.3 mm, strigose, markedly 2-ribbed. Pappus of ray florets 1-seriate, scales 0.3–0.5 mm; of disk florets 2-seriate, reddish; outer bristles ca. 0.5 mm; inner bristles ± stiff, 3.3–3.7 mm. Fl. and fr. Jun–Sep.

Open grassy slopes, disturbed open or bare slopes in alpine meadows, sometimes sandy soils and riverbanks, field margins; 2900–5600 m. Qinghai, Xizang [Bhutan, India (Sikkim)].

6. *Aster* sect. *Aster*

紫菀组 *zi wan zu*

Gymnaster Kitamura (1937), not F. Schütt (1891) [Algae]; *Kitamuraea* Rauschert; *Kitamuraster* Soják; *Leptocoma* Lessing; *Miyamayomena* Kitamura; *Rhynchospermum* Reinwardt; *Zollingeria* Schultz Bipontinus.

Herbs, perennial, usually simple, sometimes branched, erect. Leaves basal (withered at anthesis) and cauline; blade spatulate or ovate to narrowly ovate or lanceolate, sometimes pandurate, margin flat, entire or serrate to coarsely serrate, 1-veined (rarely 3-veined). Capitula radiate, rarely discoid, terminal, numerous, in corymbiform synflorescences, rarely few, rarely solitary at ends of branches or in leaf axils. Involucres hemispheric, campanulate, or obconic, to cylindric-campanulate; phyllaries 3–7-seriate, unequal or sometimes subequal, membranous (upper part sometimes leaflike) or outer leaflike, not keeled, margin scarious. Receptacles flat or ± convex, rarely conic. Ray florets 1(or 2)-seriate, 10–40, purple, blue, lavender, pink, or white; disk floret limb campanulate or sometimes funnellform, lobes equal. Achenes obovoid or oblong to oblanceoloid, ± compressed, 2–6-ribbed. Pappus of ray and disk florets 1–4-seriate, of persistent, rarely caducous, numerous free bristles, innermost series clavate, outermost series of short bristles, rarely of scales, sometimes absent in ray and/or disk florets.

About 60 species: Asia, Europe; 49 species (40 endemic) in China.

As circumscribed here, *Aster* sect. *Aster* is paraphyletic to *A. sect. Alpigeni* (Brouillet et al. in Funk et al., Syst. Evol. Biogeogr. Compositae, 589–629. 2009). The separation of *A. sect. Aster* and *A. sect. Orthomeris* Torrey & A. Gray (Y. Ling & Y. L. Chen, FRPS 74: 134, 157. 1985) is unclear, and data supporting the segregation of monophyletic groups within the section are insufficient at the present time. Removal of the shrubby species of *A. ser. Albescentes* (Incertae sedis group above) renders the group more natural. Furthermore, the name *A. sect. Orthomeris* belongs to the North American *Oclemena* Greene (Brouillet, Fl. N. Amer. 20: 78–81. 2006) and would be inappropriate in *Aster* s.s.

A hitherto unrecognized group of species within *Aster* sect. *Aster* (formerly part of *A. sect. Orthomeris*, see Y. Ling & Y. L. Chen, loc. cit.) was identified in molecular phylogenies (Brouillet et al., loc. cit.), where it appeared to be sister to members of *A. sect. Alpigeni*. The group also includes *Miyamayomena* and *Rhynchospermum*. Morphologically, it is characterized by distally unreduced or slightly reduced cauline leaves that are abaxially pale and often appearing spongy on the surface; some species are glabrous, but most are hairy with minutely stipitate glands that are often (but not always) found in shallow pits and produce an abundance of resin, making the surface or parts of the surface vernicose. Some members of the group have a caducous pappus (*Rhynchospermum*) or have lost the pappus of ray and/or disk achenes (*Miyamayomena*). Further phylogenetic work is necessary to determine the monophyly and limits of this group.

- 1a. Leaf surfaces (both) glabrous (sometimes abaxial veins sparsely strigillose), eglandular; leaves thick, margin revolute.
 - 2a. Capitula solitary in leaf axils or terminal, overall forming a paniculose-corymbiform synflorescence; pappus dirty white 65. *A. hunanensis*
 - 2b. Capitula in corymbiform synflorescences; pappus reddish or yellowish.
 - 3a. Leaves abaxially with 3 or 4 pairs of lateral veins joining to form a raised submarginal vein on each side; achenes 4-ribbed; pappus reddish 49. *A. dolichophyllus*
 - 3b. Leaves with lateral veins 2- or 3-paired; achenes 2-ribbed; pappus yellowish 50. *A. moupinensis*
- 1b. Leaf abaxial and/or adaxial surfaces hairy or glandular; leaves thick or thin, margin flat or revolute.
 - 4a. Abaxial leaf surface minutely stipitate glandular in pits.
 - 5a. Pappus absent in all achenes, or absent in ray and of scales in disk achenes.
 - 6a. Disk pappus of short scales 58. *A. piccolii*
 - 6b. Disk pappus absent.
 - 7a. Ray achenes long beaked 64. *A. verticillatus*
 - 7b. Ray achenes not beaked.
 - 8a. Achenes inconspicuously ribbed; leaf margin entire.
 - 9a. Stems and leaves hispidulous-villous; middle leaves oblong-lanceolate or subelliptic, 1.5–2.5(–4) × 0.3–0.6(–0.9) cm; ray florets ca. 16 mm 60. *A. pseudosimplex*

- 9b. Stems hirsutulous, leaves strigose; middle leaves lanceolate-ovate to narrowly oblong or linear, 1–3 × 0.1–0.6 cm; ray florets 5–7 mm 61. *A. lixianensis*
- 8b. Achenes 2–4- to multiribbed; leaf margin ± serrate or crenate.
- 10a. Leaf margin coarsely serrate to serrate 59. *A. yuanqunensis*
- 10b. Leaf margin remotely serrate, serrulate, or obscurely repand-crenate.
- 11a. Middle leaf blades oblanceolate to narrowly lanceolate, margin remotely serrate to serrulate 62. *A. sinoangustifolius*
- 11b. Middle leaf blades ovate, broadly elliptic, or obovate, margin obscurely repand-crenate 63. *A. lushiensis*
- 5b. Pappus present in all achenes.
- 12a. Ray achenes long beaked 64. *A. verticillatus*
- 12b. Ray achenes not beaked.
- 13a. Phyllary abaxially with midvein plus 3–7 dark green striae; peduncle bracts crowded below head, often grading into phyllaries 73. *A. falcifolius*
- 13b. Phyllary without dark green striae; peduncle bracts not grading into phyllaries.
- 14a. Capitula terminal, solitary (rarely 2) on branches 69. *A. molliusculus*
- 14b. Capitula few to many (rarely 1) in terminal corymbiform synflorescences.
- 15a. Involucre cylindric-campanulate.
- 16a. Ray florets purple 55. *A. alatipes*
- 16b. Ray florets white.
- 17a. Phyllaries 3- or 4-seriate; leaf blade ovate, base cordate 48. *A. formosanus*
- 17b. Phyllaries 5–7-seriate; leaf blade obovate to oblanceolate, base attenuate 51. *A. taiwanensis*
- 15b. Involucre campanulate to hemispheric.
- 18a. Phyllaries 3- or 4-seriate, unequal.
- 19a. Ray florets purple 36. *A. veitchianus*
- 19b. Ray florets white.
- 20a. Lower leaf margin coarsely 3- or 4-serrate distally, teeth pointing forward 53. *A. taoyuenensis*
- 20b. Lower leaf margin crenate-serrate 57. *A. morrisonensis*
- 18b. Phyllaries 2- or 3-seriate, subequal.
- 21a. Ray florets 10–14; capitula 1–10 54. *A. homochlamydeus*
- 21b. Ray florets 25–35(–60); capitula 10 to numerous.
- 22a. Ray florets 30–35(–60); achenes 4-ribbed 70. *A. sikkimensis*
- 22b. Ray florets 25–30; achenes 2-ribbed 72. *A. nigromontanus*
- 4b. Abaxial leaf surface eglandular or glandular (but not in pits).
- 23a. Subshrubs or woody perennial herbs.
- 24a. Phyllaries 3-seriate, unequal to subequal; leaf blades lanceolate, 4–7.5[–10] cm; ray florets 21–25 46. *A. smithianus*
- 24b. Phyllaries 4- or 5-seriate, unequal; leaf blades linear-oblong, oblong, or oblong-lanceolate to elliptic, 0.5–2.5(–3) cm; ray florets 10–20.
- 25a. Leaf and phyllary surfaces strigose, villous; involucre cylindric-campanulate; phyllaries ± leaflike 42. *A. poliothamnus*
- 25b. Leaf and phyllary surfaces densely velutinous; involucre hemispheric; phyllaries membranous 43. *A. sikuensis*
- 23b. Herbs perennial.
- 26a. Phyllaries 2- or 3-seriate, subequal, outer usually leaflike (if sometimes unequal then outer leaflike).
- 27a. Ray florets purple, mauve, pink, or blue; achenes obovoid.
- 28a. Involucre hemispheric; ray florets 50–60 44. *A. taliangshanensis*
- 28b. Involucre campanulate to broadly campanulate; ray florets 13–30.
- 29a. Leaf blade broadly ovate or oblong to lanceolate, base cordate or rounded, margin coarsely serrate to serrate; achenes 4-ribbed, pappus red-brown; disk corolla limb funnelform 34. *A. fuscescens*
- 29b. Leaf blade oblanceolate, base attenuate to cuneate or rounded, margin entire or serrulate to serrate or coarsely serrate; achenes 2-ribbed, pappus dirty white or straw-colored; disk corolla limb campanulate.
- 30a. Ray florets mauve or pink; pappus dirty white; leaf surfaces scabridulous 31. *A. indamellus*
- 30b. Ray florets blue; pappus straw-colored; leaf abaxially villous, adaxially strigillose 39. *A. trichoneurus*
- 27b. Ray florets white; achenes oblong or oblanceoloid, rarely obovoid.
- 31a. Herbs scapiform; leaves basal, rosulate; capitula 1 or 2, terminal 68. *A. itsunboshi*
- 31b. Herbs erect; leaves cauline; capitula 2 to numerous in terminal corymbiform synflorescences (rarely solitary).
- 32a. Middle leaf base auriculate, clasping; ray florets 18–30 35. *A. auriculatus*
- 32b. Middle leaf base cuneate, rounded, or attenuate; ray florets 10–20.
- 33a. Leaf base cuneate to rounded, apex obtuse or rounded, margin revolute, entire 40. *A. mangshanensis*

- 33b. Leaf base attenuate, apex acute to acuminate, margin flat, \pm serrate or entire.
- 34a. Leaf blade ovate to ovate-lanceolate, midvein prominent 45. *A. procerus*
- 34b. Leaf blade oblong-lanceolate, triplinerved 66. *A. menelii*
- 26b. Phyllaries 3–7-seriate, unequal, leaflike in upper part or not leaflike (notably if subequal).
- 35a. Leaf margin revolute, entire or \pm serrate.
- 36a. Pappus white or dirty white (innermost reddish).
- 37a. Middle leaf blade oblanceolate to ovate, base cuneate-rounded to rounded; ray florets white; pappus dirty white (innermost reddish) 52. *A. chingshuiensis*
- 37b. Middle leaf blade narrowly lanceolate to linear-lanceolate, base attenuate; ray florets blue-purple; pappus white 67. *A. gracilicaulis*
- 36b. Pappus reddish brown or orangish.
- 38a. Middle leaf abaxial surface tomentose; phyllaries 3-seriate 41. *A. vestitus*
- 38b. Middle leaf abaxial surface velutinous or moderately scabridulous, strigose; phyllaries 4–6-seriate.
- 39a. Middle leaves sessile or shortly petiolate, blade lanceolate, abaxially velutinous 77. *A. velutinosus*
- 39b. Middle leaves winged petiolate, blade ovate to linear-obovate, abaxially moderately scabridulous, strigose, minutely stipitate glandular 79. *A. sampsonii*
- 35b. Leaf margin flat, coarsely serrate or serrate to serrulate or entire.
- 40a. Ray florets white.
- 41a. Abaxial leaf surface moderately scabrous or moderately strigose, adaxial surface scabrous, margin serrate or serrulate; phyllaries 5–7-seriate.
- 42a. Middle leaf blade pandurate or ovate to ovate-lanceolate, base truncate or rounded to auriculate-clasping; capitula 1–10 in racemiform synflorescences; involucre 10–12 mm 74. *A. turbinatus*
- 42b. Middle leaf blade narrowly ovate to lanceolate, base attenuate to rounded; capitula numerous in corymbiform to paniculiform synflorescences; involucre 6–7 mm 75. *A. baccharoides*
- 41b. Abaxial leaf surface \pm hispidulous, adaxial surface sparsely puberulent or hispidulous, margin entire to subentire or sparsely serrate; phyllaries 4- or 5-seriate.
- 43a. Middle leaf blade oblong or oblong-elliptic, base attenuate 76. *A. sinianus*
- 43b. Middle leaf blade ovate, base rounded 78. *A. ovalifolius*
- 40b. Ray florets purple.
- 44a. Middle leaf blade cordate, reniform, or subrounded, cordate-ovate 56. *A. limosus*
- 44b. Middle leaf blade pandurate or ovate to ovate-lanceolate, lanceolate, or linear-lanceolate.
- 45a. Middle and upper leaves petiolate; disk corolla limb funnelform, lobes lanceolate; achenes lanceoloid 71. *A. pycnophyllus*
- 45b. Middle and upper leaves winged petiolate or sessile; disk corolla limb campanulate, lobes narrowly triangular; achenes obovoid.
- 46a. Phyllaries 5- or 6-seriate; involucre 10–12 mm 74. *A. turbinatus*
- 46b. Phyllaries 3- or 4-seriate; involucre 4–10(–12) mm.
- 47a. Involucre 7–10(–12) mm.
- 48a. Middle leaf blade ovate or pandurate to lanceolate-pandurate, base attenuate or auriculate, clasping 37. *A. sphaerotus*
- 48b. Middle leaf blade oblanceolate to ovate or lanceolate, base attenuate.
- 49a. Leaf midvein prominent; phyllary apex acute or acuminate; ray florets 14–30; achenes 4–6-ribbed 32. *A. tataricus*
- 49b. Leaf 3-veined; phyllary apex obtuse to rounded; ray florets 30–40; achenes 2-ribbed 33. *A. maackii*
- 47b. Involucre 4–6 mm.
- 50a. Middle leaves sessile, blade lanceolate to linear-lanceolate, apex acuminate; pappus white 47. *A. dolichopodus*
- 50b. Middle leaves winged petiolate or sessile, blade ovate or pandurate to lanceolate-pandurate or elliptic to oblanceolate, apex obtuse or acute; pappus reddish.
- 51a. Middle leaf blade ovate or pandurate to lanceolate-pandurate 38. *A. panduratus*
- 51b. Middle leaf blade ovate to elliptic or oblanceolate 41. *A. vestitus*

31. *Aster indamellus* Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 87. 1964.

叶苞紫苑 ye bao zi wan

Aster pseudamellus J. D. Hooker, Fl. Brit. India 3: 249. 1881, not Wenderoth (1831).

Herbs, perennial, 11–50 cm tall, from woody caudices, rhizomatous. Stems erect or ascending, simple, reddish strigillose, minutely stipitate glandular. Leaves cauline, gradually increased in size upward; lowest leaves withered by anthesis, sessile, oblanceolate, scabridulous, minutely stipitate glandular, (sometimes glabrous), margin entire or 1–7-serrulate to coarsely ser-

rate, scabridulous-ciliate, midvein slightly prominent adaxially, apex acute, mucronulate; middle to upper leaves oblanceolate, 1.6–4(–6) × 0.4–1.7(–2) cm, base attenuate to cuneate; synflorescence leaves oblanceolate, 1.4–1.6 × 0.2–0.4 cm. Capitula 1–20 in terminal, corymbiform to paniculate-corymbiform synflorescences, rarely solitary; peduncles 30–70 mm, strigillose; bracts oblanceolate, entire, upper bracts closely subtending capitula. Involucres campanulate, 5–7 mm; phyllaries 2- or 3-seriate, subequal, base hardened, margin erose, ciliate, green in distal 1/3, conspicuous midvein slightly translucent; outer phyllaries narrowly to broadly lanceolate, 5–6 × 1.5–2.5 mm, midvein sparsely to moderately strigillose, proximally minutely stipitate glandular, both surfaces densely so upward, leaflike distally, margin narrowly scarious, apex sometimes spreading, acute, ciliate; middle phyllaries oblong, 5–6 × 1.3–1.8 mm, abaxially proximally sparsely and distally densely minutely stipitate glandular, leaflike in distal 1/4 to only tip, margin ± broadly scarious, apex obtuse, mucronate, distal margin and apex purplish; inner phyllaries linear-oblong, 6–7 × 0.8–1 mm, scarious, apex sometimes purplish. Ray florets 25–30, blue, mauve, or pink, tube sparsely strigillose, lamina 13–16 × 1–2 mm, eglandular; disk florets yellow, 4.5–5 mm, tube apex and limb base sparsely strigillose, sparsely minutely stipitate glandular, limb campanulate, 2.5–3 mm, lobes erect, tip spreading, triangular to narrowly triangular, 1.2–1.5 mm, sparsely strigillose, eglandular. Achenes obovoid, ± compressed, 3–3.5 mm, sparsely to moderately strigillose, sparsely minutely stipitate glandular apically, 2-ribbed. Pappus 3-seriate, dirty white, of slender, barbellate bristles; outer bristles 0.3–1.1 mm; inner bristles 3–3.5 mm, tapering; innermost bristles 4.5–5 mm, tapering. Fl. and fr. Jul–Sep.

Alpine and subalpine open forests on grassy slopes, rock crevices, screes; 1900–4200 m. W Xizang (Yangsi) [Afghanistan, NW India, Kashmir, Nepal, Pakistan].

Aster indamellus is closely related to *A. amellus* Linnaeus but differs in having outer phyllaries leaflike, distinctly veined, acute at apex, with broader tips, and by often being glandular. Native to the area from Europe to W Siberia, *A. amellus* is sometimes cultivated in China.

32. *Aster tataricus* Linnaeus f., Suppl. Pl. 373. 1782.

紫菀 zi wan

Aster nakaii H. Léveillé & Vaniot; *A. tataricus* var. *nakaii* (H. Léveillé & Vaniot) Kitamura; *A. trinervius* Roxburgh ex D. Don var. *longifolius* Franchet & Savatier.

Herbs, perennial, 11–150 cm tall; rhizomes becoming woody; stemless rosettes often present. Stems erect, simple, ribbed, glabrate proximally to sparsely strigillose distally, minutely stipitate glandular below leaves. Leaves cauline, much reduced upward, scabrous, abaxially sparsely minutely stipitate glandular, margin scabrous-ciliate, midvein prominent abaxially, apex acuminate to acute or rounded, mucronate; lowest leaves withered by anthesis, long, slightly winged petiolate (petiole to 30 cm), petiole base sheathing; blade oblanceolate to ovate, (2.1–)30–50 × (0.9–)6–12 cm, base attenuate, margin undulate, coarsely serrate, veins pinnately 6–10-paired; lower to upper leaves shortly petiolate (base sheathing) or sessile, oblan-

ceolate to lanceolate, 2–18 × 0.6–5 cm, base attenuate, margin coarsely serrate to serrulate or entire; synflorescence leaves lanceolate, 1.3–7 × 0.2–1 cm. Capitula (2–)14–50 or more, in terminal corymbiform synflorescences; peduncles 25–65 mm, sparsely strigillose, moderately to densely minutely stipitate glandular; bracts linear-lanceolate, entire, sometimes grading into phyllaries. Involucres campanulate, 7–10(–12) mm; phyllaries 3-seriate, unequal, green along midvein, membranous, base ± hardened, margin erose, ciliate, midvein ± pronounced, slightly translucent; outer phyllaries narrowly lanceolate, 4–5 × 0.8–1 mm, sparsely strigillose, distally sparsely minutely stipitate glandular, sometimes ± leaflike, margin narrowly scarious, apex acute, ciliate, tip purplish; middle phyllaries oblong to lanceolate-oblong, 6–7 × ca. 1 mm, abaxially glabrous to sparsely strigillose distally or along midvein, eglandular or very sparsely glandular, margin scarious, apex acuminate, sometimes mucronate, distal margin and apex purplish; inner phyllaries linear-lanceolate to linear-oblong, 8–10 × 0.6–1 mm, glabrous, sparsely minutely stipitate glandular, margin scarious, apex acuminate, erose, purplish. Ray florets 14–30, blue or pale lavender or to purple, lamina 7–15 × 1.5–2.5 mm, glabrous, eglandular; disk florets yellow, 5–7 mm, limb campanulate, 3.5–4 mm, lobes erect, tip spreading, narrowly triangular, ca. 2 mm, glabrous, eglandular. Achenes dark, obovoid, slightly compressed, 2.5–3 mm, sparsely to moderately strigillose, sparsely minutely stipitate glandular apically, 4–6-ribbed. Pappus 4-seriate, reddish, of barbellate bristles; outermost bristles few, slender, 0.2–0.3 mm; outer bristles slender 1.5–2 mm; inner bristles 4.5–5 mm, tapering; innermost bristles 6–7 mm, slightly clavate. Fl. Jul–Sep, fr. Aug–Oct. $2n = 54$.

Shaded damp places, meadows, steppes, damp riverbanks; 400–3300 m. Anhui, Gansu, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Jilin, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shandong, Shanxi, Sichuan [Japan, Korea, Mongolia, Russia].

The roots of *Aster tataricus* are used medicinally to relieve coughs and reduce sputum.

33. *Aster maackii* Regel, Mém. Acad. Imp. Sci. Saint Pétersbourg, Sér. 7, 4: 81. 1861.

圓苞紫菀 yuan bao zi wan

Aster horridifolius H. Léveillé & Vaniot; *A. kodzumanus* Makino.

Herbs, perennial, 40–90 cm tall, rhizomatous. Stems erect, simple, reddish striate, sparsely scabridulous upward, sparsely minutely stipitate glandular below leaves, more so distally. Leaves cauline, gradually increased in size upward; lowest leaves withered by anthesis, sessile, (blade shape not observed), sparsely to densely scabridulous, minutely stipitate glandular, very sparsely so adaxially, margin serrate to serrulate, scabridulous-ciliate, 3-veined, midvein prominent adaxially, apex acute or sometimes obtuse, mucronulate; lower to upper leaves lanceolate, 4–11 × 0.7–2 cm, base attenuate; synflorescence leaves lanceolate, 2–6 × 0.5–1.5 cm, margin serrulate to entire. Capitula (1 or) 2–10 or more, in terminal corymbiform synflorescences, rarely solitary; peduncles 20–80 mm, moderately to densely scabridulous, minutely stipitate glandular; bracts nar-

rowly ovate, entire, upper bracts closely subtending capitula. Involucres broadly campanulate, 7–9 mm; phyllaries 3-seriate, unequal, base hardened, abaxially glabrous, eglandular or sparsely minutely stipitate glandular, margin scarious, erose, leaflike in distal 1/3, ciliate, midvein slightly translucent, apex obtuse to rounded, ciliate; outer phyllaries lanceolate to oblong, 2–4 × 0.9–1.1 mm, abaxially minutely stipitate glandular distally, midvein sparsely to moderately strigillose; middle phyllaries oblong, 6–7 × 1.2–1.3 mm, distal margin and apex purplish; inner phyllaries linear-oblong, 9.5–10 × 1–2 mm, scarious, apex purplish. Ray florets 30–40, purple, tube sparsely hairy, lamina 15–18 × ca. 1.5 mm, eglandular; disk florets yellow, ca. 7 mm, tube and limb base sparsely hairy, sparsely minutely stipitate glandular, limb campanulate, ca. 4 mm, lobes spreading, tip recurved, triangular to narrowly triangular, 1.2–1.5 mm, sparsely strigillose apically, eglandular. Achenes purple proximally to mottled purple distally, obovoid, compressed, 2.3–2.5 mm, moderately to densely strigillose, sparsely minutely stipitate glandular apically, 2-ribbed. Pappus 4-seriate, dirty white, of slender, barbellate bristles; outermost bristles 0–4, 0.2–0.6 mm; outer bristles absent or 1, ca. 2.8 mm; inner bristles 4.8–5.2 mm, tapering; innermost bristles 5.3–5.7 mm, tapering. Fl. and fr. Jul–Oct. $2n = 18$.

Damp forests, damp grasslands, mountain meadows; 400–1000 m. Heilongjiang, Jilin, Liaoning, Nei Mongol, S Ningxia [Japan, Korea, E Russia].

34. *Aster fuscescens* Bureau & Franchet, J. Bot. (Morot) 5: 49. 1891.

褐毛紫菀 he mao zi wan

Herbs, perennial, 15–120 cm tall; rhizomes long; adjacent rosettes often present. Stems erect to ascending, simple, striate, sometimes reddish, villosulous, minutely stipitate glandular, more densely so distally. Leaves cauline, usually gradually decreasing upward, abaxially pale green or silvery green, adaxially dark green, abaxially strigillose, adaxially glabrous or glabrate, or both surfaces strigillose, villosulous on veins, abaxially sparsely to densely minutely stipitate glandular, adaxially more abundantly so marginally, margin coarsely serrate to serrate (teeth mucronate), villosulous-ciliate, veins prominent abaxially or on both surfaces, apex mucronate; lowest leaves withered by anthesis or often present, long petiolate (petiole to 20 cm); blade broadly ovate or oblong to lanceolate, 4.5–12 × (2.5–)3.8–7(–10) cm, base cordate or rounded (or attenuate), apex rounded to obtuse; lower to upper leaves long to shortly petiolate; blade broadly to narrowly ovate or lanceolate, (3–)4–11 × (1.5–)3.2–11 cm, base rounded (or attenuate), apex obtuse to acute; synflorescence leaves shortly petiolate, narrowly ovate to lanceolate, 2.7–5.5 × 0.3–2.2 cm, base rounded (attenuate), margin serrulate to entire, apex acute. Capitula 7–36 in terminal corymbiform synflorescences, ca. 3 cm in diam.; peduncles 10–80 mm, glabrate to sparsely villosulous or strigillose, densely minutely stipitate glandular; bracts linear-lanceolate, entire. Involucres broadly campanulate, 5–11 × 10–15 mm; phyllaries 3-seriate, subequal, linear-lanceolate, 7–11 × 1.3–2.5 mm, abaxially sparsely villosulous along midvein to glabrous, moderately to densely minutely stipitate glandular or eglandular, base some-

times hardened, margin scarious (outer phyllaries narrowly scarious), erose, purplish, villosulous-ciliate, green, midvein slightly translucent, apex acuminate, tip purplish, ciliate. Ray florets 13–21(–25), lamina purple to bluish, 7.5–13 × 2.2–3 mm, glabrous, eglandular; disk florets yellow, 7.2–7.5 mm, tube green, sparsely strigillose, eglandular, limb funnelform, 7.2–7.5 mm, lobes spreading, sometimes tip recurved, narrowly triangular, 1.5–1.7 mm, purple tinged, glabrous or sparsely strigillose apically, sparsely glandular apically. Achenes obovoid, compressed, ca. 3.5 mm, sparsely strigillose, proximally sparsely to apically moderately to densely minutely stipitate glandular, 4-ribbed. Pappus 4-seriate, of red-brown, slender, barbellate bristles; outermost bristles 0–2, ca. 0.5 mm; outer bristles many, 1.2–4 mm; inner bristles 4–5.5 mm, tapering; innermost bristles 6–9, 7–8 mm, slightly clavate. Fl. Jul–Oct, fr. Aug–Dec.

Alpine and subalpine meadows and grassy slopes among shrubs, bamboo-*Rhododendron* thickets, bamboo thickets in disturbed deciduous forests, meadows in broad-leaved evergreen forests, rocky slopes; 2700–4200 m. Sichuan, Xizang, Yunnan [NE Myanmar].

Aster fuscescens is clearly divided into three varieties.

- 1a. Lower cauline leaves oblong to lanceolate, ± densely villous, glandular 34c. var. *oblongifolius*
- 1b. Lower cauline leaves broadly ovate, base cordate, glabrate or sparsely to moderately villous and glandular.
 - 2a. Leaves thin and soft, reticulate veins hardly prominent 34a. var. *fuscescens*
 - 2b. Leaves rough, reticulate veins prominent on both surfaces 34b. var. *scaberoides*

34a. *Aster fuscescens* var. *fuscescens*

褐毛紫菀(原变种) he mao zi wan (yuan bian zhong)

Aster doronicifolius H. Léveillé.

Stems to 60 cm tall, robust, base 4–6 mm in diam., pubescent, glandular. Lower cauline leaves broadly ovate; lowermost leaves (withered by anthesis): petiole to 12 cm; blade 7–12 × 6.5–10 cm; middle leaves: petiole to 12 cm, smaller; uppermost leaves sessile, ovate-lanceolate, sparsely villous or glabrate, sparsely glandular, thin and soft, reticulate veins hardly prominent. Phyllaries villous, short-stipitate glandular.

W Sichuan, SE Xizang, NW Yunnan [NE Myanmar].

34b. *Aster fuscescens* var. *scaberoides* C. C. Chang, Bull. Fan Mem. Inst. Biol., Bot. 6: 46. 1935.

少毛褐毛紫菀 shao mao he mao zi wan

Stems to 45 cm tall, slender, base ca. 4 mm in diam., glabrescent below, brownish pubescent above, sometimes short-stipitate glandular. Lower cauline leaves: petiole to 15 cm; blade broadly ovate, 3–6.5 × 3–6 cm, base cordate; upper cauline leaves sessile, narrower, ovate or lanceolate, adaxially sparsely to moderately villous, sparsely to moderately glandular, reticulate veins prominent on both surfaces. Phyllaries glabrous.

• E Xizang, NW Yunnan.

34c. *Aster fuscescens* var. *oblongifolius* Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 93. 1964.

长圆叶褐毛紫菀 *chang yuan ye he mao zi wan*

Stems to 35 cm tall, slender, base to 4 mm in diam., villous, glandular. Lower cauline leaves oblong to lanceolate, 5–8.5 × 2.5–3.5 cm, margin repand-dentate, teeth mucronate; upper leaves few, sessile, lanceolate, 3–7 × 1.5–3 cm, densely villous, short-stipitate glandular, reticulate veins hardly prominent on both surfaces. Phyllaries ± densely villous, densely stipitate glandular.

E Xizang (Qamdo) [N Myanmar].

35. *Aster auriculatus* Franchet, J. Bot. (Morot) 10: 376. 1896.

耳叶紫菀 *er ye zi wan*

Herbs, perennial, 23–90 cm tall, rarely caespitose; rhizomes ± woody. Stems erect, simple, ± striate, sparsely to densely villous, densely minutely stipitate glandular. Leaves cauline, somewhat reduced upward, base sometimes marcescent, both surfaces villosulous, sparsely to densely minutely stipitate glandular, margin serrate to serrulate, villosulous-ciliate, midvein prominent, more so abaxially, apex mucronate; lowest leaves withered by anthesis, broadly winged petiole, petiole base auriculate; blade oblanceolate, obovate, or oblong, base attenuate, apex obtuse; lower to upper leaves sessile, obovate or oblong to oblanceolate, sometimes pandurate, 1.5–7 × 0.4–1.5 cm, base auriculate, clasping, apex obtuse to acute (upper leaves); synflorescence leaves narrowly ovate to lanceolate, 1–4.5 × 0.1–0.9 cm, margin serrulate to entire. Capitula 2–23, in terminal corymbiform synflorescences, rarely solitary; peduncles 10–30 mm, sparsely hispidulous to villosulous, densely minutely stipitate glandular; bracts linear, entire. Involucres campanulate, 6–7 mm; phyllaries 3-seriate, unequal (to nearly subequal), abaxially glabrous or strigose, sparsely to densely minutely stipitate glandular (middle and inner phyllaries base eglandular), base hardened, midvein slightly translucent; outer phyllaries lanceolate to linear-lanceolate, 2.5–6 × 0.5–0.8 mm, leaflike, margin barely to ± scarious, eciliate or sparsely ciliate, glandular, apex sometimes spreading or squarrose, acute, ciliate; middle phyllaries narrowly oblong to narrowly lanceolate, 5–6 × 0.7–1.5 mm, margin narrowly scarious, tip green, sometimes leaflike, apex acute to acuminate, distal margin and apex ± purplish; inner phyllaries distally green, linear-oblong, 6–7 × 0.7–1.3 mm, margin broadly scarious, erose, apex sometimes acuminate, erose, sometimes purplish. Ray florets 18–30, white, tube sparsely strigillose, lamina 6–9 × 1–2.5 mm, eglandular; disk florets yellow, 4.5–5 mm, limb campanulate, 3–3.5 mm, proximally glabrous and sparsely minutely stipitate glandular, lobes erect, tip sometimes spreading, narrowly triangular, 1–1.3 mm, glabrous, tip sparsely minutely stipitate glandular. Achenes lanceolate, compressed, 3–4 mm, sparsely strigillose, sparsely to moderately minutely stipitate glandular apically, 2-ribbed. Pappus 4-seriate, reddish, of slender barbellate bristles; outermost bristles absent or 1, 0.2–0.3 mm; outer bristles 0–3, 1.2–

2.5 mm; inner bristles 3.7–4 mm, tapering; innermost bristles 4–4.3 mm, barely clavate. Fl. and fr. Apr–Aug.

• Open forests, mixed forests, thickets, grasslands; 800–3000 m. Gansu, Guangxi, Guizhou, Hubei, Sichuan, Xizang (Zayü), Yunnan.

Aster auriculatus, especially the roots, is used medicinally to reduce phlegm and treat snakebites.

36. *Aster veitchianus* Hutchinson & J. R. Drummond ex Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 3: 214. 1935.

峨眉紫菀 *e mei zi wan*

Herbs, perennial, 6–40 cm tall; rhizomes long, thin. Stems erect, simple, slender, striate, sparsely villous (crosswalls brown), sparsely minutely stipitate glandular distally. Leaves cauline, abruptly reduced upward, abaxially pale green, adaxially green, abaxially sparsely pilose on midvein and distally, sparsely minutely stipitate glandular in shallow pits, adaxially moderately pilose, very sparsely minutely stipitate glandular, margin serrate to serrulate (teeth mucronulate), pilose-ciliate, midvein slightly prominent abaxially, apex mucronate; lowest leaves present and dominant at anthesis, long petiole (petiole to 7 cm); blade spatulate or obovate to oblanceolate, 1.5–9 × 0.8–3.8 cm, base attenuate, apex rounded to obtuse; lower to middle leaves sessile, pandurate, 4–8.5 × 0.9–1.7 cm, base auriculate, clasping, margin entire; upper leaves sessile, lanceolate to linear-lanceolate, 2.5–4 × 0.3–1 cm, base auriculate, clasping; synflorescence leaves few, linear-lanceolate, 0.8–2 × 0.1–0.5 cm, base ± auriculate, margin entire. Capitula 1–10 in terminal corymbiform synflorescences, sometimes solitary; peduncles 3.5–10 cm, pilose, strigillose, sparsely to moderately minutely stipitate glandular; bracts linear, entire, upper bracts closely subtending capitula and grading into phyllaries. Involucres hemispheric, 6–8 mm; phyllaries 3-seriate, unequal, green apically, glabrous, base ± hardened, margin broadly scarious, erose, purplish, ciliate, midvein more pronounced distally, ± translucent, apex acuminate, sometimes erose, purplish, eciliate; outer phyllaries lanceolate, 3–4 × 0.6–1 mm, (outermost tip recurved, ciliate, minutely stipitate glandular); middle and inner phyllaries membranous, often multiveined; middle phyllaries oblanceolate, 5.5–6.5 × 1.2–1.3 mm; inner phyllaries lanceolate, 6.5–7 × ca. 1 mm. Ray florets 35–54, purple, tube hairy, lamina 9–10 × 1–1.5 mm, eglandular; disk florets yellow, 4.5–5.5 mm, tube base flared, tube apex and limb base strigillose, eglandular, limb campanulate, 2.8–3 mm, lobes spreading, narrowly triangular, 2.1–2.3 mm, glabrous, eglandular. Achenes oblong, slightly compressed, 2–2.5(–3) mm (immature), sparsely strigillose, minutely stipitate glandular, 2-ribbed. Pappus 3-seriate, ± reddish, of barbellate bristles; outermost series of white scales, 0.4–0.6 mm; inner bristles 4–4.6 mm, tapering; innermost bristles 5–5.2 mm, weakly clavate. Fl. May–Jun, fr. Jun–Aug.

• Shaded damp places, ravines, canal sides on slopes; 800–2400 m. C and W Sichuan.

37. *Aster sphaerotus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 145. 1985.

圆耳紫菀 *yuan er zi wan*

Erigeron panduratus C. C. Chang, Sunyatsenia 6: 17. 1941, not *Aster panduratus* Nees ex Walpers (1843).

Herbs, perennial, 30–40 cm tall, rhizomatous; stolons long, slender. Stems erect, simple, purplish striate, \pm densely villous, very sparsely minutely stipitate glandular, more densely long-stipitate glandular under leaves. Leaves cauline, gradually reduced upward, petiole base and midvein marcescent, abaxially purplish, sparsely villous, veins sparsely minutely stipitate glandular (long stipitate at base and on petiole), adaxially villous to pilose, minutely stipitate glandular apically, margin serrate, ciliate, midvein prominent abaxially, apex obtuse to acute, mucronate; lowest leaves withered by anthesis, lower to upper leaves narrowly to broadly winged petiolate (petiole to 1.3 cm, petiole base auriculate-clasping, proximal margin villous) or sessile, ovate or pandurate to lanceolate-pandurate, 2.5–3.5 \times 0.7–2 cm, base attenuate or auriculate, clasping; synflorescence leaves shortly petiolate, ovate to lanceolate, 1–2.3 \times 0.4–1 cm. Capitula 3–5 in terminal, corymbiform synflorescences; peduncles 10–42 mm, villosulous, densely minutely long-stipitate glandular; bracts ovate to lanceolate, entire. Involucres hemispheric, 7–8(–10) mm; phyllaries 4-seriate, unequal, abaxially glabrous, densely minutely stipitate glandular, base usually hardened, midvein prominent, translucent; outer phyllaries bractlike, linear-lanceolate, 5–5.5 \times 1–1.2 mm, distal 1/2 leaflike, margin not or \pm narrowly scarious, ciliate, densely minutely stipitate glandular, apex spreading, sometimes squarrose, acute, sometimes mucronulate, purplish, middle and inner phyllaries with margin erose, ciliate, apex long acuminate, tip leaflike, purplish; middle phyllaries oblong, 6–8 \times 1.3–1.5 mm, margin broadly scarious, ciliate; inner phyllaries linear-lanceolate, 8–8.5 \times 1–1.2 mm, scarious. Ray florets 35–40, purplish to pink, tube sparsely hairy, lamina 7–9 \times 1–1.2 mm, eglandular; disk florets yellow, ca. 4 mm, tube and limb base sparsely hairy, eglandular, limb campanulate, 2.2–2.5 mm, lobes erect to spreading, narrowly triangular, ca. 1 mm, glabrous, eglandular. Achenes (immature; shape unknown) ca. 2.7 mm or more, sparsely strigillose, minutely stipitate glandular, 2-ribbed. Pappus 3-seriate, reddish, of slender barbellate bristles; outermost bristles few, 1.3–1.6 mm; inner bristles 3.3–3.7 mm, tapering; innermost bristles 3.5–4 mm, long clavate. Fl. Jul–Aug, fr. Aug(to later).

• Mountain forests; ca. 2700 m. W Guangxi.

38. *Aster panduratus* Nees ex Walpers, Nov. Actorum Acad. Caes. Leop.-Carol. Nat. Cur. 19(Suppl. 1): 258. 1843.

琴叶紫菀 qin ye zi wan

Aster argyi H. Léveillé; *A. candelabrum* Vaniot.

Herbs, perennial, 14–100 cm tall, sometimes caespitose, rhizomatous, sometimes with next year's rosette. Stems erect, simple or branched upward, purplish striate, \pm densely villous, \pm densely minutely long-stipitate glandular. Leaves cauline, gradually reduced upward, abaxially villous to shortly villous (upper leaves), adaxially villous to strigose (upper leaves), veins villous, densely minutely long-stipitate glandular, margin coarsely serrate to serrulate or entire (upper leaves), villous to strigose-ciliate, midvein prominent abaxially, sometimes somewhat 3-veined, apex obtuse to acute, mucronulate; lowest

leaves withered by anthesis, (long) winged petiolate, ovate, base attenuate; lower to upper leaves sessile, ovate or pandurate to lanceolate-pandurate, 1.5–7(–9) \times 0.4–1.8(–2.5) cm, base auriculate, clasping; synflorescence leaves oblong-ovate, 1–2.5 \times 0.2–0.8 cm. Capitula 3–40, in terminal, laxly corymbiform synflorescences, rarely solitary; peduncles 5–50 mm, villosulous, densely minutely long-stipitate glandular; bracts lanceolate, entire, upper bracts grading into phyllaries. Involucres hemispheric to campanulate, ca. 5 mm; phyllaries 3-seriate, unequal, midvein thin; outer phyllaries linear-lanceolate, 3–3.5 \times 0.5–0.7 mm, abaxially glabrous, densely minutely long-stipitate glandular, leaflike, margin not to \pm narrowly scarious, ciliate, apex sometimes spreading, acute, sometimes mucronate, sometimes purplish, ciliate, middle and inner phyllaries green distally, base hardened, margin erose, ciliate; middle phyllaries oblanceolate, 3.8–4 \times 1–1.3 mm, abaxially densely minutely long-stipitate glandular, margin broadly scarious, ciliate, apex acuminate; inner phyllaries linear-oblong, 4–4.5 \times 0.8–1.1 mm, distally densely minutely long-stipitate glandular, scarious. Ray florets 15–25, purple to blue, or white tinged purplish, tube sparsely strigillose, lamina 5–7 \times 1.5–2 mm, eglandular; disk florets yellow, 4.5–5 mm, tube and limb base sparsely strigillose, minutely stipitate glandular, limb campanulate, 2.5–3 mm, lobes erect to spreading, narrowly triangular, 1.5–1.7 mm, glabrous, sparsely minutely stipitate glandular. Achenes obovoid, slightly compressed, ca. 1.5 mm, sparsely strigillose, minutely stipitate glandular, 2-ribbed. Pappus 3- or 4-seriate, of few, reddish, slender barbellate bristles; outermost bristles few, ca. 0.5 mm; outer bristles absent or 1, ca. 2 mm; inner bristles 2.5–3 mm, tapering; innermost bristles 4–5 mm, weakly clavate. Fl. Feb–Sep, fr. Jun–Oct.

• Thickets, grasslands on slopes, canal sides, roadsides, field margins; 100–1400 m. Fujian, Guangdong, Guangxi, Guizhou, W Hubei, Hunan, Jiangsu, Jiangxi, W Sichuan, Zhejiang.

39. *Aster trichoneurus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 355. 1985.

毛脉紫菀 mao mai zi wan

Herbs, perennial, 30–50 cm tall; rhizomes thick. Stems erect, simple, densely villous, more sparsely so upward, densely minutely stipitate glandular. Leaves cauline, somewhat reduced upward, base sometimes marcescent, abaxially villosulous, adaxially strigillose, both surfaces minutely stipitate glandular, thin, margin serrulate to serrate, villosulous-ciliate, 3-veined, lower secondary veins prominent, apex obtuse to acute, mucronulate; lowest leaves withered by anthesis, long winged petiolate, petiole base auriculate; blade oblanceolate, base attenuate; lower to upper leaves shortly winged petiolate (base clasping) to sessile, oblanceolate to oblong, 3–8 \times 0.7–1.8 cm, base rounded; synflorescence leaves lanceolate, 2–3.5 \times 0.5–0.9 cm, base cuneate-rounded, margin entire. Capitula 3 or 4 or more (simple specimen) in terminal corymbiform synflorescences, rarely solitary, ca. 3 cm in diam.; peduncles 25–90 mm, strigillose to villosulous, densely minutely stipitate glandular; bracts lanceolate to linear-lanceolate, entire. Involucres broadly campanulate, 5–6(–7) \times ca. 10 mm; phyllaries 3-seriate, nearly subequal, abaxially strigillose to villosulous, sparsely to densely minutely stipitate glandular, base hardened, midvein slightly

translucent, distal margin and apex \pm purplish; outer phyllaries linear-oblong, $4-4.6 \times 0.6-0.7$ mm, distal 1/2 leaflike, margin barely to \pm scarious, ciliate, glandular, apex sometimes spreading or squarrose, acute, mucronulate, ciliate; middle phyllaries linear-oblong to linear-lanceolate, $5-6 \times 1-1.2$ mm, margin narrowly scarious, tip green or sometimes leaflike, apex acute to acuminate; inner phyllaries linear-lanceolate, $5-5.5 \times$ ca. 1 mm, margin broadly scarious, erose, tip green, apex erose. Ray florets 23–27, blue, tube sparsely strigillose, lamina $7-9 \times 1.6-2$ mm, eglandular; disk florets yellow, ca. 4.5 mm, limb campanulate, ca. 3 mm, proximally sparsely strigillose and minutely stipitate glandular, lobes erect, tip sometimes spreading, narrowly triangular, ca. 1 mm, tip sparsely strigillose and minutely stipitate glandular. Achenes narrowly obovoid, \pm compressed, $2.5-2.8$ mm, densely strigillose, sparsely strigillose on ribs, minutely stipitate glandular apically, 2-ribbed. Pappus 3- or 4-seriate, straw-colored, of slender barbellate bristles; outermost bristles few, $0.2-0.5$ mm; outer bristles absent or 1, ca. 2 mm; inner bristles $3.5-3.7$ mm, tapering; innermost bristles $4.2-4.3$ mm, barely clavate. Fl. and fr. Sep.

• Ravines, mountain canals; ca. 2700 m. NW Yunnan (Dèqên).

Aster trichoneurus is similar to *A. auriculatus* but differs in its broader and larger, 3-veined leaves without clasping auricles, and narrow, sparsely hairy phyllaries.

40. *Aster mangshanensis* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 355. 1985.

莽山紫菀 mang shan zi wan

Herbs, perennial, 17–30 cm tall; rhizomes \pm robust. Stems erect, \pm densely yellowish strigose, more so upward, stipitate glandular on peduncles. Leaves moderately to densely strigose, \pm with dense sessile glands, adaxially densely strigose, abaxially midvein slightly prominent, lateral veins 3- or 4-paired, obscure; lower leaves withered by anthesis; middle leaves sessile or shortly petiolate (petiole less than ca. 2 mm); blade oblong to obovate-oblong, $2.2-2.5 \times 0.3-1.1$ cm, base cuneate to rounded, margin entire, revolute, scabrous-ciliate, apex obtuse to rounded; upper leaves gradually reduced, $0.8-1 \times 0.4-0.6$ cm. Capitula in paniculate-corymbiform synflorescence, ca. 1.5 cm in diam.; peduncles 1–3 cm; bracts oblanceolate. Involucre hemispheric (broadly obconic), $4-5 \times$ ca. 7 mm; phyllaries 3-seriate, subequal, obovate-oblong, abaxially strigose, with sessile glands, margin strigose- to \pm villous-ciliate; outer phyllaries reflexed, ca. $4 \times 1-1.5$ mm, leaflike or distally leaflike, apex obtuse to acute; inner phyllaries $4-4.5 \times$ ca. 1 mm, acute, margin scarious, erose, ciliate. Ray florets 14–16, white, tube 1–1.3 mm, lamina $6-7 \times 1.5-1.8$ mm; disk florets 4–4.2 mm, tube 1.1–1.5 mm, upper tube and limb base hairy, limb campanulate, lobes lanceolate, ca. 0.7 mm, recurved, glandular. Achenes greenish, oblanceolate, slightly compressed, slightly trigonous, $1.9-2.3$ mm, sparsely strigillose, with sparse sessile glands, pale 3-ribbed. Pappus 3-seriate, orangish; outer bristles ca. 0.4 mm; inner bristles ca. 5.6 mm; innermost bristles ca. 7.2 mm, barely clavate.

• S Hunan (Yizhang: Mang Shan).

41. *Aster vestitus* Franchet, J. Bot. (Morot) 10: 378. 1896.

密毛紫菀 mi mao zi wan

Aster mairei H. Léveillé; *A. sherriffianus* Handel-Mazzetti.

Herbs, perennial, 50–130 cm tall, rarely caespitose, rhizomatous. Stems erect-ascending, simple, reddish striate, villosulous, minutely long-stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially gray-green, adaxially green, abaxially tomentose, sometimes sparsely villous, densely minutely stipitate glandular, adaxially strigose, sparsely minutely stipitate glandular, margin serrate to serrulate, strigose-ciliate, midvein prominent abaxially, apex acute, mucronulate; lowest leaves withered by anthesis (unobserved); lower to upper leaves broadly and shortly petiolate (lower leaves) to sessile, ovate to elliptic or oblanceolate, $1.8-6 \times 0.5-1.7$ cm, base rounded or slightly auriculate to cuneate-rounded, sometimes subclasping; synflorescence leaf blade ovate to lanceolate, $1.3-2.5 \times 0.4-0.7$ cm, entire. Capitula 6–35 or more, in terminal corymbiform synflorescences; peduncles 10–35 mm, sparsely villosulous, densely minutely stipitate glandular (glands sometimes long stipitate); bracts absent or 1, oblanceolate, entire. Involucre broadly campanulate to hemispheric, 4–6 mm; phyllaries 3-seriate, unequal, distally green, distal margin and apex tip purple, abaxially glabrous, densely minutely stipitate glandular, base hardened, densely minutely stipitate glandular, midvein prominent, translucent; outer phyllaries linear-lanceolate, $3-4 \times$ ca. 0.8 mm, margin narrowly scarious, eciliate, apex acute, mucronulate, proximally strigillose, sparsely long-stipitate glandular; middle and inner phyllaries oblong to lanceolate-oblong, $4.5-5.5 \times 1.2-1.8$ mm, margin broadly scarious, erose, eciliate, apex acuminate, erose. Ray florets 18–30, white or pale purple, lamina $5-9 \times 1.5-2$ mm, glabrous, eglandular; disk florets yellow, ca. 4.5 mm, limb campanulate, ca. 2.5 mm, base sparsely strigillose, sometimes sparsely minutely stipitate glandular, lobes erect to spreading, narrowly triangular, ca. 1.2 mm, glabrous, sparsely minutely stipitate glandular. Achenes obovoid, compressed, $2.5-3$ mm, strigillose, sparsely minutely stipitate glandular, 2-ribbed. Pappus 3-seriate, reddish, of barbellate bristles; outermost bristles few, slender, $0.3-0.6$ mm; inner bristles $3-3.5$ mm, tapering; innermost bristles $4.2-4.7$ mm, slightly clavate. Fl. and fr. Sep–Dec.

Alpine and subalpine forest margins, grasses, slopes, riverbanks, sandy places; 2200–3200 m. SW Sichuan, S Xizang, N and NW Yunnan [Bhutan, India (Sikkim), N Myanmar].

42. *Aster poliothamnus* Diels, Repert. Spec. Nov. Regni Veg. Beih. 12: 503. 1922.

灰枝紫菀 hui zhi zi wan

Subshrubs, 15–100 cm tall, sometimes shrublike, caespitose, caudex woody. Stems branched, bark gray-brown, lacerate; branches erect, densely leafy, sparsely to densely villosulous, often in decurrent lines below leaves, minutely stipitate glandular. Leaves cauline, slightly reduced upward; lower leaves withered by anthesis, shortly petiolate; blade oblong or linear-oblong, sometimes conduplicate and arched, $0.5-2(-3) \times 0.1-0.5(-0.8)$ cm, abaxially densely strigillose, minutely gland-dotted, sometimes stipitate glandular on veins, adaxially strigose, base decurrent, attenuate to cuneate, margin entire, strigose-ciliate, midvein abaxially prominent, apex obtuse to acute,

mucronate. Capitula in corymbiform, sometimes paniculate-corymbiform, synflorescences, or solitary; peduncles 10–30 mm, strigillose, minutely short- to long-stipitate glandular; bracts remote, lanceolate to oblanceolate, 5–10 mm. Involucres cylindric-campanulate, 5–8 mm; phyllaries 4–6-seriate, unequal, base hardened, \pm keeled, midvein translucent distally, apex acute; outer phyllaries lanceolate, $3-4 \times 0.1-0.7$ mm, abaxially sparsely to moderately strigillose distally (leaflike part), densely minutely stipitate glandular, leaflike to distally leaflike, margin broadly scarious, narrowly so distally or not (when leaflike), ciliate; middle phyllaries lanceolate to linear-lanceolate, $5-7 \times 0.5-0.7$ mm, margin narrowly to broadly scarious, ciliate, purplish (except leaflike ones), distal $1/10-1/4$ leaflike to green area purplish, sparsely strigillose or minutely stipitate glandular in leaflike part; inner phyllaries linear-lanceolate, $6-7 \times$ ca. 1 mm, scarious, tip purplish, sparsely minutely stipitate glandular. Ray florets 10–20, lavender or lilac to purple, tube distal $1/2$ and lamina base strigillose, sometimes sparsely stipitate glandular, lamina $7-10 \times 1.2-2$ mm; disk florets yellow, 5–6.5 mm, limb funnelform, ca. 4 mm, lobes spreading, narrowly triangular, $0.7-1.2$ mm, tip glabrous, sparsely stipitate glandular. Achenes obovoid to elliptic, compressed, 3–3.5 mm, sparsely strigillose, minutely stipitate glandular, mostly on ribs, 2- or 3-ribbed. Pappus 4-seriate, straw-colored, of slender, barbellate bristles; outermost bristles few, very slender, 0.1–0.5 mm; outer bristles few, very slender, 2.5–3 mm; inner bristles 4.2–4.5 mm, tapering; innermost bristles 4.5–5 mm, tip flattened. Fl. Jun–Sep, fr. Aug–Oct.

• Dry slopes, rocky cliffs, stony places, *Artemisia-Stipa* formations, xerophytic shrublands, riverbanks, roadsides; 800–4200 m. S Gansu, E Qinghai, Shaanxi, W Sichuan, E Xizang.

43. *Aster sikuensis* W. W. Smith & Farrer, Notes Roy. Bot. Gard. Edinburgh 9: 80. 1916.

西固紫菀 *xi gu zi wan*

Subshrubs, 30–40 cm, caespitose. Stems numerous, erect or ascending, puberulent, branched above, densely leafy. Leaves cauline, thick, densely puberulent, abaxially gray-green, midvein and 3- or 4-pairs of lateral veins prominent, adaxially dark green; lower leaves withered by anthesis; middle leaves subsessile, oblong, elliptic, or oblong-lanceolate, $1.5-2.5 \times 0.5-0.8$ cm, base \pm rounded or broadly cuneate, margin entire, revolute, apex obtuse or rounded; upper leaves gradually reduced, $0.4-0.6 \times 0.2-0.3$ cm. Capitula ca. 1.5 cm in diam., solitary or in corymbiform synflorescences; peduncles to 3 cm. Involucres hemispheric, $1.5-5 \times 6-7$ mm; phyllaries 4-seriate, unequal, abaxially puberulent, membranous, margin villous-ciliate; outer phyllaries ovate-lanceolate, $1.5-2 \times$ ca. 0.8 mm, acute, sometimes somewhat purplish; inner phyllaries lanceolate, ca. 3×1 mm, acute; innermost phyllaries linear-lanceolate, $4.5-5 \times$ ca. 0.8 mm, margin narrowly scarious, acuminate. Ray florets 10–16, white or reddish, tube 2–2.4 mm, hairy, lamina linear-oblong, $8-10 \times 1.3-1.5$ mm; disk florets 4.8–5.2 mm, tube 1.8–2.1 mm, tube and limb sparsely hairy, lobes lanceolate, ca. 1.2 mm, tip glandular. Achenes lanceolate, slightly compressed, ca. 2 mm, strigose, 4-ribbed. Pappus 3-seriate, yellowish to reddish; outer bristles ca. 0.2 mm; inner bristles ca. 3 mm, acute; innermost bristles 4–4.5 mm, clavate. Fr. Oct.

• Dry slopes or stony places, dry roadsides; 800–2300 m. S Gansu (Xigu), NW Sichuan.

44. *Aster taliangshanensis* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 356. 1985.

凉山紫菀 *liang shan zi wan*

Herbs, perennial, 50–80 cm; rhizome vertical or procumbent. Stems erect or ascending, thick, multibranched, finely sulcate, strigose and strigillose. Leaves cauline, abaxially strigose, veins with sparse sessile glands and sparsely villous-strigose, midvein and 5 or 6 pairs of lateral veins prominent, conspicuously reticulate, adaxially densely strigose; lower leaves withered by anthesis; middle leaves sessile or shortly petiolate; blade ovate to broadly lanceolate, $6-11 \times 1.5-2.5$ cm, base gradually or abruptly attenuate, rarely subrounded, subclaspig, margin serrate, teeth mucronulate, scarious, apex acute to acuminate; upper leaves lanceolate, $3-5 \times 0.5-1$ cm, margin entire or serrulate. Capitula in terminal, open corymbiform synflorescences, 3–4 cm in diam.; peduncles 2–10 cm; bract linear-lanceolate when present. Involucres hemispheric, 10–12 mm in diam.; phyllaries 3-seriate, subequal, $5-6 \times 1.5-1.8$ mm, abaxially villous-strigillose, margin scarious (outer phyllaries narrowly so), erose-fimbriate, purplish; outer phyllaries oblong to oblanceolate, leaflike, base hardened, apex acute to acuminate, sometimes recurved, glandular; inner phyllaries membranous, apex herbaceous. Ray florets 50–60, blue-purple, tube 0.7–1 mm, glabrous, lamina $8-15 \times 1.5-2$ mm; disk florets yellow, 3–4 mm, glabrous, tube ca. 1.1 mm, limb campanulate, lobes 1–1.1 mm. Achenes brown, obovoid, compressed, 2–2.5 mm, sparsely strigillose to glabrate, pale 2–4-ribbed. Pappus 3-seriate, dirty white or reddish brown, of barbellate bristles; outermost bristles slender, 0.4–0.9 mm; inner bristles ca. 3.8 mm, acute; innermost bristles 4–4.1 mm, slightly clavate. Fl. Jun–Aug, fr. Aug–Sep.

• Low mountains and alpine forests, grasslands, dry stony shrubby slopes, roadsides; 2500–3100 m. SW and W Sichuan.

The involucre and the number of ray florets of *Aster taliangshanensis* are distinctive.

45. *Aster procerus* Hemsley, J. Linn. Soc., Bot. 23: 415. 1888.

高茎紫菀 *gao jing zi wan*

Asteromoea procera (Hemsley) Y. Ling; *Kalimeris procera* (Hemsley) S. Y. Hu.

Herbs, perennial, 70–100 cm tall. Stems erect, thick, strigose or \pm glabrescent in lower part, stipitate glandular below capitula, spreading branched from middle. Leaves abaxially pale green, both surfaces scarious, thin, midvein abaxially prominent; (lower leaves not seen); middle leaves shortly petiolate; blade ovate to ovate-lanceolate, $7-11 \times 3-5.5$ cm, base attenuate, margin serrate, apex acute to acuminate; upper leaves sessile, small, finely serrate or subentire. Capitula solitary at ends of branches or long peduncles, in open corymbiform synflorescences, 3–4 cm in diam.; peduncles 3–4 cm; bracts densely scarious, glandular. Involucres hemispheric, 6–7 mm, 12–15 mm in diam.; phyllaries 2- or 3-seriate; outer phyllaries leaflike, subequal, shorter to slightly longer than inner phyllaries, ca. $5.1 \times 1-1.5$ mm, densely scarious, margin sca-

brous, apex acuminate; most inner phyllaries membranous, narrower, sparsely scabrous or glabrate, margin narrowly scarious. Ray florets 10–20, white, tube 0.7–1 mm, hairy (not seen), lamina oblong-linear, ca. $15 \times 2\text{--}2.5$ mm; disk florets ca. 3.7 mm, tube 1.1–1.5 mm, hairy, limb campanulate, lobes lanceolate, 1–1.2 mm, recurved. Achenes brown, obovoid, slightly compressed, trigonous, 3.5–4 mm, strigose, 3-ribbed. Pappus 1-seriate, dirty white, of unequal, rigid bristles 1–1.5(–2) mm. Fl. May–Sep, fr. Aug–Oct.

• Forest margins, mountain slopes; below 400 m. S Anhui, W Hubei, N Zhejiang.

46. *Aster smithianus* Handel-Mazzetti, Acta Horti Gothob. 12: 216. 1938.

甘川紫菀 gan chuan zi wan

Aster smithianus var. *pilosior* Handel-Mazzetti; *Kalimeris smithiana* (Handel-Mazzetti) S. Y. Hu.

Subshrubs or herbs (woody), perennial, 60–150 cm tall, rhizomatous. Stems erect, simple or branched, shallowly striate, villosulous, minutely stipitate glandular, resinous. Leaves cauline, gradually reduced upward, abaxially silvery green, adaxially green, abaxially villosulous-strigillose, veins villosulous, sparsely to moderately minutely stipitate glandular, adaxially scabridulous, resinous, base attenuate, margin entire, sometimes shortly serrate, strigose-ciliate, midvein prominent on both surfaces, apex acute; lowest leaves withered by anthesis, shortly and narrowly winged petiolate (blade not observed); lower to upper leaves lanceolate, $4\text{--}7.5(10) \times 1\text{--}2.3$ cm; synflorescence leaves lanceolate, sometimes falcate, $1.2\text{--}6 \times 0.3\text{--}1.8$ cm, mucronulate. Capitula 7 to numerous in terminal corymbiform synflorescences; peduncles 18–70 mm, sparsely to moderately strigillose-villosulous, sparsely to moderately stipitate glandular, resinous, more densely so below capitula; bracts oblanceolate, entire, grading into phyllaries. Involucres hemispheric, 2–3 mm; phyllaries 3-seriate, unequal to subequal, abaxially sparsely to densely villosulous, more densely villosulous distally, densely minutely stipitate glandular, resinous, base hardened, slightly keeled, membranous, margin narrowly scarious, erose, ciliate, green distally, midvein prominent, translucent, sometimes faintly multiveined, inner surface shiny, apex acute to obtuse, sometimes mucronulate; outer phyllaries lanceolate, $2\text{--}4 \times 0.8\text{--}1.5$ mm; middle phyllaries oblanceolate, $4\text{--}4.5 \times 1\text{--}1.3$ mm; inner phyllaries oblanceolate, $4\text{--}4.5 \times \text{ca. } 1$ mm, tip sometimes purplish. Ray florets 21–25, white or light purple, tube apex and lamina base sparsely hairy, sometimes sparsely minutely stipitate glandular, lamina $6\text{--}10 \times 1.5\text{--}2$ mm; disk florets yellow, ca. 3 mm, tube apex and limb base sparsely hairy, sparsely minutely stipitate glandular, limb campanulate, ca. 2 mm, lobes spreading, narrowly triangular, ca. 0.7 mm, glabrous, eglandular. Achenes dark purple, broadly obovoid, \pm compressed to \pm trigonous, ca. 2 mm, strigillose, sparsely minutely stipitate glandular, 2- or 3-ribbed. Pappus 1–3-seriate, of few dirty white, basally flattened barbellate bristles; outermost series (always present) of scales ca. 0.1 mm; inner series of bristles ca. 0.5 mm; innermost bristles 1–1.5 mm; those of ray florets reduced in number. Fl. Aug–Oct, fr. Sep–Oct.

• Low mountains, subalpine grasslands, stony riverbanks; 1300–3400 m. S Gansu, W Sichuan, NW Yunnan.

47. *Aster dolichopodus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 356. 1985.

长梗紫菀 chang geng zi wan

Herbs, perennial, 38–90 cm tall, sometimes caespitose; rhizomes long, thin. Stems erect, simple, sometimes branched upward, reddish striate, villous, sparsely minutely stipitate glandular. Leaves cauline, gradually reduced upward; blade abaxially pale green, adaxially green, abaxially sparsely strigose, eglandular, adaxially scabridulous, base rounded (lower leaves) or auriculate, clasping, margin remotely serrate to entire, strigose-ciliate, midvein prominent on both surfaces, apex acuminate, often falcate, mucronulate; lowest leaves withered by anthesis (unobserved); lower to upper leaves shortly petiolate (lower leaves) or sessile, lanceolate to linear-lanceolate, $3.5\text{--}13 \times 0.3\text{--}1.8$ cm; synflorescence leaves lanceolate to linear-lanceolate, $1.5\text{--}5 \times 0.1\text{--}1$ cm. Capitula 1–16 in terminal corymbiform synflorescences, sometimes solitary; peduncles 25–150 mm, sparsely villosulous, sparsely stipitate glandular, more densely so below capitula; bracts linear-lanceolate, entire, sometimes falcate, sometimes subtending involucre. Involucres broadly campanulate, 5–6 mm; phyllaries 3- or 4-seriate, unequal, green distally, abaxially glabrous, densely minutely stipitate glandular, base hardened, membranous, margin narrowly scarious, erose, \pm purplish distally, glandular, midvein prominent, translucent, sometimes faintly multiveined, apex sometimes curved, acute, sometimes mucronulate, purplish; outer phyllaries oblong-lanceolate, $2.5\text{--}3 \times 0.6\text{--}0.8$ mm; middle phyllaries narrowly oblanceolate, $4\text{--}5 \times 1\text{--}1.2$ mm; inner phyllaries narrowly oblanceolate, $5\text{--}5.5 \times 0.8\text{--}1.1$ mm, scarious. Ray florets 19–26, light purple to purple, tube apex and lamina base sparsely hairy, sometimes sparsely minutely stipitate glandular, lamina $10\text{--}14 \times 1.5\text{--}2$ mm; disk florets yellow, sometimes becoming purplish, 4–4.5 mm, tube apex and limb base sparsely strigillose, sparsely minutely stipitate glandular, limb campanulate, 2.2–2.5 mm, lobes spreading, narrowly triangular, 1–1.2 mm, tip very sparsely strigillose, sparsely minutely stipitate glandular. Achenes dark purple, broadly obovoid, \pm compressed to \pm trigonous, 2.5–3 mm, sparsely strigillose, sparsely minutely stipitate glandular distally or eglandular, 2- or 3-ribbed. Pappus 4-seriate, dirty white, of few barbellate bristles; outermost series of narrow scales 0.2–0.4 mm; outer bristles slender, 0.8–1.5 mm; inner bristles ca. 2.5 mm, tapering; innermost bristles ca. 3 mm, clavate. Fl. and fr. Jul–Sep.

• Grasslands on slopes, *Quercus-Abies* scrub on dry slopes, scrub, thicket margins, dry stream banks, canal sides, roadsides; 2400–3500 m. Gansu, S Shaanxi, NW and W Sichuan.

48. *Aster formosanus* Hayata, Icon. Pl. Formosan. 8: 46. 1919.

台岩紫菀 tai yan zi wan

Herbs, perennial, 30–80 cm tall (specimens incomplete); rhizomes long, slender. Stems erect, simple, flexuous, sometimes branched in upper part, finely striate, purplish, glabrous, eglandular. Leaves cauline, gradually reduced upward, long

petiolate (petiole to 7 cm); petiole purple, base hyaline-auriculate, clasping; blade abaxially pale green, adaxially green, shiny, abaxially glabrous, minutely stipitate glandular in pits, adaxially scabridulous near margin, base cordate, margin coarsely serrate, sparsely ciliate, midvein and main lateral veins prominent abaxially, apex long acuminate, mucronate; lowest leaves (not seen) withered by anthesis, sometimes marcescent, blade oblong; lower to upper leaves ovate, 6–11(–16) × 2.5–7 cm; synflorescence leaves petiolate (petiole to 1 cm), lanceolate, 2–4 × 0.2–0.8 cm, base cuneate, margin serrulate or entire. Capitula to 130 or more, in terminal paniculiform-corymbiform synflorescences; peduncles 7–10 mm, sparsely to moderately strigillose, minutely stipitate glandular; bracts lanceolate, entire. Involucre cylindric-campanulate, 3–5 mm; phyllaries 3- or 4-seriate, unequal, green, ca. 1 mm wide, glabrous, minutely stipitate glandular, resinous, margin narrowly to broadly scarious, erose, midvein pronounced, ± translucent, apex rounded to obtuse or acute, erose, purplish, ciliate; outer phyllaries ovate, 1.5–2 mm; middle phyllaries oblong, 2–3 mm, base hardened; inner phyllaries oblong, 4–5 mm. Ray florets 8–15, tube strigillose, lamina white, 4–5(–6.5) × 1–1.5 mm, eglandular; disk florets yellow, ca. 7 mm, tube base flared, tube apex and limb base strigillose, limb campanulate, ca. 3.5 mm, lobes spreading, recurved, narrowly triangular, ca. 3 mm, eglandular. Achenes (immature) oblong, slightly compressed, 2.5–3 mm, 4-ribbed, strigillose, eglandular. Pappus (immature) 3-seriate, straw-colored, of barbellate bristles; outer bristles few, slender, ca. 2 mm; inner bristles 3.5–4 mm, tapering; innermost bristles ca. 4.5 mm, weakly clavate. Fl. and fr. May–Dec.

• Roadsides, exposed and damp places in mixed broad-leaved and coniferous forests; 1400–2700 m. Taiwan, Zhejiang.

49. *Aster dolichophyllus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 357. 1985.

长叶紫菀 *chang ye zi wan*

Herbs, perennial, up to ca. 45 cm tall; rhizomes strong, branched. Stems ascending, densely leafy in lower part, more sparsely leafy in upper part, glabrous or strigose in upper part. Leaves ± thick, glabrous, eglandular, abaxially with 3 or 4 pairs of lateral veins joining to form a raised submarginal vein on each side, reticulate veins ± conspicuous; basal and lower leaves present at anthesis, long petiolate; petiole subclasping; blade oblanceolate, 10–17 × 1–2 cm, base gradually attenuate, margin distally sparsely crenate-serrulate, teeth mucronulate, apex falcate-acuminate or acuminate; middle leaves shortly petiolate, narrowly lanceolate, 5–9 × 0.5–0.8 cm, base attenuate, margin entire, rarely crenulate-serrulate; upper leaves sessile, reduced, linear-lanceolate. Capitula ca. 8 in open corymbiform synflorescences, ca. 2.5 cm in diam.; peduncles densely strigose; bracts linear. Involucre hemispheric, 6–7 × 6–7 mm; phyllaries 3-seriate, lanceolate, apex long acuminate; outer phyllaries ca. 2.5 mm, sparsely strigose, apex leaflike; inner phyllaries membranous, margin scarious, ciliate. Ray florets ca. 10, white, tube ca. 2 mm, densely hairy, lamina linear, up to 10 × 1 mm; disk florets 5–6 mm, tube 1.7–2.5 mm, densely hairy, limb funnel-form, lobes lanceolate, ca. 1.7 mm, glabrous. Achenes brown, narrowly oblanceolate, slightly compressed, ca. 4.8 mm, densely

strigose, pale 4-ribbed. Pappus reddish, 4-seriate; outermost series ca. 0.6 mm; outer series slender, ca. 2.8 mm; inner series ca. 5 mm, acute; innermost series ca. 5.7 mm, clavate. Fl. Oct.

• With mosses on rocks along riverbanks in forests. N Guangxi (Longsheng).

50. *Aster moupinensis* (Franchet) Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 613. 1937.

川鄂紫菀 *chuan e zi wan*

Erigeron moupinensis Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 10: 36. 1887; *Aster henryi* Hemsl.

Herbs, perennial, 12–40 cm tall, ± caespitose; rhizomes robust, ± woody. Stems erect, slender, branched in upper part, canaliculate, glabrous or sparsely strigillose in lower part, strigillose in upper part. Leaves glabrous, eglandular, thick, margin slightly revolute or flat, thickened, remotely, sparsely serrulate or serrate, teeth mucronulate, scabrous, midvein conspicuously raised, lateral veins 2- or 3-paired, subparallel to margin and inconspicuous; basal leaves present at anthesis, ± rosulate, long petiolate, narrowly oblanceolate to linear-oblanceolate, 4–12 × 0.2–0.7 cm, gradually attenuate, apex acute or acuminate, mucronate; lower and middle leaves linear-oblong to linear, 2–4 × 0.2–0.4 cm, ± erect; upper leaves small, linear, abaxially sparsely strigillose, 1-veined. Capitula in open corymbiform synflorescences, 3–4 cm in diam. Involucre hemispheric, 7–8 × 10–12 mm; phyllaries 3-seriate, narrowly oblong, acute, apex tinged purple, strigillose; outer phyllaries narrower, green, membranous, ca. 7 × 1.5 mm, margin ciliate, of inner phyllaries scarious, erose-fimbriate. Ray florets 16–20, white, tube ca. 3 mm, hairy, lamina narrowly elliptic, ca. 15 × 1.5 mm; disk florets yellow, ca. 6 mm, tube ca. 2.5 mm, tube and limb hairy, limb funnelform, lobes ca. 1.5 mm, glabrous. Achenes tan to brown, oblong, compressed, ca. 3 mm, strigose, 2-ribbed. Pappus 3-seriate, yellowish; outer series ca. 0.3 mm; inner series ca. 4 mm, acute; innermost series ca. 5.5 mm, clavate. Fl. and fr. Jul–Sep.

• Riverbanks, grassy slopes, sandy areas, on rocks; 100–200 m. W Hubei, E Sichuan.

51. *Aster taiwanensis* Kitamura, Acta Phytotax. Geobot. 1: 145. 1932.

台湾紫菀 *tai wan zi wan*

Aster baccharoides (Benth) Steetz var. *kanehirae* Yamamoto; *A. scaberrimus* Hayata; *A. trinervius* Roxburgh ex D. Don var. *hayatae* Yamamoto; *A. trinervius* var. *scandens* Hayata.

Herbs, perennial, 30–100(–300) cm tall; rhizomes long, slender. Stems erect, simple, sometimes branched in upper part, finely striate, glabrous or glabrate or sparsely strigillose proximally, strigillose distally, minutely stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially pale green, adaxially green, shiny, abaxially glabrous, minutely stipitate glandular in pits, veins sparsely strigillose, adaxially scabridulous, margin sparsely ciliate, midvein prominent abaxially, apex acuminate, mucronate; lowest leaves withered by anthesis, shortly winged petiolate; blade obovate to oblanceo-

late, 0.7–9 cm, base attenuate, margin serrulate to coarsely serrate; lower to upper leaves shortly petiolate (petiole 0.2–0.5 cm); blade oblanceolate to narrowly lanceolate, 3–14 × 0.5–3 cm, base cuneate-rounded to rounded, margin serrate; synflorescence leaves shortly petiolate, lanceolate, 1.5–6 × 0.3–1.2 cm, base rounded, margin 1–5-serrate. Capitula 17–150 or more in terminal paniculate-corymbiform synflorescences; peduncles 3–10 mm, strigillose; bracts lanceolate, entire. Involucres cylindric-campanulate, 4.5–7 mm; phyllaries 5–7-seriate, unequal, green distally, ca. 1 mm wide, apically minutely stipitate glandular, margin scarious, erose, purplish, ciliate, midvein more pronounced distally, ± translucent, apex rounded, erose, purplish, ciliate; outer phyllaries broadly ovate, ca. 1 mm; middle phyllaries oblong, 2–3 mm, base hardened; inner phyllaries oblong, 4–5 mm. Ray florets 8–17, white, tube hairy, lamina 3.5–5(–7) × 1–1.5 mm, eglandular; disk florets yellow, 5.5(–6) mm, tube base flared, tube apex and limb base hairy and sparsely minutely stipitate glandular, limb campanulate, ca. 3 mm, lobes spreading, narrowly triangular, ca. 2 mm, glabrous, eglandular. Achenes mottled purple, oblong, slightly compressed, 2–2.5 mm, strigillose, eglandular, 2-ribbed. Pappus 3-seriate, white or (innermost) ± reddish; outermost bristles few, 0.5–0.7 mm; inner bristles ca. 4 mm, acute; innermost bristles ca. 4.2 mm, weakly clavate. Fl. and fr. May–Dec. $2n = 18^*$.

• Grassy slopes, deciduous or mixed evergreen forests on steep slopes, roadsides or trailsides in forests, rock walls, cliffs, often on limestone, exposed open sites; 100–3000 m. Taiwan.

52. *Aster chingshuiensis* Y. C. Liu & C. H. Ou, Quart. J. Chin. Forest. 14: 26. 1981.

清水马兰 qing shui ma lan

Aster hualiensis S. S. Ying.

Herbs, perennial, 10–25 cm tall, sometimes caespitose; rhizomes long, slender. Stems ascending, simple, finely striate, densely villous proximally, strigillose distally, minutely stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially pale green, adaxially green, shiny, abaxially strigillose, minutely stipitate glandular, veins densely strigillose, adaxially scabridulous, margin revolute, sparsely ciliate, midvein prominent abaxially, apex acuminate, mucronate; lowest leaves withered by anthesis, shortly winged petiolate; blade obovate to oblanceolate, 0.7–1.5 cm, base tapering, margin serrulate to serrate; lower to upper leaves shortly petiolate (petiole 0.1–0.2 cm); blade oblanceolate to ovate, 1.2–3 × 0.5–2 cm, base cuneate-rounded to rounded, margin serrate to serrulate; synflorescence leaves shortly petiolate, ovate to lanceolate, 0.5–2.5 × 0.1–0.6 cm, base rounded, margin 1–5-serrate. Capitula 3–50 in terminal, dense corymbiform synflorescences; peduncles 3–30 mm, strigillose; bracts lanceolate, entire. Involucres cylindric-campanulate, 4–5 mm; phyllaries 3–5-seriate, unequal, green distally, ca. 0.7 mm wide, apically strigillose and minutely stipitate glandular, margin scarious, erose, purplish, ciliate, midvein more pronounced distally, ± translucent, apex rounded to obtuse, erose, purplish, ciliate; outer phyllaries broadly ovate, ca. 1 mm; middle phyllaries oblong, 2–2.5 mm, base hardened; inner phyllaries oblong to lin-

ear-oblong, 4–4.5 mm. Ray florets 5–10, white, tube strigillose, lamina 3–5 × 1–1.5 mm, eglandular; disk florets yellow, ca. 3 mm, tube base flared, tube apex and limb base hairy and minutely stipitate glandular, limb campanulate, ca. 2 mm, lobes spreading, narrowly triangular, ca. 1 mm, abaxially sparsely minutely stipitate glandular. Achenes oblong, slightly compressed, ca. 2 mm, sparsely strigillose, minutely stipitate glandular, 3-ribbed. Pappus brownish, 4-seriate, dirty white or (innermost) ± reddish; outermost bristles few, 0.5–0.7 mm; outer bristles slender, very few or none, ca. 1.2 mm; inner bristles 2.8–3.2 mm, tapering; innermost bristles 3.5–4 mm, weakly clavate. Fl. and fr. Aug–Nov.

• Limestone crevices and gravel; 2000–2200 m. Taiwan.

53. *Aster taoyuenensis* S. S. Ying, J. Jap. Bot. 63: 49. 1988.

桃园马兰 tao yuan ma lan

Herbs, perennial, 30–70 cm tall; rhizomes long, slender. Stems ascending, simple, branched distally, finely striate, moderately to densely villous proximally, strigillose distally, sparsely minutely stipitate glandular. Leaves cauline, not or slightly reduced upward; lowest leaves withered by anthesis, abaxially pale green (spongelike), adaxially green, shiny, abaxially strigose, minutely stipitate glandular in pits, adaxially scabridulous, margin slightly revolute, coarsely 3- or 4-serrate distally, teeth pointing forward, villous-ciliate, ± 3-veined, veins prominent abaxially, apex acuminate, mucronate; lowest leaves shortly winged petiolate; blade obovate to oblanceolate, ca. 2.5 cm (insufficient material), base attenuate, margin serrate; lower to upper leaves shortly petiolate (petiole to 0.3 cm); blade oblanceolate (proximally) to usually lanceolate, 5.2–6.5 × 1.5–2(–2.5) cm, base rounded; synflorescence leaves shortly petiolate, lanceolate, 2.2–4 × 0.8–1.3 cm, base rounded, margin 1–3-serrate or entire. Capitula 7–9 in terminal, loose corymbiform synflorescences; peduncles 1–4 mm, densely strigillose, minutely stipitate glandular in pits; bracts narrowly lanceolate to oblanceolate or linear-oblanceolate, scarious, erose. Involucres broadly campanulate to hemispheric, (3–)5 mm; phyllaries 3- or 4-seriate, unequal, green distally, apically strigillose and minutely stipitate glandular, sometimes slightly pitted, margin scarious, erose, purplish, ciliate, midvein more pronounced distally, ± translucent, apex acuminate, erose, purplish, ciliate; outer phyllaries narrowly ovate to oblong-lanceolate, 1.5–2 × ca. 0.5 mm; middle phyllaries oblong, 3–4 × ca. 0.9 mm, base hardened; inner phyllaries linear-oblong, 4–5 × 0.4–0.5 mm. Ray florets 8–15, white, tube apex sparsely hairy, lamina 7–10 × 1.5–1.8 mm, eglandular; disk florets greenish yellow, 3.5–4 mm, tube base flared, tube apex and limb base strigillose and minutely stipitate glandular, limb campanulate, ca. 2.5 mm, lobes spreading, narrowly triangular, 1.5–1.7 mm, abaxially minutely stipitate glandular. Achenes black to mottled purple, obovoid, slightly compressed, 2–2.5 mm, strigillose, minutely stipitate glandular, 2-ribbed (straw-colored). Pappus 4-seriate, with dirty white barbellate bristles; outermost bristles few, slender, 0.3–0.7 mm; outer bristles very few, slender, ca. 2 mm; inner bristles 2.5–3 mm, tapering; innermost bristles 3.2–3.3 mm, apically flattened. Fl. Jun–Aug.

• Damp rocky mountain ridges and slopes, *Machilus-Castanopsis* forests; 500–900 m. Taiwan.

54. *Aster homochlamydeus* Handel-Mazzetti, Symb. Sin. 7: 1091. 1936.

等苞紫菀 deng bao zi wan

Aster ageratoides Turczaninow var. *grossedentatus* (Thunberg ex Diels) Kitamura; *A. trinervius* Roxburgh ex D. Don var. *grossedentatus* Thunberg ex Diels (Sep 1912); *A. trinervius* var. *grossedentatus* Franchet ex Diels (Oct 1912).

Herbs, perennial, 20–50 cm tall, sometimes caespitose; rhizomes long, slender. Stems erect, simple, finely striate, sparsely to moderately strigillose proximally, minutely stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially pale green, adaxially green, abaxially glabrous, veins strigillose to scabridulous, adaxially densely scabridulous, both surfaces sparsely minutely stipitate glandular in pits, more so apically, margin ciliate, midvein prominent abaxially, apex acuminate, mucronate; lowest leaves withered by anthesis, narrowly winged petiolate (petiole 0.5–10 cm); blade ovate, 1–2.5 cm, base attenuate, margin coarsely serrate; lower to upper leaves narrowly to very broadly petiolate; blade ovate to lanceolate, 5–10 × 1.5–4 cm, base cuneate-rounded to rounded, sometimes auriculate, sometimes clasping, margin coarsely serrate; synflorescence leaves sessile, lanceolate, 2–7 × 0.5–2 cm, base cuneate to rounded, margin 1–5-serrate. Capitula 1–10 in terminal corymbiform synflorescences; peduncles 10–90 mm, strigillose; bracts lanceolate, entire. Involucres campanulate, 5–8 mm; phyllaries 2- or 3-seriate, subequal, often squarrose, oblanceolate, abaxially sparsely to moderately villous-strigillose, sparsely minutely stipitate glandular, leaflike and green distally, margin erose, sparsely ciliate, midvein more pronounced distally, ± translucent, apex acuminate, sometimes purplish, sparsely ciliate; outer phyllaries 6–8 × ca. 1.5 mm, margin narrowly scarious; inner phyllaries 5–9 × ca. 2 mm, base ± hardened, margin broadly scarious. Ray florets 10–14, white or purple, lamina 10–15 × 2–3 mm, glabrous, eglandular; disk florets yellow, 4–5 mm, tube base flared, tube and limb glabrous, eglandular, limb campanulate, ca. 3 mm, lobes spreading, narrowly triangular, ca. 2 mm, sparsely strigose apically, eglandular. Achenes mottled purple, oblong, slightly compressed, 4–5 mm, sparsely strigillose, more densely so distally, eglandular, 4-ribbed (± translucent). Pappus 3-seriate, ± reddish; outermost bristles few, slender, 0.4–0.8 mm; inner bristles 2.5–3 mm, acute; innermost bristles 3.5–4 mm, slightly clavate. Fl. Apr–Aug, fr. Jul–Sep.

• Alpine and subalpine mixed forests; 3000–3700 m. S Gansu, SW Sichuan, NW Yunnan.

55. *Aster alatipes* Hemsley, J. Linn. Soc., Bot. 23: 407. 1888.

翼柄紫菀 yi bing zi wan

Herbs perennial, 36–100 cm tall; rhizomes long, slender, stoloniferous. Stems erect, simple, sometimes distally branched, ± flexuous, ± striate, hispid-villous, minutely stipitate glandular. Leaves cauline, slightly reduced upward, abaxially pale green, adaxially green, abaxially hispid-strigose, densely so on veins, adaxially hispid-strigose, both surfaces sparsely minutely stipitate glandular in pits, margin coarsely serrate to serrate, hispid,

strigose, or villous-ciliate, midvein prominent abaxially, apex acuminate, mucronate; lowest leaves withered by anthesis (not seen); lower to upper leaves broadly winged petiolate; blade ovate to lanceolate, 3.5–5.5(–10) × 1.5–2.5(–4) cm, base cuneate-rounded to rounded; synflorescence leaves broadly winged shortly petiolate, lanceolate, 1.3–2 × 0.6–0.9 cm, base cuneate, margin 3–6-serrate, slightly resinous. Capitula 16 or more in terminal corymbiform synflorescences, ca. 1.5 cm in diam.; peduncles 7–15 mm or longer, densely hispid-strigose, minutely stipitate glandular, resinous; bracts lanceolate, entire. Involucres campanulate, (4–)5–5.2 × ca. 5 mm; phyllaries 4-seriate, unequal, green apically, abaxially distally villosulous and minutely stipitate glandular, margin scarious, erose, moderately to densely villous-ciliate, midvein more pronounced distally, ± translucent, apex acute to rounded, villous-ciliate; outer phyllaries narrowly ovate, 1.5–2 × ca. 0.8 mm; inner phyllaries oblong, 3–6 × 1.8–1.2 mm, base hardened. Ray florets 10–14 or more, purple, tube apex and lamina base strigose, lamina 6–7(–9) × 1–1.5 mm, eglandular; disk florets yellow, (4–)5 mm, tube base flared, tube apex and proximal limb hairy, minutely stipitate glandular, limb campanulate, ca. 3.2 mm, lobes spreading, narrowly triangular, curved, ca. 1.5 mm, apically sparsely hairy, moderately to densely minutely stipitate glandular. Achenes (immature) oblong, slightly compressed, 2–3 mm, sparsely strigillose, sparsely minutely stipitate glandular, 2-ribbed (± translucent). Pappus 4-seriate, ± reddish; outermost bristles few, slender, 0.5–0.6 mm; outer bristles slender, 2–2.3 mm; inner bristles few, ca. 3 mm, acute; innermost bristles ca. 4 mm, weakly clavate. Fl. and fr. Jul–Oct.

• Shaded places in valleys of low mountains or canal banks; 800–1600 m. Anhui, Henan, NW Hubei, S Shaanxi, Sichuan.

56. *Aster limosus* Hemsley, J. Linn. Soc., Bot. 23: 413. 1888.

湿生紫菀 shi sheng zi wan

Herbs, perennial, 22–70 cm tall; rhizome thick. Stems often solitary, erect, simple or branched at middle, finely canaliculate, strigillose. Leaves thick, abaxially sparsely strigillose, veins densely villous, midvein or nearly palmate veins raised, lateral veins 3-paired, conspicuous, adaxially densely scabrous; lower leaves withered by anthesis, petiole 2–6 cm; blade cordate, reniform, or suborbicular, 2–5 × 2.2–4.5 cm; middle leaves cordate-ovate, margin serrate (teeth mucronulate), apex acute to acuminate; upper leaves gradually reduced, subsessile, ovate. Capitula many, in terminal corymbiform synflorescences, 2–2.5 cm in diam.; peduncles 7–12 cm; bracts oblong or linear. Involucres campanulate, 6–7 × ca. 8 mm; phyllaries 4-seriate, unequal (loosely imbricate), oblong, apex obtuse; outer phyllaries ca. 2 × 0.5 mm, densely strigillose, apex leaflike; inner phyllaries ca. 5 × 0.7 mm, glabrous, margin scarious, apex obtuse to acute, often purple-red. Ray florets ca. 10, purple, tube ca. 2 mm, lamina oblong, 8–9 × 1.5–2 mm; disk florets ca. 5 mm, tube 1.5–2 mm, lobes ca. 1 mm (not seen). Achenes (not seen) oblong, ca. 2 mm, densely strigillose, 2- or 3-ribbed. Pappus (not seen) of dirty white or ± reddish, subequal bristles.

• Muddy fields; ca. 1200 m. W Hubei (Yichang).

The leaf shape of *Aster limosus* is distinct from that of other species.

57. *Aster morrisonensis* Hayata, Icon. Pl. Formosan. 8: 48. 1919.

玉山紫苑 *yu shan zi wan*

Herbs, perennial, 10–40 cm tall or more, rhizomatous, stoloniferous. Stems erect, simple, sometimes branched in upper part; branches ascending, strigillose, densely leafy. Leaves cauline, slightly reduced upward, abaxially pale green, adaxially green, shiny, both surfaces scabrous, minutely stipitate glandular in pits, margin coarsely 1–5-serrate, scabrous, abaxially prominently 3-veined, apex acuminate, mucronate; lowest leaves withered by anthesis, long winged petiolate (petiole to 5.5 cm); blade spatulate to oblanceolate or lanceolate, 1.3–2.5 cm, base attenuate; lower to upper leaves shortly petiolate; blade lanceolate, 2–4 × 0.7–0.9 cm, base attenuate; synflorescence leaves shortly petiolate, lanceolate, margin entire. Capitula many in terminal paniculiform-corymbiform synflorescences (not measurable on specimen); peduncles 10–50 mm or longer, strigillose; bracts lanceolate, entire. Involucres campanulate to hemispheric, 3–5 mm; phyllaries 3-seriate, unequal, green distally, 0.7–0.9 mm wide, apically minutely glandular, margin narrowly scarious, erose, purplish, ciliate, midvein more pronounced distally, ± translucent, apex rounded, erose, purplish, ciliate; outer phyllaries broadly ovate, ca. 1.5 mm; middle phyllaries oblong, 2–3 mm, base hardened; inner phyllaries oblong, 4–5 mm. Ray florets 8–20, white, tube hairy, lamina 3.5–5(–7) × 1–1.5 mm, eglandular; disk florets yellow, 4–5.5(–6) mm, tube base flared, tube apex and limb base hairy, limb campanulate, lobes spreading, lanceolate, ca. 2 mm, glabrous, eglandular. Achenes mottled purple, oblong, slightly compressed, 1.8–2.5 mm, strigillose, eglandular, 2-ribbed. Pappus 3-seriate, white or (innermost) ± reddish; outermost bristles few, 0.5–0.7 mm; inner bristles ca. 4 mm, acute; innermost bristles ca. 4.2 mm, weakly clavate. Fl. Jul–Sep.

• Alpine areas; 3000–3700 m. Taiwan.

58. *Aster piccolii* J. D. Hooker, Bot. Mag. 125: t. 7669. 1899.

裸苑 *luo wan*

Asteromoea piccolii (J. D. Hooker) Handel-Mazzetti; *Gymnaster piccolii* (J. D. Hooker) Kitamura; *Kalimeris piccolii* (J. D. Hooker) S. Y. Hu; *Miyamayomena piccolii* (J. D. Hooker) Kitamura.

Herbs, perennial, 60–120 cm tall, rhizomatous. Stems erect, simple, sometimes branched in upper part, finely striate, strigillose, sparsely minutely stipitate glandular distally. Leaves cauline, gradually reduced upward, abaxially pale green (sponglike), adaxially green, both surfaces scabridulous, sometimes more sparsely so adaxially, abaxially minutely stipitate glandular in pits, margin coarsely serrate to serrate or entire (upper leaves), revolute, scabridulous, midvein prominent abaxially, apex acuminate, mucronate; lowest leaves withered by anthesis (not seen); lower to upper leaves shortly winged petiolate (petiole to 0.8 cm) or sessile, obovate or oblanceolate to narrowly lanceolate, 4–9 × 1.2–1.8 cm, base attenuate; synflorescence leaves sessile, linear-lanceolate, 2.1–2.8 × 0.4–0.5 cm, base cuneate, margin strongly revolute, entire. Capitula numerous in terminal or axillary corymbiform synflorescences; pe-

duncles 20–60 mm, strigillose, minutely stipitate glandular; bracts linear-lanceolate, entire, distally grading into phyllaries. Involucres hemispheric, 4–5 mm; phyllaries 3–6-seriate, unequal, often squarrose, green distally, abaxially distally sparsely strigillose, sparsely minutely stipitate glandular, margin scarious, erose, sometimes purplish, ciliate, midvein enlarged basally, almost keeled, distally ± translucent, apex obtuse to acute, erose, purplish, ciliate; outer phyllaries oblong, ca. 3 × 1.3 mm; middle phyllaries oblanceolate, 3.5–4 × ca. 1.2 mm, base hardened; inner phyllaries broadly oblanceolate, 4–5 × ca. 1.5 mm. Ray florets 10–26, purple-blue, veins prominent, tube sparsely minutely stipitate glandular, lamina 7–8.5 × 1–2.5 mm, glabrous; disk florets yellow, 3–4 mm, veins prominent, tube base flared, tube and limb base glabrous, minutely stipitate glandular, limb campanulate, 2–2.5 mm, lobes spreading, lanceolate, 0.8–1.5 mm, glabrous, minutely stipitate glandular. Achenes oblanceolate, 2.7–3 mm, sparsely strigose to glabrate or glabrous, minutely stipitate glandular distally, 3–6-ribbed. Pappus of ray absent, of disk 1-seriate; outermost series of scales 0.2–0.5 mm. Fl. Aug–Oct.

• Grasslands on slopes; 900–1700 m. Gansu, Guizhou, Henan, Shaanxi, Shanxi, Sichuan.

Specimens of *Aster piccolii* were not seen by one of us (Brouillet).

59. *Aster yuanqunensis* (J. Q. Fu) Brouillet, Semple & Y. L. Chen, **comb. nov.**

垣曲裸苑 *yuan qu luo wan*

Basionym: *Gymnaster yuanqunensis* J. Q. Fu, Bull. Bot. Res., Harbin 5(3): 141. 1985.

Herbs, perennial, ca. 57 cm tall, rhizomatous. Stems erect, simple, finely striate, glabrate at base, strigillose above. Leaves cauline, gradually reduced upward, laxly patent; lowest leaves withered by anthesis; lower to upper leaves shortly petiolate or sessile, ovate-oblong to narrowly oblong or lanceolate, 1.7–8 × 0.5–2.3 cm, thin, both surfaces sparsely strigillose, base cuneate, margin coarsely serrate to serrate, scabridulous, apex acuminate. Capitula 1–4 in terminal corymbiform synflorescences or solitary, ca. 3 cm in diam. Involucres hemispheric; phyllaries 4-seriate, unequal, green apically, abaxially strigillose, margin scarious, erose. Ray florets purple-blue, lamina oblong, ca. 17 mm; disk florets yellow, ca. 5 mm, sparsely hairy, limb campanulate, lobes reflexed, lanceolate. Achenes dark purple, obovoid, compressed, glabrous, 2–4-ribbed. Pappus (not described and absent on illustration). Fl. Oct.

• Among shrubs in mountain valleys; 900–1000 m. S Shanxi (Yuanqu).

Material of this species was not seen by us. The description is from the original Latin description and the illustration. This species is close to *Aster piccolii*.

60. *Aster pseudosimplex* Brouillet, Semple & Y. L. Chen, **nom. nov.**

四川裸苑 *si chuan luo wan*

Replaced synonym: *Aster simplex* C. C. Chang, Sinensia 6: 541. 1935, not *Aster simplex* Willdenow, Enum. Pl. 2: 887.

1809; *Asteromoea simplex* Handel-Mazzetti; *Gymnaster simplex* Y. Ling; *Miyamayomena simplex* Y. L. Chen.

Herbs, perennial, 10–67 cm tall. Stems ascending, solitary or 2–4, simple or 2- or 3-branched from middle part, white hispidulous-villous. Leaves: basal spatulate, long petiolate; lower cauline leaves withered by anthesis; middle leaves oblong-lanceolate or subelliptic, $1.5\text{--}2.5(-4) \times 0.3\text{--}0.6(-0.9)$ cm, white hispidulous-villous on both surfaces, minutely stipitate glandular in pits, midvein abaxially convex, adaxially concave, base rounded, sessile, margin entire, apex obtuse or acute; uppermost leaves remote, linear, ca. 1 cm. Capitula solitary, 2–2.5 in diam. Involucres hemispheric, ca. 6×1.5 mm; phyllaries 3- or 4-seriate, unequal; outer phyllaries green, rather short, lanceolate, $4\text{--}5 \times 1.2\text{--}1.5$ mm, acute or obtuse, externally pubescent; inner phyllaries obovate-oblong, $5\text{--}5.5 \times 1.5\text{--}2$ mm, acute, margin broadly scarious, ciliate, apically red-purplish. Ray florets purplish red, ca. 16×2 mm, tube ca. 2 mm, glandular puberulent; disk florets ca. 4 mm, tube ca. 1 mm, puberulent. Achenes yellowish, obovoid, slightly compressed, ca. 2×1.3 mm, inconspicuously marginally ribbed, glabrous. Pappus absent. Fl. and fr. Jul–Sep.

- Grasslands on slopes, canal sides; 2600–3000 m. NW Sichuan.

61. *Aster lixianensis* (J. Q. Fu) Brouillet, Semple & Y. L. Chen, **comb. nov.**

理县裸苑 li xian luo wan

Basionym: *Gymnaster lixianensis* J. Q. Fu, Bull. Bot. Res., Harbin 5(3): 143. 1985.

Herbs, perennial, 15–48(–60) cm tall, caespitose. Stems ascending, solitary or 2–4, simple, striate, densely retrorsely hirsutulous. Leaves sessile, basal and lower cauline leaves withered by anthesis; middle and upper leaves dense, gradually reduced upward, lanceolate-ovate to narrowly oblong or linear, $1\text{--}3 \times 0.1\text{--}0.6$ cm, both surfaces strigose, abaxially pale, adaxially dark green, base truncate, margin entire, apex obtuse, mucronate. Capitula solitary, 2.5–3 cm in diam. Involucres broadly campanulate; phyllaries 3-seriate, unequal; outer series green, short, oblong, strigose; inner series obovate-lanceolate, 5–7 mm, margin broadly scarious, fimbriate, apically green or purplish. Ray florets bluish, 5–7 mm; disk florets yellow, 3–5 mm, limb funnelform, lobes lanceolate. Achenes (immature) obovoid, slightly compressed, inconspicuously 2- or 3-ribbed. Pappus absent. Fl. Jul–Aug.

- 2600–2800 m. NC Sichuan (Barkam, Lixian).

Material of this species was not seen by us. The description is from the original Latin description and the illustration. This species is close to *Aster pseudosimplex*.

62. *Aster sinoangustifolius* Brouillet, Semple & Y. L. Chen, **nom. nov.**

狭叶裸苑 xia ye luo wan

Replaced synonym: *Aster angustifolius* C. C. Chang, Bull. Fan Mem. Inst. Biol., Bot. 6: 43. 1935, not *Aster angustifolius* Jacquin, Pl. Hort. Schoenbr. 3: 63. 1798; *Asteromoea angustifolia* Handel-Mazzetti; *Gymnaster angustifolius* Y. Ling; *Kali-*

meris angustifolia S. Y. Hu; *Miyamayomena angustifolia* Y. L. Chen.

Herbs, perennial, 30–50 cm tall, rhizomatous. Stems erect, simple, sometimes flexuous, sometimes branched in upper part, finely striate, glabrous or glabrate, sparsely minutely stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially pale green (spongeliike), adaxially green, abaxially sparsely scabridulous, minutely stipitate glandular in pits, adaxially scabridulous, margin remotely serrate to serrulate, revolute, scabridulous, midvein prominent abaxially, apex acuminate, mucronate; lowest leaves withered by anthesis (not seen); lower to upper leaves winged petiolate (petiole to 2 cm); blade oblanceolate to narrowly lanceolate, $(6\text{--})10\text{--}13(-15) \times 0.5\text{--}1.9$ cm, base attenuate; synflorescence leaves sessile, linear-lanceolate, $2\text{--}4 \times 0.3\text{--}0.4$ cm, base cuneate, margin entire, grading upward into phyllaries. Capitula 1–3, terminal or axillary, overall forming corymbiform synflorescences; peduncles 60–90 mm, strigillose, minutely stipitate glandular; bracts linear-lanceolate, entire. Involucres hemispheric, 5–6 mm; phyllaries 3- or 4-seriate, unequal, green distally, glabrous, sometimes apically minutely stipitate glandular, margin scarious, erose, sometimes purplish, ciliate, midvein \pm translucent, sometimes multiveined, apex rounded, erose, purplish, ciliate; outer phyllaries oblong, $3\text{--}4 \times 1.2\text{--}2$ mm; middle phyllaries obovate, $5\text{--}5.5 \times 2\text{--}2.5$ mm, base hardened; inner phyllaries oblanceolate, $6\text{--}7 \times 1.1\text{--}1.5$ mm. Ray florets 15–20, purple to lavender, veins prominent, tube and lamina base sparsely minutely stipitate glandular, lamina $6\text{--}7 \times$ ca. 1.5 mm, glabrous; disk florets yellow, ca. 3.5 mm, veins prominent, tube base flared, tube and limb base glabrous, minutely stipitate glandular, limb broadly campanulate, ca. 2.5 mm, lobes spreading, narrowly triangular, 0.7–1 mm, glabrous, tip sparsely minutely stipitate glandular. Achenes narrowly obovoid, ca. 2.1 mm, glabrous, 4–6-ribbed. Pappus absent. Fl. and fr. Jul–Oct.

- Riverbanks in valleys and forest margins; ca. 600 m. Fujian, Zhejiang.

63. *Aster lushiensis* (J. Q. Fu) Brouillet, Semple & Y. L. Chen, **comb. nov.**

卢氏裸苑 lu shi luo wan

Basionym: *Gymnaster lushiensis* J. Q. Fu, Bull. Bot. Res., Harbin 3(1): 110. 1983.

Herbs, perennial, (size not given). Stems erect, terete, slightly flexuous, branched upward, densely white appressed villous. Leaves: lowest and lower cauline leaves (not seen) shortly narrowly winged petiolate or subsessile; middle and upper cauline leaves sessile, ovate, broadly elliptic, or obovate, $2\text{--}8 \times 1\text{--}4$ cm, abaxially gray-white appressed villous, adaxially dark green, white hispidulous, base attenuate, margin obscurely repand-crenate, lateral veins 3- or 4-paired, adaxially prominent, apex obtuse or rounded. Capitula 2–5 in loose corymbiform synflorescences, 2–3 cm in diam. Involucres campanulate; phyllaries 3-seriate, unequal, abaxially puberulent; outer phyllaries shorter, ovate; inner phyllaries longer, oblong, membranous, margin scarious, hyaline. Ray florets bluish purple, lamina 8–16 mm; disk florets numerous, yellow, 3–4 mm. Achenes

(immature) obovoid-oblong, 5- or multiribbed. Pappus absent. Fl. Oct.

- Path sides on mountain slopes; ca. 800 m. Henan (Lushi).

The description of *Aster lushiensis* is incomplete because no specimens were seen by us.

64. *Aster verticillatus* (Reinwardt) Brouillet, Semple & Y. L. Chen, **comb. nov.**

秋分草 qiu fen cao

Basionym: *Rhynchospermum verticillatum* Reinwardt, Syll. Pl. Nov. 2: 8. 1825; *Leptocoma racemosa* Lessing; *R. formosanum* Yamamoto; *R. verticillatum* var. *subsessile* Oliver ex Miquel; *Zollingeria scandens* Schultz Bipontinus.

Herbs, perennial, 5–150 cm tall, sometimes caespitose; rhizomes long, slender. Stems erect, simple, usually divaricately branched in distal half, finely striate, strigillose, minutely stipitate glandular. Leaves cauline, gradually reduced upward, abaxially pale green, adaxially green, abaxially sparsely strigillose, more densely so on veins, minutely stipitate glandular in pits, adaxially scabridulous, eglandular, thin, margin sparsely ciliate, midvein prominent abaxially, apex acute to obtuse, mucronate; lowest leaves usually withered by anthesis, short, narrowly winged petiolate; blade obovate or ovate to lanceolate, 1.5–4.5 cm, base cuneate, margin crenate-serrate (teeth mucronulate); lower to upper leaves shortly petiolate (petiole to 0.6 cm); blade lanceolate to narrowly lanceolate, sometimes ovate, 3.5–14 × 0.4–5.5 cm, base attenuate, margin crenate-serrate to serrate or entire; synflorescence leaves shortly petiolate, lanceolate, 0.5–3 × 0.1–0.8 cm, base attenuate, margin 1–5-serrate or entire. Capitula 1–5 per branch, in terminal or axillary racemiform synflorescences, sometimes distributed along much of stem; peduncles 1–30 mm, sparsely to moderately strigillose; bracts absent or 1, oblanceolate, entire. Involucres broadly campanulate to hemispheric, 2–7 mm; phyllaries 3-seriate, unequal, green apically, ca. 1 mm wide, apically sometimes strigillose, sometimes minutely stipitate glandular, margin scarious, erose, ciliate, midvein more pronounced distally, ± translucent, apex rounded, erose, ciliate; outer phyllaries broadly ovate, ca. 1 mm; middle phyllaries oblong, 2–3 mm, base thin; inner phyllaries oblong, 4–5 mm. Ray florets 2- or 3-seriate, 10–40, white, tube (ca. 0.3 mm) and abaxial lamina minutely stipitate glandular, lamina ca. 1.2 × 0.3 mm, glabrous; disk florets yellow, ca. 2 mm, glabrous, minutely stipitate glandular, tube base flared, limb campanulate, ca. 1 mm, lobes spreading and reflexed, triangular, ca. 0.5 mm. Achenes purple proximally to mottled purple in proximal half (not purple above), obovoid, ca. 2 mm, glabrous, of ray compressed, distally minutely stipitate glandular, 2-ribbed, long beaked, of disk trigonous, eglandular, 3-ribbed, beakless or shortly beaked. Pappus 3-seriate, easily caducous and often absent (through loss), of mottled reddish brown, barbellulate bristles; outermost bristles 0–3, slender, ca. 0.1 mm; outer bristles absent or 1, slender, ca. 1.7 mm; innermost bristles 4 or 5, ca. 2 mm, slightly flattened distally. Fl. and fr. Aug–Nov.

Forest margins, shaded forests, disturbed forests, shaded stream-sides, damp weedy places, open grassy or brushy slopes, roadsides, thickets; 400–2500 m. Fujian, Guangdong, Guangxi, Guizhou, Hubei,

Hunan, Jiangxi, Sichuan, Taiwan, Xizang, Yunnan [Bhutan, India, Indonesia, Japan, Malaysia, Myanmar, Nepal, Vietnam].

65. *Aster hunanensis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 611. 1937.

湖南紫菀 hu nan zi wan

Herbs, perennial, ca. 35 cm tall, rhizomatous and shortly stoloniferous. Stems erect, solitary, slender, glabrate, branched in upper part, loosely leafy. Leaves glabrous on both surfaces or abaxial veins sparsely strigillose, thick, margin slightly revolute, remotely serrate (teeth mucronate), sparsely scabrous, 3-veined, 2- or 3-paired lateral veins abaxially prominent, conspicuously reticulate veined; lower leaves (not observed) long broadly winged petiolate (petiole equaling blade); blade ovate or subelliptic, 6–7 × 3–4 cm, abruptly attenuate, apex acute or obtuse; middle leaves shortly petiolate, broadly winged and ± subclasping or not winged; blade oblong-lanceolate or elliptic, 4–7 × 1.5–2.5 cm, abruptly attenuate or rounded, apex acuminate; upper leaves gradually reduced, petiolate or base ± subclasping, margin shallowly serrate or entire. Capitula in axils of leaves or terminal, solitary and overall in paniculate-corymbiform synflorescences, 2–3.5 cm in diam.; peduncles 0.5–2.5 cm; bracts linear. Involucres campanulate, 5–7 mm in diam.; phyllaries 3- or 4-seriate, unequal, apex green, oblong, 3–4 × ca. 1 mm, abaxially glabrous, margin scarious, erose, ciliate, apex rounded or obtuse. Ray florets ?purplish (immature); disk florets (immature) 3.5–4 mm, tube ca. 1.5 mm, lobes ca. 0.8 mm. Achenes (immature) obovoid, ca. 2 mm, slightly compressed, 2–4-ribbed, with white short hairs. Pappus (immature) dirty white, of many unequal bristles 1.5–2 mm. Fr. Aug.

- 500–800 m. SW Hunan (Anhua).

The glabrate or glabrous stems and leaves are distinctive of *Aster hunanensis*.

66. *Aster menelii* H. Lévillé, Fl. Kouy-Tchéou, 87. 1914.

黔中紫菀 qian zhong zi wan

Herbs, perennial, ca. 70 cm tall; rhizomes procumbent, with long fibrous roots. Stems erect, slender, branched at middle, finely canaliculate, scabrous, densely leafy. Leaves abaxially pale green, adaxially brownish (when dry), both surfaces sparsely scabrous, 3-veined, midvein abaxially prominent, lateral veins parallel with margin; basal leaves few, rosulate, long petiolate; blade ovate-lanceolate, ca. 4.5 × 2.5 cm, base attenuate, margin sparsely shallowly toothed or subentire, apex acute; lower and middle leaves oblong-lanceolate, 4–10 × 1.5–2 cm, base gradually attenuate, margin 4- or 5-serrate or subentire, apex acuminate; upper leaves narrowed. Capitula in racemose-corymbiform synflorescences, ca. 2 cm in diam.; peduncles 2–3 cm; bracts linear-lanceolate, leaflike. Involucres hemispheric, ca. 8 mm in diam.; phyllaries 3-seriate, subequal, brown, oblong-lanceolate, abaxially puberulent, membranous, midvein herbaceous, apex acute or slightly acute. Ray florets ca. 10 or more, white, tube ca. 1.3 mm, lamina ca. 10 × 1.2 mm; disk florets yellow, 3–3.5 mm, tube ca. 1 mm, lobes ca. 0.5 mm. Achenes (immature) oblong, ca. 2 mm, strigillose. Pappus (immature) white, of 10–20 unequal bristles 1–1.5 mm. Fl. Jun.

- C Guizhou (Anshun).

Aster menelii is probably closely related to *A. hunanensis*. The structure of the phyllaries and pappus is similar, but the leaf shape is different.

67. *Aster gracilicaulis* Y. Ling ex J. Q. Fu, Bull. Bot. Res., Harbin 3(1): 116. 1983.

细茎紫菀 xi jing zi wan

Herbs, perennial, 30–60 cm tall. Stems 3–5-fascicled, erect or ascending, branched in upper part, shallowly canaliculate, red-brown in lower part, yellow villous-canescens or glabrescent, loosely leafy. Leaves abaxially pale green, sparsely hairy on veins, minutely stipitate glandular, adaxially scabrous, margin \pm revolute, entire or remotely serrulate (teeth mucronulate), scabrous, midvein prominent, 3-veined, veins subparallel, reticulate veins lax, apex acute; lower leaves withered by anthesis, long petiolate, narrowly lanceolate; middle leaves shortly petiolate, linear-lanceolate, $5-9 \times 0.4-0.7$ cm, base attenuate, apex long acuminate, sometimes falcate; upper leaves reduced, linear to subulate. Capitula in corymbiform synflorescences, 2–2.5 cm in diam. Involucres campanulate, ca. $5 \times 8-10$ mm; phyllaries 3- or 4-seriate, unequal, margin scarious, erose, ciliate, midvein green, apex obtuse; outer phyllaries linear-oblong, $2-2.5 \times$ ca. 0.7 mm, apically leaflike; inner phyllaries ca. 4.5×1 mm, apically purple-red. Ray florets to 20, blue-purple, tube ca. 2.5 mm, lamina oblong, ca. 9×2.5 mm; disk florets ca. 4 mm (immature). Achenes (immature) black, obovoid, ca. 2×1.5 mm, strigillose, 2- or 3-ribbed. Pappus (immature) white, 3.5–4 mm. Fl. Jul.

• Slopes, among shrubs, gullies; 1000–1300 m. S Gansu (Hui-xian, Qingyan).

68. *Aster itsunboshi* Kitamura, Acta Phytotax. Geobot. 3: 130. 1934.

大埔紫菀 da pu zi wan

Herbs, perennial, ca. 3 cm tall, scapiform; rhizomes slender and long, woody. Stems usually simple, erect, sometimes decumbent, laxly leafy. Leaves densely strigose; basal leaves rosulate, present at anthesis, winged petiolate, obovate or oblong, $1.5-2 \times$ ca. 0.7 cm, thick, base gradually attenuate, margin serrate (teeth mucronulate), apex obtuse or \pm acute; cauline leaves gradually smaller, shortly petiolate or sessile, spatulate or lanceolate, base attenuate, apex acute. Capitula 1 or 2, shortly pedunculate, erect, ca. 8 mm in diam. Involucres hemispheric, 4–7 mm, tinged purple-red; phyllaries 2-seriate; outer phyllaries lanceolate, short, margin fimbriate-ciliate, scabrous, apex acuminate. Ray florets white, 7.5–7.7 mm, tube ca. 1.6 mm; disk florets ca. 3.6 mm, tube ca. 1.2 mm, limb campanulate, lobes lanceolate, ca. 2 mm, glabrous. Achenes (immature) strigose. Pappus (immature) dirty white, often tinged yellow, or reddish, ca. 2 mm.

• Stony mountains. Taiwan.

The original description of *Aster itsunboshi* was translated from Kitamura. The material seen at PE was damaged in the area of the capitula so some floral and achene characters could not be determined. According to Soejima and C. I. Peng (Fl. Taiwan, ed. 2, 4: 855–857. 1998), citing Kitamura, this may be a juvenile form of *A. morrisonensis*. If this hypothesis were to prove incorrect, the species might be best treated in *A. sect. Alpigeni*.

69. *Aster molliusculus* (Lindley ex Candolle) C. B. Clarke, Compos. Ind. 45. 1876.

软毛紫菀 ruan mao zi wan

Diplopappus molliusculus Lindley ex Candolle, Prodr. 5: 277. 1836; *D. roylei* Lindley ex Candolle.

Herbs, perennial, 8–30(–40) cm tall, caespitose; caudex taprooted, sometimes thick and woody. Stems erect, simple, sometimes branched in upper part, sparsely villous, more densely so upward and below leaves, very sparsely to moderately minutely stipitate glandular, resinous. Leaves cauline, usually gradually increased upward, abaxially pale green (\pm spongelike), adaxially green, abaxially glabrous or sparsely strigose or villous, veins sparsely strigillose to strigose, sparsely minutely stipitate glandular in pits, adaxially glabrous, strigose, sparsely scabridulous, or sparsely villous, sometimes resinous, margin sparsely ciliate, midvein prominent abaxially, apex acute, mucronate; lowest leaves usually withered by anthesis, scaly, marcescent; lower to upper leaves shortly petiolate (petiole to 1 cm), oblanceolate to narrowly oblanceolate, $1-3.5 \times 0.3-0.8$ cm, base attenuate to cuneate, margin sometimes revolute, entire (lower) or 2–6-serrate (upper). Capitula terminal, solitary (rarely 2) on branches; peduncles 3–13 mm, sparsely to densely strigillose, sometimes minutely stipitate glandular; bracts linear-lanceolate, entire. Involucres campanulate, 7–10 mm; phyllaries 2- or 3-seriate, unequal, green distally, linear-lanceolate, 0.5–1.1 mm wide, glabrous or strigillose on midvein, eglandular, margin scarious, erose, eciliate, midvein swollen or ridged proximally, \pm translucent, apex acuminate, erose, purplish, eciliate; outer phyllaries 4–5 mm; middle phyllaries 6–7 mm, base hardened; inner phyllaries 6–9 mm. Ray florets 15–25, white or pink, tube hairy, sometimes minutely stipitate glandular, lamina $5-9 \times 1.5-2.1$ mm; disk florets yellow, 5–6 mm, tube base flared, tube and limb base sometimes sparsely hairy, minutely stipitate glandular, limb \pm campanulate, 3–3.5 mm, lobes spreading, narrowly triangular, 0.8–1 mm, glabrous, eglandular. Achenes oblong, slightly compressed, 3–4 mm, moderately to densely strigillose, eglandular, 4-ribbed. Pappus 4-seriate, dirty white; outermost series \pm scaly, 0.5–1.5 mm; outer bristles few, slender, 2.5–3.5 mm; inner bristles 4.5–5 mm, acute; innermost bristles 5–6.5 mm, weakly clavate to clavate. Fl. May–Jun, fr. Jun–Sep. $2n = 18, 27$.

Alpine and subalpine stony slopes; 1800–3500 m. W Xizang [NW India, Kashmir, Pakistan].

70. *Aster sikkimensis* J. D. Hooker, Bot. Mag. 77: t. 4557. 1851.

锡金紫菀 xi jin zi wan

Subshrubs or herbs, perennial, 50–80 cm tall, rhizomatous. Stems erect, simple, stout, flexuous, \pm woody at base, purplish, finely striate, strigillose, villous, sparsely minutely stipitate glandular, particularly below leaves. Leaves cauline, slightly reduced upward, abaxially pale green, glabrous, veins sparsely strigillose, minutely stipitate glandular, sometimes in pits, adaxially green, densely scabridulous, margin coarsely serrate, ciliate, veins prominent, apex long acuminate, mucronate; lowest leaves withered by anthesis (not seen), broadly winged peti-

olate, lanceolate, ca. 22 cm, base attenuate, apex acuminate; lower leaves (not seen) to upper leaves shortly broadly winged petiolate (base clasping) or sessile, lanceolate, (5–)6–17 × 1.5–5.5 cm, base attenuate or auriculate, clasping; synflorescence leaves sessile, lanceolate, 0.5–6 × 0.1–1.2 cm, base auriculate, clasping, margin serrate to serrulate, rapidly becoming bracts. Capitula 10–45 or more, in terminal corymbiform synflorescences, 10–12 mm in diam.; peduncles 6–50 mm, densely strigillose; bracts linear-lanceolate, entire. Involucres campanulate, 4–4.5 mm; phyllaries 2- or 3-seriate, subequal, sometimes squarrose, green distally, oblanceolate to lanceolate or linear-lanceolate (inner phyllaries), 3.5–4.5 × 0.5–1 mm, abaxially sparsely strigillose, mainly on veins, sparsely to moderately minutely stipitate glandular, margin scarious to narrowly scarious, erose, sparsely ciliate, midvein more pronounced distally, ± translucent, apex acuminate, purplish, sparsely ciliate. Ray florets 30–35(–60), white, rose, blue, or purple, tube apex sparsely stipitate glandular, lamina 4–5 × ca. 1 mm, glabrous; disk florets yellow, becoming purplish, 3.5–4 mm, tube base flared, limb campanulate, ca. 2 mm, glabrous, proximally sparsely stipitate glandular, lobes spreading, narrowly triangular, 0.8–1 mm, purplish. Achenes obovoid, slightly compressed, ca. 2.2 mm, sparsely strigillose, eglandular, 4-ribbed. Pappus 2- or 3-seriate, brownish; outer bristles 0–2, slender, 1.5–2 mm; inner bristles 2.5–3 mm, acute; innermost bristles 3.5–4 mm, slightly clavate. Fl. Aug–Oct.

2400–3600 m. S Xizang [India (Sikkim), Nepal].

Aster sikkimensis is related to *A. nigromontanus*, but it differs by its finely pubescent phyllaries and leaf shape.

71. *Aster pycnophyllus* Franchet ex W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 8: 332. 1915.

密叶紫菀 mi ye zi wan

Aster harrowianus Diels var. *pycnophyllus* (Franchet ex W. W. Smith) H. Léveillé.

Herbs, perennial, rhizomatous. Stems erect, 30–60 cm tall, flexuous, reddish, glabrescent below, moderately to densely strigose-villous above, usually branched only at synflorescence, more densely leafy above. Leaves cauline, thin, abaxially villous on veins, adaxially scabrous, both surfaces stipitate glandular, midvein ± prominent abaxially, lateral veins in 4 or 5 pairs, distinct; lower leaves absent at anthesis; middle and upper leaves petiolate; petiole 1–2(–4) cm, rarely subsessile; blade ovate to lanceolate, 7–13 × 2–2.5 cm, base truncate, rounded, or somewhat cordate, or attenuate, margin coarsely serrate (teeth mucronate), apex long acuminate (sometimes falcate); uppermost leaves smaller, narrowly ovate to lanceolate or linear. Capitula numerous in corymbiform synflorescences, 1.5–2 cm in diam.; peduncles 1–1.5 cm; bracts linear. Involucres campanulate, 4–5 × 6–8 mm; phyllaries 3- or 4-seriate, unequal, lanceolate to oblong, 2.8–4 × 0.6–0.8 mm, abaxially villous, apex acuminate, outer phyllaries purple, inner phyllaries with margin scarious, erose-fimbriate. Ray florets 10–30, purplish blue to nearly white, tube 1.8–2 mm, hairy, lamina 4–7 × 0.7–1.2 mm; disk florets yellow or sometimes purplish tinged, 4.2–5 mm, tube 1.2–1.6 mm, limb funnelform, tube, limb, and

lobes hairy, lobes lanceolate, 1–1.1 mm. Achenes lanceoloid, compressed, 1.7–2 × ca. 0.7 mm, strigose, 2-ribbed. Pappus 3-seriate, dirty white; outer bristles slender, ca. 2.7 mm; inner bristles ca. 3.8 mm, acute; innermost bristles clavate. Fl. Jun–Oct, fr. Sep–Dec.

Subalpine slopes, grasslands, thickets; 1000–3800 m. Sichuan, E and SE Xizang, NW Yunnan [India, N Myanmar].

72. *Aster nigromontanus* Dunn, J. Linn. Soc., Bot. 35: 501. 1903 [“*nigromontana*”].

黑山紫菀 hei shan zi wan

Herbs, perennial, 40–50 cm tall, rarely caespitose, rhizomatous. Stems erect, simple, stout, flexuous, shallowly striate, glabrous proximally, sparsely strigillose distally, eglandular. Leaves: basal leaves in a rosette, disappearing before stem elongation, winged long (petiole to 2.5 cm) or shortly petiolate; blade abaxially pale green, adaxially green, oblong, 4–6 × 1.5–2.5 cm, slightly reduced upward, abaxially glabrous, veins sparsely strigillose, very sparsely minutely stipitate glandular in pits, adaxially densely scabridulous, very sparsely minutely stipitate glandular in pits, base abruptly attenuate, margin coarsely serrate (teeth mucronate), ciliate, midvein prominent, apex acuminate, mucronate; lowest leaves withered by anthesis (not seen); lower leaves (not seen) to upper leaves shortly broadly winged petiolate (base clasping) or sessile, lanceolate, 11.5–17 × 2.8–6 cm, base attenuate; synflorescence leaves sessile, lanceolate, ca. 3.3 × 1 cm, base auriculate, clasping, rapidly becoming bracts. Capitula numerous, in terminal corymbiform synflorescences, 1.5–1.8 cm in diam.; peduncles 10–20 mm, densely strigillose, minutely stipitate glandular; bracts linear-lanceolate, entire. Involucres campanulate, 5–6 × 6–7 mm; phyllaries 2- or 3-seriate, subequal, green, lanceolate to oblong-lanceolate, 4–6 × 1–1.2 mm, abaxially sparsely strigillose proximally on veins, moderately to sparsely minutely stipitate glandular proximally, margin scarious or narrowly scarious, erose, sparsely ciliate, midvein more pronounced basally, ± translucent, apex acuminate, sometimes purplish, eciliate. Ray florets 25–30, white, tube hairy, stipitate glandular, lamina 5–7 × 1–1.2 mm, (2-veined), glabrous, eglandular; disk florets yellow, ca. 5 mm, tube base flared, veins prominent, translucent, limb campanulate, ca. 3.2 mm, hairy, very sparsely stipitate glandular, lobes spreading, narrowly triangular, ca. 1.2 mm. Achenes (immature) obovoid, slightly compressed, ca. 3 mm, sparsely strigillose, sparsely minutely stipitate glandular apically, 2-ribbed. Pappus 3- or 4-seriate, dirty white or slightly reddish; outermost bristles slender, ca. 0.5 mm; outer bristles few or none, slender, ca. 3 mm; inner bristles ca. 4.2 mm, acute; innermost bristles 4.6–4.7 mm, clavate. Fl. unknown, fr. Nov.

● Grasslands on slopes; 1500–3000 m. Yunnan (Jingdong, Mengzi).

The above description of *Aster nigromontanus* is based on the copy at MO.

73. *Aster falcifolius* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 610. 1937.

镰叶紫菀 lian ye zi wan

Aster brachyphyllus C. C. Chang (1935), not (Sonder) F. Mueller (1865).

Herbs, perennial, 30–55 cm tall; rhizomes long, slender. Stems erect, simple, shortly branched in upper part, finely striate, shiny, resinous, leafy, sparsely to densely villosulous to strigillose, sparsely or densely minutely stipitate glandular. Leaves cauline, slightly reduced upward, abaxially pale green, glabrous, veins sparsely strigillose, minutely stipitate glandular in pits, adaxially green, scabridulous, sparsely minutely stipitate glandular on veins, \pm resinous, margin serrate to remotely serrate, ciliate, midvein prominent abaxially, sometimes 3-veined, reticulate venation prominent, apex acuminate to falcate-acuminate, mucronate; lowest leaves withered by anthesis, shortly winged petiolate; blade obovate to oblanceolate, 0.7–9 cm, base tapering; lower to upper leaves shortly petiolate (petiole to 0.3 cm); blade broadly to narrowly lanceolate, sometimes falcate, 2.7–7 \times 0.6–1.7 cm, base rounded. Capitula 6–20 in terminal or axillary, racemiform synflorescences, sometimes distributed along much of stem, 2.5–3 cm in diam., sessile or peduncles 0.1–20 mm, densely strigillose, minutely stipitate glandular, resinous; bracts linear-oblanceolate, entire, sometimes crowded below head, often grading into phyllaries. Involucres campanulate, 6–8 \times 8–12 mm; phyllaries 4- or 5-seriate, unequal, green apically, often squarrose, falcate, 0.7–1 mm wide, margin narrowly scarious, erose, ciliate (outer phyllaries) to densely villous-ciliate (inner phyllaries) distally, midvein more pronounced distally, plus 3–7 dark green striae, apex obtuse to rounded, tip purplish (sometimes whole apex purplish), eciliate, ?minutely stipitate glandular, thinly to thickly resinous; outer phyllaries lanceolate, 1.5–3 mm; middle phyllaries oblong, 4–7 mm, base hardened; inner phyllaries oblong to linear-oblong, 6–9 mm. Ray florets 30–35, white or lavender, tube apex and lamina base sparsely hairy, lamina 6–8 \times 1–1.5 mm, eglandular; disk florets yellow, ca. 6 mm, tube base flared, tube apex and limb base hairy, limb campanulate, ca. 4 mm, lobes spreading, triangular, ca. 1 mm, glabrous, eglandular. Achenes oblong, compressed, 2.7–3 mm, strigillose, sparsely stipitate glandular, 2-ribbed. Pappus 4-seriate, white or \pm reddish, outermost slender bristles 0.4–0.8 mm; outer bristles few, slender, 2–3.5 mm; inner bristles ca. 5 mm, acute; innermost bristles ca. 5.5 mm, weakly clavate. Fl. Aug–Oct, fr. Oct–Nov.

• Slopes, roadsides, stream banks, rock outcrops; 600–1800 m. S Gansu, W Hubei, S Shaanxi, NW and W Sichuan.

74. *Aster turbinatus* S. Moore, J. Bot. 16: 132. 1878.

陀螺紫苑 tuo luo zi wan

Herbs, perennial, 60–100 cm tall, rhizomatous. Stems erect, simple, sometimes long branched in upper part, finely striate, villous, sparsely minutely stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially pale green, adaxially green, both surfaces moderately scabrous, more densely so adaxially, very sparsely minutely stipitate glandular, margin serrate to serrulate (teeth mucronulate), scabrous, midvein prominent abaxially, apex acute to acuminate, mucronate; lowest leaves (partly observed) withered by anthesis, narrowly winged petiolate; lower to upper leaves shortly winged petiolate (lower leaves), pandurate or ovate to ovate-lanceolate, 3.5–10.5(–15) \times 0.8–2.8 cm, base truncate or

rounded or auriculate-clasping; synflorescence leaves sessile, lanceolate to ovate, 0.8–3 \times 0.4–0.8 cm, base rounded, \pm clasping. Capitula 1–10 in terminal racemiform synflorescences; peduncles 2–15 mm, strigillose; bracts numerous, sometimes overlapping, lowest bracts leaflike, ciliate, middle and upper bracts phyllary-like. Involucres campanulate, 10–12 \times 10–18 mm; phyllaries 5- or 6-seriate, unequal, green apically, abaxially glabrous, eglandular, margin scarious, erose, purplish, ciliate, midvein somewhat more pronounced distally, \pm translucent, apex obtuse, erose, purplish, ciliate; outer phyllaries broadly ovate, ca. 3 \times 2.5–3 mm; middle phyllaries ovate to oblanceolate, 5–7 \times 2–3 mm, base \pm hardened; inner phyllaries oblong to narrowly oblong, 8–12 \times 1.2–1.8 mm. Ray florets 20–27, white or purple, lamina 10–11(–14) \times 1.5–1.8(–3) mm, glabrous, eglandular; disk florets yellow, ca. 6 mm, tube base flared, limb campanulate, ca. 3.5 mm, lobes spreading, tip recurved, narrowly triangular, ca. 1.5 mm, glabrous, eglandular. Achenes mottled red, narrowly obovoid, slightly compressed, ca. 3 mm, strigillose, apically sparsely minutely stipitate glandular, 4- or 5-ribbed. Pappus 4-seriate, white; outermost bristles few, slender, 0.5–0.7 mm; outer bristles slender few, 3.5–4 mm; inner bristles 4.1–4.9 mm, tapering; innermost bristles 6–6.2(–6.5) mm, \pm clavate. Fl. Aug–Oct, fr. Oct–Nov.

• Open forests, thickets, grasslands, hillsides, stream banks, shaded places; 200–800 m. Anhui, Fujian, Jiangsu, Jiangxi, Zhejiang.

The distinction between the two varieties of *Aster turbinatus* needs to be investigated.

- 1a. Lower leaf blade ovate or ovate-lanceolate, base truncate or rounded; ray floret lamina purple, ca. 14 \times 2.5–3 mm 74a. var. *turbinatus*
- 1b. Lower leaf blade pandurate, base deeply auriculate-clasping; ray floret lamina white, smaller 74b. var. *chekiangensis*

74a. *Aster turbinatus* var. *turbinatus*

陀螺紫苑(原变种) tuo luo zi wan (yuan bian zhong)

Lower leaf blade ovate or ovate-lanceolate, base truncate or rounded. Ray floret lamina purple, ca. 14 \times 2.5–3 mm.

• Hillsides, stream banks, shaded places; 200–800 m. Anhui, Fujian, Jiangsu, Jiangxi, Zhejiang.

74b. *Aster turbinatus* var. *chekiangensis* C. Ling ex Y. Ling, Fl. Reipubl. Popularis Sin. 74: 359. 1985.

仙白草 xian bai cao

Lower leaf blade pandurate, base deeply auriculate-clasping. Ray floret lamina white, smaller.

• Open forests, thickets, grasslands. Zhejiang.

Aster turbinatus var. *chekiangensis* is used medicinally for treating snakebites.

75. *Aster baccharoides* (Benth) Steetz, Bot. Voy. Herald, 385. 1857.

白舌紫苑 bai she zi wan

Diplopappus baccharoides Benth. London J. Bot. 1: 487. 1842; *Aster brevipes* Benth.

Low shrubs or perennial herbs, 15–150 cm tall, basally woody, rhizomatous. Stems erect, branched or sometimes simple (herb), finely striate, densely strigose, minutely stipitate glandular. Leaves cauline, slightly reduced upward, abaxially pale green, moderately strigose, moderately to densely minutely stipitate glandular, adaxially green, densely scabridulous, minutely stipitate glandular, margin serrate to serrulate (teeth mucronulate), scabrous, midvein prominent abaxially, apex acute, mucronate; lowest leaves withered by anthesis (herb), lower to upper leaves shortly winged petiolate; blade narrowly ovate to lanceolate, 1.3–7.5 × 0.4–1.8 cm, base attenuate to rounded; synflorescence leaves shortly petiolate, broadly lanceolate to oblanceolate, 0.7–3 × 0.3–0.8 cm, base cuneate to rounded, margin entire. Capitula numerous, in terminal or axillary corymbiform to paniculiform synflorescences, 1.5–2 cm in diam.; peduncles 2–8 mm, strigillose; bracts oblanceolate, margin entire, becoming phyllary-like distally. Involucres campanulate, 6–7 × ca. 7 mm; phyllaries 5–7-seriate, unequal, narrowly green apically, sometimes distally purplish, abaxially moderately to densely strigose, more so distally, sparsely to moderately minutely stipitate glandular, margin scarious (more broadly so in inner phyllaries), erose, villous-ciliate, midvein somewhat more pronounced distally, ± translucent, sometimes 3-veined, apex acute to obtuse or rounded, erose, sometimes mucro or tip purplish, ciliate; outer phyllaries broadly lanceolate to lanceolate, 1.5–2 × 0.7–1 mm; middle phyllaries lanceolate-oblong, 3–5 × 1–1.2 mm, base ± hardened; inner phyllaries oblong, 6–7 × 1–1.5 mm. Ray florets 8–18, white, lamina ca. 6 × 1.2–1.7 mm, glabrous, eglandular; disk florets yellow, 4.5–6.5 mm, tube base flared (veins marked), limb campanulate, 2.5–3.5 mm, glabrous, minutely stipitate glandular proximally, lobes spreading, tip recurved, narrowly triangular, 1.2–2 mm, glabrous, eglandular. Achenes dark purple, oblong, slightly compressed, ca. 3.5 mm, strigillose, apically sparsely minutely stipitate glandular, 2-ribbed. Pappus 4-seriate, white, of slender bristles; outermost bristles 1–3, 0.5–1.2 mm; outer bristles absent or 1, ca. 3 mm; inner bristles 4–5 mm, acute; innermost bristles 5–6 mm, clavate. Fl. Jul–Oct, fr. Aug–Nov.

• Slopes, grasslands, shrublands, sandy areas, sea bluffs, roadsides; sea level to 1000 m. Fujian, Guangdong, E Guangxi, Hunan, Jiangxi, Zhejiang.

Aster baccharoides is closely related to *A. turbinatus* but differs in having basally woody stems, narrow leaves, small capitula and florets, and white ray floret lamina.

76. *Aster sinianus* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 609. 1937.

岳麓紫苑 yue lu zi wan

Herbs, perennial, rhizomatous. Stems erect, 40–60 cm tall, slender, canaliculate, woody at base, covered with spreading or crisped short hairs, shortly branched at middle part, with scattered leaves. Leaves abaxially sparsely hispidulous, rarely sparsely hispidulous on veins, adaxially sparsely puberulent, glabrescent, sometimes glandular, margin ciliate, midvein abaxially prominent, lateral veins indistinct; basal leaves absent at

anthesis; lower cauline leaves broadly winged petiolate; blade oblong or narrowly elliptic, 3–7 × 0.7–1.5 cm, base attenuate, margin entire or sparsely serrate (teeth mucronate), apex obtuse or acute; upper leaves often sessile, 0.5–2.5 mm, margin entire, apex rounded. Capitula 1–3, axillary at short branches and arranged in paniculate corymbs, ca. 1.5 cm in diam.; peduncles to 2 cm; bracts few, lanceolate, leaflike. Involucres campanulate or obconic, 4–5 × 5–6 mm; phyllaries ca. 4-seriate, unequal; outer phyllaries dark brown, ovate, 1–2 × ca. 1 mm, pubescent, apex mucronate; inner phyllaries oblong, ca. 4 × 1.2 mm, margin shortly ciliate, apex hairy. Ray florets ca. 10, white, tube ca. 3 mm, lamina ca. 4 × 1.5–2 mm; disk florets ca. 4 mm, tube ca. 1.5 mm, sparsely hairy, lobes ca. 1.5 mm. Achenes oblong, ± compressed, 1.5–2 mm, strigose. Pappus white, bristles to 4 mm. Fr. Jul–Sep.

• Roadsides on slopes; 600–900 m. Hunan, Jiangxi.

No specimens of *Aster sinianus* were seen by one of us (Brouillet).

77. *Aster velutinosus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 359. 1985.

毡毛紫苑 zhan mao zi wan

Herbs, perennial, ca. 50 cm tall (lower part not seen). Stems slender above middle, branched, puberulent, upper part white velutinous, densely or loosely leafy in upper part. Leaves abaxially gray-green, adaxially somewhat shiny, (lower leaves not seen); middle leaves sessile or shortly petiolate (petiole ca. 1.5 mm); blade lanceolate, 4–7.5 × 0.9–1.6 cm, abaxially densely velutinous, adaxially glabrous, villosulous at base and on veins, thin, base slightly rounded or subcuneate, margin slightly revolute, entire, scabrous, triplinerved, veins ± prominent abaxially, lateral veins 6 or 7 pairs, apex acuminate, sometimes falcate, mucronate. Capitula 2 or 3 at ends of branches, in ± corymbiform synflorescences; shortly pedunculate. Involucres campanulate, 4–5 mm; phyllaries 4- or 5-seriate, unequal; outer phyllaries ovate, ca. 1.5 mm, abaxially puberulent; inner phyllaries oblong, ca. 4 mm, margin narrowly scarious, apex rounded to obtuse, thick. Ray florets not seen; disk florets yellow, 3.4–3.8 mm, tube 1.2–1.3 mm, limb narrowly campanulate, lobes lanceolate, 1.1–1.2 mm, apically glandular and villosulous. Achenes brown, narrowly oblong, slightly compressed, ca. 2.9 mm, sparsely strigose, moderately so distally, pale 5- or 6-ribbed. Pappus reddish brown, 2-seriate; inner series ca. 3 mm, acute; innermost series 3.3–3.6 mm, clavate. Fl. Jul.

• Thickets on mountains; ca. 200 m. Guangxi.

Ray florets were not observed by us on the available specimens of *Aster velutinosus*; the capitula on the type specimen are too immature. On the fruiting specimen, however, there is no sign of ray florets, including on a head that was not fully opened; only disk florets were seen there.

78. *Aster ovalifolius* Kitamura, Acta Phytotax. Geobot. 1: 289. 1932.

卵叶紫苑 luan ye zi wan

Herbs, perennial, 40–100 cm tall. Stems sparsely branched, tomentose above. Leaves: basal leaves withered at anthesis;

cauline leaves crowded, sessile or shortly petiolate (petiole ca. 2 mm), adaxially pale green, ovate, $3.5\text{--}5.5 \times 1.5\text{--}2.5$ cm, slightly papery, both surfaces hispidulous, abaxially gland-dotted, base rounded, margin subentire or sparsely serrate at middle part, basally 3-veined, apex acute; upper leaves smaller, few near synflorescence, 0.8–1.5 cm. Capitula numerous, in paniculate-corymbiform synflorescences, 0.6–1.5 cm in diam.; peduncles 0.5–1.6 cm, erect or spreading, \pm strict, densely pubescent, sometimes with a bract ca. 1 mm. Involucres campanulate, $6\text{--}7 \times$ ca. 7 mm; phyllaries 4- or 5-seriate, ?unequal, oblong-lanceolate, margin entire, ciliate, apex brown, obtuse to rounded; outer phyllaries 1.5–2 mm; inner phyllaries gradually longer, 4–4.5 mm. Ray florets white, tube ca. 3 mm, lamina $7\text{--}8 \times$ ca. 1.5 mm; disk florets yellow, 4–4.5 mm, tube ca. 2.5 mm, limb ca. 2.8 mm. Achenes oblong, slightly compressed, ca. 2×0.8 mm, strigose, 4–6-ribbed. Pappus dirty white or reddish brown, of unequal bristles ca. 4.5 mm. Fl. Aug.

- Sea level to low elevations. Taiwan.

No specimens of *Aster ovalifolius* were seen by us. The description is partly based on the treatment by Soejima and C. I. Peng (Fl. Taiwan, ed. 2, 4: 859–861. 1998).

79. *Aster sampsonii* (Hance) Hemsley, J. Linn. Soc., Bot. 23: 415. 1888 [*"Sampsoni"*].

短舌紫菀 duan she zi wan

Herbs, perennial, 30–97 cm tall, basally woody, rhizomatous. Stems erect, simple, finely striate (reddish or white), sparsely to densely villous, sparsely minutely stipitate glandular below leaves. Leaves cauline, gradually reduced upward, abaxially pale green, moderately scabridulous, strigose, minutely stipitate glandular, adaxially green, densely scabridulous, margin revolute, serrate to serrulate (teeth mucronulate), villosulous-ciliate, midvein prominent abaxially, apex acute, mucronate; lowest leaves (partly observed) withered by anthesis, sometimes marcescent, narrowly winged petiolate, smaller; lower to upper leaves long to shortly winged petiolate; blade ovate to linear-oblancoate, $2\text{--}9.5 \times 0.4\text{--}3.3$ cm, base attenuate to cuneate; synflorescence leaves shortly winged petiolate, lanceolate, $0.9\text{--}2.5 \times 0.3\text{--}0.5$ cm. Capitula 7–38 in terminal, open corymbiform synflorescences, 0.8–1.5 cm in diam.; peduncles

9–45 mm, densely strigillose; bracts linear-lanceolate, entire, sometimes grading into phyllaries. Involucres campanulate, 4–6 mm; phyllaries 5- or 6-seriate, unequal, green apically, oblong, abaxially sparsely to moderately strigillose, apically minutely stipitate glandular, margin scarious, erose, purplish, villous-ciliate, midvein more pronounced distally, translucent, apex acute to obtuse, sometimes apiculate, erose, sometimes purplish; outer phyllaries $2\text{--}3 \times 0.3\text{--}0.9$ mm; middle phyllaries $4\text{--}5 \times 1\text{--}1.1$ mm, base \pm hardened; inner phyllaries $6\text{--}7 \times 0.5\text{--}1$ mm. Ray florets 15–20, white or purplish, lamina $6\text{--}9 \times 1.5\text{--}12$ mm, glabrous, eglandular; disk florets yellow, ca. 6 mm, tube base flared (veins slightly marked), limb campanulate, ca. 3.5 mm, sparsely hairy, eglandular, lobes spreading, tip recurved, narrowly triangular, ca. 1.2 mm, glabrous, minutely stipitate glandular. Achenes narrowly obovoid, slightly compressed, 1.8–2 mm, sparsely strigillose, sparsely minutely stipitate glandular, 2-ribbed. Pappus 3-seriate, orangish; outermost series of scales few, whitish, linear, 0.3–1.2 mm; inner bristles 3–4 mm, acute; innermost bristles 4.5–5 mm, \pm clavate. Fl. and fr. Jul–Oct.

- Grasslands or meadows on slopes, thickets; 500–1000 m. Guangdong, Guangxi, Hunan.

- 1a. Pappus absent in ray florets 79a. var. *sampsonii*
 1b. Pappus present in ray florets and
 disk florets 79b. var. *isochaetus*

7. *Aster* sect. *Alpigeni* Nees, Gen. Sp. Aster. 24. 1832.

山菀组 shan wan zu

Chlamyditis J. R. Drummond; *Wardaster* J. Small.

Herbs, perennial, usually simple, erect. Leaves basal (persistent or deciduous by anthesis) and cauline; blade spatulate or oblanceolate to ovate, oblong, or lanceolate to linear-lanceolate, margin flat, entire or serrate to coarsely serrate, rarely deeply pinnatifid, 1-veined. Capitula radiate, terminal, solitary at ends of scapiform stems, rarely 2–8 in corymbiform synflorescences. Involucres hemispheric to broadly campanulate; phyllaries 2- or 3-seriate, equal or subequal (outer sometimes shorter), rarely unequal, leaflike or upper part leaflike, not keeled, margin sometimes scarious. Receptacles flat or \pm convex. Ray florets 1-seriate, 10–60(–100), purple, reddish, mauve, lavender, lilac, blue, pink, or white; disk floret limb funnelform to narrowly funnelform, sometimes campanulate, lobes equal. Achenes broadly to narrowly obovoid or oblong to oblanceoid, \pm compressed, 2(–4)-ribbed. Pappus of ray and disk florets 1–4-seriate, of persistent, rarely caducous, numerous free bristles, innermost series clavate, outermost series of short bristles, sometimes scales.

About 50 species: C, NE, and SW Asia, Europe, and North America; 44 species (28 endemic) in China.

- 1a. Outer phyllary margin broadly scarious.
- 2a. Phyllaries linear to obovate-oblong; capitula 2–8, in corymbiform synflorescences 121. *A. senecioides*
- 2b. Phyllaries lanceolate to linear-lanceolate; capitula terminal, solitary.
- 3a. Phyllaries 6–12 mm; plants 3–15 cm tall 122. *A. batangensis*
- 3b. Phyllaries 5–7 mm; plants ca. 45 cm tall 123. *A. rockianus*
- 1b. Outer phyllary margin leaflike or hardened basally, sometimes narrowly or broadly scarious.
- 4a. Pappus 3- or 4-seriate, inner series of bristles equaling disk corollas, white, whitish, or somewhat tinged red, outermost series of scales.
- 5a. Phyllaries unequal, outer shorter than inner ones; leaf margin pinnatisect 120. *A. bipinnatisectus*
- 5b. Phyllaries subequal or equal; leaf margin entire or remotely serrate to serrulate.
- 6a. Ray floret lamina linear-lanceolate.
- 7a. Plants with tuberoid roots.
- 8a. Involucres 6–9 mm in diam., phyllaries 1–1.5 mm wide; disk florets orange-yellow, lobes minutely purple stipitate glandular 109. *A. asteroides*
- 8b. Involucres 6–7 mm in diam., phyllaries 1.5–3 mm wide; disk florets yellow, purplish brown distally, lobes sparsely minutely stipitate glandular 110. *A. likiangensis*
- 7b. Plants long rhizomatous.
- 9a. Involucres 2–3 cm in diam.; disk florets yellow or purplish tinged 113. *A. tsarungensis*
- 9b. Involucres 1.5–2(–3) cm in diam.; disk florets orange to yellow.
- 10a. Plants densely or sparsely villous, usually also glandular, or leaves glabrate; involucres 1.5–2(–3) cm in diam., phyllaries 1–2 mm wide 111. *A. flaccidus*
- 10b. Plants densely white hirsute or villous or tomentose; involucres ca. 1.5 cm in diam., phyllaries ca. 1 mm wide 112. *A. hololachnus*
- 6b. Ray floret lamina linear.
- 11a. Stems 5–12 cm 119. *A. brevis*
- 11b. Stems 13–75 cm.
- 12a. Phyllaries linear-lanceolate, 1–1.5 mm wide, apex acuminate to long acuminate.
- 13a. Inner phyllary margin scarious, abaxially brown stipitate glandular 117. *A. lipskii*
- 13b. Phyllary margin narrowly scarious, villous, eglandular, inner series often glabrate 118. *A. farreri*
- 12b. Phyllaries (1–)2–5 mm wide, apex acute or acuminate.
- 14a. Phyllaries dark colored stipitate glandular, \pm villous along veins; disk florets orange to yellow, apex blackish or brownish purple 114. *A. diplostephioides*
- 14b. Phyllaries white villous, sometimes glandular; disk florets yellow to orange.
- 15a. Middle and upper cauline leaves lanceolate or oblong to oblanceolate; involucres 1.5–2.5 cm in diam., phyllaries 0.8–4(–5) mm wide 115. *A. yunnanensis*
- 15b. Middle and upper cauline leaves lanceolate to linear; involucres 0.8–0.9 cm in diam., phyllaries 1.5–2 mm wide 116. *A. setchuenensis*
- 4b. Pappus 2–4-seriate, of barbellate bristles, sometimes outer series of few slender bristles or scales.
- 16a. Phyllaries lanate.
- 17a. Disk corolla tube and limb sparsely villosulous, lobes lanate 107. *A. prainii*
- 17b. Disk corolla tube and limb without long hairs 108. *A. neolanuginosus*
- 16b. Phyllaries abaxially pilose, pilosulose, scabridulous, strigillose, strigose, hirsute-villous, hirsutulous, hispidulous, villous or villosulous to lanate, glabrate, or glabrous, sometimes glandular.
- 18a. Phyllaries leaflike at least apically, apex acute or acuminate.
- 19a. Pappus brown, purplish, or reddish brown, sometimes also yellowish at base.
- 20a. Achenes not winged.
- 21a. Pappus 3-seriate, outermost series of short bristles or scales, inner series of distally brown bristles; achenes oblanceolate, sparsely strigose; ray florets 25–30, lamina 10–20 mm 101. *A. latibracteatus*
- 21b. Pappus 2–4-seriate, outermost series of scales or slender bristles, inner series of reddish brown or brown bristles; achenes obovoid; ray florets 44–100, lamina 20–30 mm.
- 22a. Pappus 3- or 4-seriate, outermost series of few slender bristles or none, inner series of barbellate bristles; achenes glabrous or distally glabrate, minutely stipitate glandular 103. *A. bietii*
- 22b. Pappus 2-seriate, outermost series of narrow to broad scales, inner series of barbellate bristles; achenes sparsely strigillose, eglandular 102. *A. bulleyanus*
- 20b. Achenes winged.
- 23a. Basal leaves present at anthesis, middle and upper cauline leaves oblong to linear-lanceolate 106. *A. jeffreyanus*
- 23b. Basal leaves withered at anthesis, middle and upper cauline leaves ovate, oblong, or ovate-lanceolate.
- 24a. Capitula 3.5–4 cm in diam.; outer phyllaries 5–7 mm wide, hispidulous; lamina ca. 14 \times 0.7 mm; pappus longer than tube of disk florets 104. *A. platylepis*

- 24b. Capitula 3–7.5 cm in diam.; outer phyllaries 1–4 mm wide, sparsely pilose to glabrate; lamina 15–35 × 1–3 mm; pappus 1–4 mm 105. *A. brachytrichus*
- 19b. Pappus white or whitish, reddish, yellowish, or straw-colored to brownish.
- 25a. Stems erect 100. *A. retusus*
- 25b. Stems ascending.
- 26a. Plants with long slender stolons (to 30 cm) 99. *A. stracheyi*
- 26b. Plants without stolons or with short stolons.
- 27a. Plants eglandular; pappus straw-colored to brownish reddish brown.
- 28a. Phyllaries leaflike, margin broadly scarious; ray florets 11–30; achenes strigose distally 95. *A. salwinensis*
- 28b. Phyllaries membranous, apex leaflike in outer series, inner bristles with broadly scarious margins; ray florets 13–17; achenes densely strigose 96. *A. tientschwanensis*
- 27b. Plants minutely stipitate glandular; pappus whitish to straw-colored or reddish based.
- 29a. Pappus whitish to straw-colored; phyllaries 2.5–3.5 mm wide; ray florets 40–70 97. *A. himalaicus*
- 29b. Pappus reddish based, whitish above; phyllaries 3–5 mm wide; ray florets 80 or more 98. *A. techinensis*
- 18b. Phyllaries of outer series leaflike or leaflike above, often hardened at base, apex rounded, obtuse, acute or acuminate.
- 30a. Pappus purplish to reddish- or purplish brown, or brown, equaling or shorter than disk florets, rarely somewhat longer.
- 31a. Pappus reddish brown or yellowish, of many bristles; capitula terminal, solitary, or 2–4, solitary at ends of stem and branches.
- 32a. Capitula terminal, solitary; phyllaries densely pilose; ray florets 11–13(–15), white; plants 4–7 cm tall, without stolons 93. *A. fanjingshanicus*
- 32b. Capitula 1–4, solitary at ends of stems and branches; phyllaries abaxially sparsely scabridulous; ray florets 12–20, blue-purple; plants 24–40 cm tall, with stolons 94. *A. giraldii*
- 31b. Pappus purplish to reddish- or purplish brown, or brown, of few bristles; capitula terminal, solitary, rarely solitary at ends of branches.
- 33a. Phyllaries squarrose, both surfaces densely hirsutulous; ray florets ca. 100 92. *A. megalanthus*
- 33b. Phyllaries appressed or sometimes squarrose, ± hairy or glabrous abaxially; ray florets 30–70.
- 34a. Rhizomes slender, often with stolons; leaves scabridulous or hirsute, phyllaries villosulous 90. *A. tongolensis*
- 34b. Rhizomes robust; leaves glabrate to sparsely pilosulose, phyllaries abaxially sparsely to densely pilosulose distally or glabrous, margin densely pilose-ciliate or eciliate 91. *A. souliei*
- 30b. Pappus white, dirty white, straw-colored, purplish, or buff, ± equaling or longer, rarely shorter, than disk florets, often with outer series of few short, slender bristles.
- 35a. Pappus purplish straw-colored; leaf surfaces strigose 89. *A. handelii*
- 35b. Pappus white or dirty white, reddish, purplish, buff, or straw-colored; leaf surfaces ± villous, hirsute-villous, pilose, scabrous, strigose, or strigillose.
- 36a. Phyllaries oblong or lanceolate, apex acute, 1–1.5 mm wide; involucre 0.7–1.5 cm in diam.
- 37a. Basal leaves withered and lower cauline withered or present at anthesis; stems 15–45 cm tall; pappus straw-colored or sometimes purplish 86. *A. lingulatus*
- 37b. Basal and lower cauline leaves present at anthesis; stems 40–75(–100) cm tall; pappus whitish 88. *A. neoelegans*
- 36b. Phyllaries lanceolate to oblong or oblanceolate, spatulate, oblong, or linear, apex obtuse, rounded, acute, or sometimes acuminate, 1.3–3 mm wide, involucre 0.6–2 cm in diam.
- 38a. Cauline leaves rather similar in size and ± evenly distributed on stem; involucre 2–2.8 cm in diam.; phyllaries oblanceolate, 2–3 mm wide, glabrate (margin ciliate) 87. *A. tricephalus*
- 38b. Cauline leaves reduced upward; involucre 0.6–2 cm in diam.; phyllaries 1.3–2.5 mm wide, densely or sparsely hairy.
- 39a. Basal leaves withered at anthesis 85. *A. ionoglossus*
- 39b. Basal leaves present or withered and marcescent at anthesis.
- 40a. Pappus reddish or buff, barbellate above 84. *A. barbellatus*
- 40b. Pappus white, dirty white, barbellate throughout.
- 41a. Disk floret lobes unequal 83. *A. takasagomontanus*
- 41b. Disk floret lobes equal.
- 42a. Phyllaries unequal 82. *A. heterolepis*
- 42b. Phyllaries equal or subequal.
- 43a. Involucre 0.6–1 cm in diam.; outer phyllaries lanceolate to oblong or oblanceolate, apex rounded or obtuse to acute or acuminate; capitula solitary, terminal 80. *A. alpinus*
- 43b. Involucre 1–1.2 cm in diam.; outer phyllaries oblanceolate or spatulate, apex rounded or acute; capitula 2–30 in terminal corymbiform synflorescences, rarely solitary 81. *A. oreophilus*

80. *Aster alpinus* Linnaeus, Sp. Pl. 2: 872. 1753.

高山紫菀 gao shan zi wan

Herbs, perennial, 10–35 cm tall, caespitose; rhizomes robust. Stems erect, simple, sparsely to densely villous, sparsely to moderately minutely stipitate glandular. Leaves basal and cauline, rosette marcescent at anthesis; cauline leaves much reduced upward, sparsely to moderately villous, sometimes sparsely minutely stipitate glandular, 3-veined, main veins \pm prominent; basal leaves rosulate, petiolate, obovate to spatulate; lower cauline leaves with petiole winged, sometimes slender, up to 11 cm; blade linear-oblong, $1-10 \times 0.4-1.5$ cm, base attenuate, margin entire, sometimes undulate, apex rounded; middle cauline leaves sessile, oblong-lanceolate to linear, base attenuate. Capitula solitary, terminal, 3–3.5(–5.5) cm in diam.; bracts linear to linear-lanceolate, 1-veined. Involucres hemispheric, $1.5-2 \times 0.6-1$ cm; phyllaries 2- or 3-seriate, equal or subequal, rarely unequal, lanceolate to oblong or oblanceolate, $7-10 \times 1.5-2.2$ mm, abaxially sparsely villous to densely lanate (crosswalls sometimes purple to black), sometimes minutely stipitate glandular, margin sparsely to densely ciliate, apex rounded or obtuse to acute or acuminate; outer phyllaries leaf-like or base sometimes hardened; inner phyllaries leaflike distally, margin whitish, sometimes purple-red. Ray florets 26–60, purple to blue or reddish, tube glabrous, sometimes sparsely minutely stipitate glandular near junction with lamina, lamina $10-15 \times 2-2.5$ mm, glabrous, eglandular; disk florets yellow, 5.5–8.5 mm, limb funnelform, 4.5–6.5 mm, proximally sparsely hairy, sparsely minutely stipitate glandular, lobes spreading, equal, narrowly triangular, 1–1.5 mm. Achenes obovoid, compressed, ca. 3 mm, 2–4-ribbed, moderately to densely strigillose, distally sparsely to moderately minutely stipitate glandular. Pappus 4-seriate, white, barbellate throughout; outermost bristles few, slender, 0.5–1.8 mm; outer bristles slender, 3–4 mm; inner bristles 5–5.5 mm, acute; innermost bristles 6.5–7 mm, weakly clavate. Fl. Jun–Aug, fr. Jul–Sep. $2n = 18, 27, 35+1$ fragm., 36, 37.

Gansu, Hebei, Heilongjiang, Nei Mongol, Qinghai, Shaanxi, Shanxi, Xinjiang [Mongolia, Russia, Tajikistan; SW Asia, Europe, W North America].

This species is very variable. Many subspecies and varieties have been recognized by previous authors. Specimens from Xiaowutai Shan (Hebei) and Taibai Shan (Shaanxi) that were identified by Handel-Mazzetti and Onno as *Aster alpinus* var. *dolomiticus* (Beck) Onno do not match the type of that name from Europe. The typical variety appears to be European and does not reach Siberia; specimens identified as *A. alpinus* var. *alpinus* in China belong to *A. alpinus* var. *vierhapperi*, the variety widespread from Siberia to North America.

- 1a. Phyllaries unequal, apex rounded 80d. var. *diversisquamus*
- 1b. Phyllaries subequal, apex obtuse or rounded.
 - 2a. Leaves abaxially \pm densely glandular 80c. var. *fallax*
 - 2b. Leaves sometimes \pm glandular.
 - 3a. Leaves densely to sparsely villous or subglabrous, lower leaves spatulate

- or oblong-spatulate 80a. var. *vierhapperi*
- 3b. Leaves densely pubescent or densely villous, lower leaves linear-oblong 80b. var. *serpentimontanus*

80a. *Aster alpinus* var. *vierhapperi* (Onno) Cronquist, Vasc. Pl. Pacific NorthW. 5: 76. 1955.

空秆高山紫菀 kong gan gao shan zi wan

Aster alpinus subsp. *vierhapperi* Onno, Biblioth. Bot. 26(Heft 106): 25. 1932; *A. culminis* A. Nelson; *Diplactis alpinus* (Linnaeus) Semple subsp. *vierhapperi* (Onno) Semple.

Stems 10–20(–30) cm tall. Lower leaves spatulate or oblong-spatulate, densely to sparsely villous or subglabrous, sometimes \pm glandular. Capitula 3–3.5 cm in diam. Phyllaries subequal, 1.5–2 mm wide, apex obtuse or rounded.

Hebei, Heilongjiang, Nei Mongol, Shanxi, N Xinjiang [E Russia; W North America].

80b. *Aster alpinus* var. *serpentimontanus* (Tamamschjan) Y. Ling, Fl. Reipubl. Popularis Sin. 74: 204. 1985.

蛇岩高山紫菀 she yan gao shan zi wan

Aster serpentimontanus Tamamschjan, Fl. URSS 25: 108. 1959; *A. alpinus* subsp. *serpentimontanus* (Tamamschjan) Á. Löve & D. Löve.

Stems 10–20(–35) cm tall. Lower leaves linear-oblong, $3-10 \times 0.2-0.5$ cm, densely pubescent or densely villous, sometimes \pm glandular. Capitula 3.5–5.5 cm in diam. Phyllaries subequal, linear, 1–1.5 mm wide, apex obtuse or rounded.

2300–2500 m. N and W Xinjiang [Mongolia, Russia (W Siberia), Tajikistan (Pamirs)].

80c. *Aster alpinus* var. *fallax* (Tamamschjan) Y. Ling, Fl. Reipubl. Popularis Sin. 74: 205. 1985.

伪形高山紫菀 wei xing gao shan zi wan

Aster fallax Tamamschjan, Fl. URSS 25: 580. 1959; *A. flaccidus* Bunge var. *atropurpureus* Onno.

Stems to 35 cm tall. Lower leaves oblong-spatulate, 1.5–8 cm, sparsely puberulent, abaxially \pm densely glandular. Capitula ca. 4 cm in diam. Phyllaries subequal, linear, ca. 10×1.5 mm, sparsely puberulent, apex obtuse or rounded.

1500–2100 m. N Heilongjiang, Nei Mongol [Russia (SE Siberia)].

80d. *Aster alpinus* var. *diversisquamus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 359. 1985.

异苞高山紫菀 yi bao gao shan zi wan

Stems 20–25 cm tall. Lower leaves \pm erect, oblong-spatulate, $2-7 \times 0.4-0.8$ cm, sparsely or densely pubescent, sparsely glandular. Capitula 3–3.5 cm in diam. Phyllaries unequal, oblong-spatulate, 1.5–2.3 mm wide, outer series ca. 3/4 length of inner, blade reddish, apex rounded.

• About 1700 m. N Xinjiang (Tacheng).

This variety has unequal phyllaries, similar to *Aster heterolepis*, but its other features differ from the latter. It might be better treated as a species.

81. *Aster oreophilus* Franchet, J. Bot. (Morot) 10: 378. 1896.

石生紫菀 shi sheng zi wan

Aster tricapitatus Vaniot; *A. vaniotii* H. Lévillé.

Herbs, perennial, 20–60 cm, caespitose; rhizomes procumbent or ascending; new rosettes sometimes present. Stems erect or ascending, simple, leafy, moderately to densely strigose and villosulous. Leaves basal and cauline; cauline leaves gradually reduced upward, sparsely to densely hispidulous, eglandular or sometimes sparsely minutely stipitate glandular, 3-veined, main veins abaxially prominent; basal leaves withered by anthesis, long winged petiolate, narrowly spatulate to obovate or oblanceolate, $2.5-8 \times 0.5-1.5$ cm, base attenuate, margin shallowly serrate distally, apex rounded or obtuse to acute; lower cauline leaves often marcescent, winged petiolate; blade lanceolate, base attenuate; middle and upper leaves erect; blade oblong to lanceolate, base attenuate, subclasping, margin serrate distally or entire, apex rounded to obtuse, mucronulate. Capitula 2–30 in terminal corymbiform synflorescences, sometimes terminal, solitary, $2.5-3.5$ cm in diam.; peduncles 2–10 cm or more, densely strigillose and villosulous, sparsely to moderately minutely stipitate glandular; bracts linear-oblong or linear-lanceolate. Involucres hemispheric, $0.6-0.7(-0.8) \times 1-1.2$ cm; phyllaries 3-seriate, subequal, abaxially moderately strigillose, sparsely to moderately minutely stipitate glandular proximally; outer phyllaries oblanceolate, sometimes spatulate, $5-7 \times 1.3-2$ mm, leaflike, margin narrowly scarious, ciliate, midvein brownish, translucent, apex rounded or acute, sometimes purplish; inner phyllaries lanceolate, leaflike distally, purplish distally, margin ciliate, apex obtuse or acute. Ray florets 21–34, blue-purple to pink or pinkish white, tube glabrous, lamina $11-17 \times 1-2$ mm, glabrous, eglandular; disk florets yellow, 4–5 mm, tube ca. 1.7 mm, limb funnelform, 3–3.5 mm, glabrous, minutely stipitate glandular proximally, lobes spreading, triangular, equal, 0.7–1 mm. Achenes broadly obovoid, compressed, ca. 2 mm, densely strigillose, eglandular, margin 2-ribbed, densely strigillose-ciliate. Pappus 4-seriate, dirty white, barbellate throughout, sometimes outermost bristles few, slender, 0.5–0.7 mm; outer bristles few, slender, 2–3 mm; inner bristles 3.5–4 mm, acute; innermost bristles 4–4.5 mm, weakly clavate. Fl. and fr. Aug–Oct.

• Alpine and subalpine forest margins, grasslands, pastures, open slopes, roadsides; 2000–4000 m. SW Sichuan, Xizang, N and NW Yunnan.

The flowering capitula of *Aster oreophilus* are used medicinally to alleviate pain and as an antiphlogistic.

82. *Aster heterolepis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 614. 1937.

异苞紫菀 yi bao zi wan

Herbs perennial, 14–45 cm tall, \pm caespitose; rhizomes robust; new rosettes sometimes present. Stems often with marcescent leaf remains, erect, branched upward or simple, villous-strigose, with sessile glands, loosely leafy above. Leaves \pm thick, strigose, with dense sessile glands, triplinerved, midvein abaxially prominent; basal leaves rosulate and lower cauline

leaves present at anthesis, winged petiolate, petiole base clasping; blade spatulate or oblanceolate, $3-9 \times 0.5-1.5$ cm, base attenuate, margin entire, scabrous, apex rounded or obtuse; middle leaves sessile, oblong to oblanceolate; upper leaves \pm linear-oblanceolate, small. Capitula solitary at ends of 2–4 branches, $3.5-5(-6)$ cm in diam. Involucres hemispheric, $0.8-1 \times 1-1.5$ cm; phyllaries 3-seriate, unequal; outer phyllaries spatulate, $4-7 \times 1.5-2.5$ mm, abaxially densely strigillose, with sessile glands, base hardened, distally leaflike, margin ciliate, apex rounded; inner phyllaries oblong to linear-oblong, ca. 10×2 mm, densely strigillose distally, \pm membranous, margin scarious, erose-fimbriate, ciliate, apex acute or acuminate, purplish. Ray florets 30, bluish, tube $2.5-2.8$ mm, sparsely hairy distally, lamina $15-18 \times 2-2.5$ mm; disk florets ca. 5.8 mm, tube ca. 2.2 mm, hairy distally onto limb base, limb funnelform, lobes lanceolate, ca. 1.3 mm, equal, tip revolute, with sessile glands. Achenes pale brown, obovoid, compressed, ca. 3 mm, strigillose, glandular apically, 2-ribbed. Pappus whitish, 3-seriate, bristles barbellate throughout; outermost bristles few, ca. 0.4 mm; inner bristles ca. 5 mm, acute; innermost bristles ca. 6.2 mm, clavate. Fl. and fr. Jun–Sep.

• Stony slopes; 1500–2500 m. S Gansu.

Aster heterolepis is closely related to *A. oreophilus*; it differs mainly in habit, the larger capitula, and phyllary shape.

83. *Aster takasagomontanus* Sasaki, Trans. Nat. Hist. Soc. Formosa 21: 151. 1931 [*"Takasago-montanus"*].

山紫菀 shan zi wan

Herbs, perennial, 8–20 cm tall; rhizomes thickened. Stems erect, simple, moderately strigillose, sparsely minutely stipitate glandular. Leaves basal and cauline; basal leaves rosulate, cauline leaves gradually reduced upward, densely hairy, sparsely to moderately minutely stipitate glandular, rarely eglandular; basal leaves present at anthesis, ascending, narrowly winged petiolate (petiole 0.9–4 cm); blade abaxially paler, ovate to broadly ovate or spatulate, $0.7-2 \times 0.5-1.4(-1.9)$ cm, base attenuate, midvein conspicuous, margin entire or sparsely serrate, apex rounded to obtuse, mucronulate; cauline leaves petiolate, few; blade ovate to lanceolate, 2–3 cm, base attenuate to cuneate, margin serrate, apex obtuse to acute; uppermost leaves sessile, narrowly ovate to lanceolate, 2–2.5 cm, serrate. Capitula solitary or 2–5 in terminal corymbiform synflorescences, 3–3.5 cm in diam.; peduncles slender, 2–6 cm; bract 1 or absent, linear-oblanceolate, densely strigillose, eglandular. Involucre hemispheric, $0.7-1 \times 1.5-1.7$ cm; phyllaries 3-seriate, subequal, densely strigillose, adaxially strigillose at apex; outer phyllaries oblong to lanceolate, $6-9 \times 1-2$ mm, leaflike, margin narrowly scarious, ciliate, apex obtuse to acute, tinged reddish purple; inner phyllaries linear-lanceolate, $6-9 \times 1-1.2$, \pm leaflike distally, margin scarious, erose, ciliate distally, acute. Ray florets 13–22, white, tube minutely hairy, minutely stipitate glandular, lamina ca. 7×2 mm, glabrous, eglandular; disk florets yellow, 3.5–4 mm, tube and proximal limb sparsely to moderately hairy, eglandular, limb funnelform, 2.5–2.8 mm, lobes spreading, triangular, unequal, 1–1.5 mm. Achenes narrowly obovoid, \pm compressed, 3–4 mm, 2-ribbed, moderately to densely strigillose, densely mi-

nutely stipitate glandular. Pappus 4-seriate (unclearly), dirty white, bristles barbellate throughout; outermost bristles few, slender, ca. 1 mm; outer bristles few, slender, 2–2.5 mm; inner bristles ca. 3 mm, acute; innermost bristles 3.5–4.5 mm, weakly clavate. Fl. Jul–Sep. $2n = 18^*$.

• Among exposed rocks on slopes, alpine regions; 3400–3700 m. Taiwan.

84. *Aster barbellatus* Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 119. 1964.

髯毛紫菀 ran mao zi wan

Herbs, perennial, 20–40 cm tall; rhizomes stout, stoloniferous. Stems erect, simple, sparsely or moderately hirsute, with sessile glands above, with marcescent leaf remains at base. Leaves basal and cauline, cauline leaves reduced upward, densely to moderately strigose, sometimes upper leaves glandular, midvein abaxially somewhat prominent, triplinerved, veins inconspicuous; basal leaves usually persistent, broadly winged petiolate; blade spatulate to oblanceolate, ca. 2.5×0.6 –1 cm, base attenuate, margin entire or sparsely serrulate, densely strigose-ciliate, apex obtuse or rounded; middle leaves oblong to oblanceolate, 2 – 3.5×0.4 – 0.7 cm, base subclasping; upper leaves small, apex acute. Capitula terminal, solitary, 4–5 cm in diam. Involucres hemispheric, 0.6 – 0.7×1.5 – 1.7 (–2) cm; phyllaries 3-seriate, spatulate-oblong to oblong or linear, 9 – 10×1.5 – 2.5 mm, abaxially sparsely strigose, leaflike, margin strigose-ciliate, inner phyllaries with margin scarious, erose-fimbriate, purplish, apex acute or obtuse, purplish. Ray florets 30–40, blue or purplish, tube 2–2.2 mm, hairy; disk florets yellow, 3.5–5 mm, tube ca. 1.3 mm, distal tube and limb base hairy, limb narrowly funnelform, lobes lanceolate, 1.2–1.5 mm, often purple. Achenes brown, obovoid, compressed, ca. 3 mm, densely strigose, sparsely glandular apically, 2-ribbed. Pappus reddish or buff, 3-seriate, bristles barbellate above; outermost bristles ca. 0.9 mm; inner bristles ca. 4.7 mm, acute; innermost bristles 5.1–5.5 mm (reaching base of disk corolla lobes), \pm clavate. Fl. Jul–Aug.

Open grassy slopes, field margins, sometimes among dwarf shrubs; 3000–4000 m. S Xizang [Bhutan, India (Sikkim), Nepal].

85. *Aster ionoglossus* Y. Ling ex Y. L. Chen, S. Yun Liang & K. Y. Pan, Acta Phytotax. Sin. 19: 87. 1981.

莖舌紫菀 jin she zi wan

Herbs, perennial, 35–40 cm tall; rhizomes stout, somewhat woody. Stems erect, thick, shallowly canaliculate, simple, base with marcescent leaf remains, hirsute-villous, short-stipitate glandular. Leaves basal and cauline; cauline leaves sparse, densely hirsute-villous, often short-stipitate glandular, \pm thick, margin entire, midvein abaxially prominent, 3-veined, veins subparallel; basal and lower cauline leaves crowded, winged petiolate; blade oblong-spatulate to oblanceolate, 4 – 6.5×0.6 – 1.2 cm, base attenuate, apex rounded or obtuse, rarely \pm acute; middle leaves oblong to lanceolate, 3 – 5×0.6 – 0.8 cm, base often cuneate or subrounded, subclasping; upper leaves small, lanceolate to linear, apex acute. Capitula terminal, solitary, 4.5–5.5 cm in diam. Involucres not described; phyllaries 2- or 3-seriate, equal, purple tipped, oblong or oblanceolate, 9 – $10 \times$ ca.

2 mm, abaxially densely hirsute-villous, margin ciliate; outer phyllaries leaflike, apex obtuse or rounded; inner phyllaries with margin scarious, erose, apex acute. Ray floret 30–40, blue-purple, tube 1.1–2 mm, lamina 15–20 mm; disk florets yellow, 5–7 mm, tube 1.1–1.4 mm, tube and limb hairy, limb funnelform, lobes lanceolate, 1.1–1.5 mm, glabrous, often purple. Achenes (immature) ca. 2.5 mm, strigillose. Pappus 3-seriate, reddish; outer bristles slender, ca. 1 mm; inner bristles ca. 4 mm, acute; innermost bristles 4.5–5.5 mm, clavate. Fl. Jul.

• Alpine open slopes; 3100–3800 m. S Xizang (Yadong).

86. *Aster lingulatus* Franchet, J. Bot. (Morot) 10: 377. 1896.

舌叶紫菀 she ye zi wan

Herbs, perennial, (15–)30–45 cm tall; rhizomes procumbent or ascending, stout. Stems erect or ascending, simple, leafy, moderately strigose and villosulous, eglandular. Leaves basal and cauline; cauline leaves slightly reduced upward, both surfaces scabrous, abaxially sparsely to moderately minutely stipitate glandular, adaxially eglandular, thick; basal leaves withered at anthesis, ascending, narrowly winged petiolate (petiole to 7 cm); blade oblanceolate or spatulate, 0.5 – 7×0.4 – 2.3 cm, base attenuate, margin serrate, apex obtuse to acute; lower cauline leaves withered or persistent at anthesis; cauline leaves petiolate to sessile, oblanceolate to lanceolate, 4 – 7×0.8 – 1.3 cm, base attenuate, often semiamplexicaul, margin serrate or entire, apex obtuse or rounded to acute; uppermost leaves erect or \pm spreading, lanceolate to narrowly lanceolate, 2 – 5×0.5 – 1.5 cm, base amplexicaul, margin slightly sinuate, entire, sometimes few serrate, apex obtuse or rounded. Capitula 2–5 in terminal corymbiform synflorescences, rarely solitary, 2–3 cm in diam.; peduncles 1–3 cm; bract 1 or absent, linear-lanceolate, densely strigillose and villosulous, eglandular. Involucres hemispheric, 0.7 – 1.2 cm in diam.; phyllaries 3-seriate, subequal, middle area green, 7 – 8×1 – 1.5 mm, densely pilose, \pm leaflike, margin scarious, slightly erose, sparsely ciliate, midvein inconspicuous, apex acute, dark purple, ciliate; outer phyllaries oblong; inner phyllaries lanceolate. Ray florets 22–28, blue-purple, tube glabrous, eglandular, lamina 15 – 18×2.2 – 2.5 mm, glabrous, eglandular; disk florets yellow, 5 – 6×3.5 – 4.5 mm, proximally sparsely hairy, lobes spreading, triangular, 1.2–2 mm. Achenes broadly obovoid, \pm compressed, ca. 3×2 mm, moderately strigillose, sparsely minutely stipitate glandular distally, margin densely strigillose-ciliate, 2-ribbed. Pappus 4-seriate, straw-colored or sometimes purplish, bristles barbellate throughout; outermost bristles few, slender, ca. 1 mm; outer bristles few, slender, 2–2.5 mm; inner bristles 4–4.5 mm, acute; innermost bristles ca. 5 mm, \pm clavate. Fl. Aug–Oct.

• Alpine or subalpine grassy slopes; 2600–3600 m. W Sichuan, NW Yunnan.

87. *Aster tricephalus* C. B. Clarke, Compos. Ind. 43. 1876.

三头紫菀 san tou zi wan

Herbs, perennial, 30–40 cm tall, rhizomatous, often with robust stolons bearing rosettes. Stems erect, simple below, sparsely pilose. Leaves basal and cauline, pilose, glandular, basal leaves (flowering stems) absent or withered by anthesis; blade spatulate, ca. 6.5×2 cm; cauline leaves \pm evenly distributed

and similar in size, usually overlapping, sessile, oblanceolate, elliptic, or lanceolate, $3.5\text{--}6.5 \times 0.6\text{--}2.1$ cm, base subclasping, margin entire or 2- or 3-serrulate, apex obtuse or acute; upper leaves often surrounding capitula. Capitula 1–3 (rarely more), 2–2.8 cm in diam. Involucres not described; phyllaries 1- or 2-seriate, leaflike, oblanceolate, $12\text{--}14 \times 2\text{--}3$ mm, glabrate, midvein brownish, ciliate, apex acute or obtuse. Ray florets 50–60, white or blue, tube ca. 0.2 cm, lamina ca. 18 mm; disk florets yellow, 4.5–5.5 mm, hairy, tube 1.5–2 mm, lobes ca. 1.5 mm. Achenes brown, obovoid, 3.4–4 mm, strigillose, apically glandular, 2-ribbed. Pappus whitish or buff, 5–5.5 mm. Fl. Aug–Oct.

3600–4000 m. S Xizang [India (Sikkim), Nepal].

Aster tricephalus is similar in height to *A. barbellatus* and *A. neoelegans* but differs in its flowering stems without basal leaves, the basal leaves being present only on well-developed stolons, its capitula usually 3, and its ray florets 50–60.

88. *Aster neoelegans* Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 118. 1964 [*“neo-elegans”*].

新雅紫苑 xin ya zi wan

Aster elegans J. D. Hooker & Thomson ex C. B. Clarke, Compos. Ind. 44. 1876, not Willdenow (1803), nor Nees (1818), nor (Nuttall) Torrey & A. Gray (1841).

Herbs, perennial, 40–75(–100) cm tall, rhizomatous, stoloniferous. Stems simple, strigillose. Leaves strigillose, margin entire, scabrous; basal leaves persistent, winged petiolate, oblanceolate to spatulate, $5\text{--}7 \times 0.8\text{--}1$ cm, base attenuate, apex rounded; cauline leaves gradually reduced upward, sessile or broadly winged shortly petiolate; blade oblong to oblanceolate, base cuneate, subclasping, apex acute or obtuse; upper leaves remote, sessile, linear, apex acute. Capitula 3–6 in open corymbose synflorescences, 2–2.5 cm in diam. Phyllaries 3-seriate, oblong, $4\text{--}8 \times 1\text{--}1.5$ mm, abaxially strigillose, leaflike above, margin narrowly scarious, erose-fimbriate, \pm purplish, villous-ciliate (red crosswalls), apex acute, purple-tipped. Ray florets 35–40, white, mauve, or blue-violet, tube ca. 1.5 mm, sparsely hairy, lamina 7–12 mm; disk florets yellow, hairy, ca. 4 mm, tube ca. 1.5 mm, limb funnelform, lobes lanceolate, ca. 1 mm. Achenes light brown, obovoid, compressed, 2.5–3 mm, sparsely strigose, glandular distally, 2-ribbed. Pappus whitish, 3-seriate, bristles barbellate throughout; outermost bristles ca. 0.6 mm; inner bristles ca. 3 mm, acute; innermost bristles ca. 3.5 mm, clavate. Fl. Jul–Sep.

Forest clearings, often on marshy ground; 2700–3000 m. S Xizang (Yadong) [Bhutan, India (Sikkim)].

89. *Aster handelii* Onno, Biblioth. Bot. 26(Heft 106): 52. 1932.

红冠紫苑 hong guan zi wan

Herbs, perennial, 9–35 cm tall, sometimes caespitose; rhizomes stout, often with stolons bearing rosettes. Stems erect or ascending, simple, sparsely to moderately strigose and/or villous, eglandular. Leaves basal and cauline; cauline leaves gradually reduced upward, both surfaces strigose, sometimes sparsely to moderately minutely stipitate glandular, abaxial

veins moderately to densely villous, sometimes \pm thick, margin villous-ciliate, midvein abaxially \pm prominent (some basal leaves abaxially \pm 3-veined); basal rosette present at anthesis; basal and lower cauline leaves winged petiolate; blade spatulate to oblanceolate, $0.7\text{--}4 \times 0.4\text{--}1.4$ cm, base attenuate, margin entire, sometimes sinuate, apex rounded to obtuse; middle cauline leaves oblong to lanceolate, $1.8\text{--}4 \times 0.2\text{--}0.8$ cm, base subclasping, apex acute or obtuse. Capitula terminal, solitary, 4–5.5 cm in diam. Involucres hemispheric, 5–7 mm; phyllaries 2-seriate, equal, squarrose, oblong-linear, $7.5\text{--}9 \times 1.2\text{--}2$ mm, abaxially sparsely to moderately villosulous proximally, adaxially distally moderately to densely villosulous, leaflike, margin narrowly scarious, villous-ciliate, midvein inconspicuous, apex obtuse to acute, tip purplish. Ray florets 28–40, bluish purple to lavender blue, lamina $12\text{--}23 \times 2.5\text{--}3$ mm; disk florets orange, ca. 6 mm, limb funnelform, ca. 4.5 mm, proximally moderately hairy, lobes spreading, triangular, ca. 1.2 mm, abaxially minutely stipitate glandular. Achenes broadly obovoid, \pm compressed, 2.6–3 mm, densely strigillose, margin 2-ribbed (ribs distally reddish brown), strigillose-ciliate (sometimes rib completely strigillose). Pappus 4-seriate, purplish straw-colored, bristles barbellate throughout; outermost bristles few, slender, ca. 0.5 mm; outer bristles slender, ca. 4 mm; inner bristles few, ca. 5 mm, acute; innermost bristles ca. 5.5 mm, slightly clavate. Fl. and fr. Jul–Sep.

• Alpine or subalpine grasslands and dry grasslands, pastures, wet meadows, mixed shrublands, clearings in *Quercus* forests; 3000–3500 m. SW Sichuan, NW Yunnan.

Aster handelii is similar to *A. tongolensis* but differs in the pappus structure.

90. *Aster tongolensis* Franchet, J. Bot. (Morot) 10: 376. 1896.

东俄洛紫苑 dong e luo zi wan

Aster subcaerulea S. Moore; *A. tongolensis* f. *glabratus* Diels; *A. tongolensis* f. *humilis* Diels.

Herbs, perennial, 14–47 cm tall, sometimes caespitose; rhizome slender, procumbent or ascending, often with stolons bearing rosettes. Stems erect, simple, somewhat slender, sparsely strigose or strigillose, villous or villosulous, sometimes sparsely minutely stipitate glandular. Leaves basal and cauline; cauline leaves gradually or sometimes abruptly reduced upward, both surfaces scabridulous or hirsute, margin ciliate, 3-veined, veins conspicuous; basal leaves winged petiolate, petiole base subclasping; blade spatulate or obovate to oblanceolate, $0.5\text{--}5 \times 0.3\text{--}2$ cm, base attenuate, margin entire or remotely serrulate in upper half, apex obtuse to rounded, sometimes acute; lower cauline leaves sessile, oblong to linear-lanceolate, base subclasping; middle and upper cauline leaves $1\text{--}5 \times 0.1\text{--}0.7$ cm, apex acute. Capitula terminal, solitary (rarely 2), 3–5(–6.5) cm in diam. Involucres hemispheric, 5–7 mm; phyllaries 2- or 3-seriate, subequal, appressed or often squarrose, oblong-linear, $5\text{--}8 \times 0.8\text{--}1.5$ mm, abaxially villosulous, hardened below, leaflike above, apex acute. Ray florets 30–70, blue or lavender to purplish, tube sparsely hairy, lamina $15\text{--}20 \times 1\text{--}2$ mm, glabrous, eglandular; disk florets orange, 3.5–4.5 mm, limb funnelform, 2.5–3 mm, proximally hairy, lobes

spreading to reflexed, narrowly triangular, 1–1.5 mm, abaxially sparsely hairy. Achenes broadly obovoid, ca. 2 mm, densely strigillose, 2-ribbed (ribs sparsely strigillose, densely so apically). Pappus 4-seriate, purple-brown to brown, of few bristles; outermost bristles slender, 0.2–0.7 mm; outer bristles slender, 0.7–1 mm; inner bristles 1.2–1.6 mm, acute; innermost bristles 1.5–2 mm, slightly to distinctly clavate. Fl. Jun–Aug, fr. Jul–Sep. $2n = 18^*$.

• Alpine and subalpine open forests, stream banks, grasslands, boggy margins of lakes, rocky or grassy slopes, pastures, shrub thickets, wet places; 2500–4000 m. S Gansu, Qinghai, NW and SW Sichuan, Xizang, NW Yunnan.

Aster tongolensis is frequently cultivated as an ornamental.

91. *Aster souliei* Franchet, J. Bot. (Morot) 10: 372. 1896.

缘毛紫菀 yuan mao zi wan

Herbs, perennial, 2–45 cm tall, sometimes caespitose; rhizomes robust, woody. Stems solitary, erect, simple, finely striate, sparsely to moderately pilose. Leaves basal and cauline, glabrate to sparsely pilosulose (more so toward apex), margin entire, sometimes remotely serrulate, eciliate to \pm densely ciliate, midvein abaxially prominent, pilose; basal leaves present at anthesis, broadly winged petiolate, petiole base subclasping; blade spatulate or obovate to oblanceolate, 0.7–5 \times 0.3–1.9 cm, base attenuate, apex obtuse to acute; cauline leaves abruptly reduced, narrowly lanceolate, 1–5 \times 0.2–0.8 cm, base clasping, apex acute. Capitula terminal, solitary, 3–4(–6) cm in diam. Involucres hemispheric, 6–8 mm; phyllaries 3-seriate, subequal, appressed or sometimes squarrose, oblong, 6–11 \times 1.5–2 mm, abaxially sparsely to densely pilosulose distally or glabrous, base \pm hardened, leaflike above, margin scarious, sometimes purplish distally, densely pilose-ciliate or eciliate, midvein glabrous or pilose, apex obtuse to slightly acute. Ray florets 25–55, blue-purple to violet, tube glabrous, lamina 12–25 \times 2–3 mm, glabrous, eglandular; disk florets yellow, 3–5 mm, limb funnelform, 2–3 mm, proximally sparsely puberulent, lobes spreading, narrowly triangular, 1–2 mm. Achenes obovoid, \pm compressed, 2.5–3 \times ca. 1.5 mm, densely strigillose. Pappus (2 or) 3-seriate, of few purplish- to reddish brown or brown, sometimes straw-colored bristles; bristles barbellate; outermost bristles few, slender, 0.1–0.3 mm; outer bristles 1–1.2 mm; inner bristles 1–2 mm. Fl. May–Jul, fr. Aug. $2n = 18^*$.

Alpine *Pinus* forest margins, open alpine coniferous forests, thickets and grasslands on slopes; 2700–4600 m. S Gansu, Qinghai, W Sichuan, Xizang, NW Yunnan [Bhutan, N Myanmar].

Aster souliei is sometimes cultivated as an ornamental.

This species is variable in size, leaf shape, involucre, and indumentum. The varieties may represent extremes in a continuum of variation.

- 1a. Phyllaries abaxially glabrous, margin ciliate or eciliate 91a. var. *souliei*
- 1b. Phyllaries abaxially sparsely or densely pilosulose, margin ciliate 91b. var. *limitaneus*

91a. *Aster souliei* var. *souliei*

缘毛紫菀(原变种) yuan mao zi wan (yuan bian zhong)

Aster ganlun Kitamura.

Phyllaries abaxially glabrous, margin densely pilose-ciliate or eciliate.

W Sichuan, Xizang, NW Yunnan [Bhutan, N Myanmar].

91b. *Aster souliei* var. *limitaneus* (W. W. Smith & Farrer) Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 620. 1937.

毛背缘毛紫菀 mao bei yuan mao zi wan

Aster limitaneus W. W. Smith & Farrer, Notes Roy. Bot. Gard. Edinburgh 9: 80. 1916; *A. forrestii* Stapf; *A. tongolensis* Franchet subsp. *forrestii* (Stapf) Onno.

Phyllaries abaxially hairy, margin densely pilose-ciliate.

S Gansu, W Sichuan, NW Yunnan [Bhutan, N Myanmar].

92. *Aster megalanthus* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 359. 1985.

大花紫菀 da hua zi wan

Herbs perennial, 35–45 cm tall; rhizomes robust (to 6 mm in diam.); roots dense, fibrous, bearing rosulate phyllome. Stems single, erect, stout (5–7 mm in diam.), purple-red above, angled and finely canaliculate, hirsute (hairs ca. 4 mm) below, densely leafy below, densely pilose above. Leaves: both surfaces densely pilose, margin hirsute-ciliate, midvein stout, hirsute, abaxially triplinerved, veins prominent, lateral veins fine; basal leaves withered or present at anthesis, broadly winged petiolate; blade oblong-spatulate, 7–12 cm, base attenuate, margin subentire toward middle, apex obtuse or rounded; middle cauline leaves sessile, oblong or oblong-lanceolate, smaller, apex obtuse or acute. Capitula terminal, solitary, ca. 6.5 cm in diam. Involucres hemispheric, ca. 2 cm in diam.; phyllaries 3-seriate, squarrose, oblong or linear-lanceolate, ca. 10 \times 1.5–2 mm, leaflike, base hardened, outer phyllaries densely hirsutulous, inner phyllaries pilose distally, margin \pm reddish, apex obtuse or \pm acute. Ray florets ca. 100, purple-red, lamina 25–30 \times ca. 3.4 mm; disk florets yellow, ca. 6 mm, sparsely hairy. Achenes (immature) \pm compressed, ca. 2 mm, densely strigose. Pappus purplish brown, of few unequal bristles, barbellate throughout, bristles shorter than disk florets. Fl. Aug.

• Slopes; ca. 4000 m. W Sichuan (Zhegu Shan).

Aster megalanthus is closely related to *A. tongolensis* but differs by being taller and in having more ray florets with broader laminae and longer disk florets.

93. *Aster fanjingshanicus* Y. L. Chen & D. J. Liu, Bull. Bot. Res., Harbin 8(3): 11. 1988.

梵净山紫菀 fan jing shan zi wan

Herbs, perennial, 4–7 cm tall; rhizomes short or long, woody, without stolons, collar clad with marcescent petiole remains, fibrous rooted. Stems slender, erect, simple, finely striate, densely or sparsely white pilose, glandular. Leaves basal and cauline; basal leaves rosulate, present at anthesis, winged petiolate; petiole equaling blade; blade oblanceolate-spatulate or spatulate, 8–15 \times 3–5 mm, abaxially pale green, sparsely pilose on veins, adaxially dark green, densely strigose, base cu-

neate-attenuate, margin ciliate, entire, midvein and lateral veins abaxially distinctly prominent, lateral veins 2- or 3-paired, apex rounded, inconspicuously mucronulate; cauline leaves (3 or) 4 or 5, sessile or subsessile, lanceolate, spatulate, or rarely linear-oblong, 5–15 × 2–3 mm, apex obtuse or acuminate. Capitula terminal, solitary. Involucre campanulate, 0.4–0.5 × 0.6–0.8 cm; phyllaries 2- or 3-seriate, subequal, leaflike; outer phyllaries oblong-lanceolate, 1–1.5 mm wide, abaxially densely pilose, apex acuminate or ± acute; inner phyllaries linear or linear-lanceolate, glabrous or apically sparsely puberulent, margin narrowly scarious. Ray florets 11–13(–15), white, tube ca. 2 mm, lamina oblong, 6–7 × ca. 1 mm; disk florets yellow, ca. 3 mm, tube ca. 1 mm, lobes ovate-lanceolate. Achenes oblong, ± compressed, 1.5–2 mm, sparsely strigose. Pappus (?3- or 4-seriate), reddish brown; bristles many, barbellate throughout, ± equalling disk corollas. Fl. Jun–Jul.

• Grasslands on slopes, rocky areas; 2000–2400 m. Guizhou (Fanjiang Shan).

No specimens of *Aster fanjiangshanicus* were seen by one of us (Brouillet).

94. *Aster giraldii* Diels, Bot. Jahrb. Syst. 36(Beibl. 82): 103. 1905.

秦中紫菀 qin zhong zi wan

Herbs, perennial, 24–40 cm tall; rhizomes slender; stolons present. Stems erect, slender, solitary or fascicled, sparsely strigillose, simple or ± branched. Leaves basal and cauline, thin, abaxially sparsely scabridulous, veins scabrous, adaxially scabrous, margin scabrous, midvein ± prominent, lateral veins 3- or 4-paired; basal leaves withered at anthesis; lower cauline leaves long petiolate; blade oblong-spatulate to oblanceolate, 4–7 × 1–1.3 cm, base attenuate, margin serrate (teeth mucronulate); middle leaves sessile or shortly petiolate; blade oblong or lanceolate, 3–5 × 1(–2) cm, base cuneate, apex acute to acuminate; upper leaves small, lanceolate, base often rounded, subclasping. Capitula terminal, solitary or 2–4, terminal at ends of stem and branches, 2–3 cm in diam. Involucre hemispheric-campanulate, 6–7 × 7–10 mm; phyllaries 3-seriate, base hardened, leaflike above, margin scarious, erose-fimbriate, ± acute; outer phyllaries 3–4 × 1–1.5 mm, abaxially sparsely scabridulous; inner phyllaries ca. 4.5 × 1.5–2 mm. Ray florets 12–20, blue-purple, tube ca. 1 mm, glabrous, lamina 10–15 × 2–2.5 mm; disk florets 2.8–4 mm, tube 1–1.5 mm, glabrous, limb campanulate, enlarged, lobes lanceolate, 0.7–1 mm, recurved. Achenes purple, obovoid, slightly compressed, ± trigonous, 2.5–3 × ca. 1.5 mm, sparsely strigose, 4-ribbed. Pappus (?3- or 4-seriate), reddish brown or yellowish; bristles many, stout, barbellate throughout, 0.9–2 mm. Fl. and fr. Aug–Dec.

• Ravines, open forests; 1800–2600 m. Shaanxi (Huxian, Taibai Shan).

95. *Aster salwinensis* Onno, Biblioth. Bot. 26(Heft 106): 74. 1932.

怒江紫菀 nu jiang zi wan

Herbs, perennial, 4–24 cm tall; rhizomes long, slender, sometimes with short stolons. Stems ascending, rarely erect, sparsely to moderately villous, eglandular. Leaves basal and

cauline; cauline leaves reduced upward, sometimes abruptly so, thin, glabrous, eglandular, abaxial veins sparsely pilose, adaxial veins also moderately pilosulose, margin serrate to serrulate or entire (uppermost leaves), midvein abaxially prominent, ciliate, apex mucronate; basal leaves present at anthesis, sometimes marcescent; basal and lower cauline leaves broadly to narrowly winged petiolate (petiole to 2 cm); blade obovate to oblanceolate, 0.5–4 × 0.3–1.5 cm, base attenuate, apex rounded; cauline leaves ± erect, sessile, obovate to ovate or ovate-lanceolate, 1–2.5 × 0.9–3 cm, base rounded or cuneate, subclasping, apex rounded to acute. Capitula terminal, solitary, often subtended by a leaflike bract, 2–3 cm in diam. Involucre hemispheric, 5–9 mm; phyllaries 2- or 3-seriate, subequal, often squarrose, linear-lanceolate, 8–10 mm, leaflike, margin broadly scarious, erose, ciliate, midvein conspicuous proximally, apex acuminate, purplish distally; outer phyllaries 1–1.8 mm wide, abaxially villous proximally to sparsely to moderately so distally, eglandular; inner phyllaries 0.6–1 mm wide, sparsely villous. Ray florets 11–30, blue to blue-purple, rarely white, tube sparsely hairy apically, lamina 7–12 × 1–2.3 mm, glabrous, eglandular; disk florets yellow, 4.5–5.5 mm, limb funnelform, 3–3.5 mm, glabrous, lobes spreading, narrowly triangular, 1–1.3 mm, often tinged purple-brown, glabrate. Achenes brown, narrowly obovoid, compressed, ca. 4 mm, strigose distally, eglandular, 3- or 4-ribbed. Pappus 4-seriate, straw-colored to brownish, with few bristles barbellate throughout; outermost series of slender bristles or narrow scales 0.7–1 mm; outer series of slender bristles, 2–3.5 mm; inner bristles 3.5–4 mm, acute; innermost bristles 4–4.5(–5) mm, weakly clavate. Fl. Jul–Sep, fr. Aug–Oct.

Alpine meadows on slopes or on rocks, openings in *Rhododendron*-bamboo thickets; 3300–4600 m. SW Sichuan, E Xizang, NW Yunnan [NE Myanmar].

96. *Aster tientschwanensis* Handel-Mazzetti, Oesterr. Bot. Z. 89: 819. 1940.

天全紫菀 tian quan zi wan

Herbs, perennial, 7–18 cm tall; rhizomes robust, without stolons. Stems ascending, simple, slender, sparsely villous, often glabrescent below. Leaves crowded below and scattered above, glabrate, rather thick, margin villous-ciliate, midvein abaxially prominent, lateral veins 2- or 3-paired and obliquely ascending; basal leaves winged petiolate; blade spatulate, 2–7 × 0.5–1.5 cm, base attenuate, margin 2–5-crenate-serrate, apex obtuse or rounded; lower cauline leaves present at anthesis, sessile or shortly winged petiolate, spatulate to oblanceolate, 1–1.5 × ca. 0.3 cm, apically 3-serrate or entire; upper leaves small, oblong or linear, margin entire. Capitula terminal, solitary, 2–2.7 cm. Involucre hemispheric-campanulate, ca. 7 × 6–10 mm; phyllaries 3-seriate, subequal, or outer phyllaries somewhat shorter, linear-lanceolate or linear-oblanceolate, 6–7.2 × ca. 1 mm, abaxially glabrous or sparsely villous, membranous, margin villous-ciliate, margin of inner phyllaries ± broadly scarious, erose-fimbriate, apex acute to acuminate, ± leaflike, purplish. Ray florets 13–17, white, tube ca. 1.5 mm, hairy, lamina 10–11 × ca. 2 mm; disk florets ca. 4.5 mm, tube 1–1.2 mm, hairy, limb funnelform, glabrous, lobes lanceolate, ca. 0.8 mm. Achenes (immature) narrowly oblong, ± compressed, ca. 2.5

mm, densely strigose, 2-ribbed. Pappus (immature) 3-seriate, reddish, bristles barbellate throughout; outer bristles short; inner bristles 3.5–4.5 mm. Fl. May–Jul.

• Mountain forest margins and thickets; ca. 3300 m. C and NC Sichuan (Lixian, Tianquan).

Aster tientschwanensis is similar to *A. salwinensis* but differs from it by its thick, glabrate leaves, densely strigose achenes, and reddish pappus.

97. *Aster himalaicus* C. B. Clarke, Compos. Ind. 42. 1876.

须弥紫菀 xū mǐ zǐ wān

Aster mekongensis Onno, p.p.

Herbs, perennial, 8–25 cm tall; rhizomes robust, without stolons, collar clad with marcescent leaf remains. Stems ascending, simple, proximally villosulous, distally sparsely so, minutely stipitate glandular, more densely so distally. Leaves basal and cauline, thin, sparsely villosulous, more densely so on veins, moderately to densely minutely stipitate glandular, margin villous-ciliate, veins abaxially prominent, apices with purple mucro; basal leaves withered at anthesis, marcescent, broadly winged petiolate (petiole to 2 cm); blade oblanceolate, 0.9–2.5(–4.5) × 0.5–2.5 cm, base attenuate, margin serrulate (teeth mucronate), apex rounded to acute; lower cauline leaves oblong or obovate to oblanceolate, 1.5–4 × 0.5–1.2 cm, base rounded, subclasping, margin entire or dentate to serrulate; upper leaves approaching capitulum. Capitula terminal, solitary, 4–4.5 cm in diam. Involucres hemispheric, 11–13 × 13–14 mm, often overtopping disk; phyllaries 2- or 3-seriate, subequal, apex slightly spreading, oblong-lanceolate to lanceolate, 13–14 × 2.5–3.5 mm, abaxially sparsely villosulous to glabrate, tip densely minutely stipitate glandular, membranous, margin scarious, ciliate, multiveined, apex acuminate, ?leaflike, purplish. Ray florets 40–50(–70), blue-purple, lamina 12–15(–17) × 0.5–0.7 mm; disk florets purple-brown or yellow, ca. 5 mm, tube and proximal limb hairy, limb funnelform, ca. 4 mm, lobes erect, triangular, ca. 1 mm, tips sparsely minutely stipitate glandular. Achenes brown, narrowly obovoid, compressed, 2.5–3 mm, strigillose, minutely stipitate glandular, more densely so distally, 2-ribbed. Pappus 4-seriate, whitish to straw-colored; outermost series of few tiny scales 0.3–0.5 mm; bristles barbellate throughout; outer bristles slender, 2–3 mm; inner bristles 4–4.5 mm, acute; innermost bristles ca. 5 mm, weakly clavate. Fl. Jul–Aug, fr. Sep–Oct. $2n = 10$.

Alpine meadows, *Pinus* forests; 3600–4800 m. Sichuan, S Xizang, NW Yunnan [Bhutan, India (Sikkim), N Myanmar, Nepal].

98. *Aster techinensis* Y. Ling, Fl. Reipubl. Popularis Sin. 74: 359. 1985.

德钦紫菀 dé qīn zǐ wān

Herbs, perennial, 15–25 cm tall, caespitose; rhizomes robust, without stolons. Stems ascending, simple, proximally villosulous, distally sparsely so, densely minutely stipitate glandular, more densely so distally. Leaves basal and cauline, thin, sparsely villous to glabrate, more densely villous on veins, minutely stipitate glandular, margin serrate to serrulate (teeth mu-

cronate), villous-ciliate, 3-veined, veins abaxially prominent, apex rounded to acute, mucronate; basal leaves withered at anthesis, marcescent, broadly winged petiolate (petiole to 4 cm); blade oblanceolate, 1.5–4.5 × 0.5–2 cm, base attenuate; lower cauline leaves winged petiolate to sessile, oblanceolate to lanceolate, 1.5–4.4 × 0.5–1.5 cm, base cuneate or attenuate to rounded, clasping; upper leaves sessile, lanceolate, base rounded, clasping. Capitula terminal, solitary, 3.5–4.5 cm in diam. Involucres hemispheric, 1.3–1.4 × 1.8–2.5 cm, often overtopping disk; phyllaries 2-seriate, unequal, multiveined, margin ciliate, apex slightly spreading, both surfaces densely minutely stipitate glandular; outer phyllaries oblong-lanceolate to lanceolate, 13–16 × 3–5 mm, abaxially sparsely villosulous on veins, leaflike, apex acuminate, green or purple tinged, tip villosulous; inner phyllaries narrowly lanceolate, 9–15 × 1.2–1.5 mm, membranous, margin broadly scarious, glabrate. Ray florets ca. 80 or more, blue-purple, tube hairy, lamina 15–18 × 1–1.5 mm, eglandular; disk florets yellow, ca. 7 mm, tube and basal limb hairy, limb funnelform, ca. 4 mm, lobes erect to spreading, purple-black, triangular, ca. 1 mm, glabrous, tip sparsely minutely stipitate glandular. Achenes (immature) oblanceolate, compressed, ca. 2.5 mm, sericeous, densely minutely stipitate glandular, 2-ribbed. Pappus 4-seriate, reddish based, whitish above, bristles few, barbellate throughout; outermost series of slender bristles or scales 0.5–1 mm; outer bristles slender, 2–5 mm; inner bristles 5–5.5 mm, acute; innermost bristles 6–7 mm, weakly clavate. Fl. Aug.

• About 3500 m. NW Yunnan (Dèqēn).

Aster techinensis is closely related to *A. himalaicus* but differs in its stems, leaves, and phyllaries sparsely villosulous and its pappus reddish.

99. *Aster stracheyi* J. D. Hooker, Fl. Brit. India 3: 250. 1881.

匐生紫菀 fú shēng zǐ wān

Herbs, perennial, 3–15 cm tall; rhizomes procumbent, with several long, slender stolons (to 30 cm) with rosettes. Stems ascending or erect, reddish, sparsely to moderately villous, eglandular. Leaves basal and cauline, sparsely to moderately pilose to glabrate, margin revolute, ciliate, apex obtuse, sometimes acute, mucronulate; basal leaves withered by anthesis, winged petiolate (petiole to 6.5 cm); blade spatulate or elliptic, 0.7–3.5 × 0.5–1.3 cm, thick, base attenuate, margin serrate, midvein pronounced; cauline leaves abruptly reduced, few, sessile or (lower leaves) shortly petiolate; blade linear or oblong to oblanceolate or obovate, 0.5–2.5 × 0.1–0.8 cm, 3-veined, base attenuate, margin entire or 1- or 2-denticulate or -serrate, apex acute or obtuse. Capitula terminal, solitary, ca. 2.5 cm in diam. Involucres hemispheric, 13–18 × 8–12 mm; phyllaries 3-seriate, equal, sometimes squarrose, lanceolate or oblanceolate, 8–12 × 1.5–3.5 mm, abaxially glabrous, membranous, shiny, margin scarious, ciliate, purplish, midvein apparent, sometimes strigillose, apex acuminate, purplish. Ray florets 29–42, violet, lamina 8–10 × 1.5–2 mm, tube and abaxial lamina base strigillose, eglandular; disk florets yellow (anther appendages bluish), 4–5 mm, limb funnelform, 2.5–3.5 mm, base sparsely hairy, lobes spreading, triangular, ca. 1 mm. Achenes (imma-

ture) obovoid, 2.2–3 mm, strigillose, minutely stipitate glandular, 2-ribbed. Pappus 3- or 4-seriate, white or whitish; outermost series of narrow scales, 0.3–0.8 mm; outer bristles slender, 3.5–4 mm; inner bristles 5.5–6 mm, acute; innermost bristles 6–6.5 mm, clavate. Fl. and fr. Jul–Sep.

Rocks near streamsides, among boulders in alpine tundra; 3300–4800 m. S Xizang (Tingri) [Bhutan, India, Nepal].

100. *Aster retusus* Ludlow, Bull. Brit. Mus. (Nat. Hist.), Bot. 2: 69. 1956.

凹叶紫菀 *ao ye zi wan*

Herbs, perennial, 2–8 cm tall; rhizomes often vertical, stout, with stolons (to 2–4 cm), collar with marcescent leaf remains. Stems erect, simple, usually purple-brown, sparsely villous at base, more densely so above (hairs with purple crosswalls). Leaves glabrous, triplinerved, with fine 1-paired marginal veins; basal leaves rosulate, present at anthesis, shortly and broadly or narrowly winged petiolate; blade spatulate to oblanceolate, 1–3 × 0.3–0.5 cm, margin entire, ciliate or sparsely ciliate, base gradually attenuate, apex rounded to obtuse, retuse, 3-mucronulate; cauline leaves 3 or 4, oblanceolate, 1–2 × 0.2–0.4 cm, sessile or rarely petiolate. Capitula terminal, solitary, 2–2.5 cm in diam. Involucres hemispheric, ca. 1 cm in diam.; phyllaries 3-seriate, subequal, lanceolate, 6.5–9 × 1.5–2.5 mm, abaxially glabrous, ± leaflike at least above, margin villous-ciliate (purple crosswalls), of inner phyllaries broadly scarious, erose-fimbriate, apex acute or acuminate, recurved, margin and apex purplish. Ray florets 16–25, purplish mauve, tube ca. 2.5 mm, hairy distally, lamina 10–18 × ca. 1.5 mm; disk florets yellow and purplish in distal 1/2, 3.5–6 mm, tube 2–2.5 mm, limb narrowly funnelform, lobes lanceolate, ca. 0.8 mm, ± recurved. Achenes (immature) ovoid, compressed, ca. 2 mm, strigose, 2-ribbed. Pappus 4-seriate, yellowish; outermost bristles 0.5–1 mm; outer bristles slender, ca. 2 mm; inner bristles ca. 4.5 mm, acute; innermost bristles ca. 5.5 mm, clavate. Fl. Jul–Aug.

- Alpine meadows or on rocks; 4000–4300 m. SE Xizang.

Aster retusus resembles *A. batangensis* in leaf shape but differs in habit and leaf surface pubescence.

101. *Aster latibracteatus* Franchet, J. Bot. (Morot) 10: 371. 1896.

宽苞紫菀 *kuan bao zi wan*

Herbs, perennial, 5–20(–60) cm tall; rhizomes robust, collar clad by marcescent leaf remains. Stems erect or ascending, ± stout, densely villous (hairs with purple crosswalls), densely leafy. Leaves basal and cauline, thin, villous (crosswalls yellow in basal leaves, purple in upper leaves), margin sparsely mucronulate, entire in upper leaves, densely villous; basal and lower cauline leaves broadly winged petiolate; blade spatulate or oblanceolate, 2–5 × 0.6–1.7 cm, base attenuate, apex rounded; upper leaves oblanceolate, oblong, lanceolate, or ovate, 1.5–4 × 0.7–1.3 cm, base rounded, apex obtuse to acute, mucronate; uppermost leaves dense, surrounding capitula. Capitula terminal, solitary, 5–6 cm in diam. Involucres 1.5–2.5 cm in diam.; phyllaries 3-seriate, subequal, leaflike, abaxially

sparsely villous, margin sparsely to densely villous-ciliate (purple to brown crosswalls); outer phyllaries ovate to lanceolate, 10–12 × 3–6 mm; inner phyllaries lanceolate to oblong, 2–3 mm wide. Ray florets 25–30, blue or purplish, tube ca. 2.5 mm, lamina 10–20 × 1–2 mm; disk florets yellow, 5.7–7.5 mm, tube 1.8–2.4 mm, distal tube and limb base hairy, limb narrowly funnelform, lobes lanceolate, 1–1.5 mm, tip purple. Achenes pale brown, oblanceolate, compressed, 3–3.2 × ca. 1.5 mm, sparsely strigose, not winged, 2-ribbed. Pappus 3-seriate, yellowish at base, brown distally; bristles barbellate throughout, stout; outermost series of short bristles or scales ca. 0.3 mm; inner bristles 3–4 mm, acute; innermost bristles ca. 5.5 mm, clavate. Fr. Aug–Oct.

Stony alpine pastures, slopes; 2800–4000 m. NW Yunnan (Dali, Dêqên, Gongshan) [N Myanmar].

102. *Aster bulleyanus* Jeffrey ex Diels, Notes Roy. Bot. Gard. Edinburgh 5: 184. 1912.

扁毛紫菀 *bian mao zi wan*

Herbs, perennial, 15–40 cm tall, sometimes caespitose; rhizome robust. Stems erect or ascending, simple, slender, finely striate, leafy, sparsely to moderately villous, minutely stipitate glandular. Leaves basal and cauline; cauline leaves gradually reduced distally, abaxially sparsely pilosulose, veins villous, sparsely minutely stipitate glandular, adaxially sparsely pilosulose, veins sparsely villous, margin serrate, ciliate, 3–5-veined, veins abaxially prominent; basal leaves sometimes withered at anthesis, long petiolate (petiole to 8 cm); blade ovate to obovate, 1.5–6 × 0.7–2 cm, apex rounded to obtuse or acute, mucronate; cauline leaves shortly and broadly winged petiolate or sessile, ovate, 1.5–8 × 0.6–3.5 cm, base attenuate, clasping, apex acute. Capitula solitary, terminal, 7–9 cm in diam. Involucre hemispheric, 2–2.3 cm in diam.; phyllaries 3-seriate, subequal, squarrose to reflexed, lanceolate to linear-lanceolate, 9–10 mm, leaflike, margin villous-ciliate, apex acuminate, tip purplish, proximally white villous, moderately to densely minutely stipitate glandular; outer phyllaries 2–3 mm wide; inner phyllaries ca. 1.5 mm wide. Ray florets 44–51(–100), purplish, tube ca. 1 mm, lamina 20–30 × 1.5–2 mm, glabrous, eglandular; disk florets purplish brown, ca. 5 mm, limb funnelform, ca. 3.5 mm, glabrous, lobes spreading, narrowly triangular, ca. 1 mm. Achenes obovoid, compressed, 3–4 mm, sparsely strigillose, densely so distally, eglandular, not winged, 4-ribbed. Pappus 2-seriate, brown, few; outer series of narrow to broad, erose scales 1–1.5 mm; inner series of stout, flat bristles barbellate throughout, 3–4 mm, long acute. Fl. and fr. Aug–Sep.

- Alpine or subalpine meadows, streamsides; 2800–4300 m. NW Yunnan.

103. *Aster bietii* Franchet, J. Bot. (Morot) 10: 373. 1896.

线舌紫菀 *xian she zi wan*

Aster mekongensis Onno, p.p.

Herbs, perennial, 14–45 cm tall, sometimes caespitose; rhizomes robust, sometimes with short stolons. Stems erect or

ascending, simple, sparsely villous (crosswalls purple), distally minutely stipitate glandular. Leaves basal and cauline; cauline leaves gradually reduced, thin, abaxially sparsely villous to pilosulose, adaxially glabrate or sparsely pilosulose, margin entire or remotely serrate to serrulate, apex mucronate; basal leaves withered at anthesis, sometimes marcescent, long winged petiolate (petiole to 10 cm); blade oblong to spatulate, $2-10 \times 1-3.5$ cm, base attenuate, apex acute or acuminate; lower to middle cauline leaves sessile, obovate to lanceolate, $3-9 \times 1-2.8$ cm, base cuneate to rounded, subclasping, apex acute to obtuse; upper cauline leaves $1.5-3 \times 0.8-1.2$ cm, apex acute. Capitula terminal, solitary, 7–8 cm in diam. Involucres hemispheric, 1.5–2.5 cm in diam.; phyllaries 2-seriate, equal, lanceolate to narrowly lanceolate, 15–20 mm, abaxially sparsely villous, densely minutely purple stipitate glandular, leaflike, margin long ciliate, apex long acuminate, often purplish; outer phyllaries 2–5 mm wide, proximally lanate and distally so on midvein, sometimes lanate more distally; inner phyllaries 2–3 mm wide. Ray florets 50–70, purplish blue, tube sparsely strigillose, lamina $30-40 \times 1-1.5$ mm, glabrous, eglandular; disk florets yellow, 7–9 mm, limb funnelform, 4–6 mm, sparsely strigillose proximally, lobes spreading, narrowly triangular, 1.8–2.3 mm, minutely stipitate glandular, tip purple. Achenes obovoid, compressed, 4–4.5 mm, glabrous or distally glabrate, moderately to densely minutely stipitate glandular, not winged, 2-ribbed. Pappus 3- or 4-seriate, reddish brown, bristles barbellate throughout; outermost bristles very few or none, slender, ca. 0.7 mm; outer bristles few, slender, 2–4 mm; inner bristles 5–5.5 mm, acute; innermost bristles ca. 6 mm, weakly clavate. Fl. Jul–Aug, fr. Aug–Nov.

• Alpine and subalpine meadows and screes, ledges of cliffs; 3300–4600 m. E Xizang, NW Yunnan.

104. *Aster platylepis* Y. L. Chen, Kew Bull. 39: 159. 1984.

阔苞紫菀 kuo bao zi wan

Doronicum latisquamatum C. E. C. Fischer, Bull. Misc. Inform. Kew 1937: 98. 1937, not *Aster latisquamatus* (Maximowicz) Handel-Mazzetti (1938).

Herbs, perennial, 20–30 cm tall. Stems erect, slender, brown or purplish, gray hairy. Leaves: basal withered at anthesis (not seen); cauline leaves oblong or somewhat obliquely ovate, $1.6-4.2 \times 0.8-2.2$ cm, membranous, abaxially pubescent, adaxially hispidulous, eglandular, base subcordate or rounded, clasping, margin \pm sinuate-crenate, 5–7-veined from base, apex obtuse. Capitula terminal, solitary, 3.5–4 cm in diam. Involucres campanulate; phyllaries 2- or 3-seriate, abaxially hispidulous; outer phyllaries lanceolate to ovate-lanceolate, $13-19 \times 5-7$ mm, margin purplish, apex subacute, purplish; innermost phyllaries usually shorter, narrower. Ray florets ?30–60, 1–3-seriate, purplish, tube ca. 2 mm, lamina ca. 14×0.7 mm; disk florets yellow-brown, ca. 4.5 mm, lobes triangular, short, acute. Achenes narrowly oblong ?when mature, sparsely hairy, ?winged, 2-ribbed. Pappus longer than tube of disk florets. Fl. Aug.

Rocky soils; 3000–4000 m. S Xizang (Tsampo Lake) [India].

No specimens of *Aster platylepis* were seen by one of us (Brouillet).

105. *Aster brachytrichus* Franchet, J. Bot. (Morot) 10: 372. 1896.

短毛紫菀 duan mao zi wan

Aster bodinieri H. Léveillé.

Herbs, perennial, 10–50 cm tall, sometimes caespitose; rhizomes robust, woody. Stems erect, simple, densely pilose proximally and apically, sparsely to moderately so at midstem, moderately to densely minutely stipitate glandular, usually regularly leafy. Leaves basal and cauline; cauline leaves slightly and gradually reduced upward, sparsely to moderately pilose or glabrous, veins villous abaxially, margin sparsely shallowly serrate or serrulate, sometimes entire, pilose-ciliate, triplinerved abaxially, veins slightly prominent; basal leaves usually withered at anthesis, long petiolate (petiole to 4 cm); blade spatulate to obovate or oblanceolate, $1-6 \times 0.6-3.5$ cm, base attenuate, apex rounded to obtuse; lower and middle cauline leaves sessile, ovate or ovate-lanceolate to oblong, $2-7 \times 0.5-3$ cm, base rounded or attenuate, subclasping, apex rounded to acute; upper leaves ovate to linear-lanceolate, $1-3.5 \times 0.2-1.8$ cm. Capitula terminal, solitary, 3–7.5 cm in diam. Involucres hemispheric, 1–2 cm in diam., overtopping disk florets; phyllaries 2- or 3-seriate, subequal, squarrose, $10-13 \times 1-4$ mm, sparsely pilose to glabrate, sometimes inner phyllaries sparsely minutely stipitate glandular distally, margin whitish, pilose-ciliate; outer phyllaries linear-lanceolate to oblong, leaflike, apex acute to obtuse; inner phyllaries linear-lanceolate to linear, apex long acuminate. Ray florets 30–60, blue to purplish, tube less than ca. 1 mm, lamina $15-35 \times 1-3$ mm, glabrous, eglandular; disk florets orange becoming reddish, 3.5–5 mm, limb funnelform becoming \pm campanulate distally, 2.5–4 mm, glabrous, lobes spreading, narrowly triangular, 0.8–1.5 mm. Achenes obovoid, \pm compressed, 2.5–4 mm, glabrous, sparsely minutely stipitate glandular apically, margin winged, 2-ribbed, plus sometimes 2- or 3-ribbed on each side. Pappus series reduced, indistinguishable, sometimes basally fused, purple brown to brown; bristles flattened, barbellate throughout, 1–4 mm, acute. Fl. Jun–Aug, fr. Aug–Oct.

Alpine meadows, mountain slopes, alpine coniferous forests, *Pinus* forests, thickets, pastures; 2500–4900 m. Guizhou, SW Sichuan, N and NW Yunnan [N Myanmar].

Aster brachytrichus is difficult to distinguish from *A. jeffreyanus*.

Leaf shape and vestiture and capitula size are variable within the species and have been used as the basis for the varieties recognized in the species. However, there seems to be a continuum in all the features used to partition the variation, and phenotypic plasticity could account for some of it. A thorough morphometric analysis would be needed to determine which varieties deserve recognition. The four varieties recognized are distinguished as follows.

Aster brachytrichus var. *tenuiligulatus* Y. Ling (Fl. Reipubl. Popularis Sin. 74: 360. 1985; 细舌短毛紫菀 xi she duan mao zi wan; 2600–3500 m. NW Guizhou, SW Sichuan) has oblong leaves densely hispidulous adaxially, with rounded apex, and smaller capitula (3–3.5 cm in diam.), with involucres ca. 1 cm in diam. and ray floret lamina ca. 15×1 mm. The other three varieties have leaves adaxially glabrous or sparsely hispidulous and larger capitula (4–7.5 cm in diam.), with involucres 1.5–2 cm in diam. and ray floret lamina $15-35 \times 1-3$ mm. *Aster brachytrichus* var. *angustisquamus* Y. Ling (Fl. Reipubl. Popularis Sin. 74: 360. 1985; 狭苞短毛紫菀 xia bao duan mao zi wan; ca. 2700 m;

NW Yunnan: Zhongdian) has linear phyllaries 1.5–2 mm wide, while *A. brachytrichus* var. *brachytrichus* and *A. brachytrichus* var. *latifolius* have linear-lanceolate phyllaries 2.3–4 mm wide. *Aster brachytrichus* var. *brachytrichus* (短毛紫菀(原变种) duan mao zi wan (yuan bian zhong); 2500–3500 m) has middle cauline leaves 2–6 × 0.5–2.5 cm, with a rounded or somewhat acute apex, but leaf shape is variable; plants with a remotely serrate leaf margin have sometimes been segregated as *A. brachytrichus* var. *oreaster* Onno. *Aster brachytrichus* var. *latifolius* Y. Ling (Fl. Reipubl. Popularis Sin. 74: 360. 1985; 宽叶短毛紫菀 kuan ye duan mao zi wan; ca. 3000 m; NW Yunnan: Lijiang, Yulong Shan) has middle cauline leaves 7–9 × 2.5–4.5 cm, with a rounded apex.

106. *Aster jeffreyanus* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 185. 1912.

滇西北紫菀 dian xi bei zi wan

Herbs, perennial, 10–30 cm tall, sometimes caespitose; rhizomes robust, with rosettes. Stems erect, simple, sparsely to densely villous, eglandular. Leaves basal and cauline; cauline leaves gradually reduced distally, abaxially sparsely pilose, villous, veins villous, adaxially glabrate proximally to villous apically, eglandular, margin remotely serrulate or entire (upper leaves), villous-ciliate, 3-veined, veins prominent; basal leaves usually present at anthesis, shortly petiolate; blade obovate to oblanceolate, 1.6–4 × 1–1.3 cm, base abruptly attenuate to attenuate, apex obtuse or rounded; middle cauline leaves ± erect, sessile, oblong to linear-lanceolate, base subclasping; upper leaves linear-lanceolate, 1–3.5 × 0.1–0.6 cm, base clasping. Capitula terminal, solitary, 3.5–5 cm in diam. Involucres hemispheric, 0.5–0.8 cm in diam.; phyllaries 2- or 3-seriate, subequal, sometimes squarrose, ovate-lanceolate, 7–8.5 × 2.5–3 mm, leaflike, margin broadly scarious, remotely erose; outer phyllaries 2.5–3 mm wide, sparsely villous proximally, glabrous distally; inner phyllaries 1.5–2 mm wide, glabrate, margin ciliate, vein sparsely villous. Ray florets 30–50, blue to purple, lamina 15–20 × ca. 2 mm, glabrous, eglandular; disk florets 3.5–4 mm, limb funnelform, ca. 2.5 mm, glabrous, lobes spreading, narrowly triangular, ca. 1 mm. Achenes broadly obovoid, compressed, ca. 2 mm, glabrous, distally strigillose and minutely stipitate glandular, margin winged, wings strigillose-ciliate apically, 4-ribbed. Pappus 2- or 3-seriate, purplish brown, bristles few, barbellate; outermost bristles 0.2–0.5 mm; inner bristles 0.8–1.2 mm, acute; innermost bristles 1.2–1.4 mm, slightly clavate. Fl. Jun–Jul.

• Alpine or subalpine open slopes, meadows; 2800–3800 m. Guizhou, SW Sichuan (Muli), NW Yunnan (Lijiang, Zhongdian).

107. *Aster prainii* (J. R. Drummond) Y. L. Chen, Geol. Ecol. Stud. Qinghai-Xizang Plateau 2: 1314. 1981.

厚棉紫菀 hou mian zi wan

Chlamyditis prainii J. R. Drummond, Bull. Misc. Inform. Kew 1907: 91. 1907.

Herbs, perennial, 4–10 cm; rhizomes creeping or ascending, caudices stout, multibranched, sometimes with long, slender stolons bearing rosettes. Stems erect or ascending, simple, densely white lanate, sparsely minutely stipitate glandular, collar with marcescent leaf petioles. Leaves basal and cauline; cauline leaves abruptly reduced, densely white lanate, margin

entire; basal leaves present at anthesis, long petiolate (petiole to 2 cm); blade spatulate, 0.6–1.5 × 0.4–0.8 cm, base attenuate, midvein visible, inconspicuously 3-veined, apex rounded to obtuse; middle cauline leaves spatulate, 0.6–0.8 cm; upper cauline leaves linear, often surrounding involucre. Capitula terminal, solitary, ca. 4.5 cm in diam. Involucres broadly campanulate, 12–15 mm; phyllaries 3-seriate, oblong-lanceolate, densely lanate; outer phyllaries sometimes squarrose, 8–12 × 1.5–2 mm, multiveined, apex acuminate, tip purplish; inner phyllaries 10–12 × ca. 1.5 mm. Ray florets 38–40, deep blue, tube and lamina base hairy, eglandular, lamina 10–16 × ca. 2 mm; disk florets orange becoming purplish, 6.5–7 mm, limb funnelform, ca. 5 mm, sparsely villous, lobes erect, triangular, ca. 1 mm, lanate. Achenes (immature) narrowly obovoid, compressed, ca. 3 mm, densely strigillose, 4-ribbed. Pappus 4-seriate, straw-colored, sometimes apically reddish, bristles barbellate; outermost series of numerous, white scales 0.7–1 mm; outer bristles slender, 4–5 mm; inner bristles 6–7 mm, acute; innermost bristles 7–8 mm, weakly clavate. Fl. Aug–Sep.

Slopes above snowline, stony grounds; 4200–5400 m. Sichuan, S Xizang [Bhutan].

108. *Aster neolanuginosus* Brouillet, Semple & Y. L. Chen, nom. nov.

棉毛紫菀 mian mao zi wan

Replaced synonym: *Wardaster lanuginosus* J. Small, Trans. & Proc. Bot. Soc. Edinburgh 29: 230. 1926; *Aster lanuginosus* (J. Small) Y. Ling in Y. Ling & Y. L. Chen, Fl. Reipubl. Popularis Sin. 74: 234. 1985, not *Aster lanuginosus* H. L. Wendland in Bartling & H. L. Wendland, Beitr. Bot. 2: 9. 1825.

Herbs, perennial, subscapiform. Stems solitary or 2. Basal leaves crowded; cauline leaves few. Capitula terminal, solitary. Involucres broadly campanulate; phyllaries 3-seriate, unequal, ca. 10 mm, densely lanate. Ray florets 20–30, purple, lamina ca. 15 mm; disk florets yellow, limb campanulate, ca. 7 mm, without long hairs. Achenes compressed, 2.5–3 mm, hairy, 2-ribbed. Pappus brownish, numerous, unequal, of barbellate bristles.

• About 5000 m. SW Sichuan (Muli).

The anthers of *Aster neolanuginosus* are described as having an apiculate base.

Specimens were not seen by us; the description is from the protologue.

109. *Aster asteroides* (Candolle) Kuntze, Revis. Gen. Pl. 1: 315. 1891 [“*asterodes*”].

星舌紫菀 xing she zi wan

Heterochaeta asteroides Candolle, Prodr. 5: 282. 1836; *Aster hedinii* Ostenfeld; *A. heterochaeta* Benth. ex C. B. Clarke, nom. illeg. superfl.; *A. likiangensis* Franchet subsp. *hedinii* (Ostenfeld) Onno; *Erigeron heterochaeta* Botschantzev.

Herbs, perennial, 2–15(–30) cm tall; rhizomes short; roots tuberoid, near ground surface. Stems erect, solitary, scapiform, purplish or green below, base without marcescent leaf remains, basally densely to distally sparsely villous, densely minutely glandular pubescent. Leaves basal and cauline; cauline leaves abruptly reduced, villous, sparsely minutely stipitate

glandular, margin entire (basal leaves rarely serrulate), ciliate, 3–5-veined; basal leaves present at anthesis, shortly petiolate, ovate to oblong, $0.5\text{--}2 \times 0.4\text{--}1.3$ cm, base rounded to \pm attenuate, apex obtuse to acute; middle cauline leaves sessile, oblong to lanceolate, apex obtuse to acuminate; upper leaves subsessile, linear to linear-lanceolate. Capitula terminal, solitary. Involucre hemispheric, 6–9 mm in diam.; phyllaries 2- or 3-seriate, subequal, oblanceolate-oblong to oblong-lanceolate, $5.5\text{--}7 \times 1\text{--}1.5$ mm, villous, densely minutely purplish stipitate glandular, more so distally, membranous, margin scarious, densely purplish villous-ciliate, multiveined, apex acuminate, leaflike, tip recurved, purplish. Ray florets 35–60, bluish purple to deep mauve, lamina linear-lanceolate, $10\text{--}15 \times 1\text{--}2$ mm; disk florets orange-yellow, 3–3.5 mm, limb funnelform, ca. 2.5 mm, base minutely purple stipitate glandular, lobes erect, triangular, 0.6–0.8 mm, abaxially sparsely hairy, minutely purple stipitate glandular. Achenes narrowly obovoid, ca. 2 mm, strigillose, eglandular, 3- or 4-ribbed. Pappus 2-seriate, straw-colored; outermost series of few broad scales 0.7–1 mm; inner series of few clavate, barbellate bristles ca. 3 mm. Fl. and fr. Jun–Aug.

Alpine thickets, damp grasslands, marshy areas; 3200–4600 m. Gansu, E Qinghai, W Sichuan, C and S Xizang, NW Yunnan [Bhutan, India (Sikkim), Kashmir, Nepal].

Aster asteroides somewhat resembles *A. flaccidus* but is easily distinguished from it by its tuberous roots and purplish glandular disk floret lobes.

110. *Aster likiangensis* Franchet, J. Bot. (Morot) 10: 370. 1896.

丽江紫菀 li jiang zi wan

Aster asteroides (Candolle) Kuntze subsp. *costei* (H. Léveillé) Grierson; *A. costei* H. Léveillé; *A. likiangensis* subsp. *costei* (H. Léveillé) Onno.

Herbs, perennial, 3–20 cm tall, scapiform, sometimes caespitose; rhizomes short, thick; roots tuberoid near ground surface. Stems erect, simple, usually \pm purplish, villosulous to villous (crosswalls often purple), proximally sparsely to distally densely minutely purplish stipitate glandular. Leaves basal and cauline; cauline leaves abruptly reduced, sparsely to moderately villosulous, sparsely minutely purple stipitate glandular, margin entire or remotely serrate to serrulate, ciliate, often 3-veined; basal leaves present at anthesis, long (petiole to 4 cm) or shortly petiolate; blade ovate to oblong or oblanceolate, $0.5\text{--}3.5 \times 0.2\text{--}2.2$ cm, base attenuate, apex acute to obtuse; middle cauline leaves sessile, ovate or obovate to linear-lanceolate, $0.8\text{--}2 \times 0.1\text{--}0.6$ cm. Capitula terminal, solitary. Involucre hemispheric, 6–7 mm in diam.; phyllaries 2- or 3-seriate, subequal, oblong to lanceolate or linear-lanceolate, $8\text{--}12 \times 1.5\text{--}3$ mm, abaxially densely purple villous proximally to sparsely so distally, sparsely proximally to densely distally minutely purplish stipitate glandular, membranous, margin narrowly scarious, purple apically, purple villous-ciliate, purple minutely stipitate glandular, multiveined, apex acute to acuminate, tip twisted, purple. Ray florets 12–55, bluish to lavender-purple, lamina $11\text{--}21 \times 1.5\text{--}3$ mm, glabrous, eglandular; disk florets yellow, sometimes purplish brown distally, 4–5 mm, tube 1–1.5 mm, glabrate, limb funnelform, 3.5–4 mm, lobes erect, triangular, 0.5–1 mm, glabrous, sparsely minutely stipitate glandular. Achenes (imma-

ture) narrowly obovoid, ca. 3 mm, sparsely strigillose, eglandular, 2-ribbed. Pappus (immature) 2-seriate, straw-colored; outermost series of few broad scales ca. 1 mm; inner series of sometimes purplish, barbellate bristles 3.5–4 mm. Fl. and fr. Jun–Aug.

Alpine meadows, wet open slopes, valleys, mixed shrubs, marshy places; 3500–4500 m. SW Sichuan, SE Xizang, NW Yunnan [Bhutan].

Aster likiangensis is closely related to *A. asteroides* and has been regarded as a subspecies of it by Grierson (Notes Roy. Bot. Gard. Edinburgh 26: 67–163. 1964). It is distinguished by the purple disk floret lobes that are stipitate glandular.

111. *Aster flaccidus* Bunge, Mém. Acad. Imp. Sci. Saint Pétersbourg, Sér. 7, 2: 599. 1835.

萎软紫菀 wei ruan zi wan

Herbs, perennial, 3–30(–40) cm tall, often scapiform; rhizome long, slender, sometimes stoloniferous. Stems erect, simple, white (sometimes purple) villous, more densely so upward (sometimes also basally), sparsely to densely minutely stipitate glandular. Leaves basal and cauline; cauline leaves reduced upward, thin, sparsely to moderately villous, sometimes glabrate, sparsely to moderately minutely stipitate glandular, margin entire or remotely serrulate (basal), ciliate, finely 3-veined; basal leaves present, sometimes withered or absent at anthesis, short or long (petiole to 7 cm) petiolate; blade spatulate to oblong to oblanceolate, $1\text{--}9.5 \times 0.5\text{--}1.6$ cm, base attenuate, apex rounded or obtuse to acute; cauline leaves usually sessile, oblong or oblong-lanceolate, $1.5\text{--}9 \times 0.2\text{--}1.5$ cm, base attenuate to cuneate or \pm rounded, usually subclasping; upper cauline leaves lanceolate to lanceolate-linear. Capitula terminal, solitary, 3.5–5(–7) cm in diam.; peduncles sparsely to densely villous, sometimes more densely so below capitula, sparsely to densely glandular. Involucre hemispheric, (1.2–)1.5–2(–3) cm in diam.; phyllaries 2-seriate, subequal, lanceolate, $7\text{--}13 \times 1\text{--}2$ mm, abaxially basally densely white lanate to sparsely white villous, usually less so upward, sparsely to densely minutely stipitate glandular, margin scarious, sometimes purple tinged, ciliate, membranous, multiveined, apex acuminate, tip sometimes spreading, often densely villous. Ray florets 31–67, blue or mauve, lavender-blue, rarely pink or pinkish white, lamina linear-lanceolate, $9\text{--}25 \times 1\text{--}2.5$ mm, abaxially proximally hairy (crosswalls purple) or glabrous, eglandular; disk florets orange to yellow, 4.5–7 mm, limb funnelform, 3.5–5 mm, proximally sparsely hairy, lobes erect, triangular, 0.7–1.5 mm. Achenes brownish, narrowly obovoid, compressed, 2.5–3.5 mm, sparsely strigillose, sparsely to moderately (apically) minutely stipitate glandular, rarely glabrous and eglandular, margin strigillose-ciliate, 2-ribbed, ribs pronounced. Pappus 4-seriate, whitish (sometimes purplish), bristles barbellate; outermost series of narrow scales 0.6–1.5 mm; outer bristles few, slender, 3.5–5 mm; inner bristles 6–6.5 mm, acute; innermost bristles 6.5–7.5 mm, weakly clavate. Fl. and fr. Jun–Nov. $2n = 54$.

Damp alpine grasslands, alpine and subalpine pastures, meadows, thickets, scree, fallow fields, forests; 1800–5100 m. S Gansu, N Hebei, E Qinghai, S Shaanxi, Shanxi, W Sichuan, Xinjiang, Xizang, NW Yunnan [Afghanistan, Bhutan, India, Kashmir, Kazakhstan, Mongolia, Nepal, Pakistan, Russia (E Siberia), Uzbekistan; SW Asia (Iran)].

Aster flaccidus is used medicinally to treat pulmonary abscesses, tuberculosis, and pertussis.

Three forms have been recognized in China: *Aster flaccidus* f. *flaccidus* with leaves ± villous, stem apex and involucre base more densely white villous and inconspicuously glandular, involucre 1.5–2(–3) cm in diam.; *A. flaccidus* f. *glabratus* Y. Ling (Fl. Reipubl. Popularis Sin. 74: 239. 1985; NE Xizang) with leaf surfaces glabrous or sparsely villous on abaxial veins only, margin ciliate or not, involucre 2–2.5 cm in diam., phyllaries to 12 mm, abaxially or on veins villous, eglandular; and *A. flaccidus* f. *griseobarbatus* Grierson (Notes Roy. Bot. Gard. Edinburgh 26: 131. 1964; 3200–4900 m; S and E Xizang, NW Yunnan [Bhutan, NE India]) with upper stems and involucre purplish brown or gray-brown hairy.

- 1a. Stems 3–15(–40) cm, sparsely glandular; leaf surfaces sparsely to densely villous or at least veins villous; involucre 1.5–2(–3) cm in diam.; outer phyllary base densely lanate or villous, abaxially sparsely glandular 111a. subsp. *flaccidus*
- 1b. Stems 3–15 cm, densely glandular upward; leaf surfaces glabrate or abaxial veins sparsely villous; involucre 1.2–1.8 cm in diam.; outer phyllary base sparsely villous, abaxially densely glandular 111b. subsp. *glandulosus*

111a. *Aster flaccidus* subsp. *flaccidus*

萎软紫菀(原亚种) wei ruan zi wan (yuan ya zhong)

Aster flaccidus subsp. *fructuglandulosus* (Ostenfeld) Onno; *A. flaccidus* var. *fructuglandulosus* Ostenfeld; *A. flaccidus* f. *stolonifer* Onno; *A. glarearum* W. W. Smith & Farrer; *A. kansuensis* Farrer; *A. tibeticus* J. D. Hooker; *Erigeron flaccidus* (Bunge) Botschantzev.

Stems 3–15(–40) cm, sparsely glandular. Leaf surfaces sparsely to densely villous or at least veins villous. Involucre 1.5–2(–3) cm in diam.; outer phyllary base densely lanate or villous, abaxially sparsely glandular.

Alpine and subalpine pastures, thickets, screes; 1800–5100 m. S Gansu, N Hebei, E Qinghai, S Shaanxi, Shanxi, W Sichuan, NW Xinjiang, Xizang, NW Yunnan [Bhutan, NW India, Kashmir, Kazakhstan, Mongolia, Nepal, Pakistan, Russia (E Siberia), Uzbekistan; SW Asia (Iran)].

111b. *Aster flaccidus* subsp. *glandulosus* (Keissler) Onno, Biblioth. Bot. 26(Heft 106): 66. 1932.

腺毛萎软紫菀 xian mao wei ruan zi wan

Aster flaccidus var. *glandulosus* Keissler, Ann. K. K. Naturhist. Hofmus. 22: 26. 1907; *A. glandulosus* (Keissler) Handel-Mazzetti (1930), not Labillardière (1806).

Stems 3–15 cm, densely glandular upward. Leaf surfaces glabrate or abaxial veins sparsely villous. Involucre 1.2–1.8(–2) cm in diam.; outer phyllary base sparsely villous, abaxially densely glandular.

Damp alpine grasslands; 4000–5000 m. S Xinjiang, S Xizang [NW India, Kashmir].

112. *Aster hololachnus* Y. Ling ex Y. L. Chen, S. Yun Liang & K. Y. Pan, Acta Phytotax. Sin. 19: 88. 1981.

全茸紫菀 quan rong zi wan

Herbs, perennial, 4–6 cm tall, caespitose; rhizomes procumbent or ascending, branched, collar clad with marcescent leaf remains. Stems erect, slender, densely white hirsute or villous. Leaves: basal leaves narrowly winged petiolate, base attenuate, apex rounded; middle cauline leaves few, spreading or erect, oblong-lanceolate, 1.7–2.2 × 0.4–0.6 cm, base subclasping, apex somewhat acute; upper leaves linear-lanceolate, acuminate, gray-white thickly tomentose, triplinerved, veins abaxially somewhat prominent. Capitula solitary, ca. 2.5 cm in diam. Involucre hemispheric, ca. 1.5 cm in diam., thickly gray-white tomentose; phyllaries 2- or 3-seriate, linear-lanceolate, ca. 8 mm, herbaceous, acuminate; outer phyllaries ca. 1 mm wide; inner phyllaries narrower to ca. 0.5 mm wide, with narrowly membranous margin, hairy above. Ray florets ca. 50, lamina (not open) linear-lanceolate, ca. 10 × 1 mm; disk florets yellow, ca. 6 mm, tube ca. 1 mm, puberulent, lobes glandular. Ovary oblong, sparsely pubescent or subglabrous. Pappus 2-seriate, white; outer bristles very short, paleaceous; inner bristles ca. as long as disk corolla.

- Glacier areas; 5300–5400 m. S Xizang (Tingri).

Aster hololachnus is closely related to *A. flaccidus*, from which it differs mainly in having densely gray-white tomentose leaves and narrower phyllaries and ray florets.

113. *Aster tsarungensis* (Grierson) Y. Ling, Fl. Reipubl. Popularis Sin. 74: 241. 1985.

察瓦龙紫菀 cha wa long zi wan

Aster flaccidus Bunge subsp. *tsarungensis* Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 133. 1964.

Herbs, perennial, 6–45 cm tall, sometimes caespitose; rhizomes long, slender. Stems erect, simple, striate, purplish brown, moderately to densely villous, moderately to densely minutely purple stipitate glandular, sparsely leafy. Leaves basal and cauline; cauline leaves gradually reduced upward, thin, villous, sparsely stipitate glandular, margin remotely serrulate, villous-ciliate, prominently 3-veined, apex acute, tip blunt; basal leaves present at anthesis, long winged petiolate (petiole to 2.5 cm); blade spatulate to ovate or lanceolate, 0.5–5 × 0.2–1.8 cm, base attenuate; lower and middle cauline leaves broadly winged petiolate or sessile, lanceolate, 2.5–9.5 × 0.5–2.3 cm, base attenuate, sometimes subclasping (upward); upper cauline leaves (when present) sessile, linear. Capitula terminal, solitary, 4–6 cm in diam. Involucre broadly hemispheric, 2–3 cm in diam.; phyllaries 2-seriate, subequal, squarrose or spreading, oblong-lanceolate to lanceolate, 6–10 × 1.5–2.5 mm, densely villous (inner phyllaries sparsely so), distally minutely stipitate glandular, membranous, margin scarious, ciliate distally, multi-veined, apex shortly acuminate, purple. Ray florets 2-seriate, 60–85, bluish purple, tube and basal lamina sparsely hairy, eglandular, lamina linear-lanceolate, 13–15(–20) × 1.6–1.8 mm; disk florets yellow or purplish tinged, 4.5–5.5 mm, limb funnel-form, 3–4 mm, lobes erect, triangular, 0.5–0.6 mm. Pappus 4-

seriate, dirty white; outermost series of white, broad scales 0.6–0.8 mm; bristles barbellate; outer bristles few, slender, 3.1–4.5 mm; inner bristles few, 5–6.5 mm, acute; innermost bristles 6–6.5 mm, weakly clavate. Fl. and fr. Jun–Oct.

• Alpine and subalpine meadows, valley slopes, *Rhododendron* thickets, limestone scree slopes; 2600–4800 m. W Sichuan, SE Xizang, NW Yunnan.

Aster tsarungensis is closely related to and usually regarded as a subspecies of *A. flaccidus*. However, its densely purplish brown glandular, villous stems and yellow disk florets distinguish it from that species.

114. *Aster diplostephioides* (Candolle) Benth. ex C. B. Clarke, Compos. Ind. 45. 1876.

重冠紫菀 chong guan zi wan

Heterochaeta diplostephioides Candolle, Prodr. 5: 282. 1836; *Aster delavayi* Franchet; *A. diplostephioides* var. *delavayi* (Franchet) Onno; *A. vilmorinii* Franchet, p.p.; *Erigeron delavayi* (Franchet) Botschantzev; *E. diplostephioides* (Candolle) Botschantzev.

Herbs, perennial, 13–57 cm tall, often caespitose; rhizomes robust, branched; roots long, thick, collar clad with marcescent basal leaf bases. Stems erect, simple, sparsely to moderately villous, sparsely to densely minutely stipitate glandular, leafy or sometimes scapiform. Leaves basal and cauline; cauline leaves gradually reduced, thin, sparsely to moderately villous, sparsely to moderately minutely stipitate glandular, margin remotely serrate to serrulate or entire, villous-ciliate, midvein prominent; basal leaves withered at anthesis; basal and lower cauline leaves long (petiole to 10 cm) or narrowly winged petiolate; blade oblong to oblanceolate, 1.3–15 × 0.8–2.3(–4) cm, base attenuate, apex acute to obtuse or rounded, sometimes mucronate; middle cauline leaves oblong to linear-lanceolate, base auriculate, subclasping; upper cauline leaves 1.4–8.5 × 0.2–1.3 cm. Capitula terminal, solitary, 6–9 cm in diam. Involucres hemispheric, 2–2.5 cm in diam.; phyllaries 2- or 3-seriate, linear-lanceolate, 9–16 × 1–1.5 mm, longer than disk, abaxially sparsely or sometimes moderately villous along veins, densely or sometimes sparsely, dark colored, and minutely stipitate glandular, membranous, margin narrowly scarious, ciliate, multiveined, apex acuminate, spreading. Ray florets 2-seriate, 45–93, mauve to purple or lilac-blue, lamina linear, 18–25 × 1–2 mm, glabrous, eglandular; disk florets 5–6 mm, orange to yellow, apex blackish or brownish purple externally, tube and proximal limb hairy, limb narrowly funnelform, 3.5–4 mm, lobes erect, triangular, ca. 1 mm. Achenes narrowly obovoid, 3–4 × 1–1.5 mm, sparsely strigillose, minutely stipitate glandular, more densely so distally, 4–6-ribbed. Pappus 3-seriate, white; outermost series of few white becoming straw-colored, broad scales 0.8–1.2 mm; bristles barbellate; inner bristles 3.5–6 mm, acute; innermost bristles 4–7 mm, weakly clavate. Fl. Jul–Sep, fr. Sep–Dec. $2n = 18$.

Alpine and subalpine grasslands, rich or wet alpine meadows, scrub, boggy areas, stream banks, floodplains, seepage areas in coniferous or mixed forests; 2700–4600 m. W Gansu, E Qinghai, SW and W Sichuan, S Xizang, NW Yunnan [Bhutan, India, Kashmir, Nepal, N Pakistan].

115. *Aster yunnanensis* Franchet, J. Bot. (Morot) 10: 375. 1896.

云南紫菀 yun nan zi wan

Herbs, perennial, 30–75 cm tall, often caespitose; rhizomes robust, branched; roots long, thick, collar clad with marcescent leaf bases. Stems erect, simple or branched, sparsely to sometimes moderately villous, moderately to densely minutely stipitate glandular, leafy. Leaves basal and cauline; cauline leaves gradually reduced, abaxially sparsely villous or glabrous, moderately to densely minutely stipitate glandular, adaxially sparsely villous or sometimes villous, moderately to densely minutely stipitate glandular, margin entire or serrate to serrulate, sparsely to moderately villous-ciliate, densely minutely stipitate glandular, midvein abaxially prominent, veins conspicuous; basal leaves withered at anthesis; basal and lower cauline leaves ± broadly winged petiolate (petiole to 6 cm) or lower leaves sessile; blade ovate to oblanceolate, (5–)7–18 × 1–4 cm, base attenuate, apex acute to obtuse; middle cauline leaves sessile, lanceolate or oblong to oblanceolate, 5–16 × 0.8–6 cm, base rounded or cordate to auriculate, semiamplexicaul, apex acute, sometimes obtuse. Capitula terminal, solitary or 2–9 in lax corymbiform synflorescences, 4–8.5 cm in diam.; peduncles 4–16 cm, sparsely to moderately villous, densely minutely stipitate glandular. Involucres hemispheric, 1.5–2.5 cm in diam.; phyllaries 3-seriate, subequal, ovate-lanceolate to linear-lanceolate, 10–16 × 0.8–4(–5) mm, densely white villous basally and glabrate above or sparsely villous distally, or sparsely villous along veins, or glabrate, moderately to densely minutely purple stipitate glandular, membranous, margin narrowly scarious, erose, purple, distally ciliate, multiveined, apex acute to acuminate, purple-tipped. Ray florets 65–125, pale purple to purple-blue, tube apex and lamina base minutely stipitate glandular, tube 1.6–2 mm, lamina linear, 20–30 × 1–2.5 mm, glabrous; disk florets yellow to orange, 5–5.6 mm, tube 1.8–2 mm, tube apex and base of limb minutely stipitate glandular, limb narrowly funnelform, ca. 3.5 mm, lobes erect, triangular, 1–1.2 mm. Achenes (immature) narrowly obovoid, compressed, 3–4 mm, sparsely strigillose, sparsely minutely stipitate glandular distally, 4-ribbed. Pappus 3-seriate; outermost series of broad scales 1–1.2 mm, white or straw-colored; bristles barbellate; inner bristles acute; innermost bristles ca. 6.5 mm, weakly clavate. Fl. Jul–Sep, fr. Sep–Oct.

• Alpine and subalpine grasslands or meadows, forest margins, slopes, seepage areas, cutover mixed forests, scrub, pastures; 2300–4500 m. Gansu, Qinghai, Sichuan, E and S Xizang, Yunnan.

Aster yunnanensis is closely related to *A. diplostephioides* but differs in having usually branched stems, usually broader phyllaries (rarely somewhat narrow), and disk florets apically yellow, not purple. Based on variations in width and indumentum of the phyllaries, this species can be divided into the following varieties. Grierson (Notes Roy. Bot. Gard. Edinburgh 26: 67–163. 1964) did not segregate *A. yunnanensis* var. *angustior* and *A. yunnanensis* var. *labrangensis*.

- 1a. Phyllaries ovate-lanceolate, 3–4(–5) mm wide, often pubescent in lower part only; ray floret lamina 1.5–2.5 mm wide 115a. var. *yunnanensis*

- 1b. Phyllaries linear-lanceolate, 0.8–2 mm wide, abaxially densely villous at least at base; ray floret lamina 1–2 mm wide.
- 2a. Leaves abaxially villous on veins, margin villous; phyllaries abaxially densely villous at base or throughout 115b. var. *angustior*
- 2b. Leaves densely yellow villous with glandular hairs, margin villous; phyllaries villous 115c. var. *labrangensis*

115a. *Aster yunnanensis* var. *yunnanensis*

云南紫菀(原变种) *yun nan zi wan* (*yuan bian zhong*)

Aster diplostephioides (Candolle) C. B. Clarke var. *yunnanensis* (Franchet) Onno.

Stems 2–8-branched, rarely simple. Leaves: margin entire or serrulate, villous, lower cauline leaves 17–18 × 2–4 cm, middle leaves abaxially villous on veins, adaxially sparsely villous, and glandular, base rounded or auriculate. Capitula 5–8.5 cm in diam. Involucres 2–2.5 cm in diam.; phyllaries ovate-lanceolate, 3–4(–5) mm wide, densely villous basally, sparsely villous and purplish glandular above. Ray floret lamina 25–35 × 1.5–2.5 mm.

• Alpine and subalpine grasslands; 2500–4500 m. SW and W Sichuan, NW Yunnan.

115b. *Aster yunnanensis* var. *angustior* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 622. 1937.

狭苞云南紫菀 *xia bao yun nan zi wan*

Aster vilmorinii Franchet; *Erigeron vilmorinii* (Franchet) Botschantzev.

Stems 2- or 3-branched or simple. Leaves: margin sparsely serrate or subentire, villous, lower cauline leaves 7–15 × 1–2.5 cm, middle leaves somewhat narrow or broader, abaxially villous at least at base, veins villous, adaxially sparsely villous, glandular, base rounded or cordate. Capitula 4–6 cm in diam. Involucres 1.5–2 cm in diam.; phyllaries linear-lanceolate, 0.8–1.5 mm wide, abaxially densely villous at base or throughout, glandular. Ray floret lamina 20–25 × 1–2 mm.

• Alpine and subalpine forest margins and open grasslands; 2300–4100 m. SW and W Sichuan, NW Yunnan.

115c. *Aster yunnanensis* var. *labrangensis* (Handel-Mazzetti) Y. Ling, Fl. Reipubl. Popularis Sin. 74: 246. 1985.

夏河云南紫菀 *xia he yun nan zi wan*

Aster labrangensis Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 621. 1937; *A. kawaguchii* Kitamura.

Stems 2–5 branched. Leaf margin serrulate or entire, villous, lower and middle cauline leaves 5–10 × 1.5–2.8 cm, densely villous, glandular, base truncate or cordate. Capitula 4–6 cm in diam. Involucre 1.5–2 cm in diam.; phyllaries linear-lanceolate, 10–13 × 1–2 mm, villous, glandular. Ray floret lamina 20–25 × 1–1.5 mm. $2n = 18^*$.

• Alpine and subalpine open slopes and grasslands; 3600–4300 m. S Gansu, E and S Qinghai, W Sichuan, E and S Xizang.

116. *Aster setchuenensis* Franchet, J. Bot. (Morot) 10: 377. 1896.

四川紫菀 *si chuan zi wan*

Herbs, perennial, 20–50 cm tall, sometimes caespitose; rhizomes slender. Stems erect, simple, striate, glabrate, densely minutely reddish stipitate glandular, leafy. Leaves basal and cauline; cauline leaves reduced upward, thin, abaxially pale green, glabrous, eglandular, adaxially scabrous distally, margin sparsely serrulate, scabrous-ciliate, midvein prominent, apex acuminate, tip rounded; basal leaves withered or present at anthesis, sessile or shortly petiolate, oblanceolate, 3–14.5 × 0.4–1.5 cm; middle cauline leaves sessile, lanceolate, 2.5–6 × 0.4–0.9 cm, base rounded-auriculate, subclasping; upper leaves linear, acute. Capitula terminal, 4–6 in lax corymbiform synflorescence, 2–4 cm in diam.; peduncles 1.5–13 cm; bracts linear, densely minutely stipitate glandular. Involucres 8–9 mm; phyllaries 3-seriate, subequal, membranous, apex acute to acuminate, reddish purple; outer phyllaries lanceolate, ca. 6 × 1.5–2 mm, abaxially densely minutely stipitate glandular; inner phyllaries linear-lanceolate, ca. 7 × 0.9 mm, minutely stipitate glandular distally, margin scarious, erose, purplish distally, ciliate distally. Ray florets 25–40, bluish mauve to purple, tube distally hairy and minutely stipitate glandular, lamina 10–12 × ca. 1.5 mm; disk florets yellow, ca. 6 mm, tube ca. 2 mm, limb funnel-form, 4–4.5 mm, proximally hairy, lobes erect, triangular, 0.7–0.8 mm. Achenes narrowly obovoid, 3–4 mm, sparsely to moderately strigillose, minutely stipitate glandular distally, margin 6-ribbed. Pappus 4-seriate, white; outermost series of scales linear, 0.7–1 mm; bristles barbellate; outer bristles few, slender, 2–2.5 mm; inner bristles 5–5.5 mm, acute; innermost bristles 5.7–6 mm, weakly clavate. Fl. Aug–Sep.

• Mountain forests or streamsides, disturbed damp shrublands; 3100–3500 m. NC Sichuan (Barkam, Lixian).

Aster setchuenensis is distinguished by its scabrous leaves and capitula in lax corymbiform synflorescences.

117. *Aster lipskii* Komarov, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 2: 8. 1921.

青海紫菀 *qing hai zi wan*

Herbs, perennial, ca. 50 cm tall, rhizomes robust. Stems erect, sparsely short villous. Leaves: basal and lower cauline leaves long petiolate, lanceolate, shortly villous, abaxial midvein densely villous, base attenuate, margin entire, shortly villous-ciliate; upper cauline leaves sessile, base clasping; uppermost leaves small, linear-lanceolate. Capitula terminal, solitary, 5–6 cm in diam. Involucres not visible; phyllaries subequal, (not fully visible) to 1.5 mm wide, abaxially brown stipitate glandular, margin of inner phyllaries scarious, ciliate, apex long acuminate. Ray florets dark purple, ca. 25 mm, tube ca. 2 mm, lamina linear, 10–15 mm; disk florets yellow, ca. 4.4 mm, tube ca. 1.1 mm, upper tube and limb base hairy, lobes lanceolate, ca. 0.7 mm. Achenes (immature) oblanceolate, compressed, 2-ribbed, strigose. Pappus (immature) whitish, 3-seriate; outermost series of scales 0.5–0.7 mm; inner series of bristles 4.1–4.7 mm, acute; innermost bristles ca. 6 mm, ± clavate. Fl. Jul.

• About 3800 m. E Qinghai (near Qinghai Hu).

The type of *Aster lipskii* has not been seen. The original description was based on seeds collected from near Qinghai Hu and cultivated at the Komarov Botanical Gardens. This species differs from *A. diplostephioides* in its narrower phyllaries (to 1.5 mm).

118. *Aster farreri* W. W. Smith & Jeffrey, Notes Roy. Bot. Gard. Edinburgh 9: 78. 1916.

狭苞紫菀 xia bao zi wan

Aster diplostephioides (Candolle) C. B. Clarke subsp. *farreri* (W. W. Smith & Jeffrey) Onno; *A. nigrotinctus* Y. Ling; *A. vilmorinii* Franchet var. *nigrotinctus* (Y. Ling) Y. Ling; *Erigeron farreri* (W. W. Smith & Jeffrey) Botschantzev.

Herbs, perennial, 30–60 cm tall, sometimes caespitose; rhizome long, slender, sometimes adjacent rosettes present, sometimes collar clad in basal marcescent leaves. Stems erect, simple, sparsely to moderately villous, sparsely minutely stipitate glandular, densely so upward, leafy. Leaves basal and cauline, sparsely villous, eglandular, margin entire or sparsely serrulate, villous-ciliate, midvein abaxially prominent; basal leaves absent at anthesis; basal and lower cauline leaves long petiolate (petiole to 7 cm); blade oblanceolate to narrowly oblanceolate, 1.5–16(–22) × 0.7–2.3 cm, base attenuate, apex acute; middle cauline leaves linear-lanceolate, 7–13 × 0.7–2 cm, base rounded, subclasping to clasping, apex acuminate; upper leaves linear, ca. 2 × 0.1 cm, apex acute. Capitula terminal, solitary, 5–8 cm in diam. Involucres hemispheric, 2–2.4 cm in diam.; phyllaries 3-seriate, subequal, linear-lanceolate, 10–16 × 1–1.5 mm, often surpassing disk florets, membranous, margin narrowly scarious, erose, ciliate, multiveined, apex acuminate, spreading; outer phyllaries abaxially villous, eglandular; innermost phyllaries colorless, glabrate, tip villous. Ray florets 75–121, purplish blue or lilac, tube distally sparsely minutely stipitate glandular, lamina 17–30 × 1–1.2 mm; disk florets yellow, 6.5–7 mm, tube and proximal limb minutely stipitate glandular, limb narrowly funnelform, ca. 5 mm, sometimes sparsely hairy proximally, lobes erect, triangular, 0.7–1 mm. Achenes narrowly obovoid, 3–4 mm, sparsely to moderately strigillose, eglandular, 4-ribbed. Pappus 4-seriate; outermost series of few white scales 0.3–1 mm; bristles dirty white, barbellate; outer bristles slender, 2–4 mm; inner bristles 5–5.5 mm, acute; innermost bristles 6–8 mm, weakly clavate. Fl. Jul–Aug, fr. Aug–Sep.

• Subalpine grasslands or meadows, open slopes, open *Picea* woodlands, forest margins, *Rhododendron* and shrub thickets, roadsides; 1300–4100 m. SE Gansu, N Hebei, E Qinghai, Shanxi, W Sichuan.

Aster farreri is distinguished from *A. diplostephioides* by its narrow, eglandular phyllaries, often overtopping the disk florets, and very narrow leaves.

119. *Aster brevis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 625. 1937.

短茎紫菀 duan jing zi wan

Aster flaccidus Bunge f. *tunicatus* Onno.

Herbs, perennial, 5–12 cm, subcaespitose; rhizome thick, clad in hard, fibrous marcescent leaf remains; roots simple. Stems strigose, with densely long-stipitate glandular leaves.

Leaves 4–7, ± equidistant, margin revolute, scabrous; basal leaves long petiolate, petiole base clasping; blade spatulate-lanceolate, 1–4 × 0.5–1 cm, thick, glabrous, base attenuate, margin serrulate, apex acute to rounded; cauline leaves sessile, oblong, 1.2–2 cm, abaxially ± hairy, midvein scabrous, adaxially glabrous, base clasping, apex obtuse (lower cauline leaves sometimes glabrous). Capitula terminal, solitary, 3.5–4 cm in diam. Involucres hemispheric, up to 1 cm; phyllaries equal, leaflike, lanceolate, ca. 2 mm wide, strigose, eglandular, apex acuminate, purplish tinged. Ray florets dark blue, tube ca. 2.3 mm, hairy, lamina linear, 10–12 × 1–1.2 mm; disk florets orange-yellow, ca. 5.3 mm, tube ca. 1.5 mm, tube and limb hairy, limb cylindric-funnelform, lobes narrowly triangular, ca. 0.9 mm, glabrous, somewhat purplish when dry. Achenes (immature) compressed, sparsely strigose, 2-ribbed. Pappus (immature) 3-seriate, yellowish; outer series of scales ca. 0.6 mm; bristles rigid, barbellate; inner series of bristles ca. 5 mm, acute; innermost bristles ca. 5.6 mm, slightly clavate. Fl. Jul.

• Alpine slopes; ca. 3900 m. NW Yunnan (Zhongdian).

According to Onno, *Aster brevis* is distinguished from *A. flaccidus* by its stout rhizomes and roots.

No specimens were seen by us.

120. *Aster bipinnatisectus* Ludlow ex Grierson, Notes Roy. Bot. Gard. Edinburgh 26: 144. 1964.

重羽紫菀 chong yu zi wan

Herbs, perennial, 2–8 cm tall, sometimes caespitose; rootstock woody, collar densely clad by marcescent leaf remains. Stems 2 or 3 or many, pilose. Leaves white villous; basal leaves dense, rosulate, petiolate, petiole 1–2 cm, base clasping; blade 1–2 cm, bipinnatisect; lobes 3–5 pairs, 5–7 mm, each with 3–8 pairs of secondary segments, 1–3 cm; cauline leaves 3 or 4, similar to but smaller than basal leaves, pinnatisect. Involucres 2.5–3.5 cm in diam.; phyllaries unequal, purplish at tips, villous; outer phyllaries 6–7 × ca. 0.75 mm; inner phyllaries 9–10 × 0.8–1 mm. Ray florets 20–35, pale mauve, tube 2.5–3 mm, lamina 1.3–1.5 × ca. 0.2 cm; disk florets yellow, 5.5–6 mm, tube ca. 1.6 mm, lobes ca. 1 mm. Achenes ca. 1.5 × 0.5 mm. Pappus: outer bristles ca. 1 mm; inner bristles slender. Fl. Jul.

• Rock faces; ca. 3200 m. SE Xizang (Xoka).

Specimens of *Aster bipinnatisectus* were not seen by us; the description is based on the protologue by Grierson.

This species is distinguished from all other species of the genus by its bipinnatisect, villous leaves. Rosettes at the base of woody stems are also a distinguishing character.

121. *Aster senecioides* Franchet, J. Bot. (Morot) 10: 381. 1896.

狗舌草紫菀 gou she cao zi wan

Aster senecioides var. *latisquamus* Y. Ling.

Herbs, perennial, 16–50 cm tall; rhizomes robust. Stems erect, often single, slender to robust, densely hirsute-villous, densely strigillose below capitula. Leaves: both surfaces densely strigose, abaxial veins densely strigose-villous, thick, midvein slightly prominent, lateral veins 4–6 pairs; basal and lower cauline leaves similar, present at anthesis; basal leaves long winged

petiolate; lower cauline leaves shortly winged petiolate; blade elliptic or oblong-spatulate, $4-18 \times 1.4-4$ cm, base attenuate, margin coarsely serrate, apex obtuse or rounded; middle and upper cauline leaves sessile, oblong or lanceolate, $2-6 \times 0.3-2$ cm, base attenuate or rounded-subclasping, margin sparsely serrate or entire, apex acute to rounded. Capitula 2-6(-8) in corymbiform synflorescences, 2-3 cm in diam.; peduncles 1.5-7 cm; bracts linear to linear-lanceolate. Involucres hemispheric, $1-1.2 \times 1-1.5$ cm; phyllaries 3-seriate, linear to obovate-oblong, apex obtuse or acute to acuminate; outer phyllaries 7-10 mm, margin broadly scarious, sparsely strigose-villous; inner phyllaries $10-11 \times 2-3.5$ mm, glabrous or strigose-villous on midvein and at tip, margin scarious, erose or not. Ray florets 16-20, purplish, tube 2-3.7 mm, hairy, lamina $12-14 \times 2-4$ mm; disk florets yellow-green, 5-6 mm, tube 1.2-2.5 mm, sparsely hairy, limb funnelform, lobes ovate, ca. 1 mm. Achenes oblanceolate, \pm compressed, $3-3.5 \times$ ca. 1 mm, strigose, 5-ribbed. Pappus yellowish, 3-seriate, stout, outer bristles ca. 1.2 mm; inner bristles ca. 4.2 mm, acute; innermost bristles ca. 5.5 mm, clavate. Fl. Aug-Sep, fr. Sep-Oct.

• Alpine valleys, coniferous forests, rocky slopes; 2000-3000 m. SW Sichuan, N and NW Yunnan.

Two varieties of *Aster senecioides* have been recognized. However, upon examination of specimens, the width of the scarious phyllary margin is identical, and phyllary width and ray floret lamina width overlap significantly. Varieties would need a morphometric study before they can be accepted.

122. *Aster batangensis* Bureau & Franchet, J. Bot. (Morot) 5: 50. 1891.

巴塘紫菀 *ba tang zi wan*

Herbs, perennial, 3-15 cm tall, caespitose; rhizome procumbent, caudex thick, branched, woody; taproot thick, woody. Stems ascending, sometimes erect, simple, slender, reddish brown striate, villous, sometimes sparsely so, sparsely to densely (distally) minutely stipitate glandular, scapiform. Leaves basal and cauline, both surfaces sparsely strigillose or glabrous or sometimes distally sparsely to moderately strigillose and veins sparsely to densely strigillose, margin entire, strigillose-ciliate, midvein prominent abaxially; basal leaves present at anthesis, marcescent, long winged petiolate (petiole to 2 cm); blade obovate to oblanceolate, $0.2-6 \times 0.1-0.9$ cm, base attenuate, apex rounded or retuse to obtuse, largest mucronulate; cauline leaves subpetiolate or sessile, narrowly oblong-oblanceolate to narrowly lanceolate, $0.9-3.5 \times 0.2-0.4(-0.7)$ cm, abruptly reduced and gradually smaller distally, base cuneate to rounded, apex obtuse to acuminate, mucronulate. Capitula terminal, solitary, 3-4.5 cm in diam. Involucres broadly campanulate, $0.5-1(-1.5)$ cm in diam.; phyllaries 3-seriate, subequal, spreading to squarrose, lanceolate to linear-lanceolate (some inner phyllaries), $6-12 \times 0.5-2$ mm, abaxially strigillose, basally more so, or glabrous, minutely stipitate glandular, membranous, margin narrowly to broadly scarious, erose, eciliate, sometimes purplish, few veined, midvein prominent, apex acute to acuminate, tip sometimes purplish. Ray florets 12-26, purple to lavender or lavender-blue, tube ca. 3 mm, lamina $12-22 \times 1-2.5$ mm, glabrous, eglandular; disk florets yellow to yellow-

orange, 4.6-5 mm, tube ca. 1.5 mm, limb narrowly funnelform, 3.2-3.5 mm, base sparsely hairy, lobes spreading, triangular, ca. 1 mm, eglandular. Achenes narrowly obovoid, \pm compressed, 3.5-4 mm, strigillose, eglandular, margin 3-ribbed. Pappus 4-seriate, white; outermost series of few white scales 0.5-1 mm; bristles barbellate; outer bristles few, slender, 2-3 mm; inner bristles 4-4.5 mm, acute; innermost bristles faintly reddish, 5-5.5 mm, weakly clavate. Fl. May-Sep, fr. Sep-Oct.

• Forest and thicket margins, open grasslands, meadows, pastures, open slopes, stony or scree slopes, cliff faces, stream banks; 2500-4600 m. SW and W Sichuan, E Xizang, NW Yunnan.

- 1a. Leaves sparsely strigillose; phyllaries strigillose, minutely stipitate glandular; stems villous 122a. var. *batangensis*
- 1b. Leaves glabrous or sometimes distally strigillose, veins strigillose; phyllaries glabrous, minutely stipitate glandular; stems sparsely villous 122b. var. *staticifolius*

122a. *Aster batangensis* var. *batangensis*

巴塘紫菀(原变种) *ba tang zi wan* (*yuan bian zhong*)

Stems villous. Leaves sparsely strigillose. Phyllaries strigillose, basally more so, minutely stipitate glandular.

• Forest and thicket margins, open grasslands, meadows, pastures, stony or scree slopes, cliff faces, stream banks; 3400-4600 m. SW and W Sichuan, E Xizang, NW Yunnan.

122b. *Aster batangensis* var. *staticifolius* (Franchet) Y. Ling, Fl. Reipubl. Popularis Sin. 74: 253. 1985 [*"staticifolius"*].

匙叶巴塘紫菀 *shi ye ba tang zi wan*

Aster staticifolius Franchet, J. Bot. (Morot) 10: 370. 1896.

Stems sparsely villous. Leaves glabrous or sometimes distally strigillose, veins strigillose. Phyllaries glabrous, minutely stipitate glandular.

• Open slopes, gravelly cliffs, forest margins, pastures; 2500-4000 m. SW Sichuan, NW Yunnan (Lijiang).

123. *Aster rockianus* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 613. 1937.

腾越紫菀 *teng yue zi wan*

Herbs, perennial, ca. 45 cm tall; rhizomes short, multi-branched. Stems simple, bearing fascicled leaves and lateral stems at ends of branches, canaliculate, appressed shortly hairy, glabrate below, densely leafy. Leaves thin, lower leaves withered at anthesis, basal leaves (non-reproducing rosettes) petiolate, petiole longer than blade; blade lanceolate, $2-4 \times$ ca. 1 cm, veins on both surfaces sparsely shortly hairy, base attenuate, apex acute or rounded, mucronate, margin sparsely serrate (teeth mucronulate); cauline leaves shortly winged petiolate, narrowly lanceolate, $3-8 \times 0.4-0.8$ cm, apex long acuminate. Capitula numerous in dense corymbiform synflorescences, ca. 10 cm in diam. Involucres broadly campanulate, ca. 1 cm in diam.; phyllaries 2-seriate, linear-lanceolate, 5-7 mm, densely

hairy, apex acuminate; outer phyllaries shorter than inner ones, inner phyllaries glabrous below, margin scarious, apex reddish. Ray florets 2-seriate, blue (when dry), lamina oblanceolate, 4–5 × ca. 1 mm; disk florets 4–5 mm. Achenes (immature) obovoid, compressed, strigose, margin thick. Pappus white or brownish, equal, equaling disk corollas.

• Yunnan (Tengchong).

In aspect, *Aster rockianus* is similar to *A. moupinensis*, but its leaf shape and capitula are different. This species may be related to *A. diplostephioides*, but it differs in habit.

No specimens were seen by us.

140. *SOLIDAGO* Linnaeus, Sp. Pl. 2: 878. 1753.

一枝黄花属 *yi zhi huang hua shu*

Chen Yilin (陈艺林 Chen Yi-ling); John C. Semple

Herbs, perennial, rarely subshrubs; rhizome short to long or woody caudex. Stems decumbent to ascending or erect. Leaves basal (persistent or not by anthesis) and cauline, alternate, sessile or petiolate, blade ovate to broadly to narrowly lanceolate. Capitula usually small, radiate, numerous in terminal racemiform, paniculiform, or corymbose-paniculiform synflorescences. Involucre narrowly campanulate to ± cylindric; phyllaries 3–5-seriate, imbricate or subequal, linear-lanceolate, deltate, or oblong, herbaceous, margin scarious, apex rounded to obtuse or acute to attenuate. Receptacles slightly convex, alveolate, naked. Florets fertile; ray florets female, 1-seriate, usually yellow, usually glabrous, apex inconspicuously 2- or 3-denticulate; disk florets bisexual, yellow turning brown with age, tubular, limb expanded or narrow, apex 5-denticulate; anther base obtuse; style branches flattened, appendage lanceolate. Achenes obconic to cylindric, sometimes ± laterally compressed, glabrous or moderately strigillose, 8–10-ribbed. Pappus of outer short setiform scales rarely present, and 2 series of 25–45 fine, persistent, long, barbellate bristles, mid series 90%–95% length of inner, apically attenuate, inner apically very weakly to moderately clavate.

About 120 species: mainly in North America, a few species in Asia, Europe, and South America; six species (three introduced) in China.

- 1a. Synflorescence racemiform, long paniculiform, or corymbose-paniculiform, branches erect, inserted around stem, capitula attached around branch; involucre 3.5–9.5(–10) mm; inner (longest) pappus bristles weakly to moderately clavate.
 - 2a. Phyllaries rounded or obtuse; involucre 4–6 mm; rare, occurs in NE China 3. *S. pacifica*
 - 2b. Phyllaries acuminate or acute; involucre 3.5–9.5(–10) mm.
 - 3a. Upper stem leaves small, length from widest point to apex 6.5–31.5 mm, mean 14.3 mm; involucre 3.5–7.7 mm; pappus bristles 3.1–5.2 mm; E and S China, common 1. *S. decurrens*
 - 3b. Upper stem leaves larger, length from widest point to apex 25–45 mm, mean 34.5 mm; involucre 6–9.5(–10) mm; pappus bristles 4.5–7 mm; NE and far W China 2. *S. dahurica*
- 1b. Synflorescence pyramidal, secund, branches usually spreading, curved, capitula attached on upper side of branch; involucre 2.3–4 mm; inner (longest) pappus bristles not obviously clavate.
 - 4a. Stem leaves with multiple prominent lateral veins 4. *S. rugosa*
 - 4b. Stem leaves with 2 very prominent lateral veins (triplinerved).
 - 5a. Upper stem leaves sharply serrate, abaxial veins sparsely hairy; involucre 2.5–3 mm; lower stem glabrous or hairy 5. *S. canadensis*
 - 5b. Upper stem leaves entire, abaxial veins densely hairy; involucre 3–4 mm; lower stem hairy 6. *S. altissima*

1. *Solidago decurrens* Loureiro, Fl. Cochinch. 2: 501. 1790.

一枝黄花 *yi zhi huang hua*

Amphirhapis chinensis Schultz Bipontinus; *A. leiocarpa* Benth; *Solidago cantoniensis* Loureiro; *S. virgaurea* Linnaeus subsp. *leiocarpa* (Benth) Hultén; *S. virgaurea* var. *leiocarpa* (Benth) A. Gray; *S. virgaurea* var. *paludosa* Honda.

Herbs, perennial, woody caudex shortly branched. Stems (5–)35–100 cm tall, erect, usually slender, solitary or rarely fascicled, simple or branched in upper part. Leaves: lower cauline 1–25 (including petiole) × 0.4–3(–4) cm, petiole 2–4 cm or more, with long wings, blade lanceolate to ovate, both surfaces puberulent or adaxially glabrous, upper margin serrate or entire; mid cauline petiole winged, blade elliptic, long elliptic, ovate, or broadly lanceolate, 2–14 × 0.4–2(–2.9) cm, base cuneate-attenuate, upper margin serrate, serrulate, or entire; upper cauline length from widest point to apex 6.5–31.5 mm, mean

14.3 mm. Capitula numerous in terminal, dense or lax racemiform or corymbose-paniculiform synflorescences, branches erect, inserted around stem, capitula attached around branch, rarely lower branches elongated terminating in separate synflorescences. Involucre 3.5–6.2(–7.7) mm; phyllaries 4–6-seriate, lanceolate or narrowly lanceolate, apex acute or acuminate. Ray florets 2–9, lamina 2–5(–6.5) × 0.9–2.8 mm. Achenes 2–3 mm, glabrous to sparsely strigose Pappus bristles 3.1–5.2 mm, inner (longest) weakly to moderately clavate. Fl. and fr. Apr–Nov.

Forests, forest margins, thickets and grasslands on slopes; below 100–2900 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Sichuan, Taiwan, Yunnan, Zhejiang [India, Japan, Korea, Laos, Nepal, Philippines, Vietnam].

This species is used medicinally for promoting hemostasis and for treating a variety of conditions, including snakebites, carbuncles, and furuncles. The leaves and capitula of *Solidago decurrens* are usually much smaller than those of *S. dahurica*.

2. *Solidago dahurica* (Kitagawa) Kitagawa ex Juzepczuk, Fl. URSS 25: 42. 1959.

兴安一枝黄花 xing an yi zhi huang hua

Solidago virgaurea Linnaeus var. *dahurica* Kitagawa, Rep. Inst. Sci. Res. Manchoukuo 1: 297. 1937; *S. virgaurea* subsp. *dahurica* (Kitagawa) Kitagawa.

Herbs, perennial, woody caudex shortly branched; rhizomes woody, sometimes to 5–10 cm. Stems erect, 36–100 cm tall, simple or inflorescence-branched in upper part, glabrous in lower part, sparsely puberulent in upper part. Leaves: lower cauline petiole usually equaling blade, winged, blade elliptic, long elliptic, or lanceolate, rarely ovate, 7–18 × 2.5–3.5 cm, both surfaces glabrous or sparsely puberulent along veins, base gradually narrowed, decurrent, margin coarsely or finely serrate; mid cauline sessile, blade elliptic, long elliptic, or lanceolate, 5–17 × 1.5–4 cm; upper cauline length from widest point to apex 25–45 mm, mean 34.5 mm. Capitula 10–12 × ca. 10 mm, few to numerous in terminal, dense or lax, long paniculiform synflorescences to 30 cm, or in racemiform ones 10–12 cm, rarely glomerate, branches erect, inserted around stem, capitula attached around branch. Involucre campanulate, 6–9.5(–10) mm; phyllaries 3–5-seriate, lanceolate, 5–8 mm, outer often not much shorter than inner, margin narrowly scarious, apex acuminate or acute. Ray florets 5–10, yellow, lamina 4.6–6.5 mm; disk florets 4–24, averaging 12, 5–7.3 mm, lobes 1.1–1.5 mm. Achenes angled, 2.5–4 mm, distal 1/3–1/2 sparsely to moderately strigose, proximally glabrous or glabrate. Pappus white, bristles 4.5–6.8 mm, inner (longest) weakly to moderately clavate. Fl. and fr. Jul–Sep.

Forests, forest glades; 300–2100 m. Hebei, Heilongjiang, Jilin, Liaoning, Shanxi, Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Nepal, E and SC Russia, Uzbekistan].

This species has been treated as a variety or subspecies of *Solidago virgaurea* Linnaeus (Sp. Pl. 2: 880. 1753; 毛果一枝黄花 *mao guo yi zhi huang hua*). Typical *S. virgaurea* is native to Europe and SW Asia eastward to India, Nepal, and Pakistan. Its presence in China has not been confirmed, but it may occur in westernmost Xinjiang. It has large capitula similar to those of *S. dahurica* but has achenes that are very sparsely to densely strigose over the entire surface, not just distally.

3. *Solidago pacifica* Juzepczuk, Fl. URSS 25: 576. 1959.

钝苞一枝黄花 dun bao yi zhi huang hua

Solidago virgaurea Linnaeus var. *coreana* Nakai.

Herbs, perennial; rhizomes robust. Stems erect, slender, to 100 cm tall, simple, glabrous, laxly leaved. Leaves elliptic or lanceolate, both surfaces glabrous, or sparsely ciliate, lower cauline narrowly petiolate, upper cauline gradually smaller. Capitula 7–12 mm, numerous, in terminal corymbs, several corymbs arranged in racemiform synflorescences to 35 cm, branches erect, inserted around stem, capitula attached around branch. Involucre campanulate, 4–6 mm; phyllaries 3- or 4-seriate, elliptic or oblanceolate, 4–6 mm, rounded or obtuse. Ray florets ca. 5 mm. Achenes ca. 2 mm, glabrous. Pappus inner (longest) bristles weakly to moderately clavate. Fl. and fr. Aug–Oct.

Grasslands on slopes, forests, forest margins; ca. 1600 m. Hebei, Heilongjiang, Jilin, Liaoning [Russia].

4. *Solidago rugosa* Miller, Gard. Dict., ed. 8, *Solidago* no. 25. 1768.

多皱一枝黄花 duo zhou yi zhi huang hua

Herbs, perennial; rhizomes creeping, branched. Stems 30–50 cm tall (potentially to 100 cm), erect, simple, green, shortly hirsute. Leaves: lower cauline absent at anthesis, similar to mid or upper ones but larger; mid to upper cauline numerous, lanceolate, 4.5–7 cm, tapering at both ends, margin of lower cauline sharply serrate, lateral veins multiple, prominent (not trinerved), apex acuminate; upper cauline similar, ± reduced, margin sometimes entire. Capitula very small, in secund, pyramidal, paniculiform synflorescences, branches spreading to curved downward, lower branches longest, capitula borne on one side, sometimes a few lower branches much elongated. Involucre 3–4 mm; phyllaries linear-lanceolate, apex acute to obtuse. Florets golden yellow; ray florets 3–8, lamina 1.6–1.9 mm; disk florets 3–6, 2.9–3.3 mm, lobes 0.8–1.1 mm. Pappus inner (longest) bristles not obviously clavate. Fl. Aug–Sep.

Forest margins. Introduced in Jiangxi [native to E North America].

The Chinese plants belong to *Solidago rugosa* var. *rugosa*.

5. *Solidago canadensis* Linnaeus, Sp. Pl. 2: 878. 1753.

加拿大一枝黄花 jia na da yi zhi huang hua

Herbs, perennial; rhizomes creeping, branched. Stems to 150 cm tall, erect, simple, shortly and softly downy above. Leaves numerous, lanceolate or linear-lanceolate, 5–12 cm, abaxially downy, veins sparsely hairy, adaxially shortly pilose, tapering at both ends, margin of basal sometimes entire, of lower and upper cauline sharply serrate, longitudinal veins 3 (triplinerved), of which 2 lateral veins protrude weakly, apex acuminate. Capitula in paniculiform synflorescences, branches (racemes) curved downward, capitula attached on upper side of branch. Involucre 2.5–3 mm; phyllaries linear-lanceolate, slightly obtuse. Florets golden yellow; ray florets hardly longer than involucre. Pappus inner (longest) bristles not obviously clavate. Fl. Aug–Sep.

Occasionally cultivated in gardens and parks in China, and may possibly become naturalized [native to North America].

6. *Solidago altissima* Linnaeus, Sp. Pl. 2: 878. 1753.

高大一枝黄花 gao da yi zhi huang hua

Herbs, perennial; rhizomes creeping, branched. Stems erect, to 250 cm tall, simple, shortly and softly aqua-rose downy. Leaves numerous, lanceolate or linear-lanceolate, 5–12 cm, tapering at both ends, apex acuminate, margin of lower leaves sharply serrate, of basal leaves sometimes entire, of upper leaves entire, with 3 longitudinal veins, of which 2 lateral veins protrude weakly, glabrous or downy abaxially, shortly pilose adaxially. Capitula in paniculiform synflorescences, capitula attached on one side, branches curved downward. Involucre 3–4 mm; phyllaries linear-lanceolate, slightly obtuse. Florets

golden yellow; ray florets hardly longer than involucre. Pappus inner (longest) bristles not obviously clavate. Fl. Aug–Sep.

Cultivated in China; now widely naturalized as an often abundant weed in disturbed areas. Anhui, Fujian, Hebei, Henan, Hubei, Jiangsu,

Jiangxi, Liaoning, Shandong, Sichuan, Taiwan, Yunnan, Zhejiang [native to North America; widely introduced elsewhere].

The Chinese plants belong to *Solidago altissima* var. *altissima*. Material from China has often been misidentified as *S. canadensis*.

141. ERIGERON Linnaeus, Sp. Pl. 2: 863. 1753.

飞蓬属 *fei peng shu*

Chen Yilin (陈艺林 *Chen Yi-ling*); Luc Brouillet

Herbs, perennial, sometimes annual or biennial, or sometimes subshrubs. Leaves alternate, margin entire, serrate, or lobed. Capitula radiate, sometimes disciform or rarely discoid, solitary or several, sometimes numerous, in racemiform, corymbiform, or paniculiform synflorescences. Involucre hemispheric to campanulate or turbinate to cylindric; phyllaries 2–5-seriate, subequal, sometimes outer ones shorter, sometimes \pm imbricate, linear-lanceolate to linear, membranous or herbaceous, margin scarious, midvein reddish brown, purplish, or green. Receptacles flat to slightly convex or conic, \pm alveolate, naked. Ray florets fertile, rarely absent (discoid capitula) or 12–350, 1–5- or more seriate, inner series lamina reduced and/or elaminate, or all reduced or elaminate (disciform capitula), lamina purple, blue, pink, or white, rarely yellow or orange, usually short and narrow, sometimes \pm broad; disk florets bisexual, 3–450, yellow (veins often orange), sometimes white, limb cylindric to narrowly funnelform [rarely campanulate], lobes (4 or) 5, deltate; anther base obtuse, apical appendages ovate-lanceolate; style branch tips deltate, obtuse or arcuate. Achenes oblong or oblong-lanceoid to oblong-obovoid, compressed to flattened, glabrous or sparsely to densely strigose or strigillose to sericeous, eglandular, 2(or 4)-veined, veins often orange. Pappus persistent or caducous, free or \pm basally connate, 1- or 2-seriate, outer series of short setae or scales, inner of 5–40(–50) fine, barbellate or barbellulate bristles, sometimes pappus only on ray or only on disk achenes [or absent].

About 400 species: Asia, Europe, North America, a few in Africa and Australia; 39 species (14 endemic, six introduced) in China.

The sections of *Erigeron* used here follow Nesom (Lundellia 11: 8–38. 2008), except that the polyphyletic *Conyza* s.s. is included within the genus, as *E. sect. Caenotus* and *E. sect. Conyza*.

Key to sections

- 1a. Ray florets 1–3-seriate, lamina strap-shaped (sometimes narrowly), usually spreading.
 - 2a. Pappus of ray florets of short scales, without bristles, of disk florets 2-seriate, outer series of short scales, inner of 10–15 bristles; capitula numerous in corymbiform synflorescences; herbs annual or biennial; capitula nodding in bud 3. *E. sect. Phalacroloma*
 - 2b. Pappus of ray and disk florets 2-seriate, outer of short scales or bristles, inner of bristles; capitula 1–5 terminal or from upper branches; herbs perennial, rarely annual or biennial; capitula erect in bud.
 - 3a. Leaves mostly basal, margin entire; capitula solitary 1. *E. sect. Erigeron*
 - 3b. Leaves mostly cauline (basal withered at anthesis), margin serrate or lobed; capitula 1–5 from upper branches 2. *E. sect. Karvinskia*
- 1b. Ray florets 4- or 5-seriate, sometimes elaminate or lamina filiform, erect.
 - 4a. Ray florets in 2 zones, outer 1–3 series laminate, inner 2 elaminate; achenes 2–2.4 mm; pappus accrescent 4. *E. sect. Trimorpha*
 - 4b. Ray florets not in 2 zones, laminate or elaminate; achenes 0.8–2 mm; pappus not accrescent.
 - 5a. Leaf margin entire or sparsely serrate 5. *E. sect. Caenotus*
 - 5b. Leaf margin coarsely serrate or lobed, rarely entire 6. *E. sect. Conyza*

1. *Erigeron* sect. *Erigeron*

飞蓬组 *fei peng zu*

Herbs, perennial, rarely biennial or subshrubs; rhizome short, erect; caudex simple or shortly branched; herbage strigose to hirsute or villous. Stems simple. Leaves mostly basal, oblanceolate to obovate or spatulate, base not clasping, margin entire. Capitula erect in bud, solitary. Ray florets white or blue, rarely yellow or orange, lamina strap-shaped, erect or spreading, coiling (rarely not coiling). Achenes 1.6–2.8 mm, 2-veined. Pappus 2-seriate, outer of short scales or setae, inner of (7–)10–30 bristles, rarely accrescent.

About 65 species: Asia, Europe, North and South America; 27 species (13 endemic) in China.

- 1a. Ray floret lamina involute when dry.
 - 2a. Disk floret limb cylindric or cylindric-funnelform, anthers and style branches not exerted from corolla.
 - 3a. Disk floret limb cylindric-funnelform 23. *E. petiolaris*
 - 3b. Disk floret limb cylindric and abruptly ampliate or narrowly cylindric.
 - 4a. Phyllaries exceeding or equaling disk florets, outer series slightly shorter than or equaling inner.

- 5a. Phyllaries appressed, apex purple, densely villous (some with purple crosswalls) 24. *E. eriocalyx*
 5b. Phyllaries \pm loose, green or purplish, densely yellowish villous at base 25. *E. lachnocephalus*
 4b. Phyllaries longer than disk florets, outer series usually 1/2 as long as inner.
 6a. Stems sparsely hirsute; achenes ca. 0.3 mm wide, sparsely strigose 26. *E. lonchophyllus*
 6b. Stems \pm densely hirsute and strigillose; achenes ca. 0.6 mm wide, strigose 27. *E. oreades*
 2b. Disk floret corollas narrowly funnelform, anthers and style branches often exserted from disk corolla.
 7a. Capitula 0.8–1.5 cm in diam.; ray florets 5–7 mm; phyllaries shorter than to equaling or sometimes slightly exceeding disk florets.
 8a. Plants 15–50(–60) cm tall; mid and upper cauline leaves narrowly oblong, apex obtuse or rounded, surfaces eglandular 20. *E. himalajensis*
 8b. Plants 5–25 cm tall; mid and upper cauline leaves linear or linear-lanceolate, apex acute or shortly acuminate, surfaces often stipitate glandular.
 9a. Stems green, 9–25 cm tall; phyllaries green, sparsely strigillose, densely short-stipitate glandular 21. *E. pseudotenuicaulis*
 9b. Stems purple, 5–7 cm tall; phyllaries purple, sparsely hirsute-villous, strigillose, often stipitate glandular at base 22. *E. purpurascens*
 7b. Capitula 1.5–3.2 cm in diam.; ray florets 6.5–13.7 mm; phyllaries exceeding or equaling disk florets.
 10a. Phyllaries sparsely to \pm densely villous and shortly strigose, \pm densely stipitate glandular, outer apex spreading, often squarrose; ray florets purple; lobes of disk florets hairy 15. *E. patentisquama*
 10b. Phyllaries villous to glabrate, strigillose, eglandular, outer appressed; ray florets white or purplish; lobes of disk florets glabrous or hairy at base.
 11a. Cauline leaves 3–6, often crowded at base, upper gradually reduced; stems sparsely long villous, strigillose 19. *E. kunshanensis*
 11b. Cauline leaves 5 to numerous, usually slightly reduced upward; stems densely villous, strigillose.
 12a. Ray florets white, sometimes pink tinged or purplish; phyllaries green, sometimes purple, sparsely to \pm densely villous, shortly scabrous; lobes of disk florets glabrous or hairy at base 16. *E. multifolius*
 12b. Ray florets purple; phyllaries \pm purple, lanate (crosswalls pale yellow or purple); lobes of disk florets glabrous or hairy.
 13a. Upper cauline leaves and phyllaries lanate (crosswalls yellow or purple); cauline leaves oblanceolate or oblong-oblanceolate to oblong; lobes of disk florets glabrous 17. *E. porphyrolepis*
 13b. Upper cauline leaves and phyllaries villous to lanate (crosswalls purple); cauline leaves elliptic-ovate; lobes of disk florets hairy 18. *E. lanuginosus*
 1b. Ray floret lamina flat.
 14a. Phyllaries distinctly exceeding disk florets; ray florets lilac to lavender or purple, or sometimes white; disk floret lobes yellow.
 15a. Capitula 1.2–2.5 cm in diam.
 16a. Lower and mid cauline leaf margins entire 12. *E. latifolius*
 16b. Lower and mid cauline leaf margins 3–6-serrate to coarsely serrate above middle 14. *E. kiukiangensis*
 15b. Capitula 2.5–4 cm in diam.
 17a. Phyllaries hirsute, densely stipitate glandular apically only; capitula 3–4 cm in diam. 11. *E. multiradiatus*
 17b. Phyllaries densely stipitate glandular, basally hirsute; capitula 2.5–3 cm in diam. 13. *E. leucoglossus*
 14b. Phyllaries shorter than to equaling or slightly longer than disk florets; ray florets blue, purple, lilac, reddish, white, or rarely orange; disk floret lobes yellow or purplish to purple.
 18a. Leaves mostly basal 10. *E. breviscapus*
 18b. Leaves basal and cauline.
 19a. Ray florets orange, sometimes yellow to brick-red 5. *E. aurantiacus*
 19b. Ray florets pale purple, blue, lilac, or rarely white.
 20a. Capitula 1–2.5 cm in diam.
 21a. Phyllaries dark cork-colored, shorter than or almost equaling disk florets, hirsute-villous and stipitate glandular; disk floret lobes yellow 1. *E. leioreades*
 21b. Phyllaries green or purple to partly purple, longer than or equaling disk florets, villous or scabridulous, eglandular or sparsely glandular; disk floret lobes purplish.
 22a. Plants 5–20(–30) cm tall; basal leaf surfaces glabrate; phyllaries \pm densely scabridulous; ray florets 6–7 mm, disk florets 3.8–4.2 mm; inner pappus bristles 3–3.5 mm 8. *E. morrisonensis*

- 22b. Plants 20–35 cm tall; basal leaf surfaces sparsely villous-strigose, strigillose; phyllaries ± densely villous; ray florets 7–8.5 mm, disk florets 5–5.1 mm; inner pappus bristles 5–6 mm 9. *E. taipeiensis*
- 20b. Capitula to 4 cm in diam.
- 23a. Ray florets blue 4. *E. vicarius*
- 23b. Ray florets lilac to pale purple, rarely white.
- 24a. Disk floret lobes purplish 7. *E. alpicola*
- 24b. Disk floret lobes yellow.
- 25a. Phyllaries densely villous to lanate, eglandular 6. *E. allochrous*
- 25b. Phyllaries villous or strigose and stipitate glandular.
- 26a. Ray florets 6.5–8(–13) mm; phyllaries hirsute-villous and margin stipitate glandular 2. *E. seravschanicus*
- 26b. Ray florets 10–12 mm; phyllaries densely stipitate glandular, sparsely strigose (or not) 3. *E. altaicus*

1. *Erigeron leioreades* Popov, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 8: 52. 1940.

光山飞蓬 *guang shan fei peng*

Herbs, perennial, 10–37 cm tall, caespitose; rhizome slender. Stems usually several, erect to ascending, green or reddish, branched or rarely simple, hirsute-villous, strigillose, especially in upper parts, stipitate glandular, densely leafy. Leaves: basal withered or present at anthesis, petiolate, petiole hirsute-villous, blade oblanceolate, 0.7–8 × 0.3–1.2 cm, surfaces hirsute-villous or strigillose adaxially only, base attenuate, margin entire, hirsute-villous-ciliate, apex obtuse to acute; mid cauline sessile, blade lanceolate, 0.7–4.5 × 0.1–0.5 cm, base subclasping, apex acute; upper smaller, stipitate glandular. Capitula 1–6 in corymbiform synflorescences, 18–25 mm in diam. Involucre hemispheric; phyllaries linear-lanceolate, 5.5–6 × 0.5–0.7 mm, often shorter than or almost equaling disk florets, apex acute, outer shorter, dark cork-colored, hirsute-villous, stipitate glandular, inner margin scarious. Ray florets lilac, 7–9 mm, tube ca. 2.5 mm, hairy distally, lamina flat; disk florets yellow, 3.5–4 mm, hairy distally, lobes lanceolate, ca. 0.4 mm, glabrous. Achenes tan, oblong, compressed, 2–3 mm, strigose. Pappus 2-seriate, outer bristles short, inner 4.5–5 mm. Fl. Jul–Sep.

Picea forests, alpine meadows; 2100–3400 m. N Xinjiang [Kazakhstan, Russia (W Siberia)].

2. *Erigeron seravschanicus* Popov, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 7: 10. 1948.

泽山飞蓬 *ze shan fei peng*

Herbs, perennial, 4–30 cm tall, often caespitose; rhizome slender. Stems usually several, rarely solitary, erect to ascending, green or purplish in lower part, often branched, hispid-villous, sparsely so in lower part and on lower leaves, more densely so in upper part, stipitate glandular below capitula, loosely leafy. Leaves: basal withered at anthesis, petiolate, petiole base clasping, blade oblanceolate, 1.2–8 × 0.25–1 cm, surfaces glabrous or glabrate, base attenuate, petiole and margin hirsute-villous-ciliate, apex acute; lower cauline shortly petiolate, blade oblanceolate, mid and upper sessile, lanceolate to linear-lanceolate, 1.5–6.5 × 0.1–0.6 cm, base subclasping, apex acute. Capitula 2–14 in corymbiform synflorescences, sometimes solitary, 0.9–1.6 × 1.8–3.3 cm. Involucre hemispheric; phyllaries green, linear-lanceolate, 5.5–9 × 0.5–1 mm, apex

acute, outer slightly shorter, hirsute-villous, inner with margin scarious, stipitate glandular. Ray florets lilac, 6.5–8(–13) mm, tube 1.5–2.5 mm, apically sparsely hairy, lamina ± flat; disk florets yellow, 4.5–5 mm, limb funnelform, lobes lanceolate, ca. 0.5 mm, glabrous. Achenes tan, oblanceoid, compressed, 2.2–2.6 mm, strigose. Pappus 2-seriate, outer bristles ca. 0.7 mm, inner 4.3–5 mm. Fl. Jul–Sep.

Subalpine meadows; ca. 2600 m. C Xinjiang [Kazakhstan, Uzbekistan].

3. *Erigeron altaicus* Popov, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 8: 53. 1940.

阿尔泰飞蓬 *a er tai fei peng*

Herbs, perennial, 15–50 cm tall, caespitose; rhizome erect or ascending. Stems several, sometimes solitary, erect, green or reddish, branched or rarely simple, sometimes glabrate in lower part, strigose, strigillose, especially on upper part, peduncles densely stipitate glandular. Leaves green, margin entire; basal rosulate, often withered at anthesis, long petiolate, blade oblanceolate or spatulate, 2–16 × 0.4–1.2 cm, base attenuate, apex rounded, mucronate; cauline 0.3–1.3 × 0.5–1 cm, lower winged petiolate, oblanceolate, base subclasping, upper sessile, blade lanceolate, apex acute. Capitula 2–5 in corymbiform synflorescences, or solitary, ca. 1.2 × 2.1–3.7 cm. Involucre hemispheric; phyllaries 3-seriate, green, subequal, lanceolate to linear-lanceolate, 6–9 × 0.5–0.75 mm, sparsely strigose (or not), densely stipitate glandular, apex acute, margin of inner scarious. Ray florets lilac, 10–12 mm, tube ca. 2.5 mm, hairy, lamina 0.5–1.2 mm wide, flat; disk florets yellow, 4–4.5 mm, tube 1–1.5 mm, hairy, limb cylindric-funnelform, lobes triangular, ca. 0.5 mm, glabrous. Achenes (immature) ± strigose. Pappus 2-seriate, outer bristles short, inner 3.5–4 mm (immature). Fl. Jun–Aug.

Subalpine meadows, grasslands; ca. 2500 m. N Xinjiang [Kazakhstan, Russia (Siberia)].

4. *Erigeron vicarius* Botschantzev, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 18: 260. 1957.

蓝舌飞蓬 *lan she fei peng*

Herbs, perennial, 25–28 cm tall; rhizome short, branching. Stems several, 1–3 mm in diam. at base, straight or ascending, simple, moderately to densely curved hirsute, usually moderately to densely stipitate glandular. Leaves green, margin entire;

basal petiolate, blade linear-lanceolate, $2-9 \times 0.1-1.1$ cm, apex acute; cauline 3-12, sessile, blade linear-lanceolate to lanceolate, apex acute; lowermost shortly petiolate, blade $0.7-6 \times 0.1-0.6$ cm. Capitula solitary, $1.4-1.8 \times 2.1-3.8$ cm. Involucre hemispheric; phyllaries 3-seriate, subequal, green, or reddish at tip, linear-lanceolate, $7-9 \times 1-1.8$ mm, densely lanate. Ray florets blue, 10-15 mm, tube 2.3-3.5 mm, hairy upward, lamina linear, 1-1.5 mm wide, flat; disk florets yellow, 4-4.5 mm, tube hairy upward. Achenes oblanceolate, flattened, $2.5-3 \times 0.5-0.6$ mm, strigose. Pappus 2-seriate, outer bristles short, inner 4-4.5 mm. Fl. Jul-Sep.

Alpine meadows, stony slopes; 2800-4500 m. Xinjiang [Kazakhstan, Uzbekistan].

No specimen of this species was seen by us.

5. *Erigeron aurantiacus* Regel, Gartenfl. 289. 1879.

橙花飞蓬 cheng hua fei peng

Herbs, perennial, 5-35 cm tall or more, caespitose; rhizome short, branched. Stems several, erect or ascending, simple or rarely branched, green or purplish below, \pm densely villous-hirsute, especially in upper part, strigillose, eglandular. Leaves: surfaces strigose, eglandular, margin entire, strigose; basal rosulate, present at anthesis, long petiolate, blade oblong-ob lanceolate or oblanceolate, sometimes obovate or elliptic, $1-16 \times 0.4-1.6$ cm, base attenuate, apex acute to obtuse; cauline 7-17, subclasping, apex acute, lower long winged petiolate, blade lanceolate or oblanceolate, mid and upper sessile, blade lanceolate to linear-lanceolate, $0.7-15 \times 1.5-1.7$ cm. Capitula 13-15 \times 23-35(-42) mm, solitary. Involucre hemispheric, $7-9 \times 15-22$ mm; phyllaries 3-seriate, subequal, green and apically purplish, linear-lanceolate, $7-9 \times 0.7-1$ mm, slightly exceeding disk florets, leaflike, apex acute or acuminate, \pm densely villous-hirsute, innermost margin narrowly scarious (if at all), erose. Ray florets 3-seriate, orange, sometimes yellow to brick-red, 7.8-12 mm, tube ca. 2.5 mm, sparsely hairy, lamina 1-1.4 mm wide, flat; disk florets yellow, 4-5.5 mm, hairy, tube ca. 0.8 mm, limb narrowly funnelform to cylindric-funnelform, lobes triangular, ca. 0.5 mm. Achenes oblong, compressed, ca. 2 mm, strigose. Pappus 2-seriate, outer bristles ca. 0.5 mm, inner 3.5-6 mm. Fl. Jul-Sep.

Forest margins, alpine meadows; 2100-3400 m. N Xinjiang [Kazakhstan].

6. *Erigeron allochrous* Botschantzev, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 18: 259. 1957.

异色飞蓬 yi se fei peng

Herbs, perennial, 7-28 cm tall, caespitose; rhizome short, branched. Stems usually several, erect, simple, 1-3 mm in diam. at base, sparsely villous, more densely so in upper part, also strigillose, eglandular, densely leafy. Leaves petiolate, villous, abaxially or sometimes both surfaces sparsely villous on veins, margin entire, villous-ciliate; basal leaves dense, present at anthesis, blade obovate or oblanceolate, $1.2-12 \times 0.3-1.4$ cm, base attenuate, apex obtuse or acute, mucronate; lower cauline shortly petiolate, blade oblanceolate, mid and upper sessile, blade lanceolate, $0.8-7 \times 0.1-0.8$ cm, base cuneate, subclasping, apex acute or acuminate. Capitula solitary, $1.1-1.8 \times 2.4-4$ cm. Involucre hemispheric; phyllaries green or tip pur-

plish, lanceolate, $6.5-8 \times 0.7-1$ mm, often exceeding disk florets, apex acute, outer slightly shorter, densely villous to lanate, eglandular. Ray florets 3-seriate, lilac, 9-13 mm, tube 2.5-3 mm, sparsely hairy, lamina flat, ca. 1.3 mm wide; disk florets yellow, 3.5-4.5 mm, tube 0.8-1 mm, limb cylindric-funnelform, hairy, lobes lanceolate, ca. 0.8 mm, glabrous. Achenes (immature) densely strigose to silky. Pappus 2-seriate, outer bristles short, inner 2.5-5 mm (immature). Fl. Jun-Sep.

Abies forests, subalpine meadows; ca. 2800 m. N Xinjiang (Ürümqi) [Kazakhstan].

7. *Erigeron alpicola* Makino, Bot. Mag. (Tokyo) 28: 339. 1914 [*"alpicolus"*].

山飞蓬 shan fei peng

Aster consanguineus Ledebour, Fl. Ross. 2: 473. 1845; *A. dubius* (Thunberg) Hultén subsp. *glabratus* (A. Gray) Kitamura & H. Hara; *A. dubius* var. *glabratus* (A. Gray) T. Shimizu; *Erigeron consanguineus* (Ledebour) Novopokrovsky (1938), not (Philippi) Cabrera (1937); *E. dubius* (Thunberg) Makino var. *glabratus* (A. Gray) Miquel ex Matsumura; *E. komarovii* Botschantzev; *E. thunbergii* A. Gray subsp. *glabratus* (A. Gray) H. Hara; *E. thunbergii* var. *glabratus* A. Gray; *E. thunbergii* subsp. *komarovii* (Botschantzev) Á. Löve & D. Löve.

Herbs, perennial, 10-35 cm tall; rhizomes short, branched. Stems several, sometimes single, erect to ascending, simple, green, striate, 1-2.5 mm in diam. at base, sparsely villous (yellow crosswalls distally), denser in upper part, strigillose, sparsely stipitate glandular, sometimes glabrate. Leaves crowded; basal rosulate, long, narrowly winged petiolate, blade obovate, spatulate, or oblanceolate, $2-10 \times 0.3-1.6$ cm, surfaces sparsely villous, sometimes glabrate, conspicuously 3-veined, base attenuate, margin entire or sometimes sparsely mucronate, villous-ciliate (yellow crosswalls), apex obtuse; lower cauline shortly petiolate, blade oblanceolate, apex acute, upper sessile, blade lanceolate or linear-lanceolate, $1-4 \times 0.1-0.9$ cm, apex acute. Capitula solitary, $0.9-1.7 \times 2-4$ cm. Involucre hemispheric; phyllaries 3-seriate, linear-lanceolate, $6-10 \times 0.8-1.6$ mm, membranous, acuminate, outer green, somewhat shorter than inner, densely villous. Ray florets 2-seriate, lilac, rarely white, $8-14 \times 1-2$ mm, tube 2-2.7 mm, hairy, lamina spreading, flat when dry; disk florets yellow, 3-4.5 mm, tube 1.2-1.8 mm, hairy from middle onto limb base, limb funnelform, lobes triangular, 0.4-0.6 mm, purplish. Achenes oblanceolate, flattened, sparsely strigose. Pappus 2-seriate, cinnamon, outer bristles short, inner 2.5-4.7 mm. Fl. Jul-Sep.

Alpine lawns or forest margins, riverbanks, lakeshores; 1700-2600 m. Jilin (Changbai Shan) [Japan, Russia (Kamchatka, E Siberia)].

8. *Erigeron morrisonensis* Hayata, J. Coll. Sci. Imp. Univ. Tokyo 25(19): 126. 1908.

玉山飞蓬 yu shan fei peng

Herbs, perennial, 5-20(-30) cm tall, \pm caespitose; rhizome short. Stems single to several, erect to ascending (procumbent), 0.8-1.5 mm in diam. at base, simple or sparsely branched above, branches ascending, sparsely villous-hirsute, moderately to densely strigillose, more densely so upward. Leaves: basal persistent at anthesis, rosulate, long petiolate, blade oblanceolate to narrowly spatulate, $2-6 \times 0.2-0.7$ cm, surfaces glabrate,

base attenuate, margin sparsely mucronulate or entire, sometimes remotely narrowly serrate-mucronulate, scabrous, apex obtuse, mucronate; cauline sessile, blade linear or oblong-lanceolate, $1-3(-5) \times 0.15-5$ mm, surfaces strigillose to glabrate, base cuneate to rounded, margin entire, villous-ciliate, apex obtuse to acuminate; upper gradually reduced; uppermost linear, 3–5 mm. Capitula 2–6, in corymbose synflorescences terminal on stems and branches, sometimes solitary, 1–2 cm in diam.; peduncle long. Involucre hemispheric, $5-7 \times 11-15$ mm; phyllaries 3-seriate, green (outer) to purple, linear-lanceolate, slightly exceeding or equaling disk florets, moderately to densely scabridulous, sparsely glandular or eglandular, membranous, margin villous-ciliate and/or glandular (distally), apex acuminate, outer 2.7–4.2 mm, inner 4.8–6.8 mm, margin narrowly scarious, erose. Ray florets 3-seriate, lilac to pale purple, $6-7 \times \text{ca. } 0.5$ mm, tube 2.7–3.2 mm, \pm hairy onto base of lamina, lamina spreading, flat when dry; disk florets yellow to greenish, 3.8–4.2 mm, tubes 1.6–1.7 mm, limb narrowly funnelform, lobes ovate, 0.4–0.6 mm, purplish. Achenes greenish straw-colored, oblong, flattened, 2–2.5 mm, densely strigose, veins orange. Pappus yellowish, outer scales 0.15–0.25 mm, inner bristles 3–3.5 mm. Fl. May–Nov.

- Alpine meadows, montane coniferous–broad-leaved forests, rocky summits, streamsides, open rocky slopes, mountain ridge grasslands, roadsides, trailsides; 1500–3600 m. Taiwan.

9. *Erigeron taipeiensis* Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 11: 406. 1973.

太白飞蓬 tai bai fei peng

Herbs, perennial, 20–35 cm tall, caespitose; rhizome vertical, ascending, branching. Stems several or solitary, erect, 1–2.5 mm in diam. at base, simple, green, hirsute-villous, stipitate glandular below capitula. Leaves green; basal dense, rosulate, long petiolate, blade oblanceolate, (specimen too damaged to provide dimensions), surfaces sparsely villous-strigose, strigillose, conspicuously 3-veined, base attenuate, margin entire or 1- or 2-serrulate, villous-ciliate; lower cauline shortly petiolate, blade oblanceolate, mid and upper sessile, blade lanceolate or linear-lanceolate, $0.8-5 \times 0.3-1.4$ cm, base \pm rounded, subclasping, margin entire, apex acute or acuminate; uppermost with surfaces villous, margin villous-ciliate. Capitula solitary, $10-13 \times 20-25$ mm. Involucre hemispheric, $7-10 \times 15-20$ mm; phyllaries 3-seriate, green, apex and midvein purplish, linear-lanceolate, acuminate, \pm densely villous, outer shorter, inner slightly longer than or rarely equaling disk florets, ca. 0.5 mm wide, 1-veined. Ray florets 3-seriate, lilac, 7–8.5 mm, tube ca. 3 mm, hairy, lamina ca. 0.4 mm wide, flat; disk florets yellow, 5–5.1 mm, tube ca. 2.5 mm, hairy, limb narrowly funnelform, lobes triangular, ca. 0.4 mm, purplish. Achenes tan, narrowly oblong, compressed, 2–2.5 mm, strigose. Pappus 2-seriate, yellowish, outer bristles ca. 0.5 mm, inner 5–6 mm. Fl. Jul.

- Alpine meadows; ca. 3200 m. S Shaanxi (Taibai Shan).

10. *Erigeron breviscapus* (Vaniot) Handel-Mazzetti, Symb. Sin. 7: 1093. 1936.

短葶飞蓬 duan ting fei peng

Aster breviscapus Vaniot, Bull. Acad. Int. Géogr. Bot. 12:

495. 1903; *Erigeron breviscapus* var. *alboradiatus* Y. Ling & Y. L. Chen; *E. breviscapus* var. *leucanthus* X. D. Dong & Ji H. Li; *E. breviscapus* var. *tibeticus* Y. Ling & Y. L. Chen; *E. dielsii* H. Léveillé; *E. praecox* Vierhapper & Handel-Mazzetti.

Herbs, perennial, 1–50 cm tall (sometimes less than 1 cm), sometimes \pm caespitose; rhizome woody, thick. Stems several or solitary, or less than 1 cm, 1–1.5 mm in diam. at base, erect or ascending, sometimes procumbent, green or rarely purplish, simple or sometimes 2–4 branched, sparsely to densely hirsute, strigillose, sparsely to moderately stipitate glandular, denser distally. Leaves mostly basal, basal rosulate, present at anthesis, winged petiolate, blade oblanceolate to obovate-lanceolate or broadly spatulate, $1.5-4 \times 0.5-2.5$ cm, surfaces sparsely to densely scabrous-hirsute, sparsely scabridulous, sparsely minutely glandular, sometimes glabrate, \pm 3-veined, base \pm gradually attenuate, margin entire, hirsute-ciliate, apex obtuse or rounded, mucronate; cauline 2–4, rarely absent, sessile, blade narrowly ovate-lanceolate to narrowly lanceolate, $1-4 \times 0.5-1$ cm, base subclasping, apex obtuse to acute; upper reduced, linear. Capitula solitary at ends of stems or branches, 1.8–2.8(–3.5) cm in diam. Involucre hemispheric, $0.5-0.8 \times 1-1.5$ cm; phyllaries 3-seriate, slightly exceeding or equaling disk florets, green or purplish at margin and apex, linear-lanceolate, ca. 8×1 mm, membranous, acute to acuminate, outer $3.8-5.6 \times 0.6-0.8$ mm, abaxially densely to sparsely hirsute, \pm densely strigillose, short-stipitate glandular, inner $5.6-7.3 \times 0.6-0.85$ mm, margin narrowly scarious, erose, sparsely ciliate. Ray florets 3-seriate, blue to purple or white, $9-12 \times 0.8-1.1$ mm, tube 2–3 mm, sparsely hairy in upper part and onto lamina base, lamina spreading, flat when dry; disk florets yellow, 3.5–4 mm, tube 1.2–1.5 mm, limb funnelform, sparsely hairy, lobes ovate, 0.55–0.6 mm, glabrous, tips sometimes reddish. Achenes narrowly oblong to oblanceolate, flattened, ca. 2.2 mm, densely strigose, often 1-ribbed abaxially. Pappus 2-seriate, brownish, outer bristles ca. 0.4 mm, inner 3.7–4 mm. Fl. Mar–Oct.

- Mid-elevation mountains, alpine to montane meadows, forest margins, *Pinus* forests, streamsides, grasslands, disturbed slopes, roadsides; 1200–3600 m. Guangxi, Guizhou, Hunan, Sichuan, E and S Xizang, Yunnan.

In addition to the typical variety, three varieties have been recognized. *Erigeron breviscapus* var. *tibeticus* (S Xizang: Qüxü; ca. 3600 m) is a high-elevation, shortly stemmed (sometimes less than 1 cm) morphotype; this extreme may represent phenotypic plasticity at the extreme limit of the species range. *Erigeron breviscapus* var. *alboradiatus* (EC Yunnan: Songming) is a white-rayed form with slender stems. The recently described *E. breviscapus* var. *leucanthus* is another pale-rayed form. Color forms frequently occur in *Erigeron* through a simple mutation within the flavonoid pathway. A biosystematic study of the complex is required to evaluate the value of these varieties.

11. *Erigeron multiradiatus* (Lindley ex Candolle) Benth. ex C. B. Clarke, Compos. Ind. 56. 1876 [“*multiradiatum*”].

多舌飞蓬 duo she fei peng

Stenactis multiradiata Lindley ex Candolle, Prodr. 5: 299. 1836; *Aster inuloides* D. Don; *A. roylei* Onno; *Erigeron multiradiatus* var. *glabrescens* Y. Ling & Y. L. Chen; *E. multiradiatus* var. *ovatifolius* Y. Ling & Y. L. Chen; *E. multiradiatus* var. *salicifolius* C. C. Chang ex Y. Ling & Y. L. Chen.

Herbs, perennial, 20–60 cm tall; rhizome woody. Stems several or single, 2–4 mm in diam. at base, erect, ascending or procumbent, branched or sometimes simple, purplish at base, rarely green, sparsely or \pm densely hirsute, scabridulous, base sometimes glabrate, long-stipitate glandular. Leaves: basal rosulate, often withered at anthesis, long winged petiolate, blade oblong-ob lanceolate to oblanceolate, sometimes ovate to ovate-elliptic, (4–)5–15 \times 0.6–1.5 (–2.6) cm, surfaces scabrous or rarely sparsely long hairy, or rarely glabrate or glabrous, glandular, 3–5-veined, base attenuate, sometimes broad, margin entire or remotely serrate, hirsute-ciliate, apex acute or obtuse, rarely rounded or acuminate; lower cauline similar, shortly petiolate, mid sessile, blade ovate-lanceolate to oblong-lanceolate or lanceolate, rarely narrowly lanceolate, 3–6 (–8.5) \times 0.6–2.2 cm, base subclasping, margin entire or remotely serrate, apex acute or acuminate, upper sessile, reduced, linear or linear-lanceolate, 1–2 cm, apex acuminate. Capitula usually 2 to several in corymbiform synflorescences, or solitary, 3–4 cm in diam. or more. Involucre hemispheric, 8–10 \times 15–20 mm; phyllaries 3-seriate, green, apex or entire surface purplish, linear-lanceolate, distinctly exceeding disk florets, 0.6–1 mm wide, abaxially sparsely to densely hirsute, densely stipitate glandular apically, leaflike (outer and inner), margin stipitate glandular, apex acuminate, outer 5–5.4 mm, innermost 6.8–7.6 mm, membranous, margin not or narrowly scarious and hyaline, long acuminate. Ray florets lilac or lavender to purple, spreading, 8.8–17 \times 0.4–1 mm, 2 \times as long as involucre, tube 1.5–2 mm, sparsely hairy in upper part to lamina base, lamina \pm flat when dry; disk florets yellow, 2.9–4.5 mm, tube 0.7–1.5 mm, sparsely hairy above to limb base, limb narrowly funnelform, 2.1–2.3 mm, lobes ovate, 0.4–0.6 mm, glabrous. Achenes oblong to lanceolate, flattened, ca. 2 mm, sparsely strigose, 1-veined abaxially. Pappus 2-seriate, dirty white or yellowish to brownish, outer bristles short, inner ca. 4 mm. Fl. May–Sep.

Alpine or subalpine meadows, slopes, forest margins, forests, open hillsides; 2300–4600 m. Sichuan, Xizang, Yunnan [Afghanistan, Bhutan, India, Kashmir, Nepal; SW Asia (Iran)].

In addition to the typical variety, three varieties have been recognized in this species. *Erigeron multiradiatus* var. *ovatifolius* (SW Sichuan: Muli) is characterized by ovate to ovate-elliptic leaves with a rounded-obtuse, mucronate apex. *Erigeron multiradiatus* var. *salicifolius* (NW Yunnan: Weixi; ca. 2900 m, in forests) has thin, narrowly lanceolate, sparsely long hairy leaves with an attenuate, somewhat clasping base and an acute or acuminate apex. These may represent extremes of leaf variation of the species or distinct forms or even the result of phenotypic plasticity in the case of *E. multiradiatus* var. *salicifolius*, which is found in forests; a morphometric study of the complex would be needed to address this issue. *Erigeron multiradiatus* var. *glabrescens*, found in alpine meadows of NW Yunnan (Zhongdian; ca. 3200 m), has glabrate or glabrous, entire leaves; other reported features appear to fall within the range of variation of the species.

12. *Erigeron latifolius* Hao Zhang & Zhi F. Zhang, *Novon* 20: 117. 2010.

宽叶飞蓬 kuan ye fei peng

Herbs, perennial, 25–50 cm tall; rhizome erect or ascending, caudices simple or branched, fibrous-rooted, with marcescent leaf bases. Stems single (or ?several), erect, simple or

branched from base, sparsely strigose, sparsely villous, sometimes hirtellous, sometimes stipitate glandular. Leaves: basal rosulate, usually withering at anthesis, petiolate, blade oblong-ob lanceolate to oblanceolate, 7–13 \times 0.7–1.5 cm, sparsely strigose to villous, stipitate glandular, 3–5-veined, margin entire, apex acute to obtuse; lower and mid cauline sessile, blade lanceolate to oblong-lanceolate, 8–15 \times 1–2.5 cm, base auriculate-clasping, margin entire, apex acute to obtuse, upper blade lanceolate, 2–5 \times 0.5–1 cm, densely white villous, apex acuminate. Capitula 1 or 2–7 in corymbiform synflorescences, 1.2–2.5 cm in diam. Involucre 0.8–1.5 \times 0.8–1.2 cm; phyllaries 3-seriate, lustrous green, linear-lanceolate, 8–10 \times 1–2 mm, exceeding disk florets, moderately villous, apex acuminate, purple, outer shorter than inner. Ray florets 3-seriate, outer 150–250 (–400), usually purple, 5–10 mm, lamina flat; disk florets 250–450, 5–7 mm, tube 1.5–2 mm, limb campanulate, lobes shortly triangular, 0.5–1 mm, purple. Achenes tan, oblong, compressed, 2–3 mm, sparsely hispidulous, 1-veined. Pappus 2-seriate, white, outer bristles short, inner ca. 4 mm. Fl. Jun–Sep.

• Mountain meadows, scrub margins; ca. 3100 m. Sichuan (Zhegu Shan).

This description is adapted from the protologue. Only a photograph of a paratype has been seen by the present authors. It is close to *Erigeron multiradiatus*.

13. *Erigeron leucoglossus* Y. Ling & Y. L. Chen, *Acta Phytotax. Sin.* 11: 411. 1973.

白舌飞蓬 bai she fei peng

Herbs, perennial, to 35 cm tall; rhizome short, woody. Stems single, erect or ascending, stout, 3–4 mm in diam. at base, often branched, sparsely to moderately hirsute-villous, strigillose, \pm densely stipitate glandular above. Leaves: basal withered or present at anthesis, narrowly winged long petiolate, petiole base clasping, blade oblanceolate to oblanceolate-spatulate, 6–9 \times 1–1.6 cm, surfaces sparsely hirsute, 3-veined, base attenuate, margin entire, hirsute-ciliate, apex obtuse, mucronate; lower cauline similar, shortly petiolate, margin entire or with 1–3 fine serrations, mid and upper sessile, blade ovate-elliptic to lanceolate, 2.5–5 \times 1–1.8 cm, surfaces abaxially hirsute on veins or glabrate, 3–5-veined, base cuneate, \pm subclasping, margin entire, hirsute-ciliate, apex acute, mucronate, uppermost blade narrowly lanceolate to linear-lanceolate, 1–2 \times 0.2–0.4 cm, surfaces and margin also distally stipitate glandular, adaxially strigillose, 1-veined. Capitula 3–7 in corymbiform synflorescences, 2.5–3 cm in diam. Involucre hemispheric, ca. 6 \times 12–17 mm; phyllaries 3-seriate, dark green, purplish at apex and margin, lanceolate, ca. 0.3 mm wide, distinctly exceeding disk, abaxially basally hirsute, densely stipitate glandular, apex acuminate, outer ones short, inner 5–6 mm, margin scarious, erose. Ray florets 3-seriate, 10–11 mm, tube 1.5–2 mm, sparsely hairy distally, lamina white, flat and patent, 1–1.2 mm wide; disk florets yellow, ca. 4.2 mm, tube ca. 1.2 mm, sparsely hairy in middle part, limb narrowly funnelform, lobes triangular, 0.4–0.5 mm, purple, glabrous. Achenes (immature) oblong, compressed, \pm strigose. Pappus 2-seriate, (immature) outer bristles short, inner ca. 3.8 mm. Fl. Aug.

• Alpine grasslands; ca. 3400 m. Xizang (Gongbo'gyamda).

14. *Erigeron kiukiangensis* Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 11: 412. 1973.

猓江飞蓬 qiu jiang fei peng

Herbs, perennial, to 55 cm tall, caespitose; rhizome woody. Stems several or solitary, erect or ascending, often branched above, green, strigillose, densely hirsute, especially upper part, densely stipitate glandular in upper part. Leaves: basal crowded, rosulate, withered or present at anthesis, narrowly winged petiolate, blade oblanceolate or oblanceolate-spatulate, 4–8 × 0.8–1.2 cm, 3–5-veined, base attenuate, margin entire or 1- or 2-serulate, strigose-ciliate, apex obtuse, mucronate; lower and mid cauline ± petiolate, blade oblanceolate, 3.5–6 × 0.6–1.5 cm, surfaces strigose, base attenuate to cuneate, margin 3–6-serrate to coarsely serrate above middle, rarely entire, upper gradually reduced, sessile, blade narrowly lanceolate or linear, surfaces strigose, stipitate glandular, 1–3-veined, base subclasping. Capitula several in corymbiform synflorescences, sometimes solitary, 2–2.5 cm in diam. Involucre hemispheric, 6–8 × 12–15 mm; phyllaries 3-seriate, green, linear-lanceolate, ca. 0.8 mm wide, often overtopping disk florets, densely stipitate glandular, rarely strigose or strigillose, inner margin scarious, apex acuminate. Ray florets 2- or 3-seriate, 9–10 mm, tube 2–2.5 mm, sparsely hairy, lamina reddish, ca. 0.6 mm wide, spreading, flat; disk florets yellow, 3.5–4 mm, hairy, tube ca. 1 mm, limb funnelform, lobes lanceolate, ca. 0.6 mm, glabrous. Achenes (immature) oblong, compressed, ca. 2 × 0.6 mm, densely strigose. Pappus (immature) yellowish, 2-seriate, outer bristles short, inner ca. 3.5 mm. Fl. Jul–Sep.

• Open mountain slopes, rocky places; 3000–3200 m. SE Xizang (Zayü), NW Yunnan (Gongshan).

15. *Erigeron patentisquama* Jeffrey ex Diels, Notes Roy. Bot. Gard. Edinburgh 5: 185. 1912.

展苞飞蓬 zhan bao fei peng

Herbs, perennial, 20–45 cm tall; rhizome woody. Stems solitary or several, erect to ascending, sometimes procumbent, ca. 3 mm in diam., purplish or green, branched from middle or upper part, rarely simple, moderately to densely hirsute and strigose, often ± densely long-stipitate glandular in upper part. Leaves: surfaces sparsely to ± densely hirsute and shortly strigose, densely stipitate glandular, sometimes sparsely so; basal dense, rosulate, long winged petiolate, blade spatulate or oblanceolate-spatulate, 4–15 × 0.6–2 cm, 3-veined and with 2–4 lateral veins, base attenuate, margin entire, apex obtuse, mucronulate; mid and upper sessile, blade narrowly lanceolate or lanceolate to lanceolate-ovate, 2–7 × 0.5–1 cm, base semi-clasping, apex acuminate or acute, uppermost reduced, linear or linear-lanceolate. Capitula solitary or 2–4 in corymbiform synflorescences, ca. 2.5 cm in diam. Involucre hemispheric, 1–1.5 × 1.5–2 cm; phyllaries 3-seriate, subequal or inner somewhat longer, lanceolate, 0.8–1 mm wide, exceeding disk florets, sparsely to ± densely villous and shortly strigose, ± densely stipitate glandular, margin stipitate glandular, apex spreading, often squarrose, outer leaflike, green, inner membranous, margin narrowly scarious. Ray florets 3-seriate, purple, 8–13.7 mm, ± exceeding involucre, tube 2–3.3 mm, sparsely hairy above, lamina linear, 0.4–0.6 mm wide, involute; disk florets yellow to

orange, limb or lobes sometimes purplish, ca. 4.3 mm, tube 1–1.5 mm, limb narrowly funnelform, lobes hairy, anthers and style branches often exserted from corolla. Achenes straw-colored, oblong or lanceoloid, compressed, 2.5–3 mm, ± densely strigose, particularly at base, 1-veined on back, veins orange. Pappus yellowish, 2-seriate, outer bristles 0.2–0.7 mm, inner 3.6–4.5 mm. Fl. Jul–Sep.

• Forest margins, alpine or subalpine meadows, grassy slopes, ridges; 2400–4100 m. SW and W Sichuan, Xizang, NE and NW Yunnan.

16. *Erigeron multifolius* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 627. 1937.

密叶飞蓬 mi ye fei peng

Erigeron multifolius var. *amplisquamus* Y. Ling & Y. L. Chen; *E. multifolius* var. *pilanthus* Y. Ling & Y. L. Chen.

Herbs, perennial, (3–)6–25 cm tall; rhizome thick, ca. 10 mm in diam. Stems single or several, erect to ascending, sometimes decumbent, 2–3 mm in diam. at base, simple, rarely branched, densely villous, strigillose, more densely so upward, ± stipitate glandular, densely leafy. Leaves: surfaces villous-scarious and scabridulous (particularly on veins), margin entire, rarely sparsely serrate; basal often withered at anthesis, blade spatulate to oblanceolate, subequal; cauline numerous, lower petiolate, petiole narrowly winged, blade oblong or oblanceolate-oblong, 3–7 × 0.3–0.7 cm, slightly reduced upward, base attenuate, apex rounded or obtuse, mid and upper sessile, lanceolate or oblong-lanceolate to linear-lanceolate, 2–6 × 0.5–1 cm, subclasping, apex obtuse or acute. Capitula solitary, or sometimes 2–4 in corymbose synflorescences, 2–3 cm in diam. Involucre hemispheric, 0.6–0.8 × 1.5–2.5 cm; phyllaries 3-seriate, equaling or exceeding disk florets, outer slightly shorter (sometimes broad, 1.5–2 mm wide), green, sometimes purple, lanceolate, abaxially sparsely to ± densely villous (particularly at base), shortly scabrous (particularly along midvein), eglandular, leaflike, inner narrowly oblong, 7–10 × 0.5–1 mm, membranous, margin ± villous-ciliate, apex acuminate, often purplish, innermost margin narrowly scarious. Ray florets 3-seriate, white, sometimes pink tinged or purplish, 8–10 mm, tube 2.5–3 mm, sparsely puberulent above, lamina linear, 0.3–0.6 mm wide, involute when dry, glabrous or sparsely hairy; disk florets yellow, veins orange, (4–)4.6–4.8 mm, tube 2.5–2.9 mm, sparsely hairy above, also sometimes on limb and lobe base, limb narrowly funnelform, lobes ovate, 0.5–0.6 mm, anthers and style branches often exserted from disk corolla. Achenes oblong to oblanceolate, flattened (immature), 2–3 mm, sparsely to ± densely strigillose. Pappus 2-seriate, yellowish, outer bristles 0.2–0.3 mm, inner 3.7–4.7 mm. Fl. Jun–Aug.

• Forest margins, alpine or subalpine meadows, rocky slopes; 2600–4100 m. SE Xizang, NW Yunnan.

Two varieties have been recognized in *Erigeron multifolius* in addition to the typical variety, both from NW Yunnan. *Erigeron multifolius* var. *pilanthus* (Weixi; 3500–3600 m) has a hairy disk corolla limb and lobe base, an extension of hairiness from the sparsely hairy tube; more data on this feature in other populations are needed before recognition of the variety is warranted. *Erigeron multifolius* var. *amplisquamus*, from alpine meadows at 3400–3800 m, has broad outer phyl-

laries (1.5–2 mm wide) equaling or exceeding the purplish ray florets. This variety may deserve recognition upon further study.

17. *Erigeron porphyrolepis* Y. Ling & Y. L. Chen, *Acta Phytotax. Sin.* 11: 416. 1973.

紫苞飞蓬 *zi bao fei peng*

Herbs, perennial, 8–27 cm tall, caespitose; rhizome robust, woody. Stems numerous or single, erect, 1.5–2 mm in diam. at base, simple, long villous (crosswalls yellow), strigillose, stipitate glandular below capitula. Leaves: basal rosulate, withered or present at anthesis, narrowly winged petiolate, blade spatulate to oblanceolate, 1.5–3 × 0.5–1 cm, 3-veined, base attenuate, margin entire or 1–3-serrulate, villous-ciliate, apex obtuse, mucronate; cauline 5–7, lower shortly petiolate or subsessile, blade oblanceolate or oblong-oblanceolate to oblong, 2–3.5 × 0.3–0.4 cm, surfaces villous, subclasping, uppermost lanate (crosswalls yellow or purple). Capitula solitary, 2–3.2 cm in diam. Involucre hemispheric, 9–20(–25) mm; phyllaries 3- or 4-seriate, purple, appressed, lanceolate, acuminate, abaxially lanate (crosswalls yellow or purple), stipitate glandular, outer 5.5–8.5 mm, mid and inner subequal, 9–11 mm, often exceeding disk florets. Ray florets 2- or 3-seriate, purple, 6.5–7 mm, tube 2.5–2.8 mm, hairy, lamina ca. 0.3 mm wide; disk florets yellow, 4.5–5 mm, tube 2.1–2.6 mm, tube and limb hairy, limb cylindric-funnelform, lobes triangular, ca. 0.5 mm, purple, glabrous, anthers and style branches often exerted from corolla. Achenes narrowly oblong, flattened, 2–2.5 mm, strigose. Pappus yellowish or brownish, 2-seriate, outer bristles 0.4–0.5 mm, inner ca. 5 mm. Fl. Aug.

• Alpine meadows; 3900–4700 m. Sichuan, E Xizang (Bomi).

18. *Erigeron lanuginosus* Y. L. Chen, *Acta Phytotax. Sin.* 19: 89. 1981.

棉毛飞蓬 *mian mao fei peng*

Herbs, perennial, 18–25 cm tall, caespitose; rhizome woody, thick, ascending. Stems numerous, green, purplish striate, simple or branched above, villous, strigillose, more densely so upward. Leaves: basal rosulate, withered or present at anthesis, narrowly winged petiolate, petiole base clasping, blade spatulate or oblanceolate, 2–7 × 0.5–0.8 cm, 3-veined, base attenuate, margin entire or 1–3-serrulate, villous-ciliate, apex obtuse, mucronate; cauline numerous, lower shortly petiolate or subsessile, blade oblong-oblanceolate or oblong, 3–5 × ca. 0.7 cm, surfaces sparsely villous, mid and upper blade elliptic-ovate, slightly reduced upward, surfaces villous, base cuneate, subclasping, margin villous-ciliate, apex acuminate, uppermost lanate (crosswalls purple). Capitula solitary or few in corymbose synflorescences, 1.5–2 cm in diam. Involucre hemispheric, 8–10 mm; phyllaries 3-seriate, ± purple, appressed, linear-lanceolate or linear, exceeding disk florets, 1–1.5 mm wide, apex acuminate, outer 7.5–8 mm, abaxially and marginally lanate (crosswalls purple), mid and inner subequal, longer, margin scarious, purplish, apex often reflexed. Ray florets 2- or 3-seriate, bright purple, 7–8 mm, tube hairy, lamina 0.3–0.4 mm wide, ± exceeding involucre, involute when dry; disk florets yellow, 4–4.8 mm, sparsely hairy, tube 2–2.3 mm, limb cylindric-funnelform, lobes triangular, ca. 0.5 mm, purplish, hairy,

anthers and style branches often exerted from corolla. Achenes narrowly oblong, 2–2.5 mm, strigose, glandular. Pappus 2-seriate, outer bristles flattened, ca. 0.5 mm, inner ca. 5.5 mm. Fl. Aug.

• Alpine grasslands on slopes; 3200–4200 m. SE Xizang (Bomi, Zayü).

19. *Erigeron kunshanensis* Y. Ling & Y. L. Chen, *Acta Phytotax. Sin.* 11: 417. 1973.

贡山飞蓬 *gong shan fei peng*

Herbs, perennial, 10–20 cm tall, caespitose; rhizome woody, rather thick. Stems numerous, rarely 1 or 2, 1–1.5 mm in diam., erect or ascending, purplish, rarely green, simple, sparsely long villous, strigillose. Leaves: basal withered at anthesis, long winged petiolate, petiole villous and villous-ciliate, blade spatulate to oblanceolate, 2–6 × 0.5–1.2 cm, 3-veined, conspicuously reticulate, base attenuate, margin entire, villous-ciliate, apex obtuse to acute; cauline 3–6, often crowded at base, lower and mid sessile, blade lanceolate or linear-lanceolate, 1.3–3.5 × 0.4–0.7 cm, subclasping, apex acute, upper gradually reduced, blade lanceolate to linear-lanceolate, abaxial surface with veins sparsely villous, adaxial villous, strigillose. Capitula solitary, ca. 2 cm in diam. Involucre hemispheric, ca. 8 × 15–20 mm; phyllaries 3-seriate, ± equaling disk florets, purplish or green, appressed, subequal, 1–1.5 mm wide, outer linear-oblanceolate, abaxially villous, strigillose, eglandular, reticulate, apex ± acute, inner linear-lanceolate, villous or glabrate, 1–3-veined, margin narrowly scarious, apex acuminate. Ray florets 3-seriate, purplish, 7–8 mm, tube 2–2.5 mm, hairy above, lamina ca. 0.5 mm wide, flat, involute when dry; disk florets yellow, 3.5–4 mm, sparsely hairy, limb cylindric-funnelform, lobes ovate, ca. 0.5 mm, glabrous, purplish, anthers and style branches often exerted from corolla. Achenes tan, narrowly oblong, compressed, 2–2.5 mm, densely strigose, 2-veined. Pappus 2-seriate, brownish, outer bristles ca. 0.6 mm, inner ca. 4 mm. Fl. Aug–Oct.

• Alpine meadows, rocky slopes; 3000–3800 m. NW Yunnan (Gongshan).

20. *Erigeron himalajensis* Vierhapper, *Beih. Bot. Centralbl.*, Abt. 2, 19: 491. 1906.

珠峰飞蓬 *zhu feng fei peng*

Herbs, perennial, 15–50(–60) cm tall, sometimes caespitose; rhizome woody, simple. Stems single or several, 1.5–2 mm in diam., erect or ascending, purple or green above, branched in middle or upper part, sparsely to moderately hirsute-villous, strigillose, base often glabrate, eglandular. Leaves: surfaces sparsely hirsute-villous, sparsely strigillose, sometimes glabrate, eglandular; basal rosulate, withered and fallen at anthesis, long petiolate, blade oblanceolate to oblong; cauline relatively numerous, thin, lower narrowly winged shortly petiolate, blade oblanceolate to oblong, 2–3.5 × 0.2–0.4 cm, ± distinctly 3-veined, base attenuate, margin entire, ciliate, apex obtuse or sometimes acute, mid and upper sessile, blade narrowly oblong, 2–5 × 0.2–0.3 cm, base subclasping, margin entire or with 1 or 2 small teeth, ciliate, apex rounded to obtuse, uppermost reduced, linear. Capitula 2 to many in corymbiform

synflorescences, 1–1.5 cm in diam.; peduncles slender; bracts 1 or 2, linear. Involucre campanulate, 5–7 × 10–15 mm; phyllaries 3-seriate, abaxially sparsely hirsute-villous, strigillose, or glabrate, eglandular. Ray florets 2- or 3-seriate, slightly exceeding or equaling disk florets, 5–6 mm, tube 3–3.5 mm, hairy distally, lamina pink to purple, linear to narrowly oblanceolate, 1–2 mm, involute when dry; disk florets yellow, 4.8–5.3 mm, tube 2.2–2.3 mm, limb cylindric to narrowly funnelform, lobes lanceolate, 0.4–0.5 mm, purplish, glabrous. Achenes straw-colored, oblong, flattened, 2–2.2 mm, strigose, 4-veined. Pappus yellowish to brownish, 2-seriate, outer bristles 0.3–0.4 mm, inner 4.8–5 mm. Fl. Jul–Sep.

Forest margins, stony slopes; 2000–3600 m. W Sichuan, E Xizang, NW Yunnan [Afghanistan].

21. *Erigeron pseudotenuicaulis* Brouillet & Y. L. Chen, nom. nov.

细茎飞蓬 xi jing fei peng

Replaced synonym: *Erigeron tenuicaulis* Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 11: 418. 1973, not *Erigeron tenuicaulis* M. E. Jones, Contr. W. Bot. 12: 44. 1908.

Herbs, perennial, 9–25 cm tall; rhizome woody, tortuous or crowded in tuber, collar clad with marcescent petiole bases, simple or branched. Stems slender, 0.6–1.5 mm in diam., erect or ascending, branched in middle or simple, green, sparsely strigose and strigillose, denser in upper part, sometimes glabrate below, sometimes short-stipitate glandular in upper part. Leaves: basal rosulate, present at anthesis, narrowly winged long petiolate, blade narrowly oblanceolate or oblanceolate-spatulate, 1.5–9 × 0.2–0.4 cm, surfaces strigillose, 3-veined, base attenuate, margin entire or sometimes 2–4-serrulate, strigillose-ciliate, apex obtuse or rounded; lower cauline identical to basal, shortly petiolate, mid and upper sessile, blade linear or linear-lanceolate, 1–2 × 0.1–0.2 cm, surfaces strigillose, short-stipitate glandular, 1–3-veined, margin strigillose-ciliate, apex shortly acuminate. Capitula solitary or 2 or 3 in corymbiform synflorescences, 1–1.5 mm in diam.; peduncles slender; bracts 1–3, linear or subulate. Involucre hemispheric, 3–4 × 8–10 mm; phyllaries 3-seriate, green, linear-lanceolate, ca. 0.5 mm wide, shorter than disk florets, abaxially sparsely strigillose, densely short-stipitate glandular, apex acute to acuminate, outer ca. 1/2 as long as inner, inner 3–4 mm, margin narrowly scarious. Ray florets 2- or 3-seriate, reddish, 6–7 mm, equaling or ± longer than disk florets, tube 2.5–3 mm, hairy, lamina ca. 0.3 mm wide, involute; disk florets yellow, 3.5–4 mm, tube 1–1.5 mm, limb narrowly funnelform, lobes lanceolate, ca. 0.4 mm, reddish. Achenes oblong, compressed, ca. 2 mm (immature), sparsely strigose, 2-veined. Pappus (immature) yellowish brown, 2-seriate, outer bristles very short, inner ca. 4 mm. Fl. Jul–Sep.

• Stony open slopes; ca. 2200 m. SW and W Sichuan (Kangding, Muli).

This species differs from *Erigeron himalajensis* by its slender stems, strigose-ciliate leaf margin, and glandular upper leaf surface.

22. *Erigeron purpurascens* Y. Ling & Y. L. Chen, Acta Phytotax. Sin. 11: 419. 1973.

紫茎飞蓬 zi jing fei peng

Herbs, perennial, 5–7 cm tall, caespitose; rhizome subwoody or tuberiform, collar clad with marcescent leaf bases. Stems several or single, ca. 1 mm in diam., erect or ascending, purple, branched in middle part, rarely simple, sparsely hirsutulous, strigillose, short-stipitate glandular below capitula. Leaves: basal rosulate, present at anthesis, narrowly winged petiolate, blade spatulate to oblanceolate, 1.5–2.5 × 0.3–0.6 cm, surfaces glabrous, 3-veined, base attenuate, margin entire or 2- or 3-serrulate, ciliate, apex obtuse or rounded; cauline 3–5, sessile, blade linear-lanceolate or linear, 0.5–2 × 0.1–0.3 cm, surfaces strigillose, often stipitate glandular (not seen), 1- or inconspicuously 3-veined, margin strigose-ciliate, apex acute. Capitula 2 or 3 in corymbiform synflorescences, rarely solitary, 0.8–1.5 cm in diam. Involucre hemispheric, 5–8 × 5–12 mm; phyllaries 3-seriate, purple, linear-lanceolate, ca. 0.5 mm wide, apex acuminate, inner shorter than to equaling disk florets, abaxially sparsely hirsute-villous, strigillose, often stipitate glandular at base (not seen), outer 2–3 mm, inner ca. 8 mm, margin narrowly scarious. Ray florets laminate, 2- or 3-seriate, 6–7 mm, tube ca. 3 mm, hairy, lamina almost filiform, purple, ca. 0.3 mm wide, not patent, involute when dry; disk florets yellow, 4–4.5 mm, tube ca. 1.7 mm, limb narrowly funnelform, sparsely hairy, lobes triangular, ca. 0.5 mm, purplish. Achenes oblong, compressed, ca. 2 mm (immature), strigose. Pappus yellowish, 2-seriate, outer bristles ca. 0.5 mm, inner ca. 5 mm. Fl. Aug–Sep.

• Grasslands on mountain slopes. Sichuan (Kangding).

23. *Erigeron petiolaris* Vierhapper, Beih. Bot. Centralbl., Abt. 2, 19: 522. 1906.

柄叶飞蓬 bing ye fei peng

Erigeron pseudoneglectus Popov.

Herbs, perennial, 5–28 cm tall, sometimes caespitose; rhizome short. Stems several, erect, simple, green or reddish, moderately to densely hirsute-villous, sparsely strigillose. Leaves: petiole, margin, and surfaces hirsute-villous, sometimes glabrate or only margin ciliate; basal present at anthesis, long petiolate, blade oblanceolate or oblanceolate-spatulate, 1.5–2 × 0.2–0.4 cm, 3-veined, base attenuate, margin entire or sometimes 2–4-serrulate, apex obtuse, mucronate; cauline 3–12, 0.7–7.2 × 0.1–0.8 cm, lower petiolate, blade oblanceolate, apex obtuse or acuminate, upper sessile, lanceolate, base subclasping, apex acute. Capitula solitary or 2 or 3 in corymbose synflorescences, 1–1.5 cm in diam.; peduncles slender; bracts 1–3, linear or subulate. Involucre hemispheric, 3–4 × 8–10 mm; phyllaries 3-seriate, green, apex purplish, linear-lanceolate, ca. 0.5 mm wide, abaxially hirsute-villous, shorter than disk, apex acuminate, outer ca. 1/2 as long as inner, inner 3–4 mm, margin narrowly scarious. Ray florets 2- or 3-seriate, pink, rarely white, 8–9 mm, tube ca. 2.5 mm, sparsely hairy, lamina ca. 0.4 mm wide, involute when dry; disk florets yellow, ca. 4 mm, hairy, tube ca. 1.5 mm, limb cylindric-funnelform, lobes lanceolate, ca. 0.5 mm, tip purple, anthers and style branches not exerted from corolla. Achenes (immature) oblong, compressed, ca. 2 mm, strigose. Pappus 2-seriate, outer bristles ca. 0.5 mm, inner ca. 4 mm (immature). Fl. Jul–Sep.

Alpine or subalpine meadows, rocky slopes; 2700–3100 m. N Xinjiang (Qinghe) [Kazakhstan, Russia (N Siberia), Uzbekistan].

24. *Erigeron eriocalyx* (Ledebour) Vierhapper, Beih. Bot. Centralbl., Abt. 2, 19: 521. 1906.

棉苞飞蓬 mian bao fei peng

Erigeron alpinus Linnaeus var. *eriocalyx* Ledebour, Fl. Altaic. 4: 91. 1833.

Herbs, perennial, 5–25 cm tall, \pm caespitose; caudex branched. Stems several, sometimes single, erect or ascending, green or reddish, simple, sometimes branched, hirsute-villous (at least some crosswalls purple in upper part), strigillose, more densely so upward, eglandular. Leaves green, surfaces sparsely hirsute-villous, margin entire, sparsely villous-ciliate (some crosswalls yellow); basal rosulate, withered at anthesis, long petiolate, blade oblanceolate, $1.5\text{--}9.5 \times 0.2\text{--}0.8\text{--}(1.3)$ cm, base attenuate, apex obtuse; cauline 2–8, lower identical to basal, short-winged petiolate, mid and upper sessile, blade lanceolate to linear-lanceolate, $1\text{--}5\text{--}(7.5) \times 0.2\text{--}0.8$ cm, base \pm subclasping, apex acute. Capitula solitary, rarely 2 or 3 in corymbiform synflorescences, $9\text{--}14 \times 19\text{--}25$ mm. Involucre hemispheric; phyllaries 3-seriate, apex purple, appressed, \pm equaling disk florets, lanceolate to linear-lanceolate, densely hirsute-villous at base (at least some with purple crosswalls), distally sparsely villous to glabrate, eglandular, membranous, apex acuminate, outer $4.2\text{--}5.2 \times 0.5\text{--}0.6$ mm, inner $5\text{--}9 \times 0.6\text{--}1$ mm, margin narrowly scarious. Ray florets purple, violet, or lilac, rarely white, $6.6\text{--}10$ mm, tube $2\text{--}2.5$ mm, lamina ca. 0.5 mm wide, hairy proximally, involute when dry; disk florets yellow, $3.5\text{--}4$ mm, tube 1.5 mm, limb cylindric, abruptly ampliate, tube and limb hairy, lobes lanceolate, $0.3\text{--}0.4$ mm, tip pink, anthers and style branches not exerted from corolla. Achenes narrowly oblong, \pm compressed, $2\text{--}2.5 \times$ ca. 0.6 mm, strigose. Pappus whitish, 2-seriate, outer bristles $0.2\text{--}0.4$ mm, inner $3.6\text{--}4.5$ mm. Fl. Jul–Sep.

Alpine or subalpine meadows; 2400–2600 m. Nei Mongol, W Xinjiang [Kazakhstan, Mongolia, Russia (Siberia); Europe].

A specimen at A from Sichuan (Dêgê Xian, *D. E. Boufford et al.* 36776), determined as *Erigeron porphyrolepis*, keys out here but appears distinct. No other material of this entity was seen at other herbaria. It may represent an unrecognized species.

25. *Erigeron lachnocephalus* Botschantzev, Fl. URSS 25: 230. 1959.

毛苞飞蓬 mao bao fei peng

Erigeron turkestanicus Vierhapper, Beih. Bot. Centralbl., Abt. 2, 19: 522. 1906, not (Regel & Schmalhausen) O. Fedtschenko (1903).

Herbs, perennial, 5–10(–15) cm tall, caespitose; caudex short, branched. Stems several, rarely single, erect or ascending, ca. 2 mm in diam. at base, simple, green or reddish, \pm densely yellowish hirsute-villous, more so under capitulum, strigillose, eglandular. Leaves green or grayish, surfaces hirsute-villous, rarely glabrate, margin entire, villous-ciliate; basal present at anthesis, petiolate, blade oblanceolate, $1\text{--}7 \times 0.2\text{--}0.9$ cm, base attenuate, apex obtuse or rounded; cauline 4–8, sessile, blade lanceolate to oblong, $0.7\text{--}4 \times 0.1\text{--}0.8$ cm, base subclasping,

apex acute. Capitula solitary, sometimes 2, $1\text{--}1.7 \times 2\text{--}3$ cm. Involucre hemispheric; phyllaries 3-seriate, equal, exceeding disk florets, \pm loose, purplish or rarely green, lanceolate, $7\text{--}9.5 \times 0.8\text{--}1$ mm, densely yellowish villous at base to glabrate apically, apex acute, sometimes \pm reflexed. Ray florets pink or lilac, $6.5\text{--}8.5$ mm, tube $2\text{--}2.7$ mm, hairy above, lamina ca. 0.5 mm wide, involute when dry; disk florets yellowish, ca. 4.9 mm, tube ca. 1.5 mm, limb cylindric, abruptly ampliate, tube and limb hairy, lobes triangular, $0.3\text{--}0.5$ mm, pink or lilac, anthers and style branches not exerted from corolla. Achenes narrowly oblong, flattened, $2\text{--}2.7$ mm, strigose, 2-veined. Pappus brownish, 2-seriate, outer bristles $0.4\text{--}0.5$ mm, inner $3.6\text{--}4$ mm. Fl. Jun–Aug.

Alpine or subalpine meadows, stony slopes; 2500–3600 m. N Xinjiang [Kazakhstan, Uzbekistan].

26. *Erigeron lonchophyllus* Hooker, Fl. Bor.-Amer. 2: 18. 1834.

矛叶飞蓬 mao ye fei peng

Erigeron armeriifolius Turczaninow ex Candolle; *E. armeriifolius* var. *elator* Ledebour; *E. armeriifolius* var. *humilis* Ledebour; *E. podolicus* Besser var. *pusillus* Ledebour; *Trimorpha armeriifolia* (Turczaninow ex Candolle) Vierhapper; *T. lonchophylla* (Hooker) G. L. Nesom.

Herbs, biennial or short-lived perennial, 3–30 cm, caespitose; rhizome weak. Stems usually several, $1\text{--}1.5$ mm in diam., erect or ascending, slenderly branched, green or purplish tinged, sparsely hirsute, especially upward. Leaves basal, rosulate, petiolate or subsessile, blade linear-lanceolate to oblanceolate or spatulate, $1\text{--}10$ cm \times $0.15\text{--}6$ mm, surfaces sparsely hirsute, margin entire, hirsute-ciliate, apex acute; cauline few, sessile, \pm subclasping, blade linear, upper reduced gradually. Capitula $8\text{--}10 \times 15\text{--}20$ mm, solitary or several in racemiform, rarely paniculiform synflorescences, long pedunculate. Involucre hemispheric; phyllaries 3-seriate, linear-lanceolate, abaxially hirsute, apex acuminate, outer almost $1/2$ as long as inner, inner yellowish green, purple at apex, often exceeding or sometimes equaling disk florets, $5.5\text{--}8.5 \times 0.5\text{--}0.75$ mm, margin narrowly scarious. Ray florets 3- or 4-seriate, lilac or pink to pale violet, $5\text{--}7$ mm, tube $2.5\text{--}3$ mm, hairy distally, lamina involute; disk florets pale yellow, ca. 4.2 mm, hairy, tube ca. 2 mm, limb narrowly cylindric, lobes lanceolate, ca. 0.2 mm, glabrous, often purplish tinged, anthers and style branches not exerted from corolla. Achenes straw-colored, narrowly oblong, $1.5\text{--}2 \times$ ca. 0.3 mm, sparsely strigose. Pappus yellowish, 2-seriate, outer bristles ca. 0.6 mm, inner $4.5\text{--}5$ mm. Fl. Jul–Sep.

Meadows on banks of rivers, lakes, and marshes, lower mountain plains. N Xinjiang [Kazakhstan, Mongolia, Russia (Siberia); SW Asia (Iran), North America].

27. *Erigeron oreades* (Schrenk ex Fischer & C. A. Meyer) Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 11(Suppl.): 17. 1846.

山地飞蓬 shan di fei peng

Erigeron uniflorus Linnaeus var. *oreades* Schrenk ex Fischer & C. A. Meyer, Enum. Pl. Nov. 2: 39. 1842; *E. alpinus* Linnaeus var. *oreades* (Schrenk ex Fischer & C. A. Meyer) Trautvetter.

Herbs, biennial or short-lived perennial, 2.5–25 cm tall; rhizome weak. Stems solitary, 1–2.5 mm in diam. at base, erect or ascending, simple, or rarely branched, green or sometimes purple-red, densely hirsute, strigillose. Leaves few, margin and petiole hirsute-ciliate, surfaces glabrous or glabrate to sparsely hirsute; basal withered at anthesis, long petiolate, petiole base subclasping, blade oblanceolate, 1–3(–7) × 0.2–0.4 cm, base attenuate, apex obtuse to rounded, mucronate; cauline 4–7, sessile, blade linear or linear-lanceolate, 1–4 × 0.1–0.3 cm, apex acute, uppermost often overtopping capitula. Capitula usually solitary, or sometimes 2–8 in racemose synflorescences, ca. 0.8 × 1.5–1.8 cm. Involucre hemispheric; phyllaries 3-seriate, green

or purple at apex, linear-lanceolate, (5–)8–9 × 0.6–1 mm, abaxially sparsely villous-hirsute, outer 1/2 as long as inner or less, inner conspicuously exceeding disk florets, margin scarious. Ray florets 2- or 3-seriate, pale violet, 6–7 mm, tube ca. 2 mm, hairy above, lamina involute when dry; disk florets yellowish, 4–4.5 mm, hairy, tube ca. 1.5 mm, limb cylindric, lobes lanceolate, ca. 0.6 mm, purple tinged, anthers and style branches not exerted from corolla. Achenes narrowly oblong, compressed, 2–2.5 × ca. 0.6 mm, strigose. Pappus 2-seriate, yellowish, outer bristles ca. 0.5 mm, inner 4.5–5 mm. Fl. Jul–Sep.

Subalpine meadows, moist places on slopes; ca. 2500 m. N Xinjiang (Qinghe) [Kazakhstan, Mongolia, Russia (Siberia)].

2. *Erigeron* sect. *Karvinskia* G. L. Nesom, Phytologia 67: 79. 1989.

加勒比飞蓬组 *jia le bi fei peng zu*

Herbs, perennial [or rarely annual], taprooted; caudex simple [or rhizomatous]; herbage strigose to hirsute. Stems branched. Leaves basal (withered at anthesis) and cauline, spatulate to oblanceolate or linear, base not clasping, margin [entire or] serrate or lobed. Capitula erect in bud, 1–5 from upper branches. Ray florets white, becoming lavender, lamina strap-shaped, spreading, not or slightly coiling. Achenes 1–1.9 mm, 2-veined. Pappus 2-seriate, outer of short setae, inner of 10–27 bristles, not accrescent.

Seven species: Central and North America; one species (introduced) in China.

28. *Erigeron karvinskianus* Candolle, Prodr. 5: 285. 1836.

加勒比飞蓬 *jia le bi fei peng*

Herbs, short-lived perennial, caespitose, [10–]15–40+[–100] cm tall; caudex short, simple or few branched, taprooted. Stems creeping or prostrate to ascending or erect, sometimes rooting at nodes, branched upward, sometimes with axillary leaf tufts, sparsely strigose to glabrate, eglandular. Leaves: basal and lower usually withered at anthesis, petiolate, petiole narrowly winged, blade elliptic or obovate; cauline shortly petiolate, elliptic to obovate or oblanceolate, 1–4 × 0.3–1.4 cm, even sized, surfaces sparsely strigose to glabrate, eglandular, base attenuate to cuneate, margin 2–4-lobed or entire, slightly revolute, strigose, apex acute or acuminate, mucronulate. Capitula 1 or 2[–5] at ends of upper branches, 5–7 × 10–13 mm. Involucre campanulate; phyllaries 3- or 4-seriate, membranous, linear to

lanceolate, 1.5–3.3 × 0.3–0.6 mm, sparsely strigose, apex acuminate, outer slightly shorter, green along midvein, inner margin narrowly scarious, erose. Ray florets female, 1- or 2-seriate, 45–80, 6–8 mm, tube 1–1.5 mm, lamina flat or slightly coiling, white, sometimes pinkish upon drying, linear, ca. 5 × 0.6 mm, 2-denticulate at apex, glabrous; disk florets bisexual, yellow, narrowly funnelform, tube ca. 2 mm, sparsely hairy, veins orange, lobes glabrous, apex papillate. Achenes oblong, flattened, ca. 0.8 mm (immature), sparsely strigose, 2-veined. Pappus 2-seriate, outer of short setae, inner bristles 15–27, ca. 2.5 mm. Fl. Mar–Nov.

Hillsides, escaped from cultivation; ca. 700 m. Naturalized in Hong Kong [native to Central America and North America (Mexico)].

Erigeron karvinskianus has become a pantropical and subtropical weed.

3. *Erigeron* sect. *Phalacroloma* (Cassini) Torrey & A. Gray, Fl. N. Amer. 2: 175. 1841.

一年蓬组 *yi nian peng zu*

Phalacroloma Cassini in F. Cuvier, Dict. Sci. Nat. 39: 404. 1826; *Achaetogeron* A. Gray; *Polyactidium* Candolle; *Stenactis* Cassini.

Herbs, annual or biennial [or short-lived perennial], fibrous-rooted [rarely rhizomatous, caudex simple]; herbage strigose to sparsely hirsute. Stems branched. Leaves basal and cauline, oblanceolate, base not clasping, margin serrate. Capitula nodding in bud, numerous in loosely corymbiform or paniculiform synflorescences. Ray floret lamina narrowly strap-shaped, white, spreading, not coiling or reflexed. Achenes (0.5–)0.8–1.2 mm, 2(–4)-veined. Pappus 2-seriate, outer of scales, bristles of ray florets absent [or present], of disk florets 8–15, not accrescent.

Twenty-one species: Asia, North America; two species (both introduced) in China.

- 1a. Stems sparsely hispid, strigose above; basal leaves withered at anthesis, lower cauline similar; leaf margin coarsely serrate to sometimes entire 29. *E. annuus*
 1b. Stems sparsely to moderately strigose to strigillose or hirsute-strigillose; basal leaves persistent at anthesis, cauline gradually reduced; leaf margin entire or ± deeply serrate to crenate 30. *E. strigosus*

29. *Erigeron annuus* (Linnaeus) Persoon, Syn. Pl. 2: 431. 1807 [“*annuum*”].

一年蓬 *yi nian peng*

Aster annuus Linnaeus, Sp. Pl. 2: 875. 1753; *Erigeron heterophyllus* Muhlenberg ex Willdenow; *Stenactis annua* (Linnaeus) Cassini ex Lessing.

Herbs, annual, [10–]30–100[–150] cm tall. Stems erect, branched in upper part, sparsely hispid, strigose above (hairs spreading). Leaves: surfaces strigose-hirsute or sometimes glabrate, eglandular; basal withered at anthesis, winged petiolate, blade elliptic or broadly ovate, rarely spatulate, 4–17 × 1.5–4 cm or more, base attenuate, margin coarsely serrate, scabrous, apex acute or obtuse; lower cauline similar, shortly petiolate, mid and upper shortly petiolate or sessile, blade oblong-lanceolate or lanceolate, 1–9 × [0.3–]0.5–2 cm, margin irregularly serrate to subentire, apex acute, uppermost linear. Capitula 5–50+, in loose paniculiform or corymbiform synflorescences, 6–8 × 10–15 mm. Involucre hemispheric; phyllaries 2- or 3(or 4)-seriate, greenish or ± brownish, abaxially sparsely hirsute, minutely glandular, subequal or outer shorter, lanceolate, 3–5 × 0.5–1 mm, herbaceous. Ray florets 80–125, 2-seriate, [4–]6–8[–10] mm, tube 1–1.5 mm, sparsely hairy above, lamina white or sometimes bluish, linear, ca. 5 × 0.6 mm, flat, tardily coiling; disk florets yellow, 2–2.8 mm, sparsely hairy, lobes glabrous. Achenes lanceolate, flattened, [0.8–]1.2 mm, sparsely strigillose. Pappus 2-seriate, outer of scales or setae, inner absent in ray florets, in disk florets of [8–]10–15 long bristles. Fl. Jun–Sep.

Wastelands, roadsides; sea level to 1100 m. Naturalized in Anhui, Fujian, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Shandong, Sichuan, Xizang [native to E North America; widely introduced worldwide].

This species is spreading in China and is probably more widespread than shown here.

30. *Erigeron strigosus* Muhlenberg ex Willdenow, Sp. Pl. 3: 1956. 1803 [*“strigosum”*].

糙伏毛飞蓬 cao fu mao fei peng

Erigeron annuus (Linnaeus) Persoon subsp. *strigosus* (Muhlenberg ex Willdenow) Wagenitz.

Herbs, annual, sometimes biennial or weakly perennial, 30–70 cm tall. Stems erect to ascending, branched in upper part, sparsely to moderately strigose to strigillose or hirsute-strigillose (hairs not spreading). Leaves: surfaces glabrous or glabrate to sparsely strigose or hirsute-strigose; basal usually persistent at anthesis, blade spatulate to oblanceolate or linear, 3–15 × 0.5–2 cm or more, base attenuate, margin entire or shallowly to deeply serrate or crenate, apex acute or obtuse; cauline gradually reduced to near capitula. Capitula 10–200+, in loose corymbiform to paniculate-corymbiform synflorescences. Involucre hemispheric; phyllaries 2–4-seriate, subequal or outer ones shorter, glabrous, strigose, or sparsely hirsute, sometimes minutely glandular, lanceolate, herbaceous. Ray florets 50–100, 2-seriate, 4–6 mm, lamina white, sometimes pinkish or bluish, linear, flat; disk florets yellow, 1.5–2 mm. Achenes lanceolate, flattened, 0.9–1.2 mm, sparsely strigillose. Pappus 2-seriate, outer of scales or setae, inner absent in ray florets, in disk florets of 8–15 long bristles. Fl. Jun–Sep.

Wastelands, roadsides. Naturalized in Anhui, Fujian, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Shandong, Sichuan, Xizang [native to North America].

The variety introduced to China appears to be *Erigeron strigosus* var. *strigosus*. This species has been confused with *E. annuus*, which explains why it is poorly known in China. Its distribution is likely more widespread than shown here.

4. *Erigeron* sect. **Trimorpha** (Cassini) Candolle, Prodr. 5: 290. 1836 [*“Trimorphaea”*].

三型花飞蓬组 san xing hua fei peng zu

Trimorpha Cassini, Bull. Sci. Soc. Philom. Paris 1817: 137. 1817.

Herbs, annual, biennial, or perennial, taprooted or fibrous-rooted; caudex simple. Stems usually branched. Leaves basal and cauline, oblanceolate or oblong to lanceolate or linear-lanceolate, base not clasping, margin entire or sparsely serrate. Capitula erect in bud, few or numerous, in corymbiform or broadly racemiform synflorescences. Ray florets 3–5-seriate, in 2 zones, outer 1–3 lamina filiform, white to pink or purplish, erect, not coiling or reflexed, inner 2 elaminate. Achenes 2–2.4 mm, 2-veined. Pappus of 12–35 bristles, accrescent.

About 30 species: Asia, C and N Europe, North America; six species (one endemic) in China.

- 1a. Ray floret lamina equaling or slightly longer than disk florets; phyllaries shorter than disk; biennial or perennial herbs 31. *E. acris*
- 1b. Ray floret lamina longer than disk florets, rarely only slightly so; phyllaries shorter than or almost equaling disk; perennial herbs.
 - 2a. Ray florets blue 34. *E. tianschanicus*
 - 2b. Ray florets pink or lilac.
 - 3a. Stems and phyllaries stipitate glandular and hirsute-villous; leaves lanceolate to oblanceolate.
 - 4a. Stems densely stipitate glandular at least below capitula and sparsely hirsute-villous; ray florets pink 32. *E. krylovii*
 - 4b. Stems sparsely stipitate glandular and densely villous, lower part almost entirely densely villous; ray florets pink or lilac 33. *E. pseudoseravschanicus*
 - 3b. Stems strigillose or strigose, or glabrate at base, phyllaries villous or strigillose, sometimes sparsely short-stipitate glandular; leaves linear-lanceolate or linear.
 - 5a. Stems reddish; leaf blade linear-lanceolate to linear, margin entire; phyllaries reddish or rarely green, villous, inner shorter than disk florets 35. *E. schmalhauseni*
 - 5b. Stems green; leaf blade linear, margin serrate or subentire; phyllaries green or reddish at apex, strigillose, inner slightly longer than or almost equaling disk florets 36. *E. fukuyamae*

31. *Erigeron acris* Linnaeus, Sp. Pl. 2: 863. 1753 [“*acre*”].飞蓬 *fei peng*

Herbs, biennial or perennial, 5–70(–100) cm, taprooted or woody rhizomatous. Stems solitary or sometimes several, 1–6 mm in diam. at base, erect, branched in upper part, strigillose, ± hirsute or hispid, or sometimes glabrate, short-stipitate glandular below capitula. Leaves thin, surfaces sparsely to ± densely strigose-villous, glabrate, or glabrous, margin entire or remotely serrulate or serrate, strigose- or villous-ciliate; basal present or absent at anthesis, long petiole, oblanceolate or oblong, 1.5–13 × 0.3–1.8 cm, inconspicuously 3-veined, base attenuate, apex obtuse or acute; mid and upper cauline sessile, blade lanceolate or oblong, 0.3–8.5 × 0.1–1 cm, base subclasping, apex acute, arcuate, or obtuse. Capitula numerous, in dense and narrow, or rarely loose and broad, paniculiform or sometimes corymbiform synflorescences, sometimes few in corymbiform synflorescences, 6–13 × 10–25 mm. Involucre hemispheric; phyllaries 3-seriate, green or purple, lanceolate to linear-lanceolate, abaxially ± densely villous or sparsely strigose, sometimes ± densely short-stipitate glandular, apex acute to acuminate, outer almost 1/2 as long as inner, inner shorter than disk florets, 5–7.5 × 0.5–1 mm, margin scarious. Ray florets 4- or 5-seriate, outer 2 or 3 series laminate, 5–7 mm, tube 2.5–3.5 mm, sparsely hairy, lamina pink or lilac, rarely white, ca. 0.25 mm wide, inner 2 series reduced to tube, uncolored, 2.5–3.5 mm, style exceeding tube by 1–2.2 mm, sometimes with rudimentary lamina; disk florets yellow, lobes sometimes ± purplish or dark lilac, 3.6–5.4 mm, sparsely hairy, tube 1.5–2.9 mm, limb cylindric or cylindric-funnelform, lobes lanceolate, 0.4–0.5 mm. Achenes straw-colored, oblong to oblong-lanceoloid, ± compressed, 1.6–2.5 mm, ± strigose, 2-veined. Pappus 1- or 2-seriate, white or whitish, outer bristles 0.2–0.5 mm, inner 4–6 mm. Fl. Jun–Sep.

Meadows, pastures, grasslands on slopes, forest margins; 700–3500 m. Gansu, Guangdong, Guangxi, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jilin, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shanxi, Sichuan, Xinjiang, Xizang, Yunnan [Afghanistan, Japan, Kazakhstan, Korea, Kyrgyzstan, Mongolia, Russia (Kamchatka, Siberia), Uzbekistan; SW Asia, Europe, North America].

“*Erigeron acer*” is an alternate spelling.

- 1a. Stems and phyllaries purple, rarely green; phyllaries densely stipitate glandular, sometimes also sparsely hispid; capitula many, in corymbose-paniculiform synflorescences 31c. subsp. *politus*
- 1b. Stems and phyllaries green, rarely purplish; phyllaries densely or sparsely villous, mixed with appressed short hairs; capitula numerous, in paniculiform or racemiform synflorescences.
 - 2a. Basal and lower cauline leaf margin entire or remotely serrulate; phyllaries abaxially ± densely villous, often short-stipitate glandular; capitula usually in dense, narrow, paniculiform synflorescences 31a. subsp. *acris*

- 2b. Basal and lower cauline leaf margin remotely serrate; phyllaries abaxially sometimes sparsely strigose, densely short-stipitate glandular; capitula usually in loose, broad, paniculiform synflorescences 31b. subsp. *kamtschaticus*

31a. *Erigeron acris* subsp. *acris*飞蓬(原亚种) *fei peng* (yuan ya zhong)

Erigeron kamtschaticus Candolle var. *hirsutus* Y. Ling; *Trimorpha acris* (Linnaeus) Gray; *T. vulgaris* Cassini, nom. illeg. superfl.

Herbs, 5–60 cm tall. Stems solitary, sometimes several, 1–4 mm in diam. at base, green or rarely purplish, moderately to densely hirsute-villous, strigillose, or sometimes glabrate. Leaves: surfaces ± densely strigose-villous, thin, margin entire or rarely remotely serrulate, strigose-villous-ciliate; basal dense, often present at anthesis, blade oblanceolate, 1.5–10 × 0.3–1.2 cm, apex obtuse or acute; mid and upper cauline lanceolate, 0.5–8 × 0.1–0.8 cm, uppermost and branch leaves small, linear. Capitula numerous, in dense, narrow, or rarely loose and broad, paniculiform or sometimes corymbiform synflorescences, 6–10 × 11–21 mm. Phyllaries abaxially ± densely villous, often short-stipitate glandular, apex acute, inner 5–7 × 0.5–0.8 mm. Ray florets: outer series 5–7 mm, tube 2.5–3.5 mm; inner series 3–3.5 mm, style exceeding tube by 1–1.5 mm; disk florets 3.6–5 mm, tube 1.5–2 mm, limb cylindric. Achenes oblong-lanceolate, ca. 1.8 mm, sparsely strigose. Pappus 2-seriate, inner 4–6 mm. Fl. Jul–Sep.

Meadows, pastures, forest margins; 1400–3500 m. Gansu, Guangxi, Hebei, Hubei, Hunan, Jilin, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shanxi, Sichuan, Xinjiang, Xizang, Yunnan [Afghanistan, Japan, Kazakhstan, Korea, Mongolia, Russia (W Siberia), Uzbekistan; SW Asia, Europe].

31b. *Erigeron acris* subsp. *kamtschaticus* (Candolle) H. Hara, J. Jap. Bot. 15: 317. 1939.堪察加飞蓬 *kan cha jia fei peng*

Erigeron kamtschaticus Candolle, Prodr. 5: 290. 1836; *E. acris* var. *kamtschaticus* (Candolle) Herder; *E. acris* var. *manshuricus* Komarov; *E. angulosus* Gaudin var. *kamtschaticus* (Candolle) H. Hara; *E. kamtschaticus* var. *manshuricus* (Komarov) Koidzumi; *Trimorpha acris* var. *kamtschatica* (Candolle) G. L. Nesom.

Herbs, 30–70(–100) cm. Stems solitary or several, 1–6 mm in diam. at base, green or sometimes purplish, strigillose, densely so below capitula, sometimes sparsely hirsute (sometimes only in basal part). Leaves: surfaces sparsely strigose or strigillose, or glabrate or glabrous, thin; basal often withered at anthesis, blade oblanceolate, 2–13 × 0.3–1.8 cm, margin remotely serrate, strigose-ciliate, apex acute; mid and upper cauline blade lanceolate, 0.3–8.5 × 0.4–1 cm, margin entire, sparsely strigose-ciliate. Capitula numerous in loose, broad, paniculiform or sometimes few in corymbiform synflorescences, 6–10 × 10–19 mm. Phyllaries abaxially sometimes

sparsely strigose, densely short-stipitate glandular, apex acute to acuminate, inner $5-6.5 \times 0.6-0.7$ mm, margin scarious. Ray florets: outer series $5-6.2$ mm, tube $3-3.5$ mm; inner $2.5-3$ mm, style exceeding tube by $1.5-2.2$ mm, sometimes with reduced lamina and pink tipped; disk florets lobes purplish, $4-5.4$ mm, tube $2-2.9$ mm, limb cylindric-funnelform. Achenes oblong, $1.6-2.5$ mm, strigose. Pappus whitish, 2-seriate, inner $5.5-6$ mm. Fl. Jun-Sep.

Grasslands on slopes, forest margins; 700–1200 m. Gansu, Guangdong, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shanxi [Mongolia, Russia (Kamchatka, W Siberia); North America].

31c. *Erigeron acris* subsp. *politus* (Fries) H. Lindberg, Enum. Pl. Fennoscandia, 56. 1901.

长茎飞蓬 chang jing fei peng

Erigeron politus Fries, Summa Veg. Scand. 1: 184. 1845; *E. elongatus* Ledebour (1833), not Moench (1802); *Trimorpha elongata* Vierhapper; *T. polita* (Fries) Vierhapper.

Herbs, 10–50 cm tall, sometimes \pm caespitose; rhizome woody, ascending. Stems usually several, 1–4 mm in diam. at base, purple, rarely green, strigillose, sparsely hispid. Leaves green or with reddish petioles, glabrous, rigid, margin entire, strigose-ciliate; basal and lower cauline long petiolate, blade oblanceolate or oblong, $1-10 \times 0.1-1.1$ cm, apex obtuse; mid and upper sessile, blade oblong or lanceolate, $0.5-7 \times$ ca. 0.8 cm, apex arcuate or obtuse. Capitula many, in corymbiform or corymbose-paniculiform synflorescences, often on long branches, $9-13 \times 17-25$ mm. Phyllaries 3-seriate, purple, rarely green, densely short-stipitate glandular, sometimes also sparsely hispid, apex acuminate, inner $5.5-7.5 \times 0.7-1$ mm. Ray florets: outer $6-8$ mm, tube $3-4.3$ mm, lamina pink or lilac, $0.3-0.5$ mm wide, inner $2.5-4.5$ mm, style exceeding tube by $1-1.7$ mm, sometimes with rudimentary lamina; disk florets yellow, lobes dark lilac, $3.5-5$ mm, tube ca. 2.3 mm. Achenes $2-2.5$ mm. Pappus white, 1- or 2-seriate, inner $4.5-6$ mm. Fl. Jul-Sep.

Meadows on slopes of low mountains, forest margins; 1900–2600 m. Gansu, Hebei, Heilongjiang, Jilin, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shanxi, Sichuan, Xinjiang, Xizang [Kazakhstan, Kyrgyzstan, Russia (Siberia); C and N Europe].

32. *Erigeron krylovii* Sergievskaya, Sist. Zametki Mater. Gerb. Krylova Tomsk. Gosud. Univ. Kuybysheva 1945(1): 2. 1945.

西疆飞蓬 xi jiang fei peng

Herbs, perennial, (5–)14–60 cm tall, caespitose; rhizome woody; caudex branched. Stems several, 1–4 mm in diam. at base, erect or ascending, green or reddish, branched in upper part, sparsely hirsute-villous, more densely so above, \pm densely short-stipitate glandular at least below capitula. Leaves green, surfaces densely short-stipitate glandular, sometimes eglandular, hirsute-villous, strigillose, margin entire, hirsute-villous-ciliate; basal long petiolate, blade oblanceolate, $3-13 \times 0.4-1.4$ cm, apex obtuse to acute; cauline $0.5-10 \times 0.7-1$ cm, lower similar to basal, narrowly to broadly winged petiolate, petiole base subclasping, blade base attenuate, upper oblanceolate to

lanceolate, sessile, subclasping, apex acute. Capitula 2–6 in corymbose-racemiform synflorescences, sometimes solitary, $9-13 \times 17-25$ mm. Involucre hemispheric; phyllaries 3-seriate, green, linear-lanceolate, densely stipitate glandular, sometimes hirsute-villous, apex acute, outer almost $1/2$ as long as inner, inner shorter than or sometimes equaling disk florets, $5.5-7.5 \times 0.7-1$ mm, margin narrowly scarious. Ray florets 3-seriate, outer laminate, (4–)7.5–10 mm, longer than disk florets, tube $2.5-3.3$ mm, hairy distally, lamina pink, filiform, $0.4-0.6$ mm wide, inner 2 series reduced to tube, uncolored, $2-3.8$ mm; disk florets yellow, lobes pink, tube hairy above. Achenes lanceoloid, slightly flattened, $2.2-2.5$ mm, densely strigose. Pappus 2-seriate, outer bristles $0.3-0.5$ mm, inner $4-5$ mm. Fl. Jul-Sep.

Open grasslands on slopes, subalpine meadows; 1700–2800 m. N Xinjiang [Kazakhstan, Russia (Siberia)].

33. *Erigeron pseudoseravschanicus* Botschantzev, Fl. URSS 25: 585. 1959.

假泽山飞蓬 jia ze shan fei peng

Herbs, perennial, 5–60 cm tall, sometimes caespitose; rhizome woody; caudex branched. Stems several, 1–3 mm in diam. at base, erect, branched, green, sometimes reddish, \pm densely hirsute-villous, sometimes also strigillose, rarely glabrate, sparsely stipitate glandular. Leaves green, surfaces sparsely hirsute-villous, sometimes also sparsely stipitate glandular, notably on petioles, margin entire or sparsely serrate, hirsute-ciliate; basal long petiolate, petiole base clasping, blade lanceolate to oblanceolate, $1-15 \times 0.3-1.6$ cm, base attenuate, apex acute or obtuse; cauline $0.3-13 \times 0.5-1.1$ cm, lower similar to basal, upper lanceolate, sessile, apex acute. Capitula usually many, in corymbose-racemiform synflorescences, sometimes solitary, $7-14 \times 13-30$ mm. Involucre hemispheric; phyllaries 3-seriate, green, sometimes reddish, slightly shorter than disk florets, linear-lanceolate, hirsute-villous or rarely glabrous, stipitate glandular, apex acute, outer ca. $1/2$ as long as inner, inner $5-7 \times$ ca. 0.8 mm, margin scarious. Ray florets 3-seriate, outer 2 series laminate, $5.8-8.5$ mm, tube $2.2-3.5$ mm, lamina pink or lilac, ca. 0.3 mm wide, inner tubular, uncolored, tube $2.2-3$ mm, apex hairy, style exceeding tube by $1-1.5$ mm, uncolored; disk florets yellow, lobe tips purple, $4-4.7$ mm, tube $1.5-2$ mm, hairy, limb cylindric-funnelform, lobes lanceolate, ca. 0.4 mm. Achenes tan, oblanceoloid, compressed, $2-2.2$ mm, strigose. Pappus 2-seriate, outer bristles very short, $0.4-0.6$ mm, inner $4-5.3$ mm. Fl. Jul-Sep.

Subalpine or alpine meadows, forest margins; 1700–2800 m. N Xinjiang [Kazakhstan, Russia (Siberia), Uzbekistan].

Two forms have been recognized in China: *Erigeron pseudoseravschanicus* f. *pseudoseravschanicus* and *E. pseudoseravschanicus* f. *glabrescens* Y. Ling & Y. L. Chen (Acta Phytotax. Sin. 11: 426. 1973). The latter, described from Qinghe, has stems and leaves glabrous or glabrate, only upper part and phyllaries stipitate glandular.

34. *Erigeron tianschanicus* Botschantzev, Fl. URSS 25: 259. 1959.

天山飞蓬 tian shan fei peng

Erigeron coeruleus Popov, Trudy Bot. Inst. Akad. Nauk

S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 7: 11. 1948, not *E. caeruleus* Urban (1912).

Herbs, perennial, 5–60 cm tall, caespitose; rhizomes woody; caudex branched. Stems several, 1–3 mm in diam., green or reddish, branched, hirsute-villous, stipitate glandular, sometimes also strigillose. Leaves green, surfaces sparsely hirsute-villous or glabrous, sparsely to densely stipitate glandular (or rarely eglandular), margin entire, hirsute-ciliate; basal long petiolate, petiole base clasping, blade oblanceolate or lanceolate, 2–15 × 0.2–0.8(–1.7) cm, base attenuate, apex acute to obtuse, mucronate; cauline 0.5–2 × 0.1–0.3 cm, lower similar to basal, upper sessile, blade lanceolate to linear-lanceolate, subclasping, apex acute. Capitula several, in corymbose-racemiform synflorescences, 7–11 × 14–23 mm. Involucre hemispheric; phyllaries 3-seriate, green, slightly shorter than disk florets, linear-lanceolate, sparsely hirsute-villous, moderately to densely stipitate glandular, apex acute, outer ca. 1/2 as long as inner, inner 5–7 × 0.5–0.8 mm, margin narrowly scarious. Ray florets 2- or 3-seriate, outer laminate, 5.9–8 mm, tube 2.5–3 mm, blue, ca. 0.5 mm wide, inner reduced to tube, 2.3–2.9 mm; disk florets yellow, lobes becoming reddish, 3.4–4.1 mm, tube ca. 3 mm, hairy distally, limb cylindric-funnelform, lobes ovate, ca. 4 mm. Achenes oblong-lanceoloid, slightly compressed, 2–2.2 mm, strigose. Pappus yellowish, 2-seriate, outer bristles short, ca. 0.5 mm, inner 4–4.8 mm. Fl. Jul–Sep.

Open slopes; ca. 2900 m. W Xinjiang [Kazakhstan].

35. *Erigeron schmalhauseni* Popov, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 8: 51. 1940.

革叶飞蓬 ge ye fei peng

Erigeron eriocephalus Regel & Schmalhausen, Trudy Imp. S.-Peterburgsk. Bot. Sada 5: 613. 1877, not J. Vahl (1840).

Herbs, perennial, 10–45 cm tall, caespitose; rhizome long, woody; caudex branched. Stems usually many, 1–3 mm in diam., ascending or erect, sinuate especially in upper part, reddish, rarely green, branched, strigillose or glabrate at base, sometimes also villous below capitula. Leaves green or reddish, surfaces glabrous, membranous, margin entire, strigillose- or villous-ciliate; basal long petiolate, blade linear-lanceolate, 1.5–6(–9) × 0.1–0.4(–0.8) cm, apex obtuse or acute; cauline sessile, blade linear or narrowly linear-lanceolate, 0.5–7(–9) × 0.3–0.5 cm, apex acute. Capitula usually numerous, in corymbose-racemiform synflorescences, 7–12 × 14–25 mm. Involucre

hemispheric; phyllaries 3-seriate, reddish or rarely green, linear-lanceolate, villous, sparsely short-stipitate glandular, apex acute, outer ca. 1/2 as long as inner, inner shorter than disk florets, 6–9 × 0.6–1.1 mm, margin scarious. Ray florets 2-seriate, outer or both series laminate, 5.5–8 mm, tube 2.5–3.5 mm, lamina pink or lilac, ca. 0.5 mm wide, inner sometimes reduced to tube, uncolored, tube 2–4.6 mm; disk florets yellow, lobes pinkish or purplish, 4.5–5.9 mm, tube ca. 2 mm, hairy. Achenes straw-colored, oblanceoloid, compressed, 2.2–2.3 mm, densely strigose. Pappus yellowish to orangish, 2-seriate, outer bristles short, inner ones 5–6.7 mm. Fl. Jun–Sep.

Glacial moraines and mountains; 1600–3600 m. W Xinjiang [Kazakhstan, Russia (W Siberia), Uzbekistan].

36. *Erigeron fukuyamae* Kitamura, Acta Phytotax. Geobot. 2: 42. 1933.

台湾飞蓬 tai wan fei peng

Erigeron morrisonensis Hayata var. *fukuyamae* (Kitamura) Kitamura.

Herbs, perennial, 10–30 cm tall, caespitose; rhizome short; caudex branched. Stems several, 1–1.5 mm in diam., erect or ascending, branched above, green, sparsely strigose, sometimes glabrate at base, stipitate glandular. Leaves: basal rosulate, withered, rarely present at anthesis, long petiolate, blade linear, 2–7 × 1–1.5 cm, glabrate or surfaces strigillose, leathery, 1-veined, margin serrate or subentire, apex acute or obtuse; cauline usually many, dense, upper sessile, gradually diminished, 2–6 × 0.1–0.3 cm, margin entire or sometimes remotely serrulate, on synflorescence branches very small, 5–6 mm. Capitula 3–9 in loose corymbiform synflorescences, 1.5–2.3 cm in diam.; peduncles 3–10 cm. Involucre hemispheric, 5–8 × 10–18 mm; phyllaries 3-seriate, equal, green or reddish at apex, linear-lanceolate, 0.5–0.7 mm wide, abaxially strigillose, sometimes also sparsely strigose, apex acuminate, outer 4–5 mm, inner 5–8 mm, margin scarious. Ray florets in 2 forms, outer laminate, ca. 6 mm, tube ca. 2.5 mm, sparsely hairy above, lamina reddish, ca. 0.5 mm wide, mid-inner tubular, ca. 2 mm; disk florets bisexual, yellow, tubular, ca. 4 mm, with scattered appressed fine hairs. Achenes oblong, ca. 2 × 0.5 mm, flattened, with appressed fine hairs. Pappus white or brownish, 2-seriate, outer bristles short, inner 3.5–4 mm. Fl. Apr–Jul.

• Alpine meadows, exposed forest roadsides; 1800–3000 m. Taiwan.

5. *Erigeron* sect. *Caenotus* (Nuttall) Brouillet & Y. L. Chen, **stat. nov.**

小篷草组 xiao peng cao zu

Basionym: *Erigeron* [unranked] *Caenotus* Nuttall, Gen. N. Amer. Pl. 2: 148. 1818; *Caenotus* (Nuttall) Rafinesque; *Conyzella* Fabricius; *Leptilon* Rafinesque.

Herbs, annual [or subshrubs], taprooted [caudex simple]; herbage hirsute or glabrate. Stems branched. Leaves linear to lanceolate or oblanceolate, base not clasping, margin entire or sparsely serrate. Capitula erect in bud, numerous, in paniculiform or loosely corymbiform synflorescences. Ray florets white, lamina filiform, slightly longer than involucre, erect, not coiling or reflexed. Achenes 0.8–1.5 mm. Pappus 1-seriate, of 11–25 bristles, not accrescent.

Six species: North and South America, one species widely introduced worldwide in temperate to tropical regions, including China.

37. *Erigeron canadensis* Linnaeus, Sp. Pl. 2: 863. 1753.

小蓬草 xiao peng cao

Conyza canadensis (Linnaeus) Cronquist; *Conyzella canadensis* (Linnaeus) Ruprecht; *Leptilon canadense* (Linnaeus) Britton; *Marsea canadensis* (Linnaeus) V. M. Badillo.

Herbs, annual, 50–100 cm tall or more; root fusiform, fibrous rooted. Stems erect, sparsely hirsute, branched above, densely leafy. Leaves: basal withered at anthesis, lower petiolate, oblanceolate, [2–]6–10 × [0.4–]1–1.5 cm, surfaces or only adaxial sparsely pilose, base attenuate, margin sparsely serrate or entire, apex acute or acuminate; mid and upper sessile or rarely 1- or 2-toothed. Capitula 3–4 mm in diam., numerous, in terminal, large paniculiform synflorescences; peduncles slender,

5–10 mm. Involucre subcylindric, 2.5–4 mm; phyllaries 2- or 3-seriate, greenish, abaxially sparsely strigose [or glabrous], linear-lanceolate or linear, acuminate, outer ca. 1/2 as long as inner, inner 3–3.5 × ca. 0.3 mm, margin scarious, glabrous. Ray florets 20–30(–45), white, 2.5–3.5 mm, lamina slightly longer than disk floret, apex 2-denticulate; disk florets 8–30, yellowish, 2.5–3 mm, tube sparsely puberulent, lobes 4 or 5. Achenes linear-lanceoloid, compressed, 1–1.5 mm, sparsely strigillose. Pappus 1-seriate, dirty white, bristles 15–25, 2.5–3 mm. Fl. May–Sep.

Common weed of open places, field margins, roadsides, dry streamsides; sea level to 3000 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Xinjiang, Xizang, Yunnan, Zhejiang [native to North America].

6. *Erigeron* sect. *Conyza* (Lessing) Baillon, Hist. Pl. 8: 143. 1882.

白酒草组 bai jiu cao zu

Conyza Lessing, Syn. Gen. Compos. 203. 1832, nom. cons., not Linnaeus (1753).

Herbs, annual or biennial [or perennial], taprooted [caudex simple]; herbage hirsute to strigose [often glandular]. Stems simple or branched. Leaves linear to lanceolate, oblanceolate, or spatulate, base clasping or not, margin coarsely serrate or pinnatifid, sometimes entire. Capitula erect in bud, in paniculiform, racemiform, or racemose-paniculiform synflorescences. Ray florets white, elaminate or lamina slightly longer than involucre. Achenes 0.8–2 mm, 2-veined. Pappus 1-seriate, of 10–25 bristles, not accrescent.

About 60–100 species: Africa, Asia, Australia, Europe, North and South America, some species widespread weeds in tropical and subtropical regions worldwide; two species (both introduced) in China.

- 1a. Lower cauline leaf blade margin usually coarsely 4–8-serrate per side, apex acute or acuminate; capitula in large and long paniculiform synflorescences, peduncles 3–5 mm; involucre ca. 4 mm; pappus white, later yellowish brown; ray floret lamina short, filiform 38. *E. sumatrensis*
 1b. Lower cauline leaf blade margin usually coarsely serrate or pinnatifid, sometimes entire, apex acute or obtuse; capitula in racemiform or racemose-paniculiform synflorescences, peduncles 10–15 mm; involucre ca. 5 mm; pappus reddish, sordid, or tawny; ray floret elaminate 39. *E. bonariensis*

38. *Erigeron sumatrensis* Retzius, Observ. Bot. 5: 28. 1788.

苏门白酒草 su men bai jiu cao

Conyza sumatrensis (Retzius) E. Walker.

Herbs, annual or biennial, 80–150 cm tall; roots fusiform. Stems erect, thick, branched above middle, densely leafy, densely gray-white strigose, sparsely hirsute. Leaves: basal withered at anthesis, lower cauline petiolate, blade oblanceolate or lanceolate, 6–10 × 1–3 cm, surfaces densely strigose, especially abaxially, base attenuate, margin usually coarsely 4–8-serrate per side, apex acute or acuminate, mid and upper reduced, blade narrowly lanceolate to linear, margin serrate or entire. Capitula 5–8 mm in diam., numerous, in large and long paniculiform synflorescences; peduncles 3–5 mm. Involucre campanulate to urceolate, ca. 4 × 3–4 mm; phyllaries 3-seriate, gray-green, linear-lanceolate or linear, abaxially scabrous, apex acuminate, outer short or ca. 1/2 as long as inner, inner ca. 4 mm, margin scarious. Ray florets numerous, 4–4.5 mm, lamina yellowish or purplish, short, filiform, apex 2-denticulate; disk florets 6–11, yellowish, ca. 4 mm, tube sparsely puberulent. Achenes linear-lanceoloid, compressed, 1.2–1.5 mm, strigillose. Pappus white, later yellowish brown. Fl. May–Oct.

Common weed of grasslands on slopes, open places, roadsides,

streamsides; 100–2500 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [presumably native to South America; widely distributed as a weed in tropical and subtropical regions worldwide].

39. *Erigeron bonariensis* Linnaeus, Sp. Pl. 2: 863. 1753.

香丝草 xiang si cao

Conyza ambigua Candolle; *C. bonariensis* (Linnaeus) Cronquist; *C. crispa* (Pourret) Ruprecht; *C. leucodasy* Miquel; *Erigeron crispus* Pourret; *E. linifolius* Willdenow; *Leptilon bonariense* (Linnaeus) Small; *Marsea bonariensis* (Linnaeus) V. M. Badillo.

Herbs, annual or biennial, [10–]20–50[–150] cm tall; roots fusiform, fibrous rooted. Stems erect or ascending, thin, often branched above middle, densely leafy, densely strigose, sparsely hirsute. Leaves: basal withered at anthesis, lower cauline long petiolate, blade oblanceolate or oblong-lanceolate, 3–5[–8] × 0.3–1[–2.5] cm, surfaces densely strigose or hispidulous, base attenuate, margin usually coarsely serrate or pinnatifid, sometimes entire, apex acute or obtuse, mid and upper shortly petiolate or sessile, blade narrowly lanceolate or linear, [1–]3–7 × 0.2–0.5[–1] cm, margin of mid dentate, margin of upper entire. Capitula 3–10 mm in diam., numerous, in racemiform or

racemose-paniculiform synflorescences; peduncles 10–15 mm. Involucre urceolate, ca. 5×8 mm; phyllaries 2- or 3-seriate, linear, abaxially densely gray-white scabrous, apex acute, outer ones slightly short or ca. 1/2 as long as inner, inner ones ca. 4×0.7 mm, margin scarious. Ray florets 65–150 or more, white, 3–3.5 mm, elaminate or 3- or 4-denticulate at apex; disk florets ca. 3 mm, tube sparsely puberulent. Achenes linear-lanceoloid,

compressed, ca. 1.5 mm, sparsely strigillose [or glabrous]. Pappus reddish, sordid, or tawny, 3–4 mm. Fl. May–Oct.

Field margins, grassy slopes, roadsides; sea level to 3100 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [native to South America; widely distributed as a weed in tropical and subtropical regions worldwide].

142. EURYBIA (Cassini) Cassini in F. Cuvier, Dict. Sci. Nat. 16: 46. 1820.

北美紫菀属 bei mei zi wan shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Aster subg. *Eurybia* Cassini, Bull. Sci. Soc. Philom. Paris 1818: 166. 1818.

Perennials, rhizomatous, usually eglandular [sometimes stipitate glandular]. Stems ascending to erect, usually simple, rarely branched at base, glabrous or \pm densely hairy. Leaves basal and cauline, sessile or petiolate, blade cordate, ovate, obovate, elliptic, or oblong to spatulate, oblanceolate, or lanceolate, glabrate to hairy, margin entire or serrate [sometimes spinulose-serrate]. Capitula radiate, numerous, usually in corymbiform synflorescences, rarely solitary. Involucre cylindric-campanulate to broadly campanulate; phyllaries in 3–7 series, unequal, bases hardened (rarely wholly leaflike), glabrous or \pm hairy [sometimes \pm stipitate glandular], margins narrowly scarious (seldom herbaceous), green zones \pm basally truncate, in distal 1/3–3/4 (outer) or less (inner), 1-veined, apices obtuse to acute. Receptacles flat to slightly convex, alveolate, epaleate. Florets fertile. Ray florets few to many, purple [or white]; disk florets few to many, bisexual, yellow, limb funnelform to campanulate, lobes 5, deltate to lanceolate; anther base obtuse, apical appendage lanceolate; style branch tip lanceolate. Achenes cylindric-obconic to fusiform, \pm compressed, glabrous or sparsely to densely strigillose, eglandular, 7–12(–18)-veined. Pappus persistent, reddish to yellowish, in 4 series, of numerous unequal, barbellate bristles, inner apically \pm clavate.

Twenty-three species: Asia, Europe, North America; one species in China.

Eurybia is North American. *Eurybia sibirica* extended into N Eurasia via the Bering land bridge.

1. *Eurybia sibirica* (Linnaeus) G. L. Nesom, Phytologia 77: 261. 1995.

西伯利亚紫菀 xi bo li ya zi wan

Aster sibiricus Linnaeus, Sp. Pl. 2: 872. 1753; *A. ircutianus* Candolle; *A. sachalinensis* Kudô.

Herbs, perennial, [1–]5–35[–60] cm tall; rhizome thin. Stems usually ascending, sometimes decumbent, often purplish, simple or sometimes branched basally or above, densely villous (sometimes lanate below capitula). Leaves: basal small, deciduous at anthesis; mid cauline sessile, blade oblong to lanceolate [or lanceolate-ovate, obovate, or spatulate], [2.5–]5–8[–9.5] \times [0.6–]1–1.7[–3.5] cm, markedly veined, abaxially glabrescent or scabridulous, adaxially sparsely to \pm densely villous or villous-strigose, base attenuate to cuneate, subclasping, margin serrate [or entire], apex acute; upper gradually reduced, linear-

oblong. Capitula solitary or 2–5[–50] in dense corymbiform synflorescences. Involucre campanulate, 10–13 mm in diam.; phyllaries 3- or 4[or 5]-seriate, purplish wholly or at apex, densely villous, membranous, green zone in distal 1/3–4/5, truncate basally, or outer often leaflike, apex \pm squarrose, outer oblong-lanceolate, 4–5 \times ca. 1 mm, 1-veined, margin narrowly scarious, apex acute, inner linear-lanceolate, 4–5 \times 1–1.5 mm, apex acuminate. Ray florets 12–50, purple [or white to pale violet], tube 3–4 mm, lamina 7–17.5 \times 0.8–1.8 mm; disk florets 25–125, yellow becoming purplish, [5–]6.5–7[–8.1] mm, tube ca. 3 mm, limb funnelform, lobes purplish, triangular, 0.5–1.1 mm. Achenes brown, fusiform, strigillose, veins 7–10. Pappus dark cinnamon to reddish, \pm equaling to slightly longer than disk corolla. Fl. Jul–Aug.

Grasslands on hills; ca. 300 m. Heilongjiang [Japan, Mongolia, E Russia; N Europe, NW North America].

143. GRINDELIA Willdenow, Ges. Naturf. Freunde Berlin Mag. Neuesten Entdeck. Gesammten Naturk. 1: 259. 1807.

胶菀属 jiao wan shu

Perennials, taprooted. Stems usually erect, simple or branched, glabrous or hairy, often gland-dotted and/or resinous. Leaves basal and cauline, alternate, petiolate or (upper) sessile, blade oblong, obovate, oblanceolate, or spatulate to triangular, lanceolate, or linear, glabrous or \pm hairy, gland-dotted, margin serrate [sometimes entire]. Capitula radiate [or discoid], usually few to numerous, in corymbiform [or paniculiform] synflorescences, sometimes solitary. Involucres globose to hemispheric or broadly urceolate [sometimes campanulate or obconic]; phyllaries in [3–]5–6[–9+] series, unequal, filiform, linear or lanceolate, glabrous or \pm resinous, bases indurate, 1-veined, apices herbaceous, looped or hooked [to straight or incurved]. Receptacles flat to slightly convex, \pm alveolate,

epaleate. Florets fertile. Ray florets [absent or] 5–60+, yellow [or orange]; disk florets (20–)100–200(–300+), bisexual, yellow, limb funnelform to campanulate, lobes 5, deltate; anther base obtuse, apical appendage lanceolate; style branch appendage lanceolate [linear to \pm deltate]. Achenes ellipsoid to obovoid, \pm compressed, sometimes \pm 3- or 4-angled, glabrous, eglandular, [striate, ribbed, furrowed, or rugose]. Pappus deciduous, of [1 or] 2–8[–15] smooth, barbellulate or barbellate, inner sometimes apically \pm clavate, subulate scales or setiform awns [or 1-seriate bristles].

About 30 species: W North America and South America, introduced in Eurasia; one species (introduced) in China.

Grindelia is North American, with a disjunct distribution in South America. Fan et al. (Pl. Diversity Resources 33: 171–173. 2011) recently reported it as introduced to China.

1. *Grindelia squarrosa* (Pursh) Dunal, Mém. Mus. Hist. Nat. 5: 50. 1819.

胶菀 jiao wan

Donia squarrosa Pursh, Fl. Amer. Sept. 2: 559. 1813; *Grindelia aphanactis* Rydberg; *G. nuda* Alph. Wood; *G. serrulata* Rydberg.

Herbs biennial, perennial, or subshrubs, [10–]40–55[–100] cm tall. Stems erect, glabrous, resinous. Leaves: cauline sessile, oval, ovate, [obovate or oblong to spatulate, oblanceolate, lanceolate, or linear], 3.1–4.2 \times 1.3–1.6 cm, glabrous, strongly gland-dotted, base \pm clasping, margin usually crenate to serrate (teeth resin-tipped) [rarely entire], apex [obtuse to] acute. Capitula in corymbiform synflorescences, rarely solitary, 0.9–1.5 cm. Involucres broadly urceolate to hemispheric or globose, [8–

20 mm in diam.]; phyllaries 5- or 6(–10)-seriate, reflexed to spreading or appressed, filiform or linear to lanceolate-linear, 4–7 mm, resinous, apex usually looped or hooked, subulate. Ray florets [absent or] (12–)24–36(–40), lamina elliptic, 7[–14] mm; disk florets 3–4 mm, limb funnelform, lobes ca. 1 mm. Achenes stramineous [or whitish, brown, or gray], [1.5–]2.8–3[–4.5] mm, faces smooth, striate or \pm furrowed. Pappus of 2–4(–8) deciduous, straight or contorted to curled scales or awns [2.5–]4[–5.5] mm, shorter than disk corollas. Fl. [Jul–]Aug–Sep[–Oct].

100–200 m or more. Liaoning [native to W North America].

The specimens were not seen by us; the description is based on Fan et al. (Pl. Diversity Resources 33: 171–173. 2011) and Strother and Wetter (Fl. North America 20: 424–436. 2006).

144. SYMPHYOTRICHUM Nees, Gen. Sp. Aster. 135. 1832.

联毛紫菀属 lian mao zi wan shu

Chen Yilin (陈艺林 Chen Yi-ling); Luc Brouillet

Brachyactis Ledebour.

Herbs, perennial or annual, rhizomatous or taprooted, eglandular [sometimes stipitate glandular]. Stems ascending to erect, usually simple, sometimes branched distally, rarely proximally, usually hairy in decurrent lines at least distally, glabrous or hairy, proximally often glabrous. Leaves basal (sometimes persistent at anthesis) and cauline, petiolate (basal and lower cauline) or sessile, blade cordate to elliptic, oblanceolate, spatulate, ovate, elliptic, lanceolate, or linear, faces glabrous or hairy, sometimes stipitate glandular, margin serrate, crenate, or entire, scabrous or ciliate. Capitula radiate or disciform, numerous, usually in paniculiform, sometimes in racemiform or subcorymbiform, synflorescences, sometimes solitary. Involucre cylindric to campanulate [or hemispheric]; phyllaries in (3 or) 4–6(–9) series, unequal to subequal, glabrous or hairy [rarely glandular], outer sometimes leaflike, base usually hardened, margin usually scarios, 1(–3)-veined, apex acute to obtuse, usually with a well-defined green zone, sometimes \pm leaflike. Receptacles flat to slightly convex, alveolate, epaleate. Florets fertile. Ray florets few to numerous, in 1 [rarely 4 or 5+] series and laminate, or in 2–5+ series and \pm elaminate, lamina white, pink, blue, or purple; disk florets few to numerous, bisexual, yellow [or rarely white], limb funnelform or cylindric, lobes 5, deltate to lanceolate; anther base obtuse, apical appendage lanceolate; style branch tip lanceolate. Achenes obovoid or obconic, sometimes fusiform, \pm compressed, glabrous or strigillose, eglandular [rarely stipitate glandular], veins (2 or) 3–5(–10). Pappus persistent, white to brownish, in 4 series, of numerous \pm equal, barbellate, apically acute bristles.

About 90 species: Asia, Europe, North and South America; three species (two introduced) in China.

Symphyotrichum pilosum (Willdenow) G. L. Nesom var. *pringlei* (A. Gray) G. L. Nesom was collected from a park in Hong Kong; it may not be established in the flora. Cultivars of *S. novi-belgii* (Linnaeus) G. L. Nesom and other undetermined taxa (possibly horticultural hybrids) are cultivated in China but appear not to have escaped. A cultivar of *S. lanceolatum* (Willdenow) G. L. Nesom is cultivated for the cut-flower market.

- 1a. Herbs perennial; cauline leaves lanceolate to lanceolate-ovate 1. *S. retroflexum*
- 1b. Herbs annual; cauline leaves linear to linear-lanceolate.
 - 2a. Capitula disciform, ray florets elaminate in 2–5+ series, disk floret limb cylindric; phyllaries subequal, outer sometimes longer, leaflike 2. *S. ciliatum*
 - 2b. Capitula radiate, ray florets laminate, purple, in 1 series, disk floret limb funnelform; phyllaries unequal 3. *S. subulatum*

1. *Symphotrichum retroflexum* (Lindley ex Candolle) G. L. Nesom, *Phytologia* 77: 291. 1995.

倒折联毛紫菀 *dao zhe lian mao zi wan*

Aster retroflexus Lindley ex Candolle, *Prodr.* 5: 244. 1836; *A. curtisii* Torrey & A. Gray.

Herbs, perennial, 45–80 cm tall. Stems erect, sometimes purplish, glabrous (except above in lines). Leaves: basal petiolate, lanceolate to ovate, rarely rounded, usually fallen at anthesis; cauline petiolate to sessile, lanceolate to lanceolate-ovate, [5–]6–9.5 × 0.7–1.5[–3.1] cm, slightly reduced in size upward, surfaces glabrous, base attenuate to cuneate or rounded, margin serrate to crenate, sometimes entire, ciliate, apex acute to acuminate. Capitula radiate, numerous, in open, leafy, paniculiform synflorescences, branches spreading; peduncles 0.2–2.5 cm; leaflike bract usually subtending capitulum. Involucre campanulate; phyllaries 3–5-seriate, outer squarrose, often leaflike, lanceolate to linear-lanceolate, ± unequal, outer 6–11 × 0.8–2 mm, eglandular, glabrous, margin narrowly scarious, erose, eciliate, apex acute to acuminate. Ray florets [13–]18–20[–30] in 1 series, lamina purplish blue, [10 or]11[–17] × 1.5[–3] mm, glabrous; disk florets cream to pale yellow, becoming pinkish, 5[–6.8] mm, limb funnelform, 3–3.5 mm, lobes erect, lanceolate, 0.9–1.2 mm, glabrous. Achenes oblanceoloid, ± compressed, 3–3.9 mm, sparsely strigillose, 4–6-veined. Pappus white to reddish, inner 4–4.5 mm, innermost 5–6 mm. Fl. and fr. Sep–Dec.

Roadsides along fields or in mountains. Introduced in Jiangxi [E North America].

2. *Symphotrichum ciliatum* (Ledebour) G. L. Nesom, *Phytologia* 77: 277. 1995.

短星菊 *duan xing ju*

Erigeron ciliatus Ledebour, *Icon. Pl.* 1: 24. 1829; *Aster angustus* Torrey & A. Gray; *A. brachyactis* S. F. Blake; *A. ciliatus* (Ledebour) B. Fedtschenko (1915), not Walter (1788), nor Muhlenberg ex Willdenow (1803), nor Nuttall (1840); *A. latisquamatus* (Maximowicz) Handel-Mazzetti; *Brachyactis ciliata* (Ledebour) Ledebour; *B. latisquamata* (Maximowicz) Kitagawa; *Conyza altaica* Candolle; *E. latisquamatus* Maximowicz.

Herbs, annual, [7–]9–60[–70+] cm tall. Stems erect, usually branched from base, branches then decumbent, often reddish below, upper half and branches sparsely to moderately pilosulose, densely leafy. Leaves: basal petiolate, fallen at anthesis; cauline sessile, linear or linear-lanceolate, 2–6 × 0.3–0.6 cm, reduced in size upward, base subclasping, slightly decurrent, margin entire, sometimes serrulate, apex acute. Capitula

disciform, numerous, in racemiform or paniculiform synflorescences, rarely solitary at ends of branches. Involucre campanulate; phyllaries 2- or 3-seriate, subequal or outer longer, linear, acute, outer leaflike, 3–6 × ca. 1 mm, margin ciliate, margin of inner scarious below, leaflike above. Ray florets 75–95+ in 4 or 5 series, reduced to tube (sometimes with an extremely reduced lamina remnant, latter sometimes pinkish), 2–3 mm, apex sparsely hairy; disk florets white with pink-tipped lobes, 3.5–5 mm, limb narrowly funnelform, ca. 2 mm, lobes erect, triangular, 0.2–0.3 mm. Achenes purplish, narrowly obovoid, [1.5–]2–2.5 mm, moderately strigillose, 2–4-veined. Pappus of many white, fine, barbellulate bristles, outer very short, inner 6–7 mm. Fl. and fr. Aug–Oct.

Salt marshes, meadows, damp riverbanks, marshes and lakes in plains and steppes, usually saline; 500–1500 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shandong, Shanxi, Xinjiang [Japan, Kazakhstan, Korea, Mongolia, Russia, Uzbekistan; E Europe, North America].

This North American species crossed the Bering Sea during the Pleistocene.

3. *Symphotrichum subulatum* (Michaux) G. L. Nesom, *Phytologia* 77: 293. 1995.

钻叶紫菀 *zuan ye zi wan*

Aster subulatus Michaux, *Fl. Bor.-Amer.* 2: 111. 1803.

Herbs, annual, 16–150 cm tall. Stems erect, sometimes purplish, glabrous, eglandular. Leaves: basal petiolate, lanceolate to ovate, usually fallen at anthesis; cauline petiolate to sessile, lanceolate to linear-lanceolate, 2–11 × 0.1–1.7 cm, slightly reducing in size upward, surfaces glabrous, eglandular, base attenuate to cuneate, margin serrulate to entire, eciliate, apex acute. Capitula radiate, numerous, in paniculiform synflorescences; peduncles 0.3–1 cm, glabrous, eglandular. Involucre cylindric; phyllaries 3–5-seriate, lanceolate to linear-lanceolate, glabrous, strongly unequal, outer 1–2 × ca. 0.2 mm, margin scarious, entire, scabrous, distally ciliate, eglandular, apex acute to acuminate. Ray florets numerous, in 1 series, lamina purplish blue, 1.5–2.5 mm, glabrous, eglandular; disk florets yellow, pinkish with age, 3–3.5 mm, limb 1.4–1.5 mm, lobes erect, triangular, 0.4–0.5 mm, glabrous, eglandular. Achenes lanceoloid, 1.5–2.5 mm, 2–6-veined, sparsely strigillose. Pappus of many white, fine, barbellulate bristles, 4–5 mm. Fl. and fr. Aug–Oct.

Disturbed areas, roadsides, grassy fields, irrigation ditches, rice field margins; near sea level to 2000 m. Introduced in Anhui, Fujian, Guangxi, Guizhou, Hebei, Henan, Hong Kong, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Sichuan, Taiwan, Yunnan, Zhejiang [Africa, Central, North, and South America].

13. Tribe ATHROISMEAE

山黄菊族 shan huang ju zu

Chen Yousheng (陈又生); Arne A. Anderberg

Annual or perennial herbs, shrubs, or small trees, sometimes aromatic. Leaves simple, alternate or fasciculate, petiolate or sessile, abaxial surface with or without sessile-glandular trichomes. Capitula terminal, in corymbiform cymes, or solitary, sometimes congested, glomerule-like or in rounded secondary capitula, pedunculate, sometimes sessile, radiate, disciform, or discoid. Phyllaries 1–4-seriate, sometimes much reduced or absent, herbaceous, subequal or gradate. Receptacles convex to conical, sometimes subglobose to globose, paleate or epaleate. Ray florets when present female; corollas yellow or white. Anthers usually ecalcarate, shortly caudate or not caudate, rarely tails well developed and branched; endothecium with polarized thickenings. Achenes brown or black, obcompressed to subterete, sometimes with thickened striations or ribs, sometimes with a proliferation of spongy cells apically, glabrous or with ciliate lateral ridges and glandular trichomes, sometimes with apically arcuate twin trichomes. Pappus of awns or variously lacerate scales, a crown of twin trichomes, sometimes with 2 awns, or absent.

Six genera and ca. 59 species: mostly in E Africa, a few species in W Africa, S and SE Asia, and Madagascar; one species in China.

201. ANISOPAPPUS Hooker & Arnott, Bot. Beechey Voy. 196. 1837.

山黄菊属 shan huang ju shu

Herbs, annual or perennial. Stems not winged, without resin canals. Leaves simple, entire to dentate or pinnatifid or deeply lobed, hairy. Capitula large or small, solitary or clustered, heterogamous, radiate. Receptacle paleate; paleae folded. Marginal florets female, in ca. 1 row; corolla yellow, radiate; epidermis not crested. Disk florets bisexual; corolla yellow with straight epidermis cell walls, without needle-shaped crystals; corolla lobes short, smooth, without spiny hairs apically. Anthers minutely calcarate, with long or very short tails; endothelial tissue polarized; cells of antheropodium wider than long. Pollen spines with a cavity. Style with obtuse, rarely acute, sweeping hairs not reaching furcation, without star-shaped crystals. Achenes ellipsoid or with obtuse indistinct edges, without crystals in epidermis. Pappus of short acute or obtuse scales, or sometimes missing. $x = 7$.

About 40 species: mostly in S and tropical Africa, Madagascar; one species in China.

That *Anisopappus* is a member of the Athroismeae, the closest relatives of the Heliantheae s.l., has received robust support from DNA analyses (Eldén et al., Pl. Syst. Evol. 210: 159–170. 2005).

1. *Anisopappus chinensis* Hooker & Arnott, Bot. Beechey Voy. 196. 1837.

山黄菊 shan huang ju

Inula yunnanensis J. Anthony; *Verbesina chinensis* Linnaeus.

Herbs, annual. Rhizome stout, 5–12 mm in diam. Stems erect, 40–100 cm tall, 2–4(–6) mm in diam., simple or rarely caespitose, with slender stripes, subwoody at base, densely rusty pubescent or sparsely pubescent in lower part during anthesis. Cauline leaves ovate-lanceolate or narrowly oblong, 3–6 × 1–2 cm, papery, both surfaces slightly pubescent, more densely so along veins, base truncate or broadly cuneate, margin obtusely serrate, apex obtuse. Capitula solitary or several in terminal corymbs; peduncles densely pubescent. Involucre hemispheric, 6–10 mm; phyllaries in 3 series, narrowly lanceolate or broadly

linear, 3–5 × ca. 1.5 mm, dorsally densely pubescent, margin membranous, apex obtuse. Paleae keeled, membranous, ca. 5 mm. Marginal florets female; corolla yellow; lamina obtriangular, ca. 6.5 × 2 mm, apex truncate, 3-dentate. Disk florets bisexual; corolla tubular, ca. 3 mm, with short triangular lobes. Achenes columnar, sparsely pubescent, apex truncate, slightly narrower to base, ca. 2 mm in female florets and ca. 1.5 mm in bisexual florets, with 4 ribs. Pappus grayish white, chaffy, of 4 or 5 bristles. Fl. Aug–Nov.

Grassy slopes, waste fields, forest margins; below 2400 m. S Fujian, Guangdong, Guangxi, Jiangxi, S Sichuan, Yunnan [India, Myanmar, N Thailand; tropical Africa, Madagascar].

In the protologue of *Anisopappus chinensis*, Hooker and Arnott referred to “*Verbesina chinensis* Linn. ?” The expression of doubt in this citation prevented *A. chinensis* from being validly published as a new combination based on *V. chinensis*. The latter name was subsequently recognized as a heterotypic synonym of *A. chinensis*.

11. Tribe CALENDULEAE

金盞花族 jin zhan hua zu

Chen Yilin (陈艺林 Chen Yi-ling); Bertil Nordenstam

Herbs, shrubs, or subshrubs, annual or perennial. Leaves often alternate. Capitula radiate, heterogamous. Involucre campanulate, hemispheric, or rarely conic; phyllaries 1–3(or 4)-seriate, often with scarious margins. Receptacle flat or convex, naked. Ray florets female, fertile or sterile, tube short; lamina yellow, orange, or white, sometimes pink to purple or blue, apically 3-denticulate. Style linear, glabrous, style branches obtuse, rarely acute. Disk florets bisexual or male, actinomorphic, funnel-shaped, 5-lobed. Anthers caudate at base. Style simple or minutely bifid, rare bifurcate, dorsally papillate or rarely hirsute. Corolla yellow or orange, rarely white. Achenes usually hard, thickened, sometimes with fleshy exocarp, terete, orbicular, obovate, or heteromorphic, curved or beaked. Pappus absent.

Twelve genera and ca. 120 species: mainly in S Africa, through tropical Africa to the Mediterranean, eastward to Iran; one species (introduced) in China.

186. CALENDULA Linnaeus, Sp. Pl. 2: 921. 1753.

金盞花属 jin zhan hua shu

Herbs, annual or perennial, sometimes suffrutescent, glandular pubescent. Leaves alternate, sessile, margin entire or repand-dentate. Capitula solitary, terminal. Involucre campanulate or hemispheric; phyllaries 1- or 2-seriate, lanceolate to linear-lanceolate, acuminate, with scarious margins. Receptacle flat or convex, glabrous, heterogamous. Ray florets female, 2- or 3-seriate, fertile; lamina apically 3-denticulate; style terete, 2-lobed. Disk florets bisexual, functionally male; corolla tubular–funnel-shaped. Style undivided, apically thickened or globose. Achenes polymorphic; outer cymbiform, somewhat curved, rostrate, or triquetrous; inner distinctly curved, sometimes winged, all dorsally rugose to tuberculate-aculeate. $x = 7, 8, 9, 11, 15$.

About 15 or 20 species: mainly in SW Asia, W Europe, Macaronesia, and Mediterranean region; one species (introduced) in China.

1. *Calendula officinalis* Linnaeus, Sp. Pl. 2: 921. 1753.

金盞菊 jin zhan ju

Herbs, annual, 20–75 cm tall, usually branched from base, green, \pm glandular pubescent. Basal leaves oblong-obovate or spatulate, 15–20 cm, margin entire or remotely denticulate; stem leaves oblong, oblong-lanceolate, or oblong-obovate, 5–15 \times 1–3 cm, \pm amplexicaul, margin inconspicuously repand-denticulate, apex obtuse, rarely acute. Capitula 4–5 cm in diam.; phyl-

laries lanceolate or oblong-lanceolate, outer slightly longer than inner, acuminate. Ray florets yellow or orange, ca. 2 \times as long as involucre, lamina up to 4–5 mm wide. Disk florets with triangular-lanceolate lobes. Achenes curved, yellowish or brownish, outer half-curved, often aculeate rostrate at apex, lateral-winged ridge irregularly rugose. Fl. Apr–Sep, fr. Jun–Oct.

Cultivated as an ornamental in parks and gardens of China [native origin unknown].

4. Tribe CARDUEAE

飞廉族 fei lian zu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube, Werner Greuter, Ludwig Martins

Herbs, annual to perennial. Leaves alternate, sometimes all basal. Capitula homogamous or heterogamous, bisexual, sometimes unisexual in dioecious plants, persistent or deciduous, solitary or clustered at end of stem and branches, sometimes surrounded by \pm leaflike spiny bracts. Phyllaries imbricate, undivided. Receptacle densely covered with bristles, rarely with short scales, or naked. Florets few to numerous. Corolla usually actinomorphic or slightly zygomorphic, equally or unequally 5-lobed or sometimes strongly zygomorphic in radiant florets of heterogamous capitula. Stamen filaments glabrous, papillose, or hairy; anther sagittate, base caudate; connective with a sterile apical appendage. Style branches distinct and divergent or coherent medially for most of their length and only seceding along stigmatic margins; sweeping hairs usually confined to a ringlike sometimes swollen zone at base of style branches or longest there and distally abruptly shorter. Achene usually glabrous, rarely \pm hairy, apex with a peripheral rim surrounding an apical plate on which pappus is inserted; rim sometimes salient as an entire or dentate crown, sometimes inconspicuous.

About 75 genera and ca. 2,400 species: E and N Africa, Asia, Australia, Europe, North and South America; 37 genera (four endemic, three introduced) and 440 species (237 endemic, five introduced) in China.

- 1a. Achene attachment scar lateral or subbasal and oblique; capitula homogamous or heterogamous and mostly with radiant outer florets 5. Subtribe Centaureinae
- 1b. Achene attachment scar \pm basal; capitula always homogamous.
 - 2a. Leaf margin unarmed, entire or with blunt to mucronulate non-pungent teeth, apex of phyllaries sometimes recurved but never hooked 1. *Saussurea* group
 - 2b. Leaf margin spiny or spinulose, or if \pm entire then apex of phyllaries hooked.
 - 3a. Pappus of distinct scabrid bristles falling off singly or (rarely) pappus absent; style branches distinct and divergent 2. *Arctium* group
 - 3b. Pappus of scabrid to plumose bristles (rarely scales) basally connate into a ring and falling off together; style branches coherent for most of their length.
 - 4a. Achene with apical rim either inconspicuous or forming a conspicuous and crenulate (rarely entire) crown, apical plate lacking an elaiosome 3. *Onopordum* group
 - 4b. Achene with apical rim forming a smooth-margined upright crown, apical plate with a prominent oleaginous central umbo (elaiosome) 4. Subtribe Carduinae

1. SAUSSUREA group

风毛菊群 feng mao ju qun

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Cauliferous herbs, stemless rosette herbs, or subshrubs, biennial, perennial, or rarely annual. Leaves without spines; leaf blade undivided to pinnatisect, margin entire or with blunt to mucronate non-pungent teeth. Capitula homogamous, bisexual. Phyllaries in several rows, without spines, apically sometimes with a green or purplish membranous or herbaceous appendage or mucronate. Receptacle densely covered with long subulate bristles, short scales, apiculate papillae, or naked and alveolate. Florets bisexual, all fertile. Corolla \pm actinomorphic. Filaments distinct, glabrous. Style branches usually distinct and divergent, rarely partly coherent. Achene usually glabrous, sometimes glandular, rarely pubescent or papillose, apical rim inconspicuous or forming a \pm developed crenulate or denticulate crown. Pappus homomorphic or heteromorphic, in 1 to several distinct or connate rows of scabrid to plumose bristles or rarely of small scales; inner pappus long, usually overtopping involucre.

About 15 genera and ca. 700 species: NW Africa, Asia, Europe, North America; nine genera (two endemic, one introduced) and 323 species (205 endemic, one introduced) in China.

- 1a. Plants annual; outer pappus an incomplete row of small scales and inner pappus a ring of plumose bristles 21. *Hemisteptia*
- 1b. Plants perennial or biennial; pappus of only bristles.
 - 2a. Pappus bristles in several rows, of different length, usually scabrid or barbellate, rarely plumose; receptacle with short scales or naked and alveolate, rarely with bristles.
 - 3a. Pappus bristles silvery, dirty white, or white, inserted on a conic cupule, 0.5–1.5 cm; receptacle with short scales or bristles 14. *Jurinea*
 - 3b. Pappus bristles dirty white, yellowish, brown, or reddish, not inserted on a conic cupule, 1.5–4 cm; receptacle either alveolate or with long bristles.
 - 4a. Capitula several and clustered or solitary in center of leaf rosette; phyllaries not densely lanate; receptacle alveolate, naked or with very short apiculate papillae, without bristles 17. *Dolomiaea*
 - 4b. Capitulum solitary on a subscapose stem; phyllaries densely lanate; receptacle with long bristles 18. *Bolopcephalus*

- 2b. Pappus bristles in 1 or 2 rows, with bristles of inner row of same length and always plumose; receptacle usually with \pm long, subulate bristles, sometimes naked and alveolate, or with short apiculate papillae.
- 5a. Pappus in 2 rows; achene smooth, ribbed, or sometimes wrinkled, apical rim inconspicuous or rarely with a short crown.
- 6a. Outer pappus a row of scabrid or rarely plumose caducous bristles (rarely lacking), inner pappus a ring of plumose bristles 22. *Saussurea*
- 6b. Outer and inner pappus bristles both plumose and connate with each other into a ring 15. *Diplazoptilon*
- 5b. Pappus in 1 row; achene wrinkled or muricate, apical rim always forming a distinct crown.
- 7a. Corolla limb with sessile glands; achene blackish, 2–5 mm, with a dentate crown 16. *Himalaiella*
- 7b. Corolla limb glabrous; achene straw-colored or brown with black spots, 5–8 mm, with a crenulate crown.
- 8a. Capitulum solitary, long pedunculate; petiole of basal leaves unwinged 19. *Frolovia*
- 8b. Capitula 2–7 and clustered, sessile or subsessile; petiole of basal leaves with a broad lobed wing 20. *Aucklandia*

14. JURINEA Cassini, Bull. Sci. Soc. Philom. Paris 1821: 140. 1821.

茼菊属 ling ju shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Pilostemon Iljin.

Herbs, perennial [or shrublets]. Leaves undivided to pinnatisect. Capitula solitary or several in a corymbiform synflorescence. Involucre bowl-shaped, ovoid, campanulate, hemispheric, or cylindric. Phyllaries herbaceous or leathery, appressed or reflexed. Receptacle with broad rigid shortly acuminate scales or bristles. Corolla red to purple, with sessile glands. Anther tails lacerate-caudate. Style branches short, divergent. Achene isodiametric, narrowly obovoid, narrowly ellipsoid, or obconic, 3- or 4-angled, glabrous or glandular, sometimes spinulose-tuberculate, apical rim forming a crown. Pappus bristles in several rows, white, scabrid, barbellate, or plumose, unequal in length, sometimes 2–5 inner bristles much longer than others; bristles inserted on a conspicuous conical cupule, persistent or caducous as a whole.

About 250 species: NW Africa, C and SW Asia, Europe; ten species (one endemic) in China.

The genus *Pilostemon* differs from *Jurinea* only in the pilose anther connectives. All other diagnostic characters given in the protologue of the genus, especially concerning the receptacle, achene, and pappus structure, can be found at least in some sections of *Jurinea* as well. *Pilostemon* is therefore not accepted in this treatment.

- 1a. Achene not spinulose-tuberculate.
- 2a. Leaf blade linear-filiform, 1–2 mm wide; involucre obconic; pappus plumose, 1–1.5 cm 3. *J. filifolia*
- 2b. Leaf blade broadly linear to elliptic, more than 3 mm wide; involucre cylindric or bowl-shaped; pappus scabrid or barbellate, 0.8–1.2 cm.
- 3a. Leaf blade broadly linear, abaxially grayish white, adaxially green, undivided; involucre cylindric; phyllaries scarious 1. *J. multiflora*
- 3b. Leaf blade elliptic, obovate, or ovate, green to grayish green, almost concolorous, pinnately dentate, pinnately lobed, or pinnately divided; involucre bowl-shaped; phyllaries leathery 2. *J. mongolica*
- 1b. Achene spinulose-tuberculate.
- 4a. Pappus elements not connate into a ring, persistent.
- 5a. Outer and middle phyllaries with reflexed or slightly bent apex 6. *J. dshungarica*
- 5b. Outer and middle phyllaries straight, appressed, apex not reflexed.
- 6a. Involucre cylindric, 1.2–1.5 cm in diam.; leaf blade grayish green, almost concolorous, arachnoid floccose 4. *J. adenocarpa*
- 6b. Involucre bowl-shaped, 2–3 cm in diam.; leaf blade abaxially grayish white and densely tomentose, adaxially green to pale green and glabrous or sparsely arachnoid tomentose 5. *J. lanipes*
- 4b. Pappus elements basally connate into a ring, caducous.
- 7a. Phyllaries straight, appressed, apex not reflexed 7. *J. lipskyi*
- 7b. Outer and middle phyllaries with reflexed to patent apex.
- 8a. Herbs (10–)20–45 cm tall; leaf blade of rosette leaves 4–11 \times 1–3 cm, green to grayish white, almost concolorous 10. *J. chaetocarpa*
- 8b. Herbs stemless or with shorter stems 2–10(–20) cm tall; leaf blade of rosette leaves 2–4 \times 0.3–1 cm, abaxially grayish white, adaxially green.
- 9a. Herbs stemless or shortly stemmed, to 10 cm tall; leaf blade of rosette leaves lyrate-pinnatifid, lyrate-pinnatisect, or pinnately divided, usually some undivided; outer phyllaries sparsely arachnoid, glabrescent, 5–15 mm 8. *J. algida*

- 9b. Herbs with developed stems, 7–18 cm tall; leaf blade of rosette leaves pinnately dentate to pinnately lobed; outer phyllaries densely arachnoid, 2–5 mm 9. *J. kaschgarica*

1. *Jurinea multiflora* (Linnaeus) B. Fedtschenko, Consp. Fl. Turkestan. 4: 295. 1911.

多花苓菊 duo hua ling ju

Serratula multiflora Linnaeus, Sp. Pl. 2: 817. 1753; *Jurinea linearifolia* Candolle; *Saussurea multiflora* (Linnaeus) Candolle.

Herbs 10–20[–50] cm tall, perennial. Caudex long, slender, usually branched. Stems several or solitary, erect, apically branched. Basal and lower stem leaves shortly petiolate; leaf blade abaxially grayish white, densely tomentose, and gland-dotted, adaxially green and glabrous or ± gland-dotted, margin entire and revolute, apex acute. Middle stem leaves sessile; leaf blade linear to broadly linear, 4–8[–15] × 0.3–0.6[–1] cm, base semamplexicaul. Bracts linear-subulate, smaller than lower stem leaves. Capitula many, in a terminal corymbose synflorescence. Involucre cylindric, 3–5 mm in diam. Phyllaries in 5 or 6 rows, scarious, appressed, glabrous or sparsely arachnoid pubescent, gland-dotted; outer phyllaries broadly to narrowly triangular, 3–5 × 1–2.5 mm; middle phyllaries elliptic to narrowly elliptic, 5–9 × 2–2.5 mm; inner phyllaries linear, 9–12 × 1–1.5 mm. Corolla pink to purple, 1.3–1.7 cm, tube 5–7.5 mm, limb 8–9 mm, lobes 4–5 mm. Achene brown to pale red, obconic, 3.5–5 mm, 4-ribbed, glabrous. Pappus bristles white, scarious, 8–10 mm, not connate into a ring, persistent. Fl. Jun–Aug, fr. Jul–Sep.

Forests, saline steppes, meadows, wastelands, fields; 1800–2000 m. NW Xinjiang [Kazakhstan, Mongolia, Russia; E Europe].

2. *Jurinea mongolica* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 19: 519. 1874.

蒙疆苓菊 meng jiang ling ju

Herbs 6–25 cm tall, perennial. Caudex stout, branched, apically covered with remains of petioles, densely white lanate. Stems erect, branched from base. Basal leaves petiolate; petiole 2–4 cm, base densely lanate; leaf blade elliptic to narrowly ovate-elliptic, 2–7 × 0.5–1.5 cm, pinnately divided, pinnately lobed, or pinnately dentate, green to grayish green, almost concolorous, glabrous or sparsely arachnoid, margin entire and revolute; lateral lobes 3 or 4 pairs, narrowly elliptic to narrowly triangular-ovate; terminal lobe narrowly ovate-elliptic, longer than lateral ones. Stem leaves sessile, similar to basal leaves or undivided. Capitulum solitary at end of branches. Involucre bowl-shaped, 1.5–2.5 cm in diam. Phyllaries in 4–6 rows, leathery, appressed, gland-dotted, apex acuminate; outer phyllaries narrowly triangular, 4–6 × 1.5–2.5 mm; middle phyllaries narrowly triangular-subulate, 7–11 × 1.5–2.5 mm; inner phyllaries linear, 15–20 × 2–3 mm. Corolla red, 2–2.5 cm, gland-dotted, tube 6–9 mm, limb 1.4–1.6 cm, lobes 5–7 mm. Achene brown, obconic, 4–6 mm, apically sparsely gland-dotted. Pappus bristles dirty white, barbellate, 5–12 mm, with 2–4 of inner ones much longer than others, not connate into a ring, persistent. Fl. Jun–Jul, fr. Jul–Aug.

Desert steppes; 1000–1500 m. Nei Mongol, Ningxia, Shaanxi, Xinjiang [Mongolia].

3. *Jurinea filifolia* (Regel & Schmalhausen) C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 170. 1890.

毛蕊苓菊 mao rui ling ju

Saussurea filifolia Regel & Schmalhausen, Trudy Imp. S.-Peterburgsk. Bot. Sada 6: 312. 1880; *Jurinea argentata* C. Shih & S. Y. Jin; *J. pilostemonoides* Iljin; *Pilostemon filifolius* (Regel & Schmalhausen) Iljin.

Herbs 25–70 cm tall, perennial. Stems solitary or few, grayish green, erect, virgately branched from base. Leaves sessile, linear to filiform, 1–7[–10] × 0.1–0.2 cm, abaxially grayish white and densely arachnoid tomentose, adaxially green and glabrous, margin revolute, apex acute. Capitulum solitary at end of branches. Involucre obconic, 1–2 cm in diam. Phyllaries in 5–8 rows, purplish red, appressed, tomentose, apex not reflexed, acuminate, and cartilaginous; outer phyllaries narrowly ovate-elliptic, 3–5 × 1–1.5 mm; middle phyllaries narrowly ovate to narrowly elliptic, 5–13 × 1.5–2 mm; inner phyllaries broadly linear, ca. 14 × 1.5 mm. Corolla purplish red, 1.5–2 cm, tube 7–9 mm, limb 6–7 mm, lobes 3–4 mm. Anther connectives with few very fine long unicellular hairs. Achene blackish brown, obconic, 3–5 mm, apically densely glandular and with a dentate crown. Pappus bristles white or dirty white, plumose, 1–1.5 cm, not connate into a ring, persistent. Fl. Jul–Aug, fr. Aug–Oct.

Gravelly riversides, moist gorges, sandy places; 700–1000 m. C Xinjiang [Kazakhstan].

Jurinea pilostemonoides does not differ from *J. filifolia*, except by the glabrous anther connectives, which, however, can be glabrescent in *J. filifolia* as well.

Jurinea karategina (Lipsky) O. Fedtschenko, described from Tajikistan and also treated as *Pilostemon karateginus* (Lipsky) Iljin, is said to occur in Xinjiang as well (G. M. Shen, Fl. Xinjiang. 5: 258. 1999; Iljin, Fl. URSS 27: 711. 1962), but no specimens from China are known. It differs from *J. filifolia* by its broader, elliptic or oblong leaves, to ca. 10 × 1.5 cm, and by its smaller florets, with a corolla of 1–1.3 cm.

4. *Jurinea adenocarpa* Schrenk ex Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 46. 1841.

腺果苓菊 xian guo ling ju

Herbs 15–40 cm tall, perennial. Caudex stout, branched, apically lanate tomentose. Stems several, erect, divaricately branched in apical half. Lower and middle stem leaves shortly petiolate; leaf blade elliptic, 5–10 × 1–2 cm, pinnately lobed or pinnately divided, both surfaces grayish green and arachnoid floccose; segments narrowly elliptic to linear, margin sinuate. Upper stem leaves sessile, elliptic to linear, gradually smaller upward on stem, undivided. Capitulum solitary at end of branches. Involucre cylindric, [0.8–]1.2–1.5 cm in diam. Phyllaries in ca. 6 rows, appressed, sparsely arachnoid floccose; outer phyllaries ovate, ca. 3 × 1 mm, apex acute; middle phyllaries narrowly ovate, 5–7 × 1–2 mm, apex spiniform-acuminate; inner phyllaries narrowly ovate, 10–14 × 2–3 mm, apex long acuminate. Corolla purple, 1–1.4 cm, tube 3.5–7.5 mm,

limb 2–3 mm. Achene cylindric to obconic, 4.5–6.5 mm, minutely glandular, apically sparsely spinulose-tuberculate. Pappus bristles barbellate, 5–10 mm, not connate into a ring, persistent. Fl. May–Aug, fr. Jul–Sep.

Sandy steppes, rocky slopes, scree slopes; ca. 1500 m. N Xinjiang (Burqin) [Kazakhstan].

5. *Jurinea lanipes* Ruprecht, Mém. Acad. Imp. Sci. Saint Pétersbourg, Sér. 7, 14(4): 58. 1869.

绒毛苓菊 rong mao ling ju

Jurinea flaccida C. Shih.

Herbs 15–50 cm tall, perennial. Caudex stout, apically covered with remains of petioles, densely lanate. Stems solitary or several, erect, simple or branched from base. Basal leaves petiolate; petiole 4–6 cm; leaf blade narrowly obovate to elliptic, 5–10 × 2–3 cm, lyrate pinnately lobed, abaxially grayish white and densely tomentose, adaxially green and glabrous or sparsely arachnoid and gland-dotted; lateral lobes 3–10 pairs, ovate to elliptic, margin entire, apex obtuse to rarely acute; terminal lobe larger than lateral ones. Lower and middle stem leaves few, shortly petiolate to sessile, similar to basal leaves. Uppermost stem leaves linear, usually undivided. Capitulum solitary at end of branches. Involucre bowl-shaped, 2–3 cm in diam. Phyllaries in ca. 6 rows, appressed, sparsely arachnoid, gland-dotted, apex spiniform-acuminate; outer phyllaries triangular, 6–10 × 1–2 mm; middle and inner phyllaries narrowly triangular-ovate, 10–18 × 1–2 mm. Corolla reddish purple, 1.6–1.7 cm, tube 4–7 mm, limb 1–1.2 cm, lobes ca. 5 mm. Achene cylindric-obconic, 5–6 mm, apically spinulose-tuberculate. Pappus bristles white, barbellate, 0.8–1.2 cm, with 1 or 2 of inner ones much longer than others, not connate into ring, persistent. Fl. May–Aug, fr. Jun–Sep.

Alpine and subalpine forest meadows, steppes, wastelands, roadsides; 1200–2900 m. NW Xinjiang (Zhaosu) [Kazakhstan, Kyrgyzstan, Tajikistan].

6. *Jurinea dshungarica* (N. I. Rubtsov) Iljin in Schischkin & Bobrov, Fl. URSS 27: 683. 1962.

天山苓菊 tian shan ling ju

Jurinea chaetocarpa (Ledebour) Ledebour subsp. *dshungarica* N. I. Rubtsov, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 8: 65. 1940.

Herbs 10–40(–60) cm tall, perennial. Caudex stout, apically covered with remains of petioles. Stems solitary or few, erect, simple or branched. Basal leaves petiolate; petiole 1.5–4(–8) cm, base adaxially densely lanate; leaf blade elliptic, 5–7(–12) × 1–2.5 cm, pinnately lobed to undivided, abaxially grayish white and densely tomentose, adaxially grayish green, arachnoid, and gland-dotted; lateral lobes 4–7 pairs, ovate, elliptic, or broadly triangular, margin entire or dentate, apex rounded to acute. Stem leaves few, similar to basal leaves, gradually smaller upward on stem. Capitulum solitary at end of branches. Involucre bowl-shaped, 1.5–2 cm in diam. Phyllaries in ca. 5 rows, yellowish green, arachnoid; outer and middle phyllaries narrowly triangular-ovate to narrowly elliptic, 3–10 ×

1–3 mm, apex spiniform-acuminate and reflexed; inner phyllaries elliptic to elliptic-linear, 8–14 × 1–2 mm, apex acuminate and not reflexed. Corolla reddish purple, 1.4–1.9 cm, tube 4–7 mm, limb 1–1.2 cm, lobes 4–6 mm. Achene obconic, 5–6 mm, apically spinulose-tuberculate. Pappus bristles white, barbellate, 0.8–1.2 cm, with 2 of inner ones much longer than others, not connate into a ring, persistent. Fl. May–Jun, fr. Jun–Aug.

Mountain slopes, sandy soils; 1800–2700 m. NW Xinjiang (Huocheng, Zhaosu) [Kazakhstan].

“*Jurinea suidunensis*” belongs here, but, to our knowledge, has never been validated by a description or diagnosis. When regarded as conspecific with *J. dshungarica* (e.g., by Tscherneva, Bot. Zhurn. 86 (12): 88–89. 2001), a concept which is followed here, the latter name has to be adopted as the correct one for this taxon.

7. *Jurinea lipskyi* Iljin, Trudy Turkestansk. Nauchn. Obshch. Sredne-Aziatsk. Gosud. Univ. 2: 23. 1925.

苓菊 ling ju

Herbs 35–50 cm tall, perennial. Stems solitary or few, erect, simple or few branched. Basal leaves petiolate; petiole 1–2 cm; leaf blade elliptic to narrowly obovate, 2–4 × 1.5–2 cm, pinnately lobed, abaxially grayish white and sparsely tomentose, adaxially green to grayish green and glabrous or sparsely arachnoid; lateral lobes 3 or 4 pairs, narrowly elliptic to narrowly triangular-ovate, margin undulate or serrulate, apex obtuse. Stem leaves few, gradually smaller upward on stem; lower stem leaves similar to basal leaves; upper stem leaves linear to subulate. Capitulum solitary at end of branches. Involucre bowl-shaped, 1.5–2 cm in diam. Phyllaries in ca. 4 rows, appressed, glabrous or sparsely arachnoid, apex acute to acuminate; outer phyllaries narrowly triangular-ovate, 4–6 × 2–3 mm; middle and inner phyllaries narrowly ovate-elliptic to linear, 10–15 × 3–4 mm. Corolla purple, ca. 1.5 cm, tube 4.5–5.5 mm, limb ca. 1 cm, lobes 4–5 mm. Achene obconic, 6–7 mm, gland-dotted, apically spinulose-tuberculate. Pappus bristles white, scabrid to barbellate, to 9 mm, with 2 of inner ones much longer than others, basally connate into a ring, caducous. Fl. May–Jun, fr. Jun–Jul.

Montane steppes and meadows; ca. 1900 m. NW Xinjiang (Zhaosu) [Kazakhstan].

8. *Jurinea algida* Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 5: 170. 1924.

矮小苓菊 ai xiao ling ju

Jurinea pamirica C. Shih.

Herbs 2–10 cm tall, perennial, stemless or shortly stemmed. Caudex simple or branched, covered with remains of petioles. Rosette leaves petiolate; petiole 1.5–3 cm, base adaxially lanate; leaf blade elliptic to narrowly obovate, 2.5–4 × 0.5–1 cm, lyrate pinnately lobed to divided or pinnately divided, abaxially grayish white and densely tomentose, adaxially green, sparsely arachnoid, and gland-dotted but glabrescent; lateral lobes 2–4 pairs, narrowly ovate, elliptic, or obliquely triangular, margin revolute and entire or sinuately dentate, apex obtuse to rounded; terminal lobe usually larger than lateral ones. Capitulum solitary, in center of leaf rosette or terminal on

stem. Involucre bowl-shaped, 1.5–2.5 cm in diam. Phyllaries in 3–5 rows, sparsely arachnoid tomentose; outer and middle phyllaries narrowly triangular-ovate, 5–15 × 1–3 mm, apex spiniform-acuminate and reflexed; inner phyllaries narrowly triangular-ovate to linear, 10–14 × 1–3 mm, apex acuminate and not reflexed. Corolla purplish red, 1.4–2 cm, tube 6–8.5 mm, limb 8–10 mm, lobes 3.5–5 mm. Achene brown, narrowly ellipsoid, 4–7 mm, glabrous, apically spinulose-tuberculate. Pappus bristles white, scabrid to barbellate, 1.2–1.6 cm, with 3 or 4 of inner ones much longer than others, basally connate into a ring, caducous. Fl. Jul–Sep, fr. Aug–Sep.

Subalpine and alpine scree slopes; 2800–3100 m. W Xinjiang (Wuqia) [Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

Jurinea pamirica does not differ from *J. algida*, except for the stronger branched caudex, which leads to a more densely caespitose or even pulvinate habit. Leaf division is quite variable in *J. algida* so that this character cannot be used to separate *J. pamirica* from it.

9. *Jurinea kaschgarica* Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 81. 1928.

南疆苓菊 nan jiang ling ju

Herbs 7–18 cm tall, perennial. Caudex stout, simple or few branched, covered with remains of petioles. Stems solitary or several, erect or ascending, simple. Rosette leaves petiolate; petiole 5–10 mm; leaf blade linear-elliptic to narrowly obovate, 1.5–4 × 0.3–1 cm, pinnately lobed or pinnately dentate, abaxially grayish white and densely tomentose, adaxially green and sparsely arachnoid; lobes triangular. Stem leaves few, similar to rosette leaves or linear, pinnately lobed or undivided; upper and uppermost stem leaves linear, smaller than lower ones, undivided. Capitulum solitary at end of stem. Involucre bowl-shaped, 1.5–2 cm in diam. Phyllaries in 4 or 5 rows, densely arachnoid tomentose to glabrescent; outer phyllaries narrowly triangular-ovate, 2–5 × 1–2 mm, apex spiniform-acuminate and reflexed to patent; middle phyllaries narrowly ovate, 5–12 × 2–3 mm, apex acuminate; inner phyllaries linear, 12–15 × 2–3 mm, apex acuminate and not reflexed. Corolla reddish purple, 1.2–1.4 cm,

tube ca. 7.5 mm, limb to 9 mm, lobes 3–4 mm. Achene obconic, 5–6 mm, apically spinulose-tuberculate. Pappus bristles white, barbellate, 2–11 mm, with 2–5 of inner ones much longer than others, basally connate into a ring, caducous. Fl. and fr. Jun.

• Scree slopes, gullies; ca. 2300 m. W Xinjiang (Wuqia).

Jurinea kaschgarica is closely related to and possibly not clearly separable from *J. algida*.

10. *Jurinea chaetocarpa* (Ledebour) Ledebour in Candolle, Prodr. 6: 676. 1838.

刺果苓菊 ci guo ling ju

Serratula chaetocarpa Ledebour, Fl. Altaic. 4: 42. 1833; *Jurinea scapiformis* C. Shih.

Herbs 10–45 cm tall, perennial. Caudex apically covered with remains of petioles, densely lanate. Stems usually several or rarely solitary, erect, simple or few branched. Rosette leaves petiolate; petiole to 9 cm; leaf blade elliptic, 4–11 × 1–3 cm, pinnately lobed, green to grayish white, almost concolorous, glabrous to densely arachnoid tomentose; lobes 4–6 pairs, narrowly elliptic, narrowly ovate, or obliquely triangular, margin entire or sinuate, apex acute to acuminate; terminal lobe narrowly ovate-elliptic, longer than lateral ones. Stem leaves few or absent, similar to rosette leaves but sessile and sometimes linear-subulate and undivided. Capitulum solitary at end of branches. Involucre bowl-shaped, 1.5–2 cm in diam. Phyllaries in 4 or 5 rows, narrowly triangular-ovate to linear-subulate, apex spiniform-acuminate; outer and middle phyllaries 6–11 × 2–3 mm, apex reflexed to patent; inner phyllaries 1.4–2 × 0.3–0.4 cm. Corolla purplish red, 1.2–1.5 cm, tube ca. 4 mm, limb ca. 9 mm, lobes 3–4 mm. Achene ellipsoid-obconic, 4–6 mm, densely spinulose-tuberculate. Pappus bristles white, barbellate, 7.5–10 mm, with 1 or 2 of inner ones much longer than others, basally connate into a ring, caducous. Fl. May–Jun, fr. Jun–Jul.

Gravelly deserts, saline and sandy steppes; 500–2000 m. N Xinjiang [Kazakhstan, W Mongolia].

15. DIPLAZOPTILON Y. Ling, Acta Phytotax. Sin. 10: 85. 1965.

重羽菊属 chong yu ju shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Herbs, perennial, stemless. Leaves in basal rosette, undivided. Capitulum solitary. Receptacle alveolate, with unequal subulate processes. Corolla purple, glabrous. Anther tails long, fimbriate-lacerate, caudate. Style branches linear, long, divergent, apex acute. Achene obconic, 4-angled, glabrous, with apical rim forming a short crown. Pappus homomorphic, in 2 rows; bristles subequal, plumose, basally connate into a ring, caducous as a whole.

• One species: China.

1. *Diplazoptilon picridifolium* (Handel-Mazzetti) Y. Ling, Acta Phytotax. Sin. 10: 85. 1965.

重羽菊 chong yu ju

Jurinea picridifolia Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 69. 1925.

Herbs 3–9 cm tall, perennial, stemless or rarely shortly

stemmed. Caudex to 1.2 cm in diam., simple, densely covered with remains of petioles. Stem (if present) solitary, ca. 3 mm in diam., erect, simple. Rosette leaves petiolate; petiole 0.5–2 cm; leaf blade elliptic, narrowly ovate, or narrowly obovate, 8–15(–27) × 1–5 cm, both surfaces green, abaxially glabrous, adaxially sparsely strigose, base attenuate, margin entire or sparsely dentate with mucronulate teeth, apex acute to obtuse and mucronulate. Capitulum solitary in center of leaf rosette.

Involucre campanulate, 2.5–3.5 cm in diam. Phyllaries in 4 or 5 rows, apex acuminate; outer and middle phyllaries triangular-ovate, 1.5–2 × 0.4–0.5 cm; inner phyllaries narrowly ovate, elliptic, or linear, 2.5–3 × 0.2–0.4 cm. Corolla 2.5–2.7 cm, tube

1.5–1.7 cm, limb ca. 1 cm, lobes ca. 5 mm. Achene 5–6 mm. Pappus bristles pale brown, 2–2.3 cm. Fl. and fr. Aug–Sep.

• Alpine grasslands, mountain slopes; 3600–3800 m. SE Xizang, NW Yunnan.

16. HIMALAIELLA Raab-Straube, Willdenowia 33: 390. 2003.

须弥菊属 *xu mi ju shu*

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Saussurea sect. *Elatae* J. D. Hooker, Fl. Brit. India 3: 373. 1881.

Herbs, biennial or perennial, tall or rarely stemless. Stems usually densely leafy or rarely scapiform. Basal leaves often lyrate-lyrate pinnately lobed to pinnately divided. Capitulum solitary and terminal on stem or in a racemiform, paniculiform, or corymbiform synflorescence, often nodding or sometimes erect, sessile or pedunculate. Involucre hemispheric to campanulate. Phyllaries sometimes reflexed. Receptacle densely covered with subulate alveolate bristles and rarely also with subulate paleae. Corolla reddish purple, purple, pink, or white, gland-dotted. Anther tails moderately lacerate. Achene blackish, 2–5.5 mm, 4- or 5-angled, glabrous, wrinkled, squamulate, or muricate, apical rim forming a conspicuous crown. Pappus homomorphic, in 1 row; bristles snow white, dirty white, or brownish, plumose, basally connate into a ring, caducous as a whole.

Thirteen species: Afghanistan, Bhutan, China, N India, Kashmir, Laos, Myanmar, Nepal, Pakistan, N Thailand, N Vietnam; SW Asia (Iran); seven species (one endemic) in China.

In C. Shih and S. Y. Jin (FRPS 78(2): 57–66. 1999), most species of *Himalaiella* are included in *Saussurea* subg. *Frolovia* (Candolle) Lipschitz. They are, however, more closely related to *Jurinea* than to *Saussurea*.

- 1a. Leaf blade of basal and lower stem leaves pinnately or bipinnately divided, terminal lobe not much larger than lateral ones.
 - 2a. Plants almost stemless; capitula few, clustered in center of leaf rosette 1. *H. yakla*
 - 2b. Plants with tall stems; capitula many, in a racemiform or paniculiform synflorescence 7. *H. peguensis*
- 1b. Leaf blade of basal and lower stem leaves lyrate-lyrate pinnately lobed or lyrate-lyrate pinnately divided, terminal lobe much larger than lateral ones or blade undivided.
 - 3a. Stem simple, scapiform with reduced leaves; capitulum always solitary; leaf blade adaxially grayish green, arachnoid tomentose 2. *H. abnormis*
 - 3b. Stem branched or rarely simple, leafy, not scapiform; capitula numerous or solitary; leaf blade adaxially green, scabrous, strigose, or glabrescent.
 - 4a. Receptacle with bristles and long subulate paleae; pappus brown 3. *H. auriculata*
 - 4b. Receptacle with bristles but without paleae; pappus white or straw-colored.
 - 5a. Plants few branched, with 2–4 capitula; outer phyllaries without appendage, long acuminate 4. *H. qinghaiensis*
 - 5b. Plants usually much branched, capitula numerous; outer phyllaries with a green, herbaceous appendage.
 - 6a. Involucre 1–2 cm in diam.; capitula solitary or clustered, subsessile or shortly pedunculate; corolla 1–1.2 cm; pappus 0.8–1 cm 6. *H. nivea*
 - 6b. Involucre 2–4 cm in diam.; capitulum mostly solitary, long pedunculate; corolla 1.5–2 cm; pappus 1.4–1.6 cm 5. *H. deltoidea*

1. *Himalaiella yakla* (C. B. Clarke) Fujikawa & H. Ohba, J. Jap. Bot. 82: 133. 2007.

亚东须弥菊 *ya dong xu mi ju*

Saussurea yakla C. B. Clarke, Compos. Ind. 227. 1876; *Diplazoptilon cooperi* (J. Anthony) C. Shih; *Dolomiaea cooperi* (J. Anthony) Y. Ling; *Jurinea cooperi* J. Anthony.

Herbs, perennial, stemless or shortly stemmed. Rosette leaves petiolate; petiole 2–6[–10] cm; leaf blade ovate, elliptic, or oblong in outline, 5–40 × 3–8 cm, bipinnately lobed to bipinnately divided, abaxially white with distinct dark veins, arachnoid tomentose, and glandular, adaxially green, puberulent, and sparsely glandular; segments 5–10 pairs, triangular,

ovate, or oblong, 1–3.3 × 0.8–3.4 cm, margin dentate and mucronate, apex acute or obtuse and mucronate. Capitula (1–)3–8(–10), in a condensed corymbiform synflorescence in center of leaf rosette, sessile or subsessile. Involucre campanulate, 0.8–3 cm in diam. Phyllaries in 4–6 rows, light brown, green, or reddish, apex erect or reflexed; outer phyllaries narrowly triangular-ovate, 5–10 × 2–4 mm, apex acute; middle phyllaries narrowly ovate-elliptic, 10–18 × 2–4 mm; inner phyllaries narrowly elliptic to linear, 1.8–3 × 0.1–0.3 cm, apex obtuse. Receptacle bristles 3–5 mm. Corolla purple, 1.7–2.7 cm, tube 1.3–1.5 cm, limb ca. 5 mm, lobes 4–6 mm. Achene 2.5–5.5 mm, 4- or 5-angled, muricate, apex with a dentate crown. Pappus bristles dirty white to light brown, 1.6–2.5 cm. Fl. and fr. Aug–Nov. $2n = 34$.

Alpine meadows, grasslands; ca. 4100 m. S Xizang (Yadong) [Bhutan, India (Sikkim), Nepal].

2. *Himalaiella abnormis* (Lipschitz) Raab-Straube, Willdenowia 33: 390. 2003.

普兰须弥菊 pu lan xu mi ju

Saussurea abnormis Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 56: 826. 1971; *S. neglecta* Ludlow.

Herbs 8–15[–30] cm tall, perennial. Stems solitary or several, grayish white, 2–3 mm in diam., erect or ascending, simple, densely arachnoid tomentose. Basal leaves petiolate; petiole 2–3 cm; leaf blade obovate to elliptic, 6–12[–25] × 1.5–5[–8] cm, lyrate-pinnately lobed, abaxially grayish white, with conspicuous veins, and densely arachnoid tomentose, adaxially grayish green and arachnoid; lateral lobes 2–6 pairs, elliptic, proximal ones small, apex obtuse to rounded; terminal lobe ovate, margin sinuate or denticulate, apex obtuse to acute. Capitulum solitary, terminal on stems, erect in bud, nodding at anthesis and in fruit. Involucre hemispheric to campanulate, 1.2–2 cm in diam. Phyllaries in 4 or 5 rows, arachnoid tomentose, apex long acuminate; outer phyllaries narrowly ovate-triangular, 8–9 × 1.2–1.5 mm, apically reflexed or erect; middle and inner phyllaries narrowly elliptic to linear, 10–12 × 1–1.5 mm. Receptacle bristles ca. 5 mm. Corolla pink, 1.4–1.7 cm. Achene cylindric, 2–3 mm, apex with a dentate crown. Pappus bristles white, ca. 1 cm. Fl. and fr. Jul.

Alpine scree slopes; 3800–4400 m. S and SW Xizang (Burang, Gyirong) [NW India, W Nepal].

3. *Himalaiella auriculata* (Candolle) Raab-Straube, Willdenowia 33: 390. 2003.

白背须弥菊 bai bei xu mi ju

Aplotaxis auriculata Candolle, Prodr. 6: 541. 1838; *Saussurea auriculata* (Candolle) Schultz Bipontinus; *S. hypoleuca* Sprengel ex C. B. Clarke, nom. illeg. superfl.

Herbs 0.4–1.5 m tall, perennial. Stem solitary, 2–5 mm in diam., erect, simple or few branched. Basal to middle stem leaves sessile, obovate, 8–22 × 2.5–10 cm, lyrate-pinnately parted, abaxially grayish green and sparsely arachnoid tomentose, adaxially black when dry and puberulent, base auriculate and amplexicaul; lateral lobes 1–3 pairs, obliquely triangular; terminal lobe triangular, large, margin dentate, apex acute. Upper stem leaves usually shortly petiolate; leaf blade narrowly ovate to elliptic, 3–11 × 0.5–5 cm, undivided. Capitula solitary or few, terminal on stem and branches, nodding at anthesis. Involucre broadly campanulate, 2–3 cm in diam. Phyllaries in ca. 5 rows, sparsely pubescent, margin ciliate, apex long acuminate; outer phyllaries narrowly triangular, 8–14 × 1.5–2.5 mm; middle and inner phyllaries narrowly triangular to linear, 12–17 × 1–2 mm. Receptacle bristles 2–5 mm; paleae yellowish brown, subulate, 1.2–1.5 cm, ciliate in distal half. Corolla dark purple, 8–10 mm, tube 3–5 mm, limb 4–6 mm, lobes 1.5–2(–3) mm. Achene blackish brown, cylindric, 3–3.5 mm, 4- or 5-ribbed, apically spinulose, apex with a denticulate crown. Pappus bristles brown, 7–10 mm. Fl. and fr. Aug–Sep. *2n* = 58.

Mixed forests; 2700–4000 m. S Xizang [Bhutan, N India, Kashmir, Nepal].

Saussurea hypoleuca is illegitimate because C. B. Clarke, in the protologue, cited the validly published earlier name *Aplotaxis auriculata* in synonymy.

4. *Himalaiella qinghaiensis* (S. W. Liu & T. N. Ho) Raab-Straube, **comb. nov.**

青海须弥菊 qing hai xu mi ju

Basionym: *Saussurea qinghaiensis* S. W. Liu & T. N. Ho, Fl. Qinghai. 3: 511. 1996.

Herbs, 80–90 cm tall, perennial. Stem solitary, apically few branched, erect, ca. 5 mm in diam. Basal and lower stem leaves often withered at anthesis, petiolate; petiole to 3 cm; leaf blade 2.5–7 × 3–4 cm, abaxially grayish green, tomentose, adaxially green, pubescent, base truncate, margin sparsely dentate, apex acute. Middle and upper stem leaves sessile, 4–10 × 0.5–3.5 cm, base auriculate, amplexicaul, apex acute to acuminate. Capitula 2–4, very long pedunculate, nodding, in racemiform synflorescence. Involucre broadly hemispheric, 2–3 cm in diam. Phyllaries in 7–9 rows, straw-colored, blackish brown at margin, arachnoid, narrowly ovate-subulate to subulate-filiform, 1–1.5 mm wide, apex long acuminate and reflexed. Corolla bluish purple, 1–1.3 cm, tube 6–7 mm, limb 6–7 mm, lobes 2–3 mm. Achene black, ca. 4 mm, 4-angled, transversely rugose, apex with a denticulate crown. Pappus pale brown, outer bristles short, inner bristles to 1.2 cm. Fl. Aug.

• Near mountain streams; ca. 3600 m. S Qinghai (Yushu).

This species has been described as having a row of short outer pappus bristles. However, on the image available to us, no such bristles can be seen. The nodding, large capitula and achene characters are typical for the genus *Himalaiella*; therefore, this taxon is excluded from *Saussurea* and included here in *Himalaiella*.

5. *Himalaiella deltoidea* (Candolle) Raab-Straube, Willdenowia 33: 391. 2003.

三角叶须弥菊 san jiao ye xu mi ju

Aplotaxis deltoidea Candolle, Prodr. 6: 541. 1838; *Frolovia formosana* (Hayata) Lipschitz; *Saussurea deltoidea* (Candolle) Schultz Bipontinus; *S. formosana* Hayata; *S. kouy-tcheensis* H. Léveillé; *S. lamprocarpa* Hemsley; *S. radiata* Franchet; *Synurus taiwanianus* S. S. Ying.

Herbs 0.6–2(–3) m tall, biennial. Stem solitary, 0.5–1.5 cm in diam., erect, simple or branched. Lower and middle stem leaves petiolate; leaf blade ovate-elliptic in outline, lyrate-pinnately divided, abaxially grayish white, arachnoid tomentose, gland-dotted, and with brown articulate hairs, adaxially green and scabrous; lateral segments 1 or 2 pairs, narrowly elliptic to triangular, 1–3 × 0.5–2 cm; terminal segment triangular-hastate, 7–35 × 6–25 cm, margin dentate, apex acute. Upper stem leaves shortly petiolate or sessile, ovate-elliptic, margin lobed or dentate. Capitula usually numerous, in an ample paniculiform synflorescence, nodding, long pedunculate. Involucre broadly campanulate, (2–)3–4 cm in diam. Phyllaries in 5–7 rows, arachnoid tomentose; outer phyllaries triangular-ovate, 4–9 × 1.5–2 mm, apically with a triangular-ovate fimbriate appendage; middle phyllaries narrowly ovate-elliptic, 8–15 × 1.5–2.5 mm, with an apical appendage; inner phyllaries narrowly ovate to linear, 15–20 × 1.5–2.3 mm, apex acuminate and without an ap-

pendage. Receptacle bristles 7–10 mm. Corolla pink or white, (1.2–)1.5–2.1 cm, tube 0.9–1.2 cm, limb 6–9 mm, lobes 2.5–4 mm. Achene black, obconic, 3–4(–5) mm, 4-angled, apically muricate, apex with a denticulate crown. Pappus bristles white, (1.2–)1.4–1.6 cm. Fl. and fr. May–Nov. $2n = 34^*$.

Mountain slopes, grasslands, forests, thickets, wastelands, pastures, forest margins; 700–3400 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Bhutan, N India, Laos, Myanmar, Nepal, Pakistan, N Thailand, N Vietnam].

6. *Himalaiella nivea* (Candolle) Raab-Straube, Willdenowia 33: 391. 2003.

小头须弥菊 xiao tou xu mi ju

Aplotaxis nivea Candolle, Prodr. 6: 541. 1838; *Saussurea cirsiium* H. Léveillé; *S. crispa* Vaniot; *S. deltoidea* (Candolle) Schultz Bipontinus var. *nivea* (Candolle) C. B. Clarke; *S. deltoidea* subsp. *polycephala* (C. B. Clarke) H. Koyama; *S. deltoidea* var. *polycephala* C. B. Clarke; *S. microdeltoidea* Kitamura; *S. nivea* (Candolle) Schultz Bipontinus (1846), not Turczaninow (1837).

Herbs (0.3–)0.5–1.8 m tall, biennial. Stem solitary, 5–10 mm in diam., erect, simple or branched. Lower stem leaves petiolate; leaf blade lyrate-pinnately parted, abaxially grayish green, with dark veins, and tomentose, adaxially green, scabrous or sparsely arachnoid, and gland-dotted; lateral lobes 1 or 2 pairs, oblong-triangular; terminal lobe triangular-hastate, 7–11 × 5–11 cm, margin dentate, apex acute. Middle and upper stem leaves petiolate; leaf blade triangular-hastate, narrowly ovate, or elliptic. Capitula numerous, in a racemiform to paniculiform synflorescence, subsessile to pedunculate. Involucre campanulate, 1–2(–2.5) cm in diam. Phyllaries in 4 or 5 rows; outer phyllaries ovate-elliptic, 3–5 × 1.5–2 mm, arachnoid tomentose and gland-dotted, with an orbicular fimbriate appendage; middle phyllaries narrowly ovate-elliptic, 5–9 × 1.5–2 mm, with an apical appendage; inner phyllaries narrowly ovate to linear, 12–13 × 1–1.5 mm, apex acuminate and without an appendage. Receptacle bristles 4–5 mm. Corolla purple, 0.9–1.2 cm, tube 5–7 mm, limb 4–6 mm, lobes 2–3 mm. Achene black, obconic, 2–3.5 mm, 4-angled, apically muricate, apex with a denticulate

crown. Pappus bristles straw-colored, 8–10 mm. Fl. and fr. Aug–Oct. $2n = 34$.

Grasslands on mountain slopes, forests and forest margins in mountain valleys; 200–2800 m. Guizhou, Sichuan, Xizang, Yunnan [NE India, Laos, Myanmar, Nepal, N Thailand, N Vietnam].

There are intermediate forms between *Himalaiella deltoidea* and *H. nivea* in those areas where both species occur. Further investigation is needed to clarify the status of these two taxa.

7. *Himalaiella peguensis* (C. B. Clarke) Raab-Straube, Willdenowia 33: 391. 2003.

叶头须弥菊 ye tou xu mi ju

Saussurea peguensis C. B. Clarke, Compos. Ind. 235. 1876; *S. dealbata* Collett & Hemsley; *S. deltoidea* (Candolle) Schultz Bipontinus var. *peguensis* (C. B. Clarke) J. D. Hooker; *S. leontopodium* H. Léveillé & Vaniot; *S. phyllocephala* Collett & Hemsley.

Herbs 0.5–1.5[–2.5] m tall, biennial. Stem solitary, 7–10 mm in diam., erect, simple. Basal and lower stem leaves petiolate; leaf blade elliptic to obovate in outline, 8–30[–40] × 5–10[–15] cm, bipinnately lobed to bipinnately divided, abaxially grayish green and densely tomentose, adaxially green, scabrous, and with brown articulate hairs; primary lobes 5–10 pairs; secondary lobes 1–4 pairs, ovate-elliptic to obliquely triangular, apex mucronate. Middle and upper stem leaves sessile, gradually smaller upward on stem, pinnately lobed to pinnately divided, base auriculate and semiamplexicaul, apex acute. Capitula numerous in a racemiform or paniculiform synflorescence, subsessile to pedunculate. Involucre campanulate, 1.5–2(–2.5) cm in diam. Phyllaries in 4 or 5 rows, apex acute; outer phyllaries grayish green, oblong-linear, 9–15 × 1–5 mm, herbaceous, arachnoid lanate, margin crenulate; middle phyllaries narrowly triangular-ovate, 8–10[–15] × 1–1.5 mm; inner phyllaries linear, 8–10[–20] × 1–1.5 mm. Corolla purple, 1.3–1.5 cm, tube 6–7 mm, limb 6–7 mm, lobes 2–2.5 mm. Achene blackish brown, cylindric, 2–4 mm, apically muricate, apex with a crenulate crown. Pappus bristles dirty white, 1.1–1.2 cm. Fl. and fr. Sep–Oct. $2n = 34$.

Forests; 1200–1600 m. Guizhou, Yunnan [Myanmar, N Thailand].

17. *DOLOMIAEA* Candolle, Arch. Bot. (Paris) 2: 330. 1833.

川木香属 chuan mu xiang shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Mazzettia Iljin; *Vladimiria* Iljin.

Herbs, perennial, rosulate and stemless or shortly stemmed. Capitula solitary or several, clustered in center of leaf rosette or terminal on stem and subtended by bracts, large. Involucre campanulate. Phyllaries in several rows, imbricate, leathery to subleathery, margin ciliate. Receptacle flat, alveolate, naked or margin of alveolae with very short subulate cartilaginous processes. Corolla gland-dotted. Anther tails lacerate. Style branches divergent or coherent. Achene trigonous or tetragonous, sometimes cylindric, with an apical rim. Pappus bristles in 2 to several rows, scabrid to shortly plumose, basally connate into a ring, caducous as a whole.

Thirteen species: China, NW India, Kashmir, Myanmar, Nepal; 12 species (ten endemic) in China.

1a. Capitulum solitary, in center of leaf rosette or terminal on stem.

2a. Leaf blade undivided.

3a. Leaves 4–9 × 1.2–2 cm, margin entire; pappus bristles in 2 rows, barbellate 1. *D. georgei*

- 3b. Leaves 7–20 × 4–19 cm, margin dentate; pappus bristles in many rows, scabrid 4. *D. berardioidea*
- 2b. Leaf blade pinnately lobed, pinnatifid, or pinnatipartite.
- 4a. Leaf blade green, concolorous, strigose or glabrous.
- 5a. Leaf blade 2.5–10 × 1–2.5 cm, glabrous; involucre 1.5–2.5 cm in diam. 2. *D. salwinensis*
- 5b. Leaf blade 5–20 × 3–17 cm, strigose; involucre 4–6 cm in diam. 3. *D. edulis*
- 4b. Leaf blade at least abaxially grayish white, densely tomentose.
- 6a. Leaf blade abaxially grayish white and densely tomentose, adaxially green and arachnoid only along midrib 5. *D. platylepis*
- 6b. Leaf blade on both surfaces grayish green to grayish white and arachnoid tomentose 10. *D. crispoundulata*
- 1b. Capitula 2–15, clustered in center of leaf rosette.
- 7a. Outermost pappus bristles recurved and covering achene 7. *D. souliei*
- 7b. Outermost pappus bristles straight and not covering achene.
- 8a. Leaf blade green, almost concolorous, undivided or sometimes pinnately lobed, strigose 6. *D. forrestii*
- 8b. Leaf blade at least abaxially grayish white, pinnately divided, densely tomentose.
- 9a. Leaf blade bipinnately lobed to bipinnatisect.
- 10a. Style branches oblong, short, ± coherent, apex rounded; pappus yellowish brown 11. *D. calophylla*
- 10b. Style branches linear, long and slender, divergent, apex acute; pappus brick-colored 12. *D. lateritia*
- 9b. Leaf blade pinnatipartite, pinnatisect, or lyrate pinnatisect.
- 11a. Leaf blade pinnatipartite, arachnoid tomentose on both surfaces 10. *D. crispoundulata*
- 11b. Leaf blade lyrate pinnatisect or pinnatisect, abaxially grayish white and tomentose, adaxially green and glabrous or sparsely arachnoid.
- 12a. Leaf blade lyrate pinnatisect, terminal lobe much larger than lateral ones 8. *D. wardii*
- 12b. Leaf blade pinnatisect, terminal lobe not much larger than lateral ones 9. *D. scabrida*

1. *Dolomiaea georgei* (J. Anthony) C. Shih, Acta Phytotax. Sin. 24: 294. 1986.

腺叶川木香 xian ye chuan mu xiang

Jurinea georgei J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 21. 1934; *Vladimiria georgei* (J. Anthony) Y. Ling.

Herbs 5–12(–18) cm tall, perennial, stemless or shortly stemmed. Caudex 0.5–1.5 cm in diam., simple or few branched. Rosette leaves petiolate; petiole 3–9 cm; leaf blade elliptic, narrowly obovate, or spatulate, 4–9 × 1.2–2 cm, both surfaces green and densely gland-dotted but otherwise glabrous, base attenuate, margin entire or shallowly undulate, apex acute to obtuse. Capitulum solitary, in center of leaf rosette or terminal on stem and subtended by bracts. Involucre campanulate or broadly cylindric, 2–3 cm in diam. Phyllaries in 4 or 5 rows, leathery, glabrous, margin purplish and scarious; outer and middle phyllaries ovate, narrowly ovate, or ovate-elliptic, 1.5–3 × 0.5–0.8(–1) cm, apex obtuse; inner phyllaries elliptic to broadly linear, 3–3.5 × 0.3–0.4 cm, apex acute to acuminate. Corolla purplish red, 3–3.5 cm, tube ca. 2.7 cm, limb 8–9 mm, lobes 3.5–4 mm. Style branches 3–4 mm, slender, divergent. Achene trigonous or quadrangular, 4–6 mm, glabrous. Pappus bristles in ca. 2 rows, dirty white to pale yellowish brown, barbellate, 2.5–3.2 cm. Fl. and fr. Aug–Oct.

• Grasslands on mountain slopes; ca. 3200 m. NW Yunnan.

2. *Dolomiaea salwinensis* (Handel-Mazzetti) C. Shih, Acta Phytotax. Sin. 24: 295. 1986.

怒江川木香 nu jiang chuan mu xiang

Jurinea salwinensis Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 69. 1925; *Mazzettia salwinensis* (Handel-Mazzetti) Iljin; *Vladimiria salwinensis* (Handel-Mazzetti) Iljin.

Herbs 4–10 cm tall, perennial, stemless or shortly stemmed. Caudex 0.5–1.5 cm in diam., unbranched. Rosette leaves petiolate; petiole long, winged; leaf blade elliptic, narrowly elliptic, narrowly ovate, or spatulate, 2.5–10 × 1–2.5 cm, both surfaces green and glabrous, base attenuate, margin entire, obtusely dentate, or ± pinnately lobed, apex obtuse to acute. Upper stem leaves similar to basal leaves, subtending and overtopping capitulum. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre 1.5–2.5 cm in diam. Phyllaries in 3 or 4 rows, apex obtuse to acute; outer phyllaries ovate, 10–13 × 3–6 mm; middle phyllaries ovate to narrowly ovate, 14–15 × 3–5 mm; inner phyllaries narrowly ovate, 1.6–2 × 0.2–0.3 cm. Corolla purplish red, 2–2.5 cm, tube 1–1.7 cm, limb 7–8 mm, lobes 4–5 mm. Style divergent, 1.5–2 mm. Achene black, trigonous, 3.5–4 mm. Pappus bristles in several rows, yellowish brown, scabrid to barbellate, 1.2–2.3 cm, apically shortly plumose. Fl. and fr. Jul–Sep.

Forest margins, grasslands on mountain slopes; 2900–3800 m. NW Yunnan (Dêqên, Gongshan) [Myanmar].

3. *Dolomiaea edulis* (Franchet) C. Shih, Acta Phytotax. Sin. 24: 294. 1986.

菜川木香 cai chuan mu xiang

Saussurea edulis Franchet, J. Bot. (Morot) 2: 337. 1888; *Jurinea edulis* (Franchet) Franchet; *J. edulis* var. *caulescens* Franchet; *Vladimiria edulis* (Franchet) Y. Ling.

Herbs 8–30 cm tall, perennial, stemless or shortly stemmed. Rosette leaves petiolate; petiole 1–11 cm; leaf blade obovate, elliptic, broadly ovate-elliptic, or suborbicular, 5–20 × 3–17 cm, pinnately divided, pinnately lobed, or sometimes undivided, both surfaces green to yellowish green and sparsely to densely strigose, base cordate, cuneate, or truncate; lobes 3–7 pairs, ovate, falcate, or obliquely triangular, margin apiculate or spinulose dentate. Capitulum solitary, in center of leaf rosette or

terminal on stem and subtended by uppermost leaves. Involucre broadly campanulate, 4–6 cm in diam. Phyllaries in 4 or 5 rows, rigid; outer and middle phyllaries ovate to elliptic, 1.2–2.6 × 0.8–1.7 cm, apex rounded to obtuse; inner phyllaries narrowly ovate, elliptic, or broadly linear, 2.5–4 × 0.3–0.6 cm, apex acuminate. Corolla purplish red to bluish purple, 2.8–3.2 cm, tube 2–2.7 cm. Achene pale brown, trigonous, 7–8 mm, wrinkled. Pappus bristles in many rows, yellowish brown, scabrid to barbellate, 2–2.6 cm. Fl. and fr. Jun–Oct.

Forest margins, grasslands, fallow open areas; 2600–4700 m. W Sichuan, SE Xizang, NW Yunnan [N Myanmar].

4. *Dolomiaea berardioidea* (Franchet) C. Shih, Acta Phytotax. Sin. 24: 294. 1986.

厚叶川木香 *hou ye chuan mu xiang*

Jurinea edulis (Franchet) Franchet var. *berardioidea* Franchet, J. Bot. (Morot) 8: 338. 1894; *J. berardioidea* (Franchet) Diels; *Vladimiria berardioidea* (Franchet) Y. Ling.

Herbs 5–17 cm tall, perennial, stemless or shortly stemmed. Caudex 2 cm in diam., simple. Rosette leaves petiolate; petiole 1–13 cm; leaf blade elliptic, ovate, or oblong, 7–20 × 4–19 cm, both surfaces green to yellowish green and densely strigose and gland-dotted, base shallowly cordate to truncate, margin undulate or sparsely spinulose-dentate, apex rounded to acute. Bracts 4–7, sessile, smaller than rosette leaves. Capitulum solitary, in center of leaf rosette, sessile or shortly pedunculate. Involucre campanulate, 4–6(–8) cm in diam. Phyllaries in 4 or 5 rows; outer phyllaries elliptic, narrowly obovate-elliptic, or narrowly ovate-elliptic, 1.5–2.5 × 1–1.3 cm; middle and inner phyllaries narrowly ovate-elliptic, 2.5–4 × 0.6–0.8 cm. Corolla purplish red, 3–3.2 cm, tube 2–2.3 cm, limb ca. 1 cm. Achene trigonous, 7–10 mm. Pappus bristles in many rows, yellowish brown, scabrid to barbellate, 2.5–2.8 cm. Fl. and fr. Jun–Oct.

• Grasslands or thickets on mountain slopes; 2800–3300(–5200) m. NW Yunnan (Dali, Lijiang, Yangbi).

5. *Dolomiaea platylepis* (Handel-Mazzetti) C. Shih, Acta Phytotax. Sin. 24: 295. 1986.

平苞川木香 *ping bao chuan mu xiang*

Jurinea platylepis Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 658. 1937; *Vladimiria platylepis* (Handel-Mazzetti) Y. Ling.

Herbs 7–12 cm tall, perennial, stemless or shortly stemmed. Rosette leaves petiolate; petiole to 10 cm; leaf blade obovate, ovate, or elliptic, 5–18 × 5–13 cm, pinnately lobed or pinnatifid, abaxially grayish white and densely tomentose, adaxially green and arachnoid only along midrib, base truncate or cuneate, margin pinnately dentate; lobes 2 or 3 pairs, obliquely broadly triangular to obliquely ovate, margin spinulose-denticulate, apex rounded, obtuse, or acute; terminal lobe semiorbicular to irregularly rhombic, apex obtuse to rounded. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre broadly bowl-shaped, 3.5–6 cm in diam. Phyllaries in ca. 4 rows, leathery; outer phyllaries broadly ovate, 1.4–1.8 ×

1–1.5 cm, apex rounded to obtuse; middle phyllaries narrowly elliptic to elliptic, 2–2.5 × 0.5–1 cm, apex obtuse to acute; inner phyllaries narrowly ovate-elliptic to linear, 2.5–3 × 0.3–0.5 cm, apex acute. Corolla purplish red, ca. 3 cm, tube ca. 2 cm and slender, limb 8–10 mm, lobes 4.5–5 mm. Style branches 3.5–4.5 mm, slender. Achene obconic, ca. 8 mm. Pappus bristles in many rows, yellowish white, barbellate, 2.5–3 cm. Fl. and fr. Sep–Oct.

• Grasslands, thickets on mountain slopes; 3100–3400 m. SW Sichuan.

6. *Dolomiaea forrestii* (Diels) C. Shih, Acta Phytotax. Sin. 24: 293. 1986.

膜缘川木香 *mo yuan chuan mu xiang*

Jurinea forrestii Diels, Notes Roy. Bot. Gard. Edinburgh 5: 200. 1912; *Dolomiaea denticulata* (Y. Ling) C. Shih; *Vladimiria denticulata* Y. Ling; *V. forrestii* (Diels) Y. Ling.

Herbs 6–15 cm tall, perennial, stemless or shortly stemmed. Caudex 1–1.5 cm in diam., simple. Rosette leaves petiolate; petiole 3–10 cm; leaf blade elliptic, obovate, ovate, or subtriangular, 10–20(–30) × 5–15 cm, pinnately lobed to undivided, green or yellowish green, almost concolorous, sparsely strigose, base subcordate, truncate, or cuneate-attenuate, margin spinulose-dentate to sinuate-denticulate, apex rounded to acuminate; lobes 4–8 pairs, ovate, broadly triangular, or falcate. Upper leaves smaller, pale yellowish green, base cuneate-attenuate, apex acute. Capitula 3–9, clustered in center of leaf rosette, sessile or shortly pedunculate. Involucre campanulate, 2–2.5(–3) cm in diam. Phyllaries in 5 or 6 rows, leathery, glabrous, margin dark brown and scarious; outer phyllaries ovate to elliptic, 7–15 × 5–9 mm, apex rounded to obtuse; middle and inner phyllaries elliptic to narrowly elliptic, 1.5–3 × 0.4–0.7 cm, apex obtuse, acute, or acuminate. Corolla purplish red, 2.3–2.8(–3.5) cm, tube 1.4–2 cm, limb 8–10 mm, lobes 5–6 mm. Achene cylindric, 4–7 mm, 4-angled, apically verrucose. Pappus bristles in many rows, yellowish brown, scabrid to barbellate, 2–2.5 cm. Fl. and fr. Jul–Nov.

• Grasslands on mountain slopes, thickets, forests, forest margins; 3000–4200 m. SW Sichuan, SE Xizang, NW Yunnan.

Dolomiaea denticulata was described from a specimen without basal leaves and is only known from two collections. The diagnostic characters, exclusively of the upper leaves, do not seem to be sufficient to treat these plants as specifically different from *D. forrestii*.

7. *Dolomiaea souliei* (Franchet) C. Shih, Acta Phytotax. Sin. 24: 294. 1986.

川木香 *chuan mu xiang*

Herbs, perennial, stemless. Caudex 1.5–2 cm in diam., simple. Rosette leaves petiolate; petiole 2–6(–16) cm; leaf blade elliptic, narrowly elliptic, narrowly ovate, or narrowly obovate, 10–30 × 5–13 cm, pinnately lobed, pinnatisect, or sometimes bipinnatisect, green, pale green, or grayish white, concolorous or abaxially grayish white, both surfaces sparsely strigose and gland-dotted or abaxially sparsely arachnoid to tomentose, margin lobed and spinulose-dentate, rarely entire; lateral lobes 4–7 pairs, obliquely triangular to narrowly ovate; terminal lobe

similar to lateral ones but smaller. Capitula 2–12, clustered in center of leaf rosette, pedunculate. Involucre broadly campanulate, 2.5–4(–6) cm in diam. Phyllaries in ca. 6 rows, apex acuminate and spinulose; outer phyllaries ovate to ovate-elliptic, 2–2.5 × 0.8–1 cm; middle phyllaries elliptic to narrowly ovate-elliptic, 2.5–3 × 0.6–1.1 cm; inner phyllaries narrowly ovate-elliptic, 3–3.5 × 0.5–0.8 cm. Corolla dark red, 3–4 cm, tube 2–3 cm, limb 1–1.2 cm, lobes 6–7 mm. Achene cylindric, 7–8 mm, glabrous or apically gland-dotted. Pappus bristles in many rows, yellowish brown, scabrid to barbellate, 2.5–4 cm; outermost pappus recurved, plicate and covering achene. Fl. and fr. Jul–Oct.

• Alpine grasslands or thickets, grasslands on mountain slopes; 3500–4800 m. W Sichuan, E Xizang, NW Yunnan.

The roots are used medicinally.

- 1a. Leaf blade green to pale green, ± concolorous 7a. var. *souliei*
 1b. Leaf blade abaxially grayish white, adaxially green to pale green 7b. var. *cinerea*

7a. *Dolomiaea souliei* var. *souliei*

川木香(原变种) chuan mu xiang (yuan bian zhong)

Jurinea souliei Franchet, J. Bot. (Morot) 8: 337. 1894;
Vladimiria souliei (Franchet) Y. Ling.

Leaf blade green to pale green, ± concolorous, sparsely strigose, gland-dotted.

• Alpine grasslands or thickets; 3700–4800 m. W Sichuan, E Xizang.

7b. *Dolomiaea souliei* var. *cinerea* (Y. Ling) Q. Yuan, Acta Bot. Yunnan. 30: 439. 2008.

灰毛川木香 hui mao chuan mu xiang

Vladimiria souliei var. *cinerea* Y. Ling, Acta Phytotax. Sin. 10: 79. 1965; *Dolomiaea souliei* var. *mirabilis* (J. Anthony) C. Shih; *Jurinea mirabilis* J. Anthony; *J. muliensis* Handel-Mazzetti; *J. trachyloma* Handel-Mazzetti; *V. muliensis* (Handel-Mazzetti) Y. Ling; *V. trachyloma* (Handel-Mazzetti) Y. Ling.

Leaf blade abaxially grayish white, sparsely arachnoid to arachnoid tomentose, and gland-dotted, adaxially green to pale green, sparsely strigose, and gland-dotted.

• Grasslands on mountain slopes; 3500–4200 m. W Sichuan, E Xizang, NW Yunnan.

Jurinea muliensis and *J. trachyloma* were described on account of their leaf shape and indumentum, which is quite different from that of *Dolomiaea souliei* and seems to be a constant character at least in *J. trachyloma* from SW Sichuan. More material is needed to clarify the taxonomic status of these plants.

8. *Dolomiaea wardii* (Handel-Mazzetti) Y. Ling, Acta Phytotax. Sin. 10: 88. 1965.

西藏川木香 xi zang chuan mu xiang

Jurinea wardii Handel-Mazzetti, J. Bot. 76: 290. 1938.

Herbs 3–5 cm tall, perennial, stemless. Rosette leaves

petiolate; petiole 1.5–7.5 cm; leaf blade obovate, narrowly obovate, or oblong, 5–20 × 2–5 cm, lyrate pinnatisect, abaxially grayish white and densely tomentose, adaxially green and glabrous or sparsely arachnoid; lateral segments in 3–6 pairs, broadly elliptic, oblong, or suborbicular, 0.7–1.5 × 0.7–1.5 cm, margin serrate-dentate or denticulate or rarely shallowly crenate, apex rounded; terminal segment ovate to broadly ovate, 2.5–5 × 1.5–3 cm. Capitula 4–8, clustered in center of leaf rosette, forming a hemispheric synflorescence, sessile or subsessile. Involucre campanulate, 1.5–2(–3) cm in diam. Phyllaries in 4 or 5 rows, herbaceous, basally straw-colored, apically purple, apex acute to acuminate; outer phyllaries obovate to elliptic, 4–8 × 3.5–4 mm; middle phyllaries elliptic to narrowly ovate-elliptic, 10–15 × 2–3(–5) mm; inner phyllaries linear-elliptic to broadly linear, 1.5–2.3 × 0.2–0.3 cm. Corolla purplish red, 1.6–2 cm, tube 7.5–11 mm, limb 8–9 mm, lobes 3–3.5 mm. Style branches ca. 3 mm, slender. Achene grayish brown, obconic, 6–7 mm, wrinkled. Pappus bristles in many rows, dirty white but basally pale brown, scabrid, 1.5–2 cm. Fl. and fr. Jul–Sep.

• Thickets on mountain slopes, gravelly and sandy riversides; 3800–4500 m. SE Xizang.

9. *Dolomiaea scabrida* (C. Shih & S. Y. Jin) C. Shih, Acta Phytotax. Sin. 24: 293. 1986.

糙羽川木香 cao yu chuan mu xiang

Vladimiria scabrida C. Shih & S. Y. Jin, Acta Phytotax. Sin. 21: 91. 1983.

Herbs, perennial, stemless. Rosette leaves petiolate; petiole 2–4.5 cm; leaf blade narrowly elliptic, 4–12 × 1–3 cm, pinnately divided, abaxially grayish white and densely arachnoid tomentose, adaxially green and glabrous or sparsely arachnoid on veins; lateral segments 4–6 pairs, elliptic, obliquely ovate, or obovate, 0.5–2 × 0.4–1.5 cm, margin denticulate; terminal segment narrowly ovate, 2–3 × 1–2 cm. Capitula 2 or 3, clustered in center of leaf rosette, shortly pedunculate. Involucre ca. 3 cm in diam. Phyllaries in ca. 4 rows, glabrous, apex acuminate; outer phyllaries narrowly triangular, ca. 15 × 4 mm; middle phyllaries narrowly ovate to elliptic, 16–19 × 2–3 mm; inner phyllaries broadly linear, ca. 1.9 × 0.2 cm, apex acuminate. Corolla purple, ca. 2 cm, tube ca. 1.1 cm, limb ca. 9 mm. Style branches ca. 2.5 mm, apex acuminate. Achene brown, obconic, 6–7 mm, glabrous. Pappus bristles in 2 rows, pale brown to dirty brown, scabrid, ca. 3 cm. Fl. and fr. Aug.

• Gravelly places by rivers; 4400–4500 m. SC Xizang (Ngam-ring).

This species is only known from a single locality and is probably close to *Dolomiaea wardii*.

10. *Dolomiaea crispoundulata* (C. C. Chang) Y. Ling, Acta Phytotax. Sin. 10: 9. 1965.

皱叶川木香 zhou ye chuan mu xiang

Jurinea crispoundulata C. C. Chang, Bull. Fan Mem. Inst. Biol., Bot. 6: 67. 1935; *Dolomiaea crispoundulata* var. *chienenii* Y. Ling; *Vladimiria crispoundulata* (C. C. Chang) C. Shih & S. Y. Jin.

Herbs to 6 cm tall, perennial, stemless or shortly stemmed. Caudex stout, simple or branched. Rosette leaves petiolate; petiole 1–3 cm; leaf blade elliptic to broadly linear, 2–7 × 0.7–1.3 cm, pinnately divided, abaxially grayish white and densely arachnoid tomentose, adaxially grayish green and arachnoid tomentose, base obtuse to rounded; segments in 3–15 pairs, obtusely triangular, broadly ovate, or semiorbicular; terminal lobe ovate, to 1 cm, apex obtuse. Capitula solitary or to 3, in center of leaf rosette, sessile or subsessile. Involucre campanulate, 2–3 cm in diam. Phyllaries in 4 or 5 rows, pale green, apically purplish, leathery, sparsely arachnoid, glabrescent, apex acuminate; outer phyllaries triangular to ovate-triangular, 6–13 × 1.5–2.5 mm; middle and inner phyllaries triangular to narrowly ovate, 1.4–2.5 × 0.3–0.4 cm. Corolla pale purple, 2.1–2.3 cm, tube 1.2–1.5 cm, limb 8–10 mm, lobes 4–6 mm. Style branches linear, ca. 2 mm, divergent, apex obtuse. Achene cylindric, 3–5 mm, wrinkled, glabrous. Pappus bristles in 2–4 rows, basally yellowish brown and apically purplish, scabrid, 1.5–1.6 cm. Fl. Jul.

• Thickets, open ground; 4100–4400 m. SC Xizang (Gyangzê, Nyêmo).

11. *Dolomiaea calophylla* Y. Ling, Acta Phytotax. Sin. 10: 88. 1965.

美叶川木香 mei ye chuan mu xiang

Herbs, perennial, stemless. Rosette leaves petiolate; petiole 2–4 cm; leaf blade elliptic to narrowly obovate, 6–30 × 2–5 cm, bipinnately lobed, abaxially white and densely tomentose, adaxially green and strigose or sparsely arachnoid; primary lobes 5–10 pairs, ovate to elliptic; secondary lobes elliptic, obliquely ovate, or semiorbicular, margin spinulose-dentate. Capitula 5–15, clustered in center of leaf rosette, forming a hemispheric synflorescence. Involucre 1.5–2 cm in diam. Phyllaries in 5 or 6 rows, apically purplish red, apex mucronate; outer phyllaries elliptic, 9–11 × ca. 5 mm; middle phyllaries narrowly ovate-elliptic, 12–17 × ca. 5 mm; inner phyllaries narrowly ovate-elliptic to linear, 1.8–2 × 0.2–0.3 cm. Corolla purplish red, 1.5–2.2 cm, tube ca. 1.2 cm, lobes 4–5 mm. Style branches ca. 1 mm, ± coherent, apex obtuse. Achene tetragonous, obconic, 4–5 mm, ± wrinkled. Pappus bristles in many

rows, blackish to yellowish brown, barbellate, ca. 2 cm. Fl. and fr. Aug.

• Alpine grasslands, scree slopes; 3300–4700 m. SC Xizang.

Dolomiaea calophylla is very close to *D. macrocephala* Royle, which occurs to the SW of Xizang in Nepal, NW India, and Kashmir. That species is said to differ from *D. calophylla* by larger capitula (involucre to 2.5 cm in diam.; phyllaries to 3.5 cm; corolla 2.5–3 cm; achene 6–8 mm; pappus ca. 2.5 cm), scabrous phyllaries with serrulate margin, and a brown or purplish brown pappus. Further studies are needed to investigate whether these plants actually represent two different species. *Dolomiaea macrocephala* has been recorded from Xizang (Yadong and Lhasa) (S. Y. Liang, Fl. Xizang. 4: 917. 1985), but no specimens were seen.

12. *Dolomiaea lateritia* C. Shih, Acta Phytotax. Sin. 32: 190. 1994.

红冠川木香 hong guan chuan mu xiang

Herbs, perennial, stemless. Rosette leaves petiolate; petiole ca. 5 cm; leaf blade elliptic, 9–24 × 5–8 cm, bipinnately lobed to bipinnately divided, abaxially grayish white and densely tomentose, adaxially green and glabrous; primary lobes ca. 8 pairs, narrowly ovate to elliptic; secondary lobes triangular, narrowly triangular, or ovate, margin spinulose-denticulate. Capitula ca. 8, clustered in center of leaf rosette, forming a hemispheric synflorescence, shortly pedunculate. Involucre campanulate, ca. 2.5 cm in diam. Phyllaries in ca. 6 rows, dark red, leathery, glabrous, apex acuminate; outer phyllaries narrowly ovate-triangular, ca. 10 × 2 mm; middle phyllaries narrowly triangular, 1.5–2.5 × 0.5–0.6 cm; inner phyllaries narrowly ovate-elliptic to elliptic, 2.3–3.5 × 0.6–0.7 cm. Corolla purplish red, ca. 3 cm, tube ca. 2.2 cm, limb 8–10 mm, lobes 4–5 mm. Style branches linear, narrowed, divergent. Achene (ripe) unknown. Pappus bristles in many rows, brownish in basal half and brick-colored in apical half, scabrid, ca. 1.8 cm. Fl. Sep.

• Alpine meadows, thickets; ca. 3400 m. S Xizang (Gyirong).

Dolomiaea lateritia is only known from the type collection. Except for the divergent and narrowed style branches and for the pappus color, this species is very similar to *D. calophylla* and *D. macrocephala*. Lack of material does not permit a decision here about whether these plants are conspecific or not.

18. *BOLOCEPHALUS* Handel-Mazzetti, J. Bot. 76: 291. 1938.

球菊属 qiu ju shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Herbs, perennial. Stems subscapose. Capitulum large. Involucre densely white lanate. Phyllaries imbricate, herbaceous. Receptacle with long subulate bristles. Corolla limb 3 × as long as tube. Anther tails filiform-acuminate, undivided. Style branches long, slender, divergent, apex truncate to obtuse. Pappus homomorphic, in several rows, inner bristles longer than outer ones, fragile, basally connate into a ring, caducous.

• One species: China.

The character combination for this genus is rather unique within the *Saussurea* group, but *Bolocephalus* is probably closely related to *Dolomiaea* and *Frolovia*. In the protologue, the receptacle was described as naked, whereas by C. Shih (FRPS 78(1): 44. 1987) that description was corrected to a receptacle having long bristles. *Bolocephalus* is preliminarily maintained here as a distinct genus because morphological data of receptacle, achene, and pappus structure are not sufficient to attribute it to another genus, and molecular data are lacking.

1. Bolocephalus saussureoides Handel-Mazzetti, J. Bot. 76: 292. 1938.

球菊 qiu ju

Dolomiaea saussureoides (Handel-Mazzetti) Y. L. Chen & C. Shih.

Herbs 10–30 cm tall, perennial. Caudex stout, unbranched. Stem solitary, 4–6 mm in diam., erect, simple, hollow, basally sparsely arachnoid, apically densely lanate. Basal leaves many, petiolate; petiole 3–6 cm; leaf blade elliptic to broadly linear, 10–20 × 1–1.5 cm, runcinate, pinnately lobed, or pinnatifid, abaxially grayish white and densely tomentose, adaxially green and sparsely arachnoid tomentose but glabrescent; lobes 2–5

pairs, broadly or obliquely triangular, margin entire; terminal lobe elliptic to narrowly elliptic, apex acute to rounded. Stem leaves few, similar to basal leaves. Uppermost stem leaves linear, undivided. Capitulum solitary, drooping. Involucre globose, 5–6 cm in diam. Phyllaries in 5 or 6 rows, densely and fluffily lanate, apex long acuminate; outer and middle phyllaries triangular-subulate, 1.5–2.5 × 0.1–0.3 cm; inner phyllaries linear-subulate, 2.5–3.5 × 0.1–0.3 cm. Receptacle bristles to 1.1 cm. Corolla purplish red, ca. 1.6 cm, tube ca. 4 mm, limb ca. 1.2 cm, lobes ca. 2.5 mm. Achene brown, obconic, ca. 5 mm, 4- or 5-ribbed, apically with a rim. Pappus bristles scabrid, to 1.5 cm. Fl. and fr. Aug.

• Alpine scree slopes, cliffs, rocks, *Rhododendron* thickets; 4000–5000 m. Xizang (Nangxian).

19. FROLOVIA (Candolle) Lipschitz, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 16: 461. 1954.

齿冠属 chi guan shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Aplotaxis sect. *Frolovia* Candolle, Prodr. 6: 538. 1838.

Herbs to 1 m tall, perennial. Stems stout, erect, hollow. Basal leaves large, lyrate pinnatisect with large terminal lobe or undivided and ovate to narrowly ovate-elliptic. Capitula solitary or few, 2–8 cm in diam., long pedunculate. Phyllaries in many rows, narrowly ovate-elliptic to linear, subequal in length, apex long acuminate; outer phyllaries ± reflexed. Receptacle with numerous bristles. Corolla bluish or reddish purple, glabrous. Anther tails lacerate. Achene large, obtusely 4-angled, wrinkled, glabrous, apex with an obtusely crenulate crown. Pappus homomorphic, in 1 row; bristles numerous, snow white or light brown, plumose, basally connate into a ring, caducous as a whole.

Five species: Afghanistan, China, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Tajikistan, Uzbekistan; one species in China.

Frolovia is very closely related to *Aucklandia* (see note under that genus). In G. M. Shen (Fl. Xinjiang, 5: 273. 1999), the species of this genus is included in *Saussurea*. Molecular analysis by Y. J. Wang et al. (Ann. Bot. 99: 311–322. 2007) has shown that *Frolovia* and *Aucklandia* are more closely related to *Dolomiaea* than to *Saussurea*.

1. Frolovia frolowii (Ledebour) Raab-Straube, Willdenowia 33: 391. 2003.

大序齿冠 da xu chi guan

Saussurea frolowii Ledebour, Icon. Pl. 4: 16. 1833; *Aplotaxis frolowii* (Ledebour) Candolle.

Herbs 25–80[–110] cm tall, perennial. Stem solitary, 5–8 mm in diam., simple, apically sparsely leafy or leafless. Basal and lower stem leaves petiolate; petiole to 15 cm; leaf blade obovate-elliptic, 10–35 × 5–20 cm, lyrate pinnatisect, abaxially grayish green and arachnoid tomentose, adaxially green and sparsely pilose; lateral lobes 1–4 pairs, ovate-triangular, gradually smaller toward base; terminal lobe ovate to triangular-hastate, large, margin crenate-dentate or subentire, apex acuminate. Middle and upper stem leaves narrowly ovate-oblong to linear, 3–15 × 0.2–2 cm, margin dentate or entire. Capitula solitary or rarely 2, nodding. Involucre broadly campanulate to

hemispheric, 2–3 cm in diam. Phyllaries in ca. 6 rows, blackish green, narrowly triangular-ovate to linear, 2.5–2.8 × 0.15–0.3 cm, subequal in length, apex long acuminate; outer phyllaries reflexed; inner phyllaries erect. Receptacle bristles filiform, 6–12 mm. Corolla reddish purple, 1.5–1.6 cm, tube 7–9 mm, limb 6–8 mm, lobes (2.5–)5–6 mm. Achene brown to straw-colored with dark spots, cylindric to obconic, 5–8 mm, wrinkled, apex with a short obtusely crenulate crown. Pappus straw-colored, bristles 1.1–1.3 cm. Fl. Jul–Aug. $2n = 36$.

Alpine and subalpine meadows, forest meadows, coniferous forests; ca. 2000 m. N Xinjiang [Kazakhstan, Russia (S Siberia)].

The specific epithet of *Saussurea frolowii* is spelled in the protologue with a “w” (except on the accompanying figure, which, however, does not have nomenclatural impact), whereas the sectional and hence the generic names are spelled with a “v.” As both spellings are transcriptions from a Russian personal name, the former in German and the latter in Latin, they cannot be treated as correctable errors but have to be accepted as they are.

20. AUCKLANDIA Falconer, Ann. Mag. Nat. Hist. 6: 475. 1841.

云木香属 yun mu xiang shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Herbs 0.3–2 m tall, perennial. Stem stout, erect, hollow. Basal leaves very large, lyrate with winged petiole shallowly pinnately

lobed or undivided; leaf blade cordate, triangular-ovate, or ovate. Capitula usually clustered at stem apex, large. Involucre hemispheric. Phyllaries blackish, imbricate, narrowly ovate-elliptic to linear, apex long acuminate and often reflexed. Receptacle with many long subulate bristles. Corolla glabrous, tube as long as limb. Anther tails lacerate, lanate. Achene glabrous, wrinkled, apically crowned. Pappus homomorphic, in 1 row; bristles numerous, straw-colored to brownish, plumose, flattened, basally connate into a ring, caducous as a whole.

One species: N India, Kashmir, N Pakistan; introduced to China.

Aucklandia and *Frolovia* are very closely related. In a molecular study by Y. J. Wang et al. (Ann. Bot. 99: 311–322. 2007), the two genera form together a small clade, which is nested within the morphologically much different genus *Dolomiaea*. However, as sampling and analysis of this group is not yet complete, we prefer not to make generic rearrangements of these species here. In C. Shih and S. Y. Jin (FRPS 78(2): 58. 1999), the species of this genus is included in *Saussurea* subg. *Frolovia*.

1. *Aucklandia costus* Falconer, Ann. Mag. Nat. Hist. 6: 475. 1841.

云木香 yun mu xiang

Aplotaxis lappa Decaisne; *Saussurea costus* (Falconer) Lipschitz; *S. lappa* (Decaisne) Schultz Bipontinus.

Herbs (0.4–)1–1.5(–2) m tall, perennial. Rootstock 1–5 cm in diam. Stems 1.5–2 cm in diam., simple or apically branched. Basal and lower stem leaves petiolate; petiole 10–40 cm, broadly winged and lobate; leaf blade lyrate, cordate, or triangular-hastate, 20–50 × 10–30 cm, abaxially sparsely pubescent and gland-dotted, adaxially sparsely strigose, margin sinuate-dentate and mucronate, apex acute. Middle and upper stem leaves petiolate or sessile; leaf blade lyrate, ovate, or triangular-ovate, (5–)10–45 × (3–)5–25 cm. Capitula (1 or)2–5, clustered

in a synflorescence or sometimes solitary, sessile. Involucre hemispheric, 2–4 cm in diam. Phyllaries in 7–10 rows, dark purple to black, apically arachnoid but glabrescent, apex spiniform and reflexed; outer phyllaries narrowly triangular-ovate, (8–)15–20 × 1–2 mm; middle phyllaries narrowly ovate-elliptic, 1.5–2 × 0.2–0.3 cm; inner phyllaries narrowly elliptic-linear, 1.8–2.5 × 0.2–0.3 cm. Receptacle bristles subulate, 5–12 mm. Corolla dark blackish purple, 1.5–2 cm, tube 7–12 mm, limb 7–10 mm, lobes 4–5 mm. Achene brown with black spots, obconic to cylindric, 6–8 mm, apically wrinkled, apex with a crenulate or dentate crown. Pappus straw-colored, 1.2–1.7 cm. Fl. and fr. May–Aug. $2n = 36$.

Cultivated in Anhui, Fujian, Guangxi, Guizhou, Shaanxi, Sichuan, Yunnan, and Zhejiang [native to and also cultivated in NW India, Kashmir, and NE Pakistan].

The roots of *Aucklandia costus* are used medicinally.

21. *HEMISTEPTIA* Bunge ex Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 2: 38. 1836.

泥胡菜属 ni hu cai shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Herbs, annual. Involucre campanulate to hemispheric. Phyllaries imbricate; outer and middle phyllaries apically with a purplish red crista. Receptacle densely covered with subulate alveolate bristles. Corolla glabrous. Anther tails sagittate, lacerate or undivided. Style branches short, divergent, apex truncate. Achene obovoid, laterally compressed, with 10–16 distinct ribs, glabrous, with apical rim forming a crenulate crown. Pappus heteromorphic, in 2 rows; outer pappus row of small scales; inner pappus row of plumose bristles, basally connate into a ring.

One species: E and S Asia, E Australia.

1. *Hemisteptia lyrata* (Bunge) Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 2: 38. 1836.

泥胡菜 ni hu cai

Cirsium lyratum Bunge, Enum. Pl. China Bor. 36. 1833; *Aplotaxis australasica* F. Mueller; *A. bungei* Candolle, nom. illeg. superfl.; *A. carthamoides* Candolle; *A. multicaulis* Candolle; *Hemisteptia carthamoides* (Candolle) Kuntze; *Saussurea carthamoides* (Candolle) Benthams; *S. lyrata* (Bunge) Franchet; *Serratula carthamoides* Buchanan-Hamilton ex Roxburgh (1832), not (Willdenow) Poiret (1805).

Herbs 20–150 cm tall, annual. Stems solitary or rarely several, erect, apically branched or rarely simple. Basal leaves usually withered at anthesis. Lower and middle stem leaves petiolate; leaf blade narrowly elliptic to narrowly obovate, 4–15 × 1.5–5 cm, lyrate pinnately divided, abaxially grayish white and ± tomentose, adaxially green and glabrous, margin dentate or entire; segments 1–6 pairs, narrowly obovate to narrowly

ovate; terminal segment rhombic, triangular, or ovate, larger than lateral ones. Upper stem leaves sessile, narrowly ovate-elliptic to linear, gradually smaller upward on stem. Capitula many, in a lax corymbiform synflorescence or rarely solitary, long pedunculate. Involucre 1.5–3 cm in diam. Phyllaries in 4–10 rows, apex acuminate and purplish red; outer phyllaries triangular-ovate, 2–3 × 1–1.5 mm; middle phyllaries ovate-elliptic to elliptic, 3–7 × 1.3–1.5 mm; inner phyllaries elliptic to linear-elliptic, 7–13 × 1.5–1.8 mm. Receptacle bristles white, 2–4 mm. Corolla rose-purple, 1.2–1.4 cm, tube 1–1.1 cm, limb 2.5–3 mm, lobes 2–2.5 mm. Achene brown, 2.2–3 mm, glabrous. Pappus white; outer pappus row of 3–9 minute flat rectangular scales on abaxial side of achene, 0.2–0.5 mm, persistent; inner pappus row of plumose bristles, 1–1.3 cm, caducous. Fl. and fr. Mar–Aug. $2n = 36^*$.

Forests, forest margins, grasslands, wastelands, farmlands, riversides, roadsides; near sea level to 3300 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jilin, Liaoning, Shaanxi, Shandong, Shanxi, Si-

chuan, Taiwan, Yunnan, Zhejiang [?Bangladesh, Bhutan, India, Japan, Korea, Laos, Myanmar, Nepal, Thailand, Vietnam; E Australia].

The earlier publication of the name “*Hemistepta* [sic!] *lyrata*” by Bunge in Ledebour (Dorpat. Jahrb. Litt. 1: 221. 1833) was not valid because the generic name had not been previously validly published (*Vienna Code*, Art. 43.1); nor were the generic and specific names si-

multaneously validated there (Art. 42.1: “Reference to an earlier description is not acceptable in place of a descriptio generico-specifica”).

“*Saussurea affinis* Spreng.” and “*S. stricta* Spreng.” (Candolle, Prodr. 6: 540. 1838) both belong here but were not validly published because they were merely cited as synonyms of *Aplotaxis carthamoides* and *A. multicaulis*, respectively (*Vienna Code*, Art. 34.1(c)).

22. SAUSSUREA Candolle, Ann. Mus. Natl. Hist. Nat. 16: 156, 198. 1810, nom. cons., not *Saussuria* Moench (1794).

风毛菊属 feng mao ju shu

Shi Zhu (石铸 Shih Chu); Eckhard von Raab-Straube

Herbs, usually perennial or sometimes biennial, sometimes subshrubs, cauliferous or stemless, often with woody caudex. Capitulum solitary or to very numerous and in a corymbiform, hemispheric, paniculiform, or racemiform synflorescence, sessile or pedunculate. Involucre campanulate, globose, ovoid, cylindric, or tubular. Phyllaries imbricate, sometimes with an apical appendage. Receptacle flat or convex, usually with subulate bristles or sometimes with short papillae, rarely naked. Corolla usually purple, often bluish or reddish, sometimes brownish, blackish, or pink, rarely white, usually glabrous, sometimes with sessile glands or papillae. Anthers dark purple, dark blue, or black; anther tails sagittate, entire, lacerate, or lanate. Achene straw-colored, sometimes with black spots, brown or black, ± ribbed, smooth or transversely wrinkled, usually glabrous, rarely with glands, papillae, or hairs; apical rim inconspicuous, entire or sometimes forming a short crown. Pappus in 2 rows, heteromorphic, dirty white, yellowish, straw-colored, brown, dark gray, or black; outer bristles usually more numerous and shorter than inner ones, often of different lengths, scabrid, very rarely barbellate or plumose, individually caducous, very rarely lacking; inner bristles fewer and longer than outer ones, usually of same length, basally connate into a ring, always plumose, caducous or persistent.

About 415 species: Asia, C, E, and N Europe, W North America; 289 species (191 endemic) in China.

By far, the greatest diversity of the genus is in high mountains of temperate Asia, particularly in Siberia, C Asia, the Himalaya, and the Qinghai-Xizang Plateau. In China, the Hengduan Shan area is the center of diversity of *Saussurea*, with more than one hundred species, many of them endemic.

The taxonomy of the genus *Saussurea* in this treatment follows largely the monograph by Lipschitz (Rod *Saussurea*, 1–284. 1979), although it is quite clear that his infrageneric taxa do not represent natural groups. Despite some recent attempts to clarify the evolution of *Saussurea*, also with the help of molecular methods (Raab-Straube, Willdenowia 33: 379–402. 2003; Kita et al., Taxon 53: 679–690. 2004; Y. J. Wang & J. Q. Liu, Biochem. Syst. Ecol. 32: 1009–1023. 2004; Y. J. Wang et al., Biol. J. Linn. Soc. 97: 893–903. 2009), a well-supported phylogeny of the whole genus is still lacking. Therefore, and because of the pragmatic need to subdivide the large genus into manageable and recognizable groups, we still adopt to a large extent the infrageneric subdivision by Lipschitz, keeping in mind that this classification is a highly artificial one. However, those species placed by him in *Saussurea*, which are now thought to belong to *Aucklandia*, *Frolovia*, and *Himalaiella* (see Raab-Straube, loc. cit.), are excluded from this treatment and can be found under the respective segregate genera. *Saussurea* is divided here into four subgenera: *S. subg. Eriocoryne*, *S. subg. Amphilaena*, *S. subg. Theodorea*, and *S. subg. Saussurea*. *Saussurea* subg. *Saussurea* is further divided into eight sections: *S. sect. Jurineiformes*, *S. sect. Jacea*, *S. sect. Gymnocline*, *S. sect. Laguranthera*, *S. sect. Lagurostemon*, *S. sect. Strictae*, *S. sect. Rosulascentes*, and *S. sect. Saussurea*. Some of the sectional names used by Lipschitz have to be replaced by older ones that have priority at this rank.

Many *Saussurea* species are used medicinally, as for example: *S. arenaria*, *S. epilobioides*, *S. involucreta*, *S. laniceps*, *S. leucoma*, *S. medusa*, *S. obvallata*, and *S. stella*. Some of them are collected and marketed in large quantities and need strong protection in their natural habitats.

- 1a. Capitula or synflorescence enclosed, half-enclosed, or subtended by yellowish, red, or purple, membranous uppermost leaves; leaves always undivided 2. *S. subg. Amphilaena* (p. 67)
- 1b. Capitula or synflorescence not enclosed, half-enclosed, nor subtended by colored, membranous uppermost leaves; leaves undivided to pinnatisect.
 - 2a. Capitula usually clustered in densely congested hemispheric or rarely an interrupted spiciform or corymbiform synflorescence, rarely solitary terminal on stem or in rosette of leaves, usually surrounded or half-surrounded by densely lanate subtending leaves or subtended and exceeded by stellately arranged uppermost leaves; stems usually hollow, apically widened and club-shaped 1. *S. subg. Eriocoryne* (p. 57)
 - 2b. Capitula in a corymbiform, paniculiform, or racemiform synflorescence or solitary terminal on stem, not surrounded by densely lanate subtending leaves nor by stellately arranged uppermost leaves; stems solid or hollow but not apically widened.
 - 3a. Phyllaries or at least inner phyllaries with a conspicuous appendage; appendage often colored and membranous, or herbaceous and callose-serrulate, or cartilaginous spiniform; herbs mostly biennial, rarely perennial 3. *S. subg. Theodorea* (p. 75)
 - 3b. Phyllaries without an appendage or with a green herbaceous appendage but neither callose-serrulate nor spiniform, rarely with a long cusp or pectinate; plants always perennial 4. *S. subg. Saussurea* (p. 82)

1. *Saussurea* subg. *Eriocoryne* (Wallich ex Candolle) J. D. Hooker, Fl. Brit. India 3: 376. 1881.

雪兔子亚属 xue tu zi ya shu

Aplotaxis sect. *Eriocoryne* Wallich ex Candolle, Prodr. 6: 541. 1838.

Herbs, perennial or rarely biennial, monocarpic or polycarpic, cauliferous, stemless, or substemless, often densely lanate, rarely glabrous or subglabrous. Stem erect, usually hollow, apex usually club-shaped and inflated. Leaves densely lanate, cottony, sericeous, tomentose, or glabrous, margin entire, denticulate, dentate, pinnately lobed, or pinnately divided. Capitula numerous or rarely solitary, usually aggregated in a densely congested hemispheric synflorescence in center of leaf rosette or terminal on stem, enclosed or subtended by uppermost stem leaves or rarely in an interrupted spiciform or corymbiform synflorescence. Phyllaries without an appendage. Receptacle usually with subulate bristles, sometimes with short papillae, or naked. Corolla usually glabrous, sometimes papillose. Achene smooth or wrinkled, usually glabrous, sometimes papillose, rarely thinly arachnoid or gland-dotted, usually without apical crown (in *Saussurea stella* with dentate crown). Pappus dirty white, straw-colored, light to dark brown, gray, or blackish, usually in 2 rows; outer bristles usually scabrid or rarely plumose, sometimes lacking.

Thirty-four species: Afghanistan, Bhutan, China, India, Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, Nepal, Pakistan, Russia (Siberia), Tajikistan; 30 species (14 endemic) in China.

Saussurea subg. *Eriocoryne* occurs mainly on the Qinghai-Xizang Plateau and adjacent areas.

- 1a. Plants stemless or shortly stemmed, monocarpic; caudex simple, bearing a single terminal rosette.
 - 2a. Leaves yellowish green or grayish green, densely sericeous or lanate.
 - 3a. Leaves spatulate or elliptic, more than 5 mm wide; receptacle without bristles; pappus in 1 row 11. *S. depsangensis*
 - 3b. Leaves narrowly triangular or linear, usually less than 5 mm wide; receptacle with bristles; pappus in 2 rows.
 - 4a. Leaves densely lanate in basal part, glabrous in apical part, apex long acuminate 9. *S. wellbyi*
 - 4b. Leaves densely sericeous or lanate throughout, apex obtuse 10. *S. aster*
 - 2b. Leaves green and often with a red or purplish base or reddish, glabrous or sparsely arachnoid floccose.
 - 5a. Capitulum solitary, large, 3–4 cm in diam., in center of leaf rosette 6. *S. grandiceps*
 - 5b. Capitula numerous, much smaller, in a clustered hemispheric synflorescence.
 - 6a. Leaves pinnately lobed to pinnately divided 5. *S. thoroldii*
 - 6b. Leaves undivided, margin entire or crenulate.
 - 7a. Leaves sessile, narrowly triangular to linear, 2.5–20 cm, apex very long acuminate 7. *S. stella*
 - 7b. Leaves petiolate, elliptic, ovate, or spatulate, 1–2.5 cm, apex obtuse or rounded 8. *S. thomsonii*
- 1b. Plants usually with a developed stem, monocarpic or polycarpic, if almost stemless then polycarpic with branched caudex bearing several sterile leaf rosettes and flowering shoots.
 - 8a. Leaves glabrous or sparsely pilose or tomentose and glabrescent.
 - 9a. Plants 40–90 cm tall, not caespitose; capitula in a ± congested corymbiform synflorescence 1. *S. uliginosa*
 - 9b. Plants 10–20 cm tall, caespitose; capitula in a densely clustered hemispheric synflorescence 2. *S. fistulosa*
 - 8b. Leaves densely lanate, villous, sericeous, or tomentose, sometimes adaxially glabrous.
 - 10a. Annuals or biennials; stem diffusely branched; capitula in a lax corymbiform synflorescence 4. *S. kingii*
 - 10b. Perennials; stem simple; capitula in a densely congested corymbiform, hemispheric, or spiciform synflorescence or rarely solitary (in *S. conaensis* and *S. tridactyla* var. *maiduoganla* and sometimes in *S. paxiana*).
 - 11a. Stem 15–35 cm tall, not hidden by leaves or lanate indumentum 3. *S. delavayi*
 - 11b. Stem usually less than 15 cm tall, if taller then entirely hidden by leaves and lanate indumentum.
 - 12a. Synflorescence at anthesis concealed in lanate indumentum; capitula surrounded and much exceeded by densely lanate bracts.
 - 13a. Capitulum solitary 28. *S. conaensis*
 - 13b. Capitula numerous, in a ± aggregated synflorescence.
 - 14a. Synflorescence interrupted spiciform; capitula not clustered on stem apex 25. *S. laniceps*
 - 14b. Synflorescence hemispheric; capitula clustered on stem apex.
 - 15a. Capitula loosely clustered on obovoid stem apex 29. *S. topkegolensis*
 - 15b. Capitula densely aggregated on flat or convex stem apex.
 - 16a. Phyllaries in 3–6 rows, unequal in length 26. *S. gossipiphora*
 - 16b. Phyllaries in 1–4 rows, almost equal in length.
 - 17a. Plants monocarpic, not caespitose; caudex simple; leaves with white hairs; phyllaries in 3 or 4 rows 27. *S. nishiokae*
 - 17b. Plants polycarpic, caespitose; caudex branched; leaves with yellowish golden hairs; phyllaries in 1 row 30. *S. bhutkesh*

- 12b. Synflorescence at anthesis not concealed in lanate indumentum; capitula exposed on stem apex, not exceeded by densely lanate bracts.
- 18a. Pappus dull dark brown, mouse-gray, or blackish.
- 19a. Plants not caespitose; caudex long, creeping, fragile, branched below ground level; leaf blade elliptic to narrowly elliptic, pinnately lobed to pinnately divided, 5–15 mm wide 16. *S. quercifolia*
- 19b. Plants usually caespitose; caudex short, branched at ground level; leaf blade obovate, spatulate, or linear-oblong, undivided, 2–8 mm wide.
- 20a. Rosette and lower stem leaves green, glabrescent; petioles green, elongated; leaf margin obtusely sinuate-dentate; outer pappus bristles always reflexed and appressed on achene 13. *S. inversa*
- 20b. Rosette and lower stem leaves whitish, densely tomentose; petioles purple, short; leaf margin entire or shallowly crenate; outer pappus bristles usually erect 14. *S. gnaphalodes*
- 18b. Pappus white, dirty white, straw-colored, light brown, or brown.
- 21a. Plants shortly stemmed, less than 10 cm tall.
- 22a. Leaf blade very small, less than 1 cm 15. *S. sugongii*
- 22b. Leaf blade larger, more than 1 cm.
- 23a. Upper stem leaves elliptic, not reflexed, apex obtuse to rounded 12. *S. glacialis*
- 23b. Upper stem leaves linear, reflexed, apex acuminate 19. *S. gyacaensis*
- 21b. Plants with a distinct elongate erect flowering stem, usually more than 10 cm tall.
- 24a. Rosette and lower stem leaves adaxially densely yellowish or white lanate throughout.
- 25a. Leaf margin apically 3–6-lobed; corolla glabrous 22. *S. tridactyla*
- 25b. Leaf margin pinnately lobed or dentate; corolla \pm papillose.
- 26a. Lower stem leaves fan-shaped to rhombic, more than 1 cm wide, margin dentate or pinnately lobed; achene glabrous or sparsely papillose on rim 23. *S. medusa*
- 26b. Lower stem leaves narrowly spatulate, less than 1 cm wide, margin pinnately lobed; achene densely papillose on rim 24. *S. namikawae*
- 24b. Rosette and lower stem leaves adaxially dark green or purplish, arachnoid floccose, tomentose, or glabrescent, sometimes only lanate toward base.
- 27a. All leaves deeply pinnatisect 20. *S. leucoma*
- 27b. Leaves denticulate, dentate, or pinnately lobed.
- 28a. Rosette and lower stem leaves abaxially often reddish, glabrous; stem leaves erect or spreading; capitula solitary or 2–5; involucre 1–2 cm in diam. 18. *S. paxiana*
- 28b. Rosette and lower stem leaves abaxially dark green, arachnoid; stem leaves reflexed; capitula numerous (8–20); involucre 0.4–0.9 cm in diam.
- 29a. Plants not caespitose; leaves elliptic, to 3 cm; upper stem leaves arachnoid; achene glabrous 17. *S. georgei*
- 29b. Plants usually caespitose; leaves narrowly elliptic to linear, to 6 cm; upper stem leaves densely white lanate; achene sparsely papillose 21. *S. simpsoniana*

1. *Saussurea uliginosa* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 16. 1925.

湿地雪兔子 shi di xue tu zi

Herbs 40–90 cm tall, perennial, polycarpic. Caudex stout, simple or few branched. Stem solitary, 5–7 mm in diam., erect, simple or apically branched. Basal and lower stem leaves sessile, narrowly ovate-elliptic to linear, 20–30(–40) \times 0.8–4 cm, abaxially light green, gland-dotted, and thinly tomentose but glabrescent, adaxially dark green and sparsely pilose but glabrescent, margin remotely denticulate, apex acuminate. Middle

and upper stem leaves narrowly elliptic to linear, 8–20 \times 1–2.5 cm. Uppermost stem leaves linear, 4–8 \times 0.2–1.2 cm. Capitula 6–17, in a densely congested or laxly corymbiform synflorescence, sessile or pedunculate. Involucre obovoid to globose, (0.8–)1–1.3 cm in diam. Phyllaries in 5 or 6 rows; outer phyllaries triangular-ovate, (7–)10–17 \times 2–3.5 mm, apex long acuminate; middle phyllaries narrowly ovate, 6–8 \times 1.5–2.5 mm, apex acute to obtuse; inner phyllaries linear, 9–10 \times 1–1.5 mm, apex obtuse. Receptacle bristles 6–7 mm. Corolla blackish purple, 1–1.1 cm, tube 5–6 mm, limb 5–5.5 mm, lobes 2.5–3 mm. Achene (ripe) unknown. Pappus light brown; outer bristles 2–3 mm; inner bristles 8–9 mm. Fl. and fr. Jul–Aug.

• Grasslands on stony mountain slopes, forests, forest margins, thickets, marshes; 2000–4200 m. SW Sichuan, NW Yunnan.

- 1a. Leaves (1.5–)2–4 cm wide; capitula in a densely congested hemispheric corymbiform synflorescence, sessile or shortly pedunculate 1a. var. *uliginosa*
 1b. Leaves 0.8–1.5 cm wide; capitula in an ample widely spreading corymbiform synflorescence, long pedunculate 1b. var. *vittifolia*

1a. *Saussurea uliginosa* var. *uliginosa*

湿地雪兔子(原变种) shi di xue tu zi (yuan bian zhong)

Saussurea dumetorum J. Anthony.

Leaves narrowly ovate-elliptic, (1.5–)2–4 cm wide. Capitula terminal on stem, in a densely congested hemispheric corymbiform synflorescence, sessile or shortly pedunculate with basalmost ones to 2.5 cm, overtopped by stellately arranged uppermost leaves.

• Grasslands on stony mountain slopes, forests, forest margins, thickets, marshes; 3600–4200 m. SW Sichuan (Muli), NW Yunnan (?Dêqên, Lijiang, Zhongdian).

1b. *Saussurea uliginosa* var. *vittifolia* (J. Anthony) Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 649. 1937.

线叶湿地雪兔子 xian ye shi di xue tu zi

Saussurea vittifolia J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 215. 1934.

Leaf blade linear, 0.8–1.5(–1.7) cm wide. Capitula in apical third of stem, in an ample widely spreading corymbiform synflorescence, long pedunculate with basalmost ones to 8 cm, subtended by uppermost leaves.

• Grasslands on stony mountain slopes; 2000–3400 m. NW Yunnan (Lijiang, Zhongdian).

2. *Saussurea fistulosa* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 206. 1934.

管茎雪兔子 guan jing xue tu zi

Herbs 10–20 cm tall, perennial, polycarpic, caespitose. Caudex stout, branched, covered with dark remains of petioles. Stem solitary, 7–10 mm in diam., erect, simple, hollow and clavate at apex. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic to linear, 3–10 × 0.3–1 cm, abaxially pale green and scabrous, adaxially dark green and sparsely pilose but glabrescent, margin dentate, apex acute. Middle and upper stem leaves sessile, 3–6 × 1–1.5 cm. Uppermost stem leaves stellately arranged, overtopping synflorescence, sessile, narrowly triangular-ovate, 2–6 × 1–2 cm. Capitula 10–15, in a hemispheric synflorescence 4–5 cm in diam., sessile. Involucre narrowly campanulate or cylindric, 6–9 mm in diam. Phyllaries in ca. 4 rows, narrowly ovate to obovate, apically villous, apex caudate; outer phyllaries 10–12 × 3–4 mm; middle phyllaries 8–10 × 2–3 mm; inner phyllaries 8–9 × 1.5–2 mm. Receptacle bristles 2–3 mm. Corolla reddish purple, 7–8 mm, tube 3–4 mm, limb 3.5–4 mm, lobes 1–1.5 mm. Achene obconic, ca. 3

mm, smooth, glabrous. Pappus brown; outer bristles 2–3 mm; inner bristles 6–7 mm. Fl. and fr. Aug–Sep.

• Grasslands on mountain slopes; 3400–4300 m. NW Yunnan (Dêqên, Zhongdian).

3. *Saussurea delavayi* Franchet, J. Bot. (Morot) 2: 355. 1888.

大理雪兔子 da li xue tu zi

Herbs (10–)15–35 cm tall, perennial, polycarpic. Caudex stout, simple or few branched, covered with remains of petioles. Stem solitary, 4–6 mm in diam., erect, simple. Basal and lower stem leaves petiolate; petiole to 4 cm; leaf blade linear, 5–18 × 0.2–0.8 cm, abaxially light or grayish green, sericeous, tomentose, and gland-dotted, adaxially dark green and glabrous or sericeous-villous, margin slightly revolute and entire or denticulate, apex acuminate. Middle and upper stem leaves sessile, linear, 5–10 × 0.2–0.8 cm. Uppermost stem leaves stellately arranged, overtopping synflorescence, narrowly triangular-linear, 1.5–6 × 0.4–0.8 cm, apex acuminate. Capitula 10–15, in a hemispheric synflorescence 3–6 cm in diam., sessile. Involucre campanulate, 0.8–1.2 cm in diam. Phyllaries in 4 or 5 rows, blackish, apex caudate to acuminate; outer phyllaries narrowly triangular-ovate, 9–11 × 2.5–3 mm; middle phyllaries narrowly elliptic, 7–9 × 2–2.5 mm; inner phyllaries linear, 8–9 × 1–1.5 mm. Receptacle bristles 5–6 mm. Corolla bluish purple, 7–9 mm, tube 4–5 mm, limb 3–4 mm, lobes ca. 2 mm. Achene dark brown, obconic, 3–5 mm, smooth, glabrous. Pappus brown; outer bristles 2–4 mm; inner bristles 6–8 mm. Fl. and fr. Aug–Oct. $2n = 34^*$.

• Grasslands on mountain slopes; 3300–4400 m. NW Yunnan.

- 1a. Leaves adaxially glabrous; basal leaves usually less than 5 mm wide 3a. var. *delavayi*
 1b. Leaves adaxially sericeous-villous; basal leaves usually more than 5 mm wide 3b. var. *hirsuta*

3a. *Saussurea delavayi* var. *delavayi*

大理雪兔子(原变种) da li xue tu zi (yuan bian zhong)

Stem appressed sericeous. Leaves abaxially light green, appressed sericeous, tomentose, and gland-dotted, adaxially glabrous. Basal leaves 2–5 mm wide.

• Grasslands on mountain slopes; 3300–4000 m. NW Yunnan (Dali, Gongshan, Lijiang).

3b. *Saussurea delavayi* var. *hirsuta* (J. Anthony) Raab-Straube, *stat. nov.*

硬毛大理雪兔子 ying mao da li xue tu zi

Basionym: *Saussurea delavayi* f. *hirsuta* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 205. 1934; *S. hirsuta* (J. Anthony) Handel-Mazzetti.

Stem densely sericeous-villous. Leaves abaxially grayish green, sericeous-villous, tomentose, and gland-dotted, adaxially sericeous-villous. Basal leaves 5–8 mm wide.

• Grasslands on mountain slopes; 4300–4400 m. NW Yunnan (Fugong, Lijiang).

4. *Saussurea kingii* C. E. C. Fischer, Bull. Misc. Inform. Kew 1937: 98. 1937.

拉萨雪兔子 la sa xue tu zi

Saussurea erecta S. W. Liu, J. T. Pan & J. Quan Liu.

Herbs 2–15(–25) cm tall, biennial or annual, monocarpic. Stem solitary, 2–4 mm in diam., sometimes erect, diffusely branched from base, apically branched or stem almost absent. Rosette leaves petiolate; petiole 0.5–5 cm; leaf blade narrowly oblong-elliptic to linear, 2–14 × 0.3–1.7 cm, pinnately lobed, both surfaces green, abaxially gland-dotted and arachnoid tomentose but glabrescent, adaxially sparsely arachnoid and gland-dotted, apex mucronate; lateral lobes 5–10 pairs, margin dentate or entire. Capitula 8–25, in a corymbiform synflorescence 3–15 cm in diam.; peduncle 0.3–1 cm. Involucre narrowly campanulate, 7–10 mm in diam. Phyllaries in 3 or 4 rows, apically purple, arachnoid, gland-dotted, apex acute and mucronate; outer phyllaries ovate to narrowly ovate-elliptic, 6–9 × 3–3.5 mm, appendage rhombic-spatulate and tridentate; middle and inner phyllaries narrowly ovate-elliptic, 5.5–9 × 1.5–2.5 mm. Receptacle without bristles. Corolla purplish red, rose, or white, 7–11 mm, tube 2.5–5.5 mm, limb 4–5.5 mm, lobes 3–4 mm and gland-dotted. Achene grayish with a dark wavy pattern, obconic, 3–4 mm, wrinkled, with thin long crisp hairs, glabrescent. Pappus white; outer bristles 2–2.5 mm; inner bristles (6–)8–9 mm, basally straw-colored. Fl. and fr. Aug–Sep. $2n = 34^*$.

• Sandy river edges and mountain slopes, sand dunes; 2900–5000 m. Xizang.

Saussurea erecta, described from a single specimen, differs from *S. kingii* only by its more erect habit and glabrous achenes. *Saussurea kingii* is variable in growth habit, and glabrous achenes have been observed in some specimens of *S. kingii* as well. As long as these characters are not found to be stable in a larger population, we regard *S. erecta* as synonymous with *S. kingii*.

5. *Saussurea thoroldii* Hemsley, J. Linn. Soc., Bot. 30: 115. 1894.

草甸雪兔子 cao dian xue tu zi

Herbs 2–6 cm tall, perennial, monocarpic, stemless or shortly stemmed. Taproot 1–3 mm in diam. Caudex densely covered with fibrous remains of petioles. Rosette leaves shortly petiolate; petiole purplish, basally widened; leaf blade narrowly triangular-ovate to linear, 2–10 × 0.2–1.5 cm, both surfaces green but purple in basal part, glabrous, pinnately lobed to pinnately divided, margin entire or sparsely dentate, apex acute and mucronate; lateral lobes 5–10 pairs, narrowly elliptic to linear, 1–4(–10) mm, recurved or patent. Capitula 8–40, clustered in a corymbiform to hemispheric synflorescence 2–8(–15) cm in diam., subsessile or on a peduncle to 3 cm. Involucre cylindric, 5–7 mm in diam. Phyllaries in ca. 4 rows, glabrous, margin apically ciliate, apex obtuse; outer phyllaries elliptic, 4–7 × 1.5–2 mm; middle and inner phyllaries oblong, 6–8 × 1.5–2 mm. Receptacle bristles 1–2 mm. Corolla rose to bluish purple, 8–11 mm, tube 3.5–6 mm, limb 4–6 mm, lobes 2–3 mm. Achene ivory-colored with a dark wavy pattern, cylindric to obconic, 2–3 mm, wrinkled, glabrous, apex with a lacerate

crown to 2 mm. Pappus pale brown; outer bristles 2–4 mm; inner bristles (6–)8–10 mm. Fl. and fr. Jul–Sep. $2n = 32^*$.

• Sandy and gravelly soil by lakes, river terraces, open steppes, saline marshlands; 3100–5200 m. Gansu, Qinghai, S Xinjiang, Xizang.

6. *Saussurea grandiceps* S. W. Liu, Acta Biol. Plateau Sin. 3: 69. 1984.

硕首雪兔子 shuo shou xue tu zi

Herbs 7–12 cm tall, perennial, monocarpic, stemless or shortly stemmed. Taproot conic, fleshy. Caudex covered with remains of petioles. Rosette and stem leaves petiolate; petiole 0.5–3.5 cm, straw-colored with purple wings, widened at base; leaf blade narrowly elliptic-oblong to linear, 2–8 × 0.2–0.8 cm, abaxially pale or grayish green and thinly arachnoid to densely villous, adaxially green and glabrous, margin often revolute and entire or sparsely dentate, apex acuminate. Capitulum solitary, in center of leaf rosette. Involucre hemispheric to broadly campanulate, 3–4(–5) cm in diam. Phyllaries in 4 or 5 rows, straw-colored, apically and near margin dark purple, sparsely pilose, apex acuminate; outer phyllaries narrowly triangular-ovate, 1.5–1.7 × 0.4–0.6 cm; middle phyllaries narrowly elliptic, 1.8–2 × 0.3–0.4 cm; inner phyllaries narrowly elliptic, 2–2.3 × 0.2–0.3 cm. Receptacle bristles brownish, subulate, 2–3 mm, hyaline. Corolla bluish purple, 1.9–2.1 cm, tube 1.3–1.4 cm, limb 6–7 mm, lobes 3–4.5 mm. Achene brown with a blackish wavy pattern, rectangular, 7–8 mm, 4-angled, wrinkled, glabrous. Pappus straw-colored; outer bristles (2–)4–6 mm; inner bristles 1.4–1.6 cm. Fl. and fr. Aug.

• Alpine scree slopes; 5000–5300 m. S Xizang (Saga).

7. *Saussurea stella* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 490. 1882.

星状雪兔子 xing zhuang xue tu zi

Herbs 2–5 cm tall, perennial, monocarpic, stemless. Rosette leaves sessile; leaf blade very narrowly triangular-ovate to linear but basally ovately widened, 2.5–20 × 0.3–1.3 cm, both surfaces glabrous, adaxially purplish red in basal part but green in apical part, margin entire, apex long acuminate. Capitula 2–25, in center of leaf rosette, in a hemispheric synflorescence 2–6 cm in diam., sessile. Involucre cylindric, 8–10 mm in diam. Phyllaries in ca. 5 rows, glabrous, basally hyaline, apically purple, apex rounded to obtuse and ciliate; outer phyllaries oblong or spatulate, 6–9 × 2–3(–5) mm; middle phyllaries narrowly oblong, 7–12 × 1.5–2 mm; inner phyllaries linear, 12–14 × 1–1.5 mm. Receptacle bristles white, 1–3 mm. Corolla purple, 1.3–1.7 cm, tube 0.8–1.2 cm, limb 5–6 mm, lobes 3–3.5 mm. Achene ivory-colored with dark spots, obconic, 2–3(–5) mm, obtusely 5-ribbed, glabrous, apex with a few-dentate ca. 1 mm crown. Pappus dirty white to light brown, in 1 row; bristles 0.9–1.3 cm, unequal in width, plumose, persistent. Fl. and fr. Jul–Sep.

Alpine grasslands, marshlands near rivers and lakes, wet meadows, bogs; 2000–5400 m. Gansu, Qinghai, W Sichuan, Xizang, NW Yunnan [Bhutan, India (Sikkim)].

8. *Saussurea thomsonii* C. B. Clarke, Compos. Ind. 227. 1876.

肉叶雪兔子 rou ye xue tu zi

Saussurea acaulis Klatt; *S. amblyophylla* C. Winkler.

Herbs 1–4 cm tall, perennial, monocarpic, stemless. Taproot 1–2 mm in diam. Caudex short, with brown remains of petioles. Rosette leaves petiolate; petiole 5–10(–30) mm, basally widened; leaf blade elliptic, ovate, or spatulate, 1–3 × 0.5–1.7 cm, fleshy but leathery and rigid when dry, both surfaces green, abaxially glabrous, adaxially sparsely arachnoid but glabrescent, base cuneate-attenuate, margin crenulate to subentire, apex obtuse, rounded, or rarely acute. Uppermost leaves suborbicular. Capitula 2–10, in center of leaf rosette, in a hemispheric synflorescence 1.5–3 cm in diam., sessile. Involucre campanulate, (6–)8–10 mm in diam. Phyllaries in 3 or 4 rows, membranous, purplish red, glabrous, apex obtuse to rounded; outer phyllaries elliptic to obovate, 5–6(–8) × 2.5–3 mm; middle phyllaries obovate, 6–7 × 2.5–3 mm; inner phyllaries narrowly elliptic, 7–8 × 1.5–2 mm. Receptacle bristles brown, 0.2–0.8 mm. Corolla bluish purple, 6–7 mm, tube 3–3.5 mm, limb 3.5–4 mm, lobes 1.5–2 mm. Achene brown, cylindric to obconic, ca. 4 mm, wrinkled, glabrous. Pappus brown; outer bristles 2–4 mm, plumose, corkscrewlike twisted; inner bristles 6–7 mm. Fl. and fr. Jun–Sep.

High mountain pastures and meadows by rivers and lakes, marshlands; 4000–5200 m. Qinghai, S Xinjiang, Xizang [NW India, Kashmir, ?Pakistan].

9. *Saussurea wellbyi* Hemsley, Hooker's Icon. Pl. 26: t. 2588. 1899.

羌塘雪兔子 qiang tang xue tu zi

Saussurea hyperiophora Handel-Mazzetti.

Herbs 2–7 cm tall, perennial, monocarpic, stemless or shortly stemmed. Taproot conic, fleshy. Caudex 0.5–1.5 cm in diam., simple, covered with remains of leaf bases; leaf bases brown, adaxially white sericeous-villous. Rosette leaves sessile, narrowly ovate-linear but base ovately widened, 2–5(–7) × 0.1–0.8(–1) cm, abaxially sericeous, adaxially sericeous-villous to densely lanate in basal part and glabrous in apical part, margin entire, apex long acuminate to caudate. Capitula 8–30, in center of leaf rosette, in a hemispheric synflorescence 2.5–4 cm in diam., sessile or shortly pedunculate. Involucre cylindric, ca. 6 mm in diam. Phyllaries in 3 or 4 rows, membranous, apically purple, apex acute; outer phyllaries narrowly obovate to oblong, 7–10 × 3–4 mm, apically villous; middle and inner phyllaries narrowly elliptic to linear, 10–12 × 2–2.5 mm, glabrous. Receptacle bristles 1–3 mm. Corolla purplish red, 8–10 mm, tube 3–5 mm, limb 4–6 mm, lobes 2–3 mm. Achene gray with some dark spots or blackish brown, cylindric to obconic, 3–5 mm, smooth, glabrous. Pappus brown; outer bristles 2–4 mm; inner bristles 7–10 mm. Fl. and fr. Jul–Sep. $2n = 28^*$.

• Alpine scree slopes, alpine meadows; 4300–5500 m. Qinghai, W Sichuan, S Xinjiang, Xizang.

10. *Saussurea aster* Hemsley, J. Linn. Soc., Bot. 30: 115. 1894.

云状雪兔子 yun zhuang xue tu zi

Herbs 2–7 cm tall, perennial, monocarpic, stemless or shortly stemmed. Taproot conic, fleshy. Caudex 0.5–1.5 cm in diam., simple, covered with remains of petioles. Rosette leaves

petiolate; leaf blade narrowly elliptic, spatulate, or linear, 0.5–2(–4) × 0.1–0.4(–1) cm, abaxially white and densely sericeous to lanate, adaxially grayish green or yellowish green, base attenuate, margin entire, apex obtuse. Capitula 5–25, in center of leaf rosette, in a hemispheric synflorescence 2.5–5 cm in diam., sessile. Involucre cylindric to campanulate, 5–8 mm in diam. Phyllaries in 3 or 4 rows, apically purple and villous, margin purplish, hyaline, and entire or apically with 1 or 2 lateral teeth, apex acute to acuminate; outer phyllaries narrowly oblong to obovate, 8–10 × 2.5–3 mm; middle and inner phyllaries linear, 9–10 × 0.5–2 mm. Receptacle bristles 1–2 mm. Corolla rose-purple, 7–9 mm, tube 3–4 mm, limb 4.5–5 mm, lobes 1.5–2 mm. Achene brown or gray with dark spots, cylindric to fusiform, 4–6 mm, glabrous. Pappus in 2 rows; outer bristles dirty white, 3–4 mm; inner bristles brown, 7–8 mm. Fl. and fr. Jun–Aug.

Alpine scree slopes; 3900–5400 m. Qinghai, W Sichuan, Xizang [?NW India, Kashmir].

11. *Saussurea depsangensis* Pampanini, Lav. Ist. Bot. Reale Univ. Cagliari 22 [Aggiunte Fl. Caracorum]: 176. 1934.

昆仑雪兔子 kun lun xue tu zi

Herbs 2–5 cm tall, perennial, monocarpic, stemless or shortly stemmed. Taproot slender, fleshy. Rosette leaves shortly petiolate; leaf blade obovate, spatulate, or suborbicular, 1–3 × 0.5–1.4 cm, abaxially sparsely whitish lanate but glabrescent, adaxially densely lanate with yellowish brown or whitish articulate matted hairs in basal part but arachnoid floccose and glabrescent in apical part, base cuneate-attenuate, margin entire or sparsely denticulate, apex rounded to obtuse. Capitula numerous, in center of leaf rosette, in a hemispheric synflorescence 2–4 cm in diam., sessile. Involucre cylindric to campanulate, 4–8 mm in diam. Phyllaries in ca. 3 rows, subequal, apex acuminate; outer phyllaries narrowly ovate-oblong, 8–9 × 2–3 mm, herbaceous, apically densely yellowish brown lanate; middle and inner phyllaries narrowly oblong to linear, 7–9 × 1–2 mm, light brown, scarious, glabrous. Receptacle without bristles. Corolla rose-purple to purplish red, 9–10(–13) mm, tube 3.5–4 mm, limb 5–6 mm, lobes 2–2.5 mm. Achene (ripe) unknown, ca. 4 mm, glabrous. Pappus yellowish brown, in 1 row; bristles plumose, 0.9–1.1 cm. Fl. and fr. Aug–Sep.

Alpine scree slopes; 4800–5400 m. Qinghai, S Xinjiang, Xizang [Kashmir].

12. *Saussurea glacialis* Herder, Bull. Soc. Imp. Naturalistes Moscou 40(3–4): 144. 1867.

冰川雪兔子 bing chuan xue tu zi

Saussurea chthonocephala Bornmüller; *S. pamirica* C. Winkler; *S. violacea* Pampanini.

Herbs 2–6(–10) cm tall, perennial, polycarpic, shortly stemmed. Caudex slender, branched, with several leaf rosettes and flowering stems, covered with remains of petioles. Stem solitary, 1–3 mm in diam., erect, simple. Rosette and stem leaves shortly petiolate; leaf blade narrowly elliptic to obovate, 1.5–4 × 0.4–1 cm, abaxially white lanate, adaxially yellowish or white lanate, base cuneate-attenuate, margin crenate or entire, apex obtuse. Capitula 3–15, in a hemispheric synflorescence

1.5–4 cm in diam., sessile. Involucre cylindric to narrowly campanulate, (5–)7–10 mm in diam. Phyllaries in 3 or 4 rows, scarious, apically purple or blackish, apex acute to acuminate; outer phyllaries narrowly ovate-elliptic, 9–13 × 2.5–3 mm, apically lanate; middle phyllaries narrowly oblong, 8–13 × 1.5–2.5 mm; inner phyllaries narrowly elliptic to linear, 9–13 × 1–1.5 mm, glabrous. Receptacle bristles white, 0.5–2.5 mm. Corolla purple, 9–10 mm, tube 3–4 mm, limb 6–6.5 mm, lobes 2–2.5 mm. Achene cylindric to obconic, 3–4 mm, glabrous. Pappus in 2 rows; outer bristles dirty white, 2–5 mm, scabrid to plumose, sometimes lacking; inner bristles basally brown, apically dirty white, 8–11 mm. Fl. and fr. Jul–Aug.

Alpine scree slopes; 3800–5200 m. Qinghai, Xinjiang, Xizang [E Afghanistan, NW India, Kashmir, E Kazakhstan, Kyrgyzstan, Mongolia, N Pakistan, Russia (Siberia), Tajikistan].

13. *Saussurea inversa* Raab-Straube, Willdenowia 41: 92. 2011.

黑毛雪兔子 *hei mao xue tu zi*

Saussurea sorocephala (Schrenk ex Fischer & C. A. Meyer) Schrenk var. *glabrata* J. D. Hooker, Fl. Brit. India 3: 377. 1881, not *S. glabrata* (Candolle) C. Shih (1999); *S. gnaphalodes* (Royle ex Candolle) Schultz Bipontinus var. *glabrata* (J. D. Hooker) Handel-Mazzetti; *S. hypsipeta* Diels var. *glabrata* (J. D. Hooker) Lipschitz.

Herbs 3–15 cm tall, perennial, polycarpic, sometimes caespitose. Caudex simple or branched at ground level. Stem solitary, 2–5 mm in diam., erect, simple. Rosette and lower stem leaves long petiolate; petiole green; leaf blade narrowly obovate-spatulate, elliptic, or oblong, 1–3 × 0.3–1 cm, both surfaces green but sometimes tinged purple and glabrous or sparsely white arachnoid, base attenuate, margin obtusely dentate or entire, apex obtuse. Upper stem leaves sessile, narrowly triangular-ovate, usually reflexed, both surfaces white and blackish lanate, margin crenate or entire, apex obtuse to acuminate. Capitula 5–15, in a hemispheric synflorescence 2–4 cm in diam., sessile. Involucre cylindric, 5–6 mm in diam. Phyllaries in ca. 3 rows, membranous; outer phyllaries narrowly elliptic-linear, 8–9 × 1.5–2 mm, densely black and white lanate, apex subacute; middle and inner phyllaries obovate-elliptic, 8–9 × 2–3 mm, apex acute. Receptacle bristles 0.5–1.5 mm. Corolla rose-purple, 7–8(–9) mm, tube 3–4(–5) mm, limb 3.5–4(–5) mm, lobes (1.2–)1.5–2 mm. Achene brown, cylindric to obconic, 4–5 mm, smooth, glabrous. Pappus mouse-gray to blackish; outer bristles 1–3 mm, reflexed and appressed on achene; inner bristles 7–8 mm. Fl. and fr. Jul–Sep.

Alpine scree slopes, alpine meadows; 3700–5400 m. Qinghai, S Xinjiang, Xizang [Kashmir].

The type material of *Saussurea hypsipeta*, now present at WRSL and WU, was not seen by Lipschitz, who assumed that the type had been lost at B, though that was not the case. His choice of a neotype is therefore superseded (*Vienna Code*, Art. 9.17). Unfortunately, the type of *S. hypsipeta* differs taxonomically from the neotype. The original material of *S. hypsipeta* belongs in part to *S. gnaphalodes* and in part to *S. quercifolia*, both of which have priority over *S. hypsipeta*, so the taxon formerly widely known as *S. hypsipeta* (e.g., in Lipschitz, *Rod Saussurea*, 30. 1979; Y. L. Chen, *Fl. Xizang*, 4: 876. 1985; S. W. Liu, *Fl.*

Qinghai, 3: 458. 1996; C. Shih & S. Y. Jin, *FRPS* 78(2): 11. 1999) had to be given a new name at the species level, which cannot be “*glabrata*” as this name is already occupied in *Saussurea*.

14. *Saussurea gnaphalodes* (Royle ex Candolle) Schultz Bipontinus, Linnaea 19: 331. 1846.

鼠曲雪兔子 *shu qu xue tu zi*

Aplataxis gnaphalodes Royle ex Candolle, Prodr. 6: 542. 1838; *A. sorocephala* Schrenk ex Fischer & C. A. Meyer; *Saussurea sorocephala* (Schrenk ex Fischer & C. A. Meyer) Schrenk.

Herbs 1.5–6(–10) cm tall, perennial, polycarpic, caespitose. Caudex branched at ground level, usually with many leaf rosettes and flowering shoots. Stem solitary, 1–3 mm in diam., erect, simple. Rosette and stem leaves shortly petiolate; petiole purple; leaf blade obovate, spatulate, or linear-oblong, 5–20 × 2–8 mm, abaxially whitish with dark midvein and arachnoid tomentose, adaxially white or brownish arachnoid lanate, base cuneate-attenuate, margin entire, crenate, or obtusely dentate, apex obtuse to rounded. Capitula 5–20, in a hemispheric synflorescence 2–4 cm in diam., sessile. Involucre cylindric, (3–)5–8 mm in diam. Phyllaries in 3 or 4 rows, membranous, straw-colored to light brown, apically dark brown strigose, apex obtuse to acuminate; outer phyllaries ovate-oblong, 7–8 × 2–3.5 mm; middle and inner phyllaries narrowly ovate-elliptic to linear, 6–9 × 1–2 mm. Receptacle bristles 0.5–1.5 mm. Corolla rose-purple, 8–9 mm, tube 4–5 mm, limb 4–4.5 mm, lobes 2–2.5 mm. Achene brown to dirty white with dark spots, cylindric to obconic, 3–4 mm, smooth, glabrous or gland-dotted. Pappus mouse-gray to blackish; outer bristles 2–4 mm, sometimes reflexed; inner bristles 8–9 mm. Fl. and fr. Jun–Sep. $2n = 48^*$.

Alpine scree slopes; 2700–5800 m. Gansu, Qinghai, W Sichuan, S and W Xinjiang, Xizang [NE Afghanistan, NW India, Kashmir, E Kazakhstan, Kyrgyzstan, W Nepal, N Pakistan, Tajikistan].

The basionym was not validly published by Royle (Ill. Bot. Himal. Mts. 251, t. 59, f. 1. 1835). There was no written description or diagnosis, or reference to such, and the illustration was lacking an analysis (*Vienna Code*, Art. 32.1(d), 44.1, 42.4).

15. *Saussurea sugongii* S. W. Liu & T. N. Ho, Novon 20: 174. 2010.

武素功雪兔子 *wu su gong xue tu zi*

Herbs 1.5–2 cm tall, perennial, polycarpic, almost stemless. Caudex slender, trailing, usually branched, usually with several sterile leaf rosettes and flowering stems, apically covered with remains of petioles. Rosette leaves petiolate; petiole purple, base widened; leaf blade ovate, fan-shaped, spatulate, or orbicular, (1–)3–10 × (1–)2–7 mm, abaxially grayish green and densely arachnoid tomentose, adaxially green and sparsely arachnoid or glabrous, base cuneate, margin entire or crenulate, apex rounded. Capitula 3–8, terminal in center of leaf rosette, in a hemispheric synflorescence 1–2.5 cm in diam., sessile. Involucre narrowly campanulate, 3–5 mm in diam. Phyllaries in 2 or 3 rows, membranous, apically purple or brown, apex acute to acuminate and dentate; outer phyllaries narrowly elliptic-oblong, 6–7 × 2–3 mm, apically sparsely arachnoid; middle and inner phyllaries narrowly elliptic to narrowly obovate, 6–8 × 1–

2.5 mm. Receptacle without bristles. Corolla 6–8 mm, tube 3–4 mm, limb 3–4 mm, lobes 1.5–2 mm. Achene dark brown, obconic, 3.5–4 mm, smooth, glabrous. Pappus pale yellowish brown, in 1 row; bristles 6–7 mm, plumose. Fl. Jul–Aug.

• Scree slopes, gravelly or sandy areas; 4800–5200 m. SE Xinjiang (Ruoqiang).

16. *Saussurea quercifolia* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 8: 115. 1913.

槲叶雪兔子 hu ye xue tu zi

Saussurea chionophora Handel-Mazzetti; *S. hypsipeta* Diels; *S. quercifolia* var. *major* J. Anthony.

Herbs 4–15(–22) cm tall, perennial, polycarpic. Caudex 3–5 mm in diam., creeping, branched, with sterile leaf rosettes and flowering stems. Stem solitary, 0.5–1.5 cm in diam., erect, simple, hidden by reflexed leaves. Rosette and lower stem leaves petiolate; leaf blade elliptic to narrowly elliptic, 0.8–4.5(–8) × 0.5–1.5 cm, abaxially whitish with dark veins, tomentose, and gland-dotted, adaxially green and sparsely arachnoid, base cuneate-attenuate, margin obtusely dentate to pinnately divided, apex acute to obtuse. Upper stem leaves oblong to linear, 1–5 × 0.2–0.8 cm, abaxially and basally densely lanate, adaxially glabrescent, margin pinnately divided or entire, apex acuminate. Capitula 10–20, in a hemispheric synflorescence 2.5–5 cm in diam., sessile. Involucre cylindric, 5–8 mm in diam. Phyllaries in 3 or 4 rows, apically grayish villous, apex acute; outer phyllaries narrowly ovate-elliptic, 6–10 × 2.5–4 mm; middle and inner phyllaries narrowly elliptic to linear, (6–)9–12 × 1.5–4 mm. Corolla bluish purple, 0.8–1.2 cm, tube 4–6 mm, limb 4–6 mm, lobes 2–3 mm. Achene brown, obconic, 4–6 mm, smooth, glabrous. Pappus mouse-gray; outer bristles 1–5 mm, barbellate to plumose; inner bristles 7–12 mm. Fl. and fr. Jul–Oct.

• Alpine scree slopes; 3300–5300 m. Qinghai, W Sichuan, EC and SE Xizang, NW Yunnan (Dêqên, Gongshan, Zhongdian).

Comparison of type material of *Saussurea chionophora* and *S. quercifolia* has shown that this is in fact a single species. No characters could be found to separate the two. *Saussurea quercifolia* is very variable in leaf size and division; the large specimens described as *S. quercifolia* var. *major* are included here.

For a synonymization of *Saussurea hypsipeta* see the discussion under *S. inversa*.

17. *Saussurea georgei* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 207. 1934.

川滇雪兔子 chuan dian xue tu zi

Herbs 5–15 cm tall, perennial, polycarpic. Caudex 3–10 mm in diam., creeping, branched, with sterile leaf rosettes and flowering stems. Stem solitary, 2–5 mm in diam., erect, simple, hidden by reflexed leaves. Rosette and stem leaves petiolate; leaf blade elliptic, 1.5–3 × 0.5–1.5 cm, both surfaces dark green, abaxially arachnoid but glabrescent, adaxially arachnoid but lanate in proximal part, margin dentate to subentire, apex acute. Uppermost stem leaves sessile, linear, 1–3 × 0.2–0.5 cm, reflexed, margin entire, apex acuminate. Capitula 8–20, in a hemispheric synflorescence 2.5–6 cm in diam., sessile. Involucre narrowly campanulate, 7–9 mm in diam. Phyllaries in 3 or

4 rows, light brown but apically blackish purple, margin hyaline; outer phyllaries obovate-oblong, 14–15 × 4–4.5 mm, apically arachnoid, apex acuminate; middle and inner phyllaries narrowly elliptic, (13–)15–16 × 3–4 mm, glabrous, apex acute. Receptacle bristles straw-colored, 4–5 mm. Corolla purplish red, 1.2–1.4 cm, tube 6–7 mm, limb 6–7 mm, lobes 3–3.5 mm. Achene brown, cylindric, 5–6 mm, smooth, glabrous. Pappus light brown; outer bristles few, 1.5–4 mm, scabrid or smooth, sometimes lacking; inner bristles 1.2–1.3 cm. Fl. and fr. Jul–Aug.

• Alpine scree slopes; 3400–5300 m. S Qinghai (Yushu), SW and W Sichuan (Litang, Muli), ?Xizang, NW Yunnan (Dêqên, Zhongdian).

18. *Saussurea paxiana* Diels, Repert. Spec. Nov. Regni Veg. Beih. 12: 512. 1922.

红叶雪兔子 hong ye xue tu zi

Herbs 5–15 cm tall, perennial, polycarpic. Caudex 1–4 mm in diam., branched, with sterile leaf rosettes and flowering stems. Stem solitary, 2–3 mm in diam., erect, simple. Rosette and lower stem leaves distinctly petiolate; leaf blade obovate, elliptic, ovate, or orbicular, 1.5–10 × 0.5–3(–5) cm, green but becoming purplish red, abaxially usually reddish and glabrous, adaxially sparsely white arachnoid but glabrescent, base cuneate-attenuate, margin dentate, apex rounded to acuminate. Uppermost stem leaves sessile, narrowly elliptic to linear, both surfaces white and brownish lanate, apex acuminate and usually reflexed. Capitula (1 or)2–5(–13), in a hemispheric synflorescence 2–5 cm in diam. or rarely solitary, sessile. Involucre campanulate, 1–1.5(–2) cm in diam. Phyllaries in ca. 4 rows, straw-colored, apically white and brown lanate, apex acuminate; outer phyllaries narrowly triangular-ovate, 10–12(–18) × 3–4 mm; middle and inner phyllaries narrowly elliptic-linear, 12–14(–18) × 1.5–3 mm. Receptacle bristles filiform, to 1 mm. Corolla dark red or pink, 1.2–1.7 cm, tube 6–11 mm, limb 6–7 mm, lobes 3–4 mm. Achene ivory-colored, cylindric, (5–)7–8 mm, 5-ribbed, smooth, glabrous. Pappus straw-colored; outer bristles 0.5–1.5 mm; inner bristles 1–1.3(–1.6) cm. Fl. and fr. Jun–Sep. $2n = 28^*$.

• Alpine scree slopes and meadows; 3500–5000 m. Gansu, Qinghai, W Sichuan, E Xizang, NW Yunnan.

19. *Saussurea gyacaensis* S. W. Liu, Acta Biol. Plateau Sin. 3: 69. 1984.

加查雪兔子 jia cha xue tu zi

Herbs 6–10 cm tall, perennial, polycarpic, caespitose. Caudex slender, branched, with several sterile leaf rosettes and flowering stems. Stem solitary, 2–5 mm in diam., erect or ascending, simple. Rosette and lower stem leaves petiolate; leaf blade spatulate to linear, 0.4–2 × 0.5–1.1 cm, white lanate, base attenuate, margin entire or crenate, apex obtuse to acuminate. Upper stem leaves linear, 1.5–3 × 0.2–0.3 cm, both surfaces densely white or yellowish lanate, margin entire or apically lobed, apex acuminate. Uppermost stem leaves narrowly triangular to linear, 1.5–3 × 0.2–0.3 cm, reflexed, both surfaces densely white or yellowish lanate, base purplish and widened, margin entire, apex acuminate. Capitula numerous, in a hemispheric synflorescence 3.5–4.5 cm in diam., sessile. Involucre

cylindric, ca. 5 mm in diam. Phyllaries in several rows, narrowly obovate-linear, 1–1.4 cm, dark purple, subglabrous, apex acute. Receptacle without bristles. Corolla bluish purple, ca. 1.2 cm, tube 6–7 mm, limb ca. 5 mm, lobes ca. 2 mm. Achene black, 6–6.5 mm. Pappus pale brown, in 1 row; bristles ca. 1.1 cm, plumose. Fl. and fr. Jul–Aug.

- Alpine scree slopes; ca. 4800 m. Xizang (Gyaca).

Saussurea gyacaensis is known only from the type collection.

20. *Saussurea leucoma* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 197. 1912.

羽裂雪兔子 yu lie xue tu zi

Saussurea franchetiana H. Léveillé.

Herbs 10–18 cm tall, perennial, monocarpic. Caudex to 2 cm in diam., unbranched. Stem solitary, erect, simple, hidden by leaves. Lower and middle stem leaves petiolate; leaf blade narrowly elliptic, 3–5 × 0.5–2.5 cm, pinnatisect, abaxially grayish white, arachnoid tomentose to lanate, and gland-dotted, adaxially green and arachnoid to glabrescent; lobes 5–10 pairs, linear, 5–10 × 1–2 mm, margin entire, apex acute. Uppermost stem leaves sessile, linear, 2–3 × 0.1–0.2 cm, reflexed, both surfaces densely yellowish white lanate, margin entire, apex acute. Capitula numerous, in a hemispheric synflorescence 4–6 cm in diam., sessile. Involucre cylindric, 0.5–0.8 mm in diam. Phyllaries in 3 or 4 rows; outer phyllaries narrowly triangular-ovate, 10–15 × 3–5 mm, apically yellowish lanate, apex acuminate; middle and inner phyllaries narrowly elliptic to linear, 9–15 × 2–3 mm, apically sparsely pilose, margin membranous, apex acute. Receptacle bristles brown, 1–3 mm. Corolla blackish purple, 1–1.4 cm, tube 7–8 mm, limb 6–7 mm, lobes 2–3 mm. Achene black, obconic, 4–5 mm, smooth, glabrous. Pappus straw-colored; outer bristles 3–4 mm; inner bristles 1–1.3 cm. Fl. and fr. Aug–Oct.

- Alpine scree slopes; 3200–5300 m. SW Sichuan (Muli), SE Xizang, NW Yunnan (Dêqên, Lijiang, Zhongdian).

21. *Saussurea simpsoniana* (Fielding & Gardner) Lipschitz, Novosti Sist. Vyssh. Rast. 1964: 319. 1964.

小果雪兔子 xiao guo xue tu zi

Aplotaxis simpsoniana Fielding & Gardner, Sert. Pl. t. 26. 1844; *A. gossypina* Candolle var. *minor* Candolle; *Saussurea sacra* Edgeworth; *S. yushuensis* S. W. Liu & T. N. Ho.

Herbs 2–12[–25] cm tall, perennial, caespitose, polycarpic. Caudex stout, branched, with several sterile leaf rosettes and flowering stems. Stem solitary, ca. 6 mm in diam., erect, simple, usually hidden by leaves. Rosette and lower stem leaves petiolate; leaf blade narrowly oblong or narrowly elliptic to linear, 2–6 × 0.3–0.6[–1.2] cm, both surfaces green or purplish and sparsely arachnoid, base cuneate-attenuate, margin dentate to pinnately lobed, apex acute. Uppermost stem leaves linear, 10–25 × 1–2 mm, usually reflexed, both surfaces densely white lanate, margin entire or denticulate, apex acute. Capitula numerous, in a hemispheric synflorescence 2–3.5 cm in diam., sessile or shortly pedunculate. Involucre cylindric, 4–6 mm in diam. Phyllaries in 3 or 4 rows, membranous, apex acute to acuminate; outer phyllaries narrowly triangular-ovate, 11–13 ×

ca. 3 mm, apically lanate; inner phyllaries narrowly ovate-elliptic to linear, 9–10 × 1.5–2 mm, apically sparsely pilose. Receptacle bristles ca. 1.5 mm. Corolla purple, 0.9–1.1 cm, tube 3.5–5 mm, limb 5.5–6 mm, lobes 2–3 mm. Achene brown, 2–3 mm, wrinkled, apically sparsely papillose. Pappus straw-colored; outer bristles ca. 3 mm; inner bristles ca. 1 cm. Fl. and fr. Aug–Sep. $2n = 32$.

Alpine scree slopes; 3700–5800 m. S Qinghai (Chindu, Nangqên), SW Xinjiang (Taxkorgan), S and SW Xizang (Burang, Yadong, Zhongba) [?Bhutan, NE and NW India, Kashmir, Nepal].

The characters that were used to distinguish *Saussurea yushuensis* from *S. simpsoniana* fall within the range of the latter, which has a large distribution area and exhibits a considerable morphological variability.

22. *Saussurea tridactyla* Schultz Bipontinus ex J. D. Hooker, Fl. Brit. India 3: 377. 1881.

三指雪兔子 san zhi xue tu zi

Herbs 8–15[–20] cm tall, perennial, polycarpic. Caudex usually branched. Stem solitary, 3–8 mm in diam., erect, simple, hidden by reflexed leaves. Rosette and lower stem leaves petiolate; leaf blade spatulate, 5–25 × 2–6 mm, both surfaces grayish green and densely white or yellowish lanate, margin apically 3–6-lobed, apex obtuse to rounded. Middle and upper stem leaves narrowly spatulate to linear, 1–3(–4.5) × 0.3–0.7(–1) cm, margin apically 2–6-lobed or entire, apex obtuse to rounded. Capitula usually numerous, in a hemispheric synflorescence 2–3(–5.5) cm in diam. or rarely solitary, sessile. Involucre oblong to cylindric, 3.5–4(–8) mm in diam. Phyllaries in 3 or 4 rows, linear-oblong, 9–13 × 1.5–3 mm, subequal, apex acute; outer phyllaries densely villous; middle and inner phyllaries membranous, apically sparsely pilose. Receptacle bristles 0.2–0.5(–1.5) mm. Corolla dark to blackish purple, 1–1.4 cm, tube 5–7.5 mm, limb 5–6 mm, lobes 1.5–2.7 mm. Achene brown, cylindric to obconic, [3.2–]5–7 mm, smooth, glabrous. Pappus straw-colored to light brown; outer bristles thin, plumose, 2–4 mm; inner bristles 1–1.2 cm. Fl. and fr. Aug–Sep. $2n = 36^*$.

Alpine scree slopes, among boulders, grasslands on mountain slopes; 4300–5300 m. S Xizang [Bhutan, India (Sikkim), Nepal].

- 1a. Capitula numerous; involucre oblong 22a. var. *tridactyla*
- 1b. Capitulum solitary; involucre hemispheric 22b. var. *maiduoganla*

22a. *Saussurea tridactyla* var. *tridactyla*

三指雪兔子(原变种) san zhi xue tu zi (yuan bian zhong)

Plants with a single flowering stem. Capitula numerous in a hemispheric synflorescence. Involucre oblong.

Alpine scree slopes, among boulders, grasslands on mountain slopes; 4300–5300 m. S Xizang [Bhutan, India (Sikkim), Nepal].

22b. *Saussurea tridactyla* var. *maiduoganla* S. W. Liu, Acta Biol. Plateau Sin. 3: 71. 1984.

丛株雪兔子 cong zhu xue tu zi

Plants caespitose, with several flowering stems. Capitulum solitary. Involucre hemispheric.

- Alpine scree slopes; 4600–4700 m. S Xizang (Gyirong).

Saussurea tridactyla var. *maiduogana* is only known from the type collection.

23. *Saussurea medusa* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 488. 1882.

水母雪兔子 shui mu xue tu zi

Saussurea dainellii Pampanini; *S. trullifolia* W. W. Smith; *S. trullifolia* var. *pinnatibracteata* J. Anthony.

Herbs 6–20 cm tall, perennial, polycarpic. Caudex 3–8 mm in diam., usually branched. Stem solitary, 0.5–1.5 cm in diam., erect, simple, hidden by reflexed leaves. Rosette and lower stem leaves petiolate; leaf blade obovate, fan-shaped, rhombic, or orbicular, 1–7.5 × (0.5–)1–5 cm, both surfaces grayish green and white or yellowish arachnoid lanate, margin dentate to pinnately lobed, apex obtuse. Middle and upper stem leaves ovate-elliptic, pinnately lobed or divided, both surfaces densely lanate, apex acute to acuminate. Uppermost stem leaves narrowly ovate to linear, both surfaces densely lanate, margin dentate. Capitula numerous, in a hemispheric synflorescence 3–7 cm in diam., sessile. Involucre cylindric, 5–8 mm in diam. Phyllaries in 3 or 4 rows; outer phyllaries narrowly ovate-triangular, 1.5–2.5 × 0.5–0.6 cm, apically white or brown lanate, apex caudate; middle and inner phyllaries narrowly obovate-oblong, 10–14 × 1–4 mm, glabrous, apex rounded and ciliate. Receptacle bristles 0.5–2 mm. Corolla bluish purple, sparsely papillose, 1–1.3 cm, tube 5–7 mm, limb 3–6 mm, lobes 1–3 mm. Achene dark brown, narrowly fusiform, 8–10 mm, sparsely papillose on apical rim or glabrous. Pappus dirty white; outer bristles 3–6 mm; inner bristles 1–1.3 cm. Fl. and fr. Jul–Sep. $2n = 34^*$.

- Rocky slopes, alpine scree slopes; 3000–5600 m. Gansu, Qinghai, W Sichuan, S Xinjiang, Xizang, NW Yunnan (Dêqên, Zhongdian) [?Kashmir].

The whole plant of *Saussurea medusa* is used medicinally.

24. *Saussurea namikawae* Kitamura, Acta Phytotax. Geobot. 24: 5. 1969.

尼泊尔雪兔子 ni bo er xue tu zi

Herbs 7–9[–15] cm tall, perennial. Stem solitary, ca. 5 mm in diam., erect, simple, hidden by reflexed leaves. Lower and middle stem leaves petiolate; leaf blade spatulate, obovate, or elliptic, 8–15 × 7–8 mm, both surfaces yellowish green and densely white and yellowish lanate, base attenuate, margin pinnately lobed, apex obtuse; lobes 2 or 3 pairs, linear, 1–4 × ca. 1 mm. Uppermost stem leaves sessile, linear, 15–20 × 1–3 mm, margin sparsely dentate or entire. Capitula numerous, in a hemispheric synflorescence 3–5 cm in diam., sessile. Involucre cylindric, 5–6 mm in diam. Phyllaries in 3 or 4 rows, hyaline, apically purplish red, glabrous but apically ciliate, apex acute; outer phyllaries narrowly spatulate-linear, 10–11 × ca. 3 mm; middle and inner phyllaries linear, 13–14 × 1–2 mm. Receptacle bristles 1.5–2.5 mm. Corolla dark purple, densely papillose, 1.1–1.3 cm, tube 6–7 mm, limb 5–6 mm, lobes 1.5–2 mm. Achene brown, narrowly fusiform, 7–8 mm, densely papillose on apical rim. Pappus light brown; outer bristles 5–8 mm;

inner bristles 1.2–1.3 cm. Fl. and fr. Aug–Sep.

Alpine scree slopes; ca. 4900[–5200] m. SC Xizang (Lhasa) [W Nepal].

Saussurea namikawae from Nepal is very close to *S. medusa*, from which it is said to differ mainly by dense papillae on the corolla limb and on the apical rim of the achene; however, this kind of papillae is sometimes present in *S. medusa* as well. A specimen from C Xizang (Ludlow & Sherriff 9066) additionally differs from *S. medusa* by its much narrower leaves, which approach those of *S. tridactyla* in shape and color. This plant is therefore tentatively included here as *S. namikawae*.

25. *Saussurea laniceps* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 657. 1937.

绵头雪兔子 mian tou xue tu zi

Herbs 15–45 cm tall, perennial, monocarpic. Caudex to 2 cm in diam., unbranched. Stem solitary, to 2 cm in diam., erect, simple, hidden by leaves, basally covered with fibrous remains of petioles. Rosette and stem leaves petiolate; leaf blade narrowly obovate-elliptic, 5–15 × 1–2 cm, both surfaces green or blackish purple, abaxially brownish white tomentose, adaxially arachnoid in basal part but glabrous in apical part, margin dentate, apex acute. Uppermost stem leaves narrowly ovate-elliptic to linear, 3–6 × 0.2–0.5 cm, both surfaces densely yellowish white or blackish lanate, margin entire, apex acute. Capitula numerous, in an interrupted spiciform synflorescence to 8 cm in diam., hidden in lanate indumentum, pedunculate. Involucre campanulate, 1.5–2 cm in diam. Phyllaries in 3 or 4 rows, apically lanate, apex acuminate-caudate; outer phyllaries subulate, 2–2.5 × 0.2–0.3 cm; middle and inner phyllaries subulate-linear, 15–20 × 1–2 mm. Receptacle bristles 1–2 mm. Corolla dark purple, 0.9–1.3 cm, tube 1.5–3 mm, limb 7–8 mm, lobes 1.5–3 mm. Achene dark brown, obconic, 2.5–3(–5.5) mm, smooth, glabrous. Pappus light brown or blackish; outer bristles 2–5 mm; inner bristles 1–1.2 cm. Fl. and fr. Aug–Oct.

Alpine scree slopes; 3200–5500 m. SW Sichuan, SE Xizang, NW Yunnan [India (Sikkim), ?N Myanmar].

The whole plant of *Saussurea laniceps* is used medicinally, and the species is threatened in many regions by over-collecting.

26. *Saussurea gossipiphora* D. Don, Mem. Wern. Nat. Hist. Soc. 3: 414. 1821.

雪兔子 xue tu zi

Aplotaxis gossypina (Wallich) Candolle; *Saussurea gossipiphora* var. *lilliputa* Lipschitz; *S. gossipiphora* subsp. *luxuriosa* Lipschitz; *S. gossypina* Wallich.

Herbs 9–30[–48] cm tall, perennial, monocarpic. Caudex unbranched. Stem solitary, ca. 1 cm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade linear-oblong to narrowly obovate, 5–22 × 0.6–2.8 cm, both surfaces green and sparsely pilose or glabrous, margin sparsely denticulate, apex acute. Middle and upper stem leaves sessile, narrowly ovate-elliptic to linear, gradually smaller upward on stem, both surfaces densely white or pale yellowish lanate, apex acute or acuminate. Capitula numerous, densely clustered on flat stem apex in a synflorescence [4–]7–10 cm in diam., hidden at anthesis in

a lanate indumentum, sessile. Involucre cylindric to campanulate, 5–10 mm in diam. Phyllaries in 3–6 rows, apex acute; outer phyllaries ovate, ca. 4×3 mm; inner phyllaries narrowly ovate-elliptic to linear, ca. 7.5×1.5 mm. Receptacle bristles ca. 2 mm. Corolla bright purple to reddish purple, 7–12.5 mm, tube 2–5.5 mm, limb 5–7 mm, lobes 1.5–2 mm. Achene cylindric, 2–4.5 mm, apically sparsely papillose or glabrous. Pappus pale brown; outer bristles 4–5 mm; inner bristles 8–10 mm. Fl. and fr. Aug–Oct. $2n = 36$.

Alpine scree slopes, rock crevices; 4200–5000 m. S Xizang (Yadong), ?Yunnan [Bhutan, NE and NW India, ?Kashmir, Nepal].

The whole plant of *Saussurea gossipiphora* is used medicinally.

No specimens of *Saussurea gossipiphora* from China were seen by the present authors, and this description is based on material from outside the Flora area and on the revision by Fujikawa (Makinoa, n.s., 8: 46–51. 2010). The record from Yunnan relies only on a picture, which was not seen by the authors, and not on an actual specimen. Also, from a chorological point of view, such a record is improbable and is probably due to a confusion with *S. laniceps*.

27. *Saussurea nishiokae* Kitamura, Acta Phytotax. Geobot. 24: 6. 1969.

须弥雪兔子 xū mí xuě tu zǐ

Herbs 9–30 cm tall, perennial, monocarpic. Caudex unbranched. Stem solitary, ca. 6.5 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic to oblong, $3.5\text{--}11.5 \times 0.8\text{--}2.5$ cm, both surfaces dark reddish green to blackish purple and arachnoid, margin dentate, apex acute. Upper stem leaves linear, both surfaces densely white lanate, margin entire, apex acute. Capitula numerous, densely clustered on flat stem apex in a synflorescence ca. 4 cm in diam., hidden at anthesis in a lanate indumentum, sessile. Involucre cylindric, 5–6 mm in diam. Phyllaries in 3 or 4 rows, membranous; outer phyllaries spatulate to narrowly obovate, $8\text{--}8.5 \times$ ca. 2.5 mm, densely pilose and glandular, apex apiculate; inner phyllaries narrowly ovate to linear, $8\text{--}8.5 \times$ ca. 1.5 mm, sparsely pilose, apex acute to apiculate. Receptacle densely papillose; papillae ca. 0.5 mm. Corolla bright purple to reddish purple, 1–1.3 cm, glabrous, tube 5.5–6.5 mm, limb 4.5–6.5 mm, lobes 1.5–2 mm. Achene purplish black, cylindric, 4–7 mm, densely papillose. Pappus dirty white; outer bristles 2.5–4.5 mm; inner bristles 1.1–1.3 cm. Fl. and fr. Aug–Sep. $2n = 36^*$.

Alpine scree slopes; ca. [3900–]4900[–5500] m. S Xizang (Nyalam) [?Bhutan, India (Sikkim), Nepal].

No specimens of *Saussurea nishiokae* were seen by the present authors. This treatment is based on the original description and on the revision by Fujikawa (Makinoa, n.s., 8: 53–55. 2010).

28. *Saussurea conaensis* (S. W. Liu) Fujikawa & H. Ohba, Makinoa, n.s., 8: 73. 2010.

错那雪兔子 cuò nà xuě tu zǐ

Saussurea gossipiphora D. Don var. *conaensis* S. W. Liu, Acta Biol. Plateau Sin. 3: 71. 1984.

Herbs 12–20[–30] cm tall, perennial, monocarpic. Caudex unbranched. Stem solitary, ca. 1 cm in diam., erect, simple. Lower and middle stem leaves petiolate; leaf blade narrowly

obovate or narrowly oblong, $5\text{--}10\text{--}17 \times [0.5\text{--}]1\text{--}2\text{--}3$ cm, both surfaces green and sparsely arachnoid but glabrescent, margin sinuate-dentate, apex obtuse to acute. Upper stem leaves linear, $2\text{--}5 \times 0.5\text{--}1.5$ cm, both surfaces purplish black and densely white lanate, margin entire, apex acute to acuminate. Capitulum solitary, on flat stem apex, sessile, hidden at anthesis by lanate indumentum. Involucre broadly campanulate, $[1\text{--}]2\text{--}3\text{--}6\text{--}]$ cm in diam. Phyllaries not seen. Receptacle without bristles or papillae. Corolla bright purple to purple, 7–12.5 mm, tube 2–5 mm, limb 5–7.5 mm. Achene cylindric, 3–5 mm, smooth, glabrous. Pappus dirty white; outer bristles ca. 5 mm; inner bristles ca. 1 cm. Fl. and fr. Aug–Sep.

Alpine scree slopes; 4000–4700 m. S Xizang (Cona) [Bhutan].

29. *Saussurea topkegolensis* H. Ohba & S. Akiyama, Univ. Mus. Univ. Tokyo Nat. Cult. 4: 68. 1992.

藏南雪兔子 zāng nán xuě tu zǐ

Herbs 4–20 cm tall, perennial, monocarpic. Caudex unbranched. Stem solitary, 8–10 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly ovate-oblong to linear, $4.5\text{--}16 \times 0.5\text{--}1.5$ cm, both surfaces green and sparsely pilose or glabrous, margin sparsely dentate to pinnately lobed, apex acute. Upper stem leaves sessile, linear, both surfaces purplish black and densely white lanate, margin sparsely denticulate, apex acute. Capitula numerous, loosely clustered on obovoid stem apex in a synflorescence 3–4.5 cm in diam., hidden at anthesis in a lanate indumentum, very shortly pedunculate. Involucre campanulate, ca. 1 cm in diam. Phyllaries in 3 or 4 rows, margin membranous, apex acute; outer phyllaries narrowly ovate, ca. 13×3 mm, apically blackish purple, densely pilose and glandular; inner phyllaries narrowly ovate to linear, ca. 11×2.5 mm, apically densely pilose. Receptacle bristles ca. 1.5 mm. Corolla bright purple to reddish purple, 7–8.5 mm, tube 2.5–3.5 mm, limb 4.5–5 mm, lobes 1.3–2 mm. Achene ca. 2.5 mm, wrinkled, apically sparsely papillose. Pappus dirty white; outer bristles ca. 4 mm; inner bristles ca. 8 mm. Fl. and fr. Aug–Sep. $2n = 32$.

Alpine meadows, sandy or stony places, scree slopes; 4500–5200 m. S Xizang [Bhutan, NW India, Nepal].

No specimens of *Saussurea topkegolensis* were seen by the present authors. This treatment is based on the original description and on the revision by Fujikawa (Makinoa, n.s., 8: 66–67. 2010).

30. *Saussurea bhutkesh* Fujikawa & H. Ohba, Edinburgh J. Bot. 59: 283. 2002.

定日雪兔子 dìng rì xuě tu zǐ

Herbs 10–30 cm tall, perennial, polycarpic, caespitose. Caudex branched. Stem solitary, 3–15 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade spatulate, narrowly elliptic, or oblong, $2\text{--}25 \times 0.5\text{--}2.8$ cm, both surfaces green and densely golden yellow and white tomentose, margin dentate, apex acute. Upper stem leaves sessile, gradually shorter upward on stem. Capitula densely clustered on flat stem apex in a synflorescence 1.3–5.5 cm in diam., hidden at anthesis in a lanate indumentum, sessile. Involucre tubular, 0.5–1.5 cm in diam. Phyllaries in 1 row, narrowly elliptic to linear,

5–9.5 × 0.5–1.5 mm, apically pilose and glandular, margin membranous, apex acute. Receptacle sparsely papillose; papillae ca. 0.3 mm. Corolla pale purple to bright purple, 0.8–1.2 cm, tube 1.5–4 mm, limb 5.5–8.5 mm, lobes 1.5–2.5 mm. Achene cylindric to fusiform, 2.4–3.8 mm, smooth, densely papillose. Pappus dirty white; outer bristles 1–4 mm; inner bristles 8–11 mm. Fl. and fr. Aug–Sep. $2n = 36$.

Alpine rock crevices, scree slopes; ca. [4400–]5300 m. S Xizang (Tingri) [E Nepal].

The only record of *Saussurea bhutkesh* from China is a picture from Langma La in Tingri Xian (Fujikawa & Springate, Newslett. Himalayan Bot. 39: 38. 2007). This treatment is based on the original description and on the revision by Fujikawa (Makinoa, n.s., 8: 53–55. 2010).

2. *Saussurea* subg. *Amphilaena* (Stscheglejew) Lipschitz, Trudy Moskovsk. Obshch. Isp. Priir., Biol. Ser. 3: 182. 1960.

雪莲亚属 xue lian ya shu

Saussurea sect. *Amphilaena* Stscheglejew, Bull. Soc. Imp. Naturalistes Moscou 21(3): 244. 1848.

Herbs, perennial or rarely biennial, polycarpic or rarely monocarpic, cauliferous, rarely substemless or stemless. Stems erect or ascending, simple or apically branched, leafy. Leaves elliptic, oblong, ovate, obovate, or linear, undivided, margin entire, denticulate, or sinuate-dentate. Uppermost stem leaves and bracts boat-shaped and keeled or flat, membranous or papery, enclosing, half-enclosing, or subtending and surrounding synflorescence or capitulum, colored pale yellow, yellowish green tinged purple, purple, or red. Capitula 1 to many, terminal on stem, solitary or in a lax or condensed corymbiform or hemispheric synflorescence. Phyllaries without an appendage. Receptacle usually with many subulate bristles, rarely papillose or naked. Corolla glabrous. Anther tails lacerate or sometimes simple. Achene smooth or ribbed, sometimes wrinkled, glabrous, usually without an apical crown. Pappus dirty white, yellowish, straw-colored, or light brown, always in 2 rows; outer bristles scabrid.

Twenty-eight species: Bhutan, China, N India, Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, N Myanmar, Nepal, Pakistan, Russia (Siberia); 25 species (18 endemic) in China.

- 1a. Uppermost leaves and bracts pale yellow, membranous, usually more than 3 cm wide.
 - 2a. Capitula (1 or) 2–5, in a laxly paniculiform synflorescence or rarely solitary, nodding, with a long (to 7 cm) peduncle; uppermost stem leaves and bracts not aggregated but distant from each other 41. *S. wettsteiniana*
 - 2b. Capitula numerous (5–30), in a condensed corymbiform or hemispheric synflorescence, erect, sessile or with a short (to 3 cm) peduncle; uppermost stem leaves aggregated below synflorescence.
 - 3a. Uppermost stem leaves connivent and enclosing synflorescence; synflorescence laxly corymbiform; stem 0.4–1.4 cm in diam. 44. *S. obvallata*
 - 3b. Uppermost stem leaves stellately spreading; synflorescence strongly condensed corymbiform hemispheric; stem 1.5–3 cm in diam.
 - 4a. Stem base covered with band-shaped remains of leaf sheaths; outer phyllaries linear-subulate, 1.1–1.8 cm, densely sericeous 42. *S. orgadayi*
 - 4b. Stem base densely covered with fibrous remains of leaf sheaths; outer phyllaries narrowly triangular-ovate, 0.8–1.1 cm, glabrescent 43. *S. involucrata*
- 1b. Uppermost leaves and bracts yellowish or greenish tinged with purple, yellowish rose, or purple, membranous or papery, usually less than 3 cm wide.
 - 5a. Capitula (1 or) 2–9(–13), in a corymbiform synflorescence or rarely solitary.
 - 6a. Leaves abaxially grayish white and sericeous-tomentose, adaxially green 34. *S. phaeantha*
 - 6b. Leaves concolorous, green, glabrescent.
 - 7a. Phyllaries obtuse or rounded at apex.
 - 8a. Uppermost stem leaves large, 1–2.5 cm wide, half-enclosing synflorescence; capitula usually 3–6 54. *S. iodostegia*
 - 8b. Uppermost stem leaves small, 0.2–1 cm wide, not enclosing synflorescence; capitula 1–3 53. *S. nigrescens*
 - 7b. Phyllaries acute or acuminate at apex.
 - 9a. Colored uppermost stem leaves not aggregated below synflorescence, distant from each other, not covering capitula.
 - 10a. Involucre obconic, 1–2 cm in diam.; phyllaries glabrescent; leaves green, abaxially ± densely glandular 50. *S. erubescens*
 - 10b. Involucre broadly obconic, 2–2.5 cm in diam.; phyllaries densely villous; leaves blackening when dry, subglabrous, without glands 51. *S. taipaiensis*
 - 9b. Colored uppermost stem leaves aggregated below synflorescence, surrounding and covering at least basal part of capitula.
 - 11a. Leaves smooth, sparsely villous and without glands 55. *S. veitchiana*
 - 11b. Leaves scabrid, glabrescent and usually with sessile or stalked glands.
 - 12a. Leaf margin subentire to minutely denticulate 52. *S. gymnocephala*
 - 12b. Leaf margin sinuate-dentate.

- 13a. Capitula in a clustered synflorescence, sessile or subsessile; plants usually less than 20 cm tall; leaves usually less than 7 cm 45. *S. tangutica*
- 13b. Capitula in a corymbiform synflorescence, pedunculate; plants usually more than 20 cm tall; leaves usually more than 10 cm.
 - 14a. Plants tufted and forming large clumps; stems many; achene distinctly ribbed, apex with a dentate crown 48. *S. luae*
 - 14b. Plants not tufted; stems solitary or few; achene smooth or indistinctly ribbed, apex without a dentate crown.
 - 15a. Uppermost stem leaves yellowish tinged with purple, margin irregularly dentate; involucre obconic to broadly campanulate 47. *S. schultzei*
 - 15b. Uppermost stem leaves intensely red to purple, margin subentire; involucre globose 49. *S. globosa*
- 5b. Capitulum 1(or 2).
 - 16a. Colored uppermost stem leaves not aggregated below capitulum, distant from each other, not covering capitulum.
 - 17a. Phyllaries obtuse at apex 53. *S. nigrescens*
 - 17b. Phyllaries acute or acuminate at apex.
 - 18a. Leaves abaxially grayish white and densely tomentose, adaxially green 33. *S. pubifolia*
 - 18b. Leaves green and \pm concolorous.
 - 19a. Leaf blade glabrescent, sometimes glandular, margin sinuate-dentate.
 - 20a. Involucre obconic, 1.5–2 cm in diam.; phyllaries glabrescent; leaves green, abaxially \pm densely glandular 50. *S. erubescens*
 - 20b. Involucre broadly obconic, 2–2.5 cm in diam.; phyllaries densely villous; leaves blackening when dry, subglabrous and without glands 51. *S. taipaiensis*
 - 19b. Leaf blade pubescent or sericeous, without glands, margin subentire or denticulate.
 - 21a. Involucre 3–3.5 cm in diam.; outer phyllaries 1.5–2.3 cm; upper stem leaves to 2.5 cm wide; leaf blade sericeous, base attenuate and gradually tapering into winged petiole, apex acute to acuminate 39. *S. longifolia*
 - 21b. Involucre 1–2.5 cm in diam.; outer phyllaries 1–1.5 cm; upper stem leaves to ca. 1.5 cm wide; leaf blade pilose or glabrescent, base asymmetric and rounded, cordate, or cuneate, abruptly narrowed into petiole, apex obtuse to subacute 40. *S. polycolea*
 - 16b. Colored uppermost stem leaves aggregated below capitulum, surrounding and covering at least basal half of involucre.
 - 22a. Leaves linear, 1–5 mm wide.
 - 23a. Leaves grayish green, concolorous, both surfaces \pm densely villous; caudex with hard tunic of pale brown persistent remains of petioles 31. *S. pilinophylla*
 - 23b. Leaves adaxially dark green and glabrous; caudex with blackish brown withered remains of petioles 32. *S. hookeri*
 - 22b. Leaves narrowly elliptic, narrowly ovate, or linear, more than 6 mm wide.
 - 24a. Leaves on both surfaces grayish green and lanate-tomentose 35. *S. velutina*
 - 24b. Leaves adaxially green and not lanate-tomentose.
 - 25a. Leaves adaxially green, abaxially grayish white.
 - 26a. Leaf margin sinuate-dentate; uppermost stem leaves few, purplish red, enclosing capitulum 33. *S. pubifolia*
 - 26b. Leaf margin entire; uppermost stem leaves many, pale yellow, stellately spreading and subtending capitulum 36. *S. baotingensis*
 - 25b. Leaves green, \pm concolorous.
 - 27a. Leaves abaxially with sessile glands, margin subentire to minutely denticulate 52. *S. gymnocephala*
 - 27b. Leaves with stalked glandular hairs or without glands, margin sinuate-dentate.
 - 28a. Leaves smooth, pilose, or sericeous 37. *S. muliensis*
 - 28b. Leaves scabrid, glabrescent.
 - 29a. Leaves usually more than 2 cm wide, apex usually obtuse 38. *S. uniflora*
 - 29b. Leaves usually less than 2 cm wide, apex acute.
 - 30a. Involucre broadly campanulate; phyllaries densely villous, subequal, 1–1.6 cm; corolla 1–1.5 cm 45. *S. tangutica*
 - 30b. Involucre obconic; phyllaries pilose, glabrescent, unequal, 0.6–2.2 cm; corolla 1.5–1.8 cm 46. *S. bracteata*

31. *Saussurea pilinophylla* Diels, Repert. Spec. Nov. Regni Veg. Beih. 12: 513. 1922.

膜鞘风毛菊 mo qiao feng mao ju

Saussurea tunicata Handel-Mazzetti.

Herbs (2–)7–23 cm tall, perennial, caespitose, forming large clumps. Caudex stout, many branched near ground level, densely covered by hard tunic of pale brown persistent remains of petioles. Stems numerous, 2–4 mm in diam., erect, simple. Rosette and lower stem leaves shortly petiolate; leaf blade narrowly ovate-elliptic to linear, (1.5–)4–7 × 0.2–0.6 cm, both surfaces grayish green and ± densely villous to sericeous, margin revolute and subentire or mucronulate, apex acute. Middle and upper stem leaves sessile, both surfaces grayish green to purplish red. Uppermost stem leaves ± aggregated, narrowly ovate, ovate-elliptic, or ovate-triangular, 1.3–3 × 0.6–1 cm, membranous, covering basal part of capitulum, both surfaces purplish red or pale purple, apex acuminate. Capitulum solitary. Involucre obconic to campanulate, 1.5–2.5 cm in diam. Phyllaries in 4–6 rows, dark purple to blackish, densely sericeous, apex acuminate to caudate; outer phyllaries narrowly ovate-elliptic, 5–8 × 2–4 mm; middle phyllaries narrowly ovate-elliptic, 8–10 × 1.5–2 mm; inner phyllaries linear, 12–14 × 1–2 mm. Corolla purplish red, 1.1–1.6 cm, tube 4.5–7.5 mm, limb 5.5–6.5 mm, lobes 3.5–4.5 mm. Achene cylindric, 3.5–4 mm, glabrous. Pappus straw-colored; outer bristles 2–3 mm; inner bristles 0.9–1.1 cm. Fl. and fr. Jul–Aug.

• Alpine scree slopes and grasslands; 4000–5300 m. Qinghai, NW Sichuan, Xizang.

Examination of rediscovered type material of *Saussurea pilinophylla* at WRSL and WU has shown that these plants from NW Sichuan are identical with those of *S. tunicata* from Xizang and Qinghai. They only differ in taller growing stems. There is a pronounced tendency toward smaller, almost stemless plants in higher and drier regions of the Qinghai-Xizang Plateau.

32. *Saussurea hookeri* C. B. Clarke, Compos. Ind. 230. 1876.

椭圆风毛菊 tuo yuan feng mao ju

Herbs 4–30 cm tall, perennial. Caudex simple or few branched, covered with blackish brown withered remains of leaf bases. Stems usually solitary, 1.5–3.5(–5) mm in diam., erect, simple. Rosette and lower stem leaves narrowly linear, 4–18 × 0.1–0.6 cm, abaxially paler green and pilose on midvein, adaxially dark green and glabrous, base attenuate, margin revolute and entire or denticulate, apex obtuse. Middle and upper stem leaves sessile, linear-subulate to narrowly ovate, 2–10 × 0.3–1 cm, both surfaces sericeous, apex acuminate. Uppermost stem leaves triangular-ovate, ovate, or elliptic, 1.3–2 × 0.4–1.1 cm, both surfaces blackish purple and densely sericeous, apex acute. Capitulum solitary. Involucre campanulate, 2–3 cm in diam. Phyllaries in 4 or 5 rows, black, sericeous; outer phyllaries narrowly triangular-ovate, 7–13 × 3–4 mm, apex obtuse; middle and inner phyllaries 11–14 × 1–2 mm, apex obtuse to acute. Receptacle bristles (0.6–)4–7 mm. Corolla purple, 0.9–1.5 cm, tube 4.5–8 mm, limb 5.5–7 mm, lobes 3–5 mm. Achene straw-colored with black spots, cylindric, 3.5–5.5 mm, ribbed,

apex with a short crown. Pappus dirty white; outer bristles 1–6 mm; inner bristles 0.9–1.2 cm. Fl. and fr. Aug–Sep.

Alpine grasslands; 4300–5300 m. Qinghai, W Sichuan, Xizang [Bhutan, NE and NW India, Kashmir, Nepal].

33. *Saussurea pubifolia* S. W. Liu, Acta Biol. Plateau Sin. 3: 70. 1984.

毛背雪莲 mao bei xue lian

Herbs 15–45 cm tall, perennial. Caudex stout, few branched, densely covered with persistent remains of petioles. Stems usually solitary, 2–5 mm in diam., erect, simple. Rosette, basal, and lower stem leaves petiolate; leaf blade narrowly elliptic to linear, 8–25 × 0.4–1.5 cm, abaxially grayish white, densely lanate, and sometimes gland-dotted, adaxially green and sparsely pilose, base attenuate, margin revolute and sinuate-dentate, apex acute. Middle and upper stem leaves sessile, narrowly ovate to elliptic, 5–9 × 1–1.5 cm, base semiamplexicaul. Uppermost stem leaves ovate and boat-shaped, 2.5–5.5 × 1–2.6 cm, enclosing or subtending capitulum, both surfaces purplish red, base rounded, margin dentate, apex acute. Capitulum solitary. Involucre broadly campanulate, 2–2.5(–3) cm in diam. Phyllaries in ca. 4 rows, blackish brown, densely villous, apex acuminate; outer phyllaries narrowly triangular-ovate, 7.5–8.5 × ca. 2.5 mm; middle phyllaries narrowly ovate, 9–12 × 2–2.5 mm; inner phyllaries linear, 15–16 × 0.8–1.7 mm. Corolla purple, 1.2–1.6 cm, tube 7–8 mm, limb 7–8 mm, lobes 4.8–5.4 mm. Achene black, obconic, 4.4–5.8 mm. Pappus straw-colored; outer bristles 1.2–2.4 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Sep.

• Alpine scree slopes, grasslands; 4500–5200 m. SC Xizang.

- 1a. Uppermost stem leaves large, membranous, surrounding capitulum; leaves abaxially with golden glands 33a. var. *pubifolia*
- 1b. Uppermost stem leaves small, herbaceous, not surrounding capitulum; leaves abaxially without golden glands 33b. var. *lhasaensis*

33a. *Saussurea pubifolia* var. *pubifolia*

毛背雪莲(原变种) mao bei xue lian (yuan bian zhong)

Leaves with golden glands. Uppermost stem leaves large, membranous, surrounding capitulum.

• Alpine scree slopes; 4500–5100 m. SC Xizang.

33b. *Saussurea pubifolia* var. *lhasaensis* S. W. Liu, Acta Biol. Plateau Sin. 3: 71. 1984.

小苞雪莲 xiao bao xue lian

Leaves without golden glands. Uppermost stem leaves small, herbaceous, not surrounding capitulum.

• Alpine grasslands; 4600–5200 m. SC Xizang (Lhasa).

34. *Saussurea phaeantha* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 489. 1882.

褐花雪莲 he hua xue lian

Saussurea tsarongensis J. Anthony.

Herbs 4–40 cm tall, perennial, caespitose. Caudex simple or few branched. Stems solitary or 2–4, 3–6 mm in diam., erect, simple. Rosette and basal stem leaves petiolate; leaf blade narrowly elliptic to linear, 3–15 × 0.5–1.6 cm, abaxially pale green and densely sericeous-villous, adaxially dark green and pilose but glabrescent, margin undulate or sinuate-dentate, apex acuminate. Middle and upper stem leaves sessile, 2–7.5 × 0.3–1.2 cm, base semiamplexicaul. Uppermost stem leaves narrowly elliptic or triangular-ovate, 1–2.5 × 0.2–0.6 cm, membranous, half-enclosing synflorescence, both surfaces purple, margin entire or with a few teeth. Capitula 3–10(–15), in a congested corymbiform synflorescence 2.5–5 cm in diam., shortly pedunculate or sessile. Involucre cylindric, 0.7–1.5 cm in diam. Phyllaries in 3 or 4 rows, blackish purple, densely villous; outer phyllaries triangular-ovate, (5–)7.5–12 × 2–4.5 mm, apex acute; middle and inner phyllaries narrowly ovate, 8–11 × 0.9–2.8 mm, apex obtuse. Receptacle bristles 3–4 mm. Corolla dark brownish purple, 0.8–1.2 cm, tube 3.3–5 mm, limb 4.6–6 mm, lobes 2.4–3 mm. Achene straw-colored, cylindric to obconic, 3.3–4.8 mm, obtusely 5-ribbed. Pappus dirty white to pale brown; outer bristles 0.4–2.8 mm; inner bristles 8–10 mm. Fl. and fr. Jun–Sep.

• Alpine meadows, grasslands, mountain steppes; (2300–)3000–4800 m. Gansu, Qinghai, W Sichuan, SE Xizang (Zayü), NW Yunnan (Dêqên).

35. *Saussurea velutina* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 12: 221. 1920.

毡毛雪莲 zhan mao xue lian

Herbs 17–40 cm tall, perennial, caespitose. Caudex stout, many branched, covered with persistent remains of petioles. Stems many, 5–8 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic to linear, 5.5–17 × 0.7–2 cm, both surfaces grayish green and densely lanate-tomentose, margin shallowly sinuate-denticulate to subentire, apex acute. Middle and upper stem leaves sessile, narrowly ovate to narrowly elliptic, 6.5–12.5 × 1–2 cm. Uppermost stem leaves ovate or narrowly ovate and boat-shaped, (1–)3–6 × (0.8–)1.5–3 cm, membranous, enclosing involucre, both surfaces purplish red and sparsely villous, margin denticulate or entire. Capitulum solitary. Involucre broadly campanulate, 3–4 cm in diam. Phyllaries in 4 or 5 rows, black or blackish purple, yellowish white villous, apex acuminate and often reflexed; outer phyllaries narrowly triangular-ovate, 11–14 × 3–5 mm; middle phyllaries narrowly triangular-ovate, 14–15 × 2–3 mm; inner phyllaries narrowly ovate to linear, 15–19 × 1–2.5 mm. Receptacle bristles 1.5–5.8 mm. Corolla purple, 1.2–1.5 cm, tube 6.5–8 mm, limb 6–7.5 mm, lobes 3.2–4.8 mm. Achene obovoid to cylindric, 3–5.5 mm. Pappus dirty white; outer bristles 2–6 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Sep.

• Alpine scree slopes, mats, and pastures; (3300–)4100–5500 m. SW Sichuan, SE Xizang, NW Yunnan.

36. *Saussurea baoxingensis* Y. S. Chen, Nordic J. Bot. 28: 761. 2010.

宝兴雪莲 bao xing xue lian

Herbs 20–40 cm tall, perennial. Caudex stout, woody,

much branched. Stem solitary, 4–5 mm in diam. near base, erect, simple. Lower stem leaves sessile, linear, 6–25 × 0.6–0.9 cm, abaxially light green and densely lanate, adaxially green and sparsely villous, margin entire, apex acute. Upper stem leaves narrowly triangular-ovate, 5–12 × 1.2–1.5 cm. Uppermost stem leaves 12–14, sessile, ovate, 4.3–5 × 1.2–2.5 cm, membranous, aggregated and stellately spreading below capitulum, both surfaces yellowish white, abaxially sparsely villous, adaxially glabrous, margin entire and ciliate, apex acute. Capitulum solitary. Involucre broadly campanulate, ca. 2 cm in diam. Receptacle bristles 3–4 mm. Phyllaries in ca. 4 rows, yellowish to purplish black but with a dark brown margin, apically densely villous, margin minutely denticulate, apex acute; outer phyllaries narrowly ovate-elliptic, 11–13 × 2–2.5 mm; middle phyllaries narrowly ovate-elliptic, 10–12 × 1.5–2 mm; inner phyllaries narrowly elliptic, 9–10 × 1–1.1 mm. Corolla purple, 9–10 mm, tube 3–4 mm, limb 4.5–6 mm, lobes 1.3–1.5 mm. Achenes only seen when immature. Pappus dirty yellowish white; outer bristles 2.5–3 mm; inner bristles 7–8 mm. Fl. and fr. Aug–Sep.

• Open rock crevices; ca. 4000 m. Sichuan (Baoping).

Saussurea baoxingensis is a very distinct taxon only known from the type collection and has not been observed in the field since 1936.

37. *Saussurea muliensis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 656. 1937.

木里雪莲 mu li xue lian

Herbs 20–30 cm tall, perennial. Caudex stout, few branched, covered with blackish remains of petioles. Stems usually solitary, 3–5 mm in diam., erect, simple. Rosette and lower stem leaves sessile or shortly petiolate; leaf blade narrowly elliptic to obovate, 10–16 × 1–2.4 cm, both surfaces green and sparsely pilose to densely villous, base attenuate, margin denticulate to subentire, apex acute. Middle and upper stem leaves sessile, narrowly ovate to ovate, 6.5–10 × 2–3.4 cm, both surfaces green to purple, base semiamplexicaul. Uppermost stem leaves ovate and boat-shaped, 4–6.5 × 2–4.8 cm, half-enclosing involucre, both surfaces purplish red. Capitulum solitary. Involucre broadly campanulate, 2.5–4 cm in diam. Phyllaries in 3–5 rows, blackish brown, villous, apex acute; outer phyllaries triangular-ovate, 8–10 × 3–3.5 mm; middle phyllaries narrowly elliptic to ovate, 11–14 × 3–3.5 mm; inner phyllaries linear, 1.6–2 × 0.2–0.3 cm. Corolla purple, 1.4–1.7 cm, tube 6–9 mm, limb 7.5–8 mm, lobes 4.6–5.7 mm. Achene (immature) cylindric, ca. 5 mm. Pappus dirty white; outer bristles 3–6.5 mm; inner bristles 1.7–1.8 cm. Fl. and fr. Aug–Sep.

• Grasslands on mountain slopes; 4300–4400 m. SW Sichuan (Muli).

38. *Saussurea uniflora* (Candolle) Wallich ex Schultz Bipontinus, Linnaea 19: 330. 1846.

单花雪莲 dan hua xue lian

Aplotaxis uniflora Candolle, Prodr. 6: 539. 1838; *Saussurea conica* C. B. Clarke; *S. uniflora* var. *conica* (C. B. Clarke) Lipschitz; *S. uniflora* var. *sinensis* J. Anthony.

Herbs 14–70 cm tall, perennial. Caudex stout, simple or few branched. Stems usually solitary, 3–7 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade oblong, elliptic, narrowly elliptic, or obovate, (3–)12–32 × (1–)2–6.5 cm, both surfaces green and glabrescent, margin sinuate-dentate, apex obtuse to acute. Middle and upper stem leaves sessile, elliptic to elliptic-ovate, 7–19 × 2–4.5(–7.5) cm, both surfaces green tinged with purple, base cuneate or auriculate-amplexicaul, apex acute to obtuse. Uppermost stem leaves sessile, elliptic, boat-shaped, 1.5–4.5 × 0.6–1.8 cm, membranous, half-enclosing capitula, both surfaces purplish red, abaxially villous and sometimes glandular hairy, adaxially glabrescent, margin entire, apex acute to acuminate. Capitulum solitary [or several in a corymbiform synflorescence]. Involucre obconic, 2.5–4 cm in diam. Phyllaries in ca. 4 rows, apically villous, apex acuminate; outer phyllaries ovate-triangular, 10–15 × 2.5–5 mm; middle and inner phyllaries narrowly ovate to linear, 1.6–2 × 0.1–0.3 cm. Receptacle bristles 5–7.5 mm. Corolla bluish purple, 1.2–1.8 cm, tube 6–9 mm, limb 6.5–8 mm, lobes 3.6–5.7 mm. Achene blackish brown, cylindric, 4.5–6 mm, indistinctly ribbed. Pappus yellowish white; outer bristles 3–8.5 mm; inner bristles 1–1.3 cm. Fl. and fr. Jul–Sep. $2n = 32$.

Forests, thickets, alpine meadows; 3600–4800 m. S Xizang, NW Yunnan [Bhutan, NE India, Nepal].

Saussurea uniflora is a very variable species. Plants with several capitula have been described as *S. conica* from N India, but there is no reason to keep them separate from *S. uniflora* at any taxonomic rank. However, the name *S. conica* has been misapplied in a number of Chinese floras for a different taxon, the recently described *S. luae* (see discussion under that species).

39. *Saussurea longifolia* Franchet, J. Bot. (Morot) 2: 354. 1888.

长叶雪莲 chang ye xue lian

Herbs 25–40 cm tall, perennial. Caudex simple or few branched. Stem solitary, 4–6 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic to linear, 10–35 × 1–5 cm, both surfaces green, abaxially densely sericeous, adaxially sparsely villous, margin subentire to denticulate, apex acute. Middle and upper stem leaves sessile, narrowly elliptic to ovate or obovate to linear and boat-shaped, 5–16 × 1.5–4 cm, both surfaces green to dark purple, base semiamplexicaul, margin entire, apex acute to acuminate. Capitulum solitary. Involucre obconic to broadly campanulate, 3–3.5(–4.5) cm in diam. Phyllaries in 3 or 4 rows, blackish brown or purple, sericeous, apex acuminate; outer phyllaries narrowly triangular-ovate, 1.5–2.3 × 0.3–0.5 cm; middle phyllaries linear-subulate, 2.2–2.3 × 0.3–0.4 cm; inner phyllaries linear, 2.1–2.3 × 0.2–0.3 cm. Receptacle bristles 4–9 mm. Corolla dark purple, 1.8–2.1 cm, tube 1.1–1.2 cm, limb 7–9 mm, lobes 4.8–5.6 mm. Achene straw-colored with some black spots, cylindric to obovoid, 5–5.5 mm. Pappus yellowish brown; outer bristles 1.5–5 mm; inner bristles 0.8–1.4 cm. Fl. and fr. Jul–Sep.

• Grasslands, thickets, alpine meadows; 3000–4700 m. ?Qinghai (Nangqên), SW Sichuan (Muli), SE Xizang, NW Yunnan.

We cannot confirm the record of *Saussurea longifolia* from Qinghai reported by S. W. Liu (Fl. Qinghai. 3: 450. 1996).

40. *Saussurea polycolea* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 654. 1937.

多鞘雪莲 duo qiao xue lian

Saussurea nidularis Handel-Mazzetti.

Herbs (3–)6–45 cm tall, perennial. Caudex simple or few branched. Stems solitary or several, 1–4 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly ovate, elliptic, or obovate, 2–20 × 0.5–3 cm, both surfaces green and pubescent, base usually asymmetric and cuneate, rounded, or cordate, margin subentire to shallowly sinuate-denticulate, apex obtuse to acute and mucronate. Middle and upper stem leaves sessile, ovate or obovate and boat-shaped, 3–13 × 0.8–3.2 cm, both surfaces green to purple, base amplexicaul, margin entire, apex acuminate. Uppermost stem leaves boat-shaped, 1.5–6.5 × 0.3–1.6 cm, both surfaces purplish red. Capitulum solitary. Involucre obconic to campanulate, 1–2.5 cm in diam. Phyllaries in 4 or 5 rows, blackish brown or purple, sericeous-villous, apex acute to acuminate; outer phyllaries narrowly triangular-ovate, 10–15 × 2–5 mm; middle phyllaries narrowly elliptic, 12–16 × 2–3 mm; inner phyllaries linear, 12–18 × 1–2 mm. Receptacle bristles 2.5–6(–9) mm. Corolla purple, 1.5–1.7 cm, tube 7–9 mm, limb 6–9 mm, lobes 4.5–5.8 mm. Achene straw-colored to blackish, obovoid, 3.8–4.6 mm, indistinctly 5-ribbed. Pappus pale brown; outer bristles 1–5.5 mm; inner bristles (0.8–)1–1.2 cm. Fl. and fr. Jul–Oct.

• Grasslands on mountain slopes, scree slopes, thickets, rocky pastures; 3200–4700 m. W Sichuan, E Xizang, NW Yunnan.

Saussurea nidularis, only known from the type collection, was described from juvenile specimens with capitula in bud stage. It does not differ from *S. polycolea* in any developed character; its substemless growth form is most probably due to its early developmental stage.

Saussurea polycolea var. *acutisquama* is a synonym of *S. erubescens*. The name of the variety was often misapplied for a recently recognized good species, *S. acutisquama* of *S. subg. Saussurea*.

41. *Saussurea wettsteiniana* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 57: 144. 1920.

垂头雪莲 chui tou xue lian

Herbs 30–90 cm tall, perennial. Caudex stout, simple or few branched. Stems 1–3, 3–5 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic to linear, 15–55 × 1.5–6 cm, both surfaces light green, pilose, and glandular hairy, margin undulate and usually denticulate, apex acute. Middle and upper stem leaves sessile, narrowly elliptic, 7.5–25 × 1.5–4.5 cm. Uppermost stem leaves sessile, ovate and boat-shaped, 3–15 × (1–)2.5–14 cm, membranous, half-enclosing synflorescence, both surfaces yellowish, base cordate, rounded, or cuneate and auriculate-amplexicaul, margin entire or denticulate, apex acuminate. Capitula (1 or)2–5, in a laxly paniculiform synflorescence or rarely solitary, nodding at anthesis and fruiting time, long pedunculate. Involucre campanulate, 2–3.5 cm in diam. Phyllaries in 3 or 4 rows, blackish purple, villous, apex acuminate; outer phyllaries narrowly triangular-ovate, 14–16 × 3–6 mm; middle and inner phyllaries narrowly ovate to linear, 1.6–2.2 × 0.2–0.5 cm. Receptacle bristles 5.5–9 mm. Corolla dark purple, 1.3–1.9 cm,

tube 6–9.5 mm, limb 6–9.5 mm, lobes 2.5–5.5 mm. Achene straw-colored with blackish spots, obovoid, 5.4–6.7 mm, indistinctly ribbed. Pappus light yellowish brown; outer bristles 1–5.4 mm; inner bristles 1.1–1.4 cm. Fl. and fr. Jul–Sep.

• Forest margins, grasslands, meadows near mountain rivers; 3200–4300 m. W Sichuan, NW Yunnan.

Records of *Saussurea wettsteiniana* from Xizang are due to misidentifications (see discussion under *S. luae*).

42. *Saussurea orgaadayi* Khanminchun & Krasnoborov, Izv. Sibirsk. Otd. Akad. Nauk S.S.S.R. 13(2): 15. 1984.

阿尔泰雪莲 a er tai xue lian

Herbs 40–65 cm tall, perennial or biennial. Stem solitary, 2.5–3 cm in diam., erect, simple, hollow, densely leafy, covered at base with band-shaped remains of petioles. Rosette and lower stem leaves petiolate; leaf blade elliptic to narrowly elliptic-obovate, 6–16 × 3–4 cm, both surfaces green, scabrous, glandular hairy, and sparsely pilose, margin sinuate-dentate to serrate, apex acute. Middle and upper stem leaves sessile, narrowly ovate, elliptic, or obovate, 8–17 × 2–5.5 cm, base auriculate. Uppermost stem leaves ovate to narrowly triangular-ovate, 4–12 × 1.5–6.5 cm, membranous, stellately surrounding synflorescence, both surfaces yellowish, margin dentate. Capitula 20–30, in a hemispheric synflorescence 12–15 cm in diam., sessile or shortly pedunculate. Involucre campanulate, 2–3 cm in diam. Phyllaries in 3–5 rows, linear-subulate, brown with dark margin, sericeous-villous, apex acuminate; outer phyllaries 11–18(–23) × 1–2.5 mm; middle and inner phyllaries 14–18 × 1.4–1.8 mm. Receptacle naked or shortly papillose. Corolla purple, 1.7–1.9 cm, tube 8.5–9.5 mm, limb 8.5–9 mm, lobes 4.2–4.6 mm. Achene straw-colored with blackish spots, cylindric, 5–6.7 mm, obtusely 5-ribbed. Pappus straw-colored; outer bristles 1–4 mm; inner bristles 1.1–1.4 cm. Fl. Jul–Aug, fr. Aug–Oct. $2n = 32$.

N Xinjiang (Altay Shan) [Mongolia, Russia (Siberia)].

The whole plant of *Saussurea orgaadayi* is used medicinally.

See also the discussion under *Saussurea involucrata*.

43. *Saussurea involucrata* (Karelin & Kirilov) Schultz Bipontinus, Linnaea 19: 331. 1846.

雪莲花 xue lian hua

Aplataxis involucrata Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 389. 1842; *Saussurea involucrata* var. *axillicalathina* J. S. Li; *S. ischnoides* J. S. Li; *S. karelinii* Stscheglejew; *S. lioui* Y. Ling; *S. polylada* J. S. Li.

Herbs 15–50 cm tall, perennial. Caudex stout, unbranched, densely covered with fibrous remains of petioles. Stem solitary, 1.5–3 cm in diam., erect, simple. Rosette and stem leaves petiolate; leaf blade narrowly ovate, elliptic, or obovate, 8–13 × 2–4 cm, both surfaces green and glandular hairy, base decurrent, margin denticulate to serrulate, apex acute to obtuse. Uppermost stem leaves sessile, ovate to elliptic, 5.5–12 × 3.5–6.5 cm, membranous, stellately surrounding synflorescence, both surfaces pale yellow. Capitula 10–20, in a hemispheric synflores-

cence 8–15 cm in diam., sessile or shortly pedunculate. Involucre hemispheric to broadly campanulate, 1–2.5 cm in diam. Phyllaries in 3 or 4 rows, dark or light brown with dark margin, sparsely pubescent, apex acute; outer phyllaries narrowly ovate-elliptic, 8–11 × 2.5–5 mm; middle and inner phyllaries narrowly elliptic to linear, 10–18 × 1.5–2 mm. Receptacle papillose; papillae 0.5–1 mm. Corolla purple, 1.3–1.8 cm, tube 7–9 mm, limb 6–9 mm, lobes 3–5 mm. Achene straw-colored with blackish spots, cylindric, 4.8–6.7 mm, 5- or 6-ribbed. Pappus dirty white; outer bristles 0.5–3 mm; inner bristles 0.8–1.5 cm. Fl. Jul–Aug, fr. Aug–Oct. $2n = 32^*$.

Mountain slopes, mountain valleys, by water, meadows, in rock fissures; 2400–4100 m. C, N, and W Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia].

The whole plant of *Saussurea involucrata* is used medicinally, and the species is endangered in China due to over-collecting.

Most previous records from the Chinese Altay probably belong to *Saussurea orgaadayi*, but the occurrence of *S. involucrata* cannot be excluded there.

44. *Saussurea obvallata* (Candolle) Schultz Bipontinus, Linnaea 19: 331. 1846.

苞叶雪莲 bao ye xue lian

Aplataxis obvallata Candolle, Prodr. 6: 541. 1838; *Saussurea obvallata* var. *orientalis* Diels.

Herbs 15–80 cm tall, perennial. Caudex stout, usually unbranched. Stem solitary, 4–14 mm in diam., erect, simple. Basal and lower stem leaves petiolate; leaf blade ovate, elliptic-oblong, or obovate, 7–32 × 1–6.5 cm, both surfaces pilose and glandular hairy but glabrescent, base attenuate, margin subentire to sinuate-dentate, apex obtuse to acute. Middle and upper stem leaves sessile, narrowly elliptic to ovate, 5–16 × 1.5–8 cm, base semiamplexicaul. Uppermost stem leaves elliptic or ovate, boat-shaped, 5–15 × 1.5–9 cm, membranous, enclosing synflorescence and forming a lanternlike head of 4–14 cm in diam., both surfaces pale yellow. Capitula 2–16, in a corymbiform synflorescence 3.5–9 cm in diam., pedunculate or subsessile. Involucre globose to campanulate, 1–3 cm in diam. Phyllaries in 3–5 rows, straw-colored with dark margin and apex, pilose to glabrescent, apex acute to acuminate; outer phyllaries triangular-ovate, 5–15 × 2–6 mm; middle phyllaries narrowly ovate, 7–15 × 1–4 mm; inner phyllaries linear, 8–14 × 1–2 mm. Receptacle bristles 1–5 mm. Corolla purple, 0.9–1.3 cm, tube 4–7 mm, limb 4.5–6 mm, lobes 1.8–3.3 mm. Achene straw-colored with dark spots, cylindric, 2–5 mm, 4–7-ribbed. Pappus dirty white-yellowish; outer bristles 2–5 mm; inner bristles 7.5–11 mm. Fl. and fr. Jul–Sep. $2n = 32^*$.

Grasslands, rocky places on mountain slopes, by streams, scree slopes; 3200–5200 m. E Qinghai, W Sichuan, SE Xizang, NW Yunnan [Bhutan, NE and NW India, Kashmir, N Myanmar, Nepal].

The whole plant of *Saussurea obvallata* is used medicinally.

The combination *Saussurea obvallata* by Schultz Bipontinus preceded the same name by Edgeworth (Trans. Linn. Soc. London 20: 76. Aug 1846) by one month.

45. *Saussurea tangutica* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 489. 1882.

唐古特雪莲 tang gu te xue lian

Saussurea tangutica var. *bayankaraensis* W. Y. Wang.

Herbs 6–20(–30) cm tall, perennial, caespitose. Caudex simple or branched. Stems solitary or several, 2.5–4 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic, 3–9 × 0.7–2.3 cm, both surfaces green, abaxially pilose, adaxially scabrous but glabrescent, margin sinuate-dentate, apex acute and mucronate. Middle stem leaves sessile, 3.3–5 × 0.6–1.2 cm. Uppermost stem leaves ovate and boat-shaped, 3–4.5 × 1.5–2.5 cm, membranous, enclosing synflorescence and forming a lanternlike head of 3.5–7 cm in diam., both surfaces yellowish rose to purple, margin denticulate, apex acuminate. Capitula 1–5, solitary or in a condensed corymbiform synflorescence 3–7 cm in diam., subsessile. Involucre campanulate, 1–3 cm in diam. Phyllaries in ca. 4 rows, blackish purple, densely villous, apex acuminate; outer phyllaries elliptic, (5–)10–13 × 2–5 mm; middle phyllaries narrowly elliptic, 11–15 × 2–3 mm; inner phyllaries linear, 13–16 × 1–2 mm. Receptacle bristles 0.5–2 mm. Corolla purple, (1–)1.4–1.5 cm, tube (5–)6.5–8 mm, limb (5–)7–7.5 mm, lobes (2.8–)4.2–4.8 mm. Achene straw-colored, sometimes tinged purple and with blackish spots, cylindric, 4.5–5.5 mm. Pappus dirty white; outer bristles 2–4 mm; inner bristles 0.9–1.1 cm. Fl. and fr. Jul–Sep.

• Alpine scree slopes, alpine meadows; 3600–5300 m. Gansu, Qinghai, NW Sichuan, Xizang.

46. *Saussurea bracteata* Decaisne in Jacquemont, Voy. Inde 4(Bot.): 94. 1843.

膜苞雪莲 mo bao xue lian

Saussurea nana (Pampanini) Pampanini; *S. schultzii* J. D. Hooker var. *nana* Pampanini.

Herbs 3–8(–20) cm tall, perennial, sometimes stemless. Caudex simple or few branched. Stems usually solitary, 2–3 mm in diam., erect, simple. Rosette and lower stem leaves shortly petiolate; leaf blade narrowly elliptic, 2–10 × 0.2–1 cm, abaxially glabrescent, adaxially glandular hairy, margin sinuate-dentate, apex acute. Middle and upper stem leaves sessile, narrowly ovate-elliptic, 3–5 × 0.5–1.8 cm. Uppermost stem leaves elliptic or ovate, 1.5–3.5 × 0.8–1.7 cm, membranous, half-enclosing capitulum, both surfaces yellowish green tinged purple to purplish red, margin dentate, apex acuminate. Capitulum solitary. Involucre narrowly campanulate to obconic, (1–)1.5–2.5(–3.5) cm in diam. Phyllaries in ca. 4 rows, densely villous to sparsely pilose, apex acute; outer phyllaries triangular-ovate, 6–9(–14) × 3–4 mm; middle phyllaries narrowly ovate to linear, 13–18 × 2–3 mm; inner phyllaries linear, 1.5–2.2 × 0.1–0.2 cm. Receptacle bristles 1.5–2.5 mm. Corolla purplish red, 1.5–1.8 cm, tube 6.5–8.5 mm, limb 7.5–9.5 mm, lobes 4.4–6 mm. Achene straw-colored, cylindric to obovoid, 5–6 mm, 4- or 5-ribbed. Pappus dirty white; outer bristles 2–3.6(–5) mm; inner bristles 1.1–1.5 cm. Fl. Jul–Sep, fr. Sep–Oct.

Alpine meadows and scree slopes; 4500–5400 m. S Xinjiang, W Xizang [NW India, Kashmir].

47. *Saussurea schultzii* J. D. Hooker, Fl. Brit. India 3: 366. 1881.

克什米尔雪莲 ke shi mi er xue lian

Herbs 16–42 cm tall, perennial. Caudex usually unbranched. Stem solitary, 3–7 mm in diam., erect, simple. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic, 7.5–23 × 1.2–3 cm, both surfaces green, scabrous, and densely glandular hairy, margin sinuate-dentate, apex acute. Middle and upper stem leaves sessile, 5.5–15 × 1–2.5 cm, base semiamplexicaul. Uppermost stem leaves sessile, elliptic or obovate and boat-shaped, 1.5–8 × 1–3.7 cm, membranous, half-enclosing synflorescence, both surfaces yellowish rose, margin dentate, apex acuminate. Capitula 3–8, in a condensed corymbiform synflorescence 3–10 cm in diam., pedunculate. Involucre obconic to campanulate, 1–2.5(–3) cm in diam. Phyllaries in 3–5 rows, straw-colored with dark margin and distal part, villous, apex acute to acuminate; outer phyllaries narrowly triangular, 9–12 × 1.5–3 mm; middle phyllaries narrowly elliptic to linear, 12–15 × 1–2.5 mm; inner phyllaries linear, 15–18 × 1–2 mm. Receptacle bristles (1–)3–4.5 mm. Corolla purple, 1.6–1.9 cm, tube 9–10 mm, limb 7.5–9 mm, lobes 4.2–5.2 mm. Achene brown, cylindric to obovoid, 3.5–5 mm, obtusely 5–7-ribbed. Pappus dirty white; outer bristles 2.8–5 mm; inner bristles 1.2–1.4 cm. Fl. Jul–Aug, fr. Aug–Sep. $2n = 32$ (as *Saussurea bracteata*).

Glacier moraines, rocky slopes, scree slopes; ca. 5200 m. SW Xinjiang (Yecheng) [NW India, Kashmir, Pakistan].

The only record of *Saussurea schultzii* in China is from the N declivity of the Karakorum range, where it was collected only twice in the first half of the 20th century.

48. *Saussurea luae* Raab-Straube, Willdenowia 39: 103. 2009.

宝璐雪莲 bao lu xue lian

Herbs 30–70 cm tall, perennial, caespitose, forming large clumps. Caudex stout, much branched. Stems many, 4–6 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic, 10–35 × 0.6–3.2 cm, both surfaces green, abaxially gland-dotted, adaxially sparsely pilose to glabrescent, margin sinuate-dentate, apex acute. Middle and upper leaves sessile, narrowly elliptic to narrowly ovate, 7.5–14 × 1.4–2.8 cm. Uppermost stem leaves sessile, ovate, boat-shaped, 1.7–8 × 0.7–3.2 cm, half-enclosing synflorescence, both surfaces pale greenish yellow ± tinged purple, margin dentate, apex acuminate. Capitula (1 or) 2–8, in a corymbiform synflorescence or rarely solitary, pedunculate. Involucre campanulate, 1.5–2.5 cm in diam. Phyllaries in 5 or 6 rows, blackish or purplish brown, villous, glabrescent, apex acute; outer phyllaries triangular-ovate, 7–8 × 2–3.5 mm; middle phyllaries narrowly ovate, 8–13 × 1.5–2.5 mm; inner phyllaries narrowly elliptic to linear, 13–15 × 1–2 mm. Receptacle bristles 3.5–7.5 mm. Corolla purple, 1.1–1.7 cm, tube 5.5–9 mm, limb 5–8 mm, lobes 3.2–4.4 mm. Achene blackish brown, cylindric to obconic, 4–5.7 mm, 5–7-ribbed, apex with a denticulate crown. Pappus rose-purple; outer bristles 1.5–3.5 mm; inner bristles 1.4–1.6 cm. Fl. Aug–Sep, fr. Sep–Oct. $2n = 32^*$.

• Open gravelly and rocky slopes, stabilized boulder scree slopes, ravine beds; 4000–5000 m. NW Sichuan, E Xizang.

This taxon has been confused with *Saussurea conica* (here treated as a synonym of *S. uniflora*) and with *S. wettsteiniana*. All literature records of *S. conica* and *S. wettsteiniana* from Xizang (Y. L. Chen, Fl. Xizang, 4: 869. 1985; C. Shih & S. Y. Jin, FRPS 78(2): 29–30. 1999) belong in fact to *S. luae*.

49. *Saussurea globosa* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 6: 96. 1935.

球花雪莲 qiu hua xue lian

Herbs 10–70 cm tall, perennial. Caudex simple or few branched. Stems usually solitary, 2–7 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly ovate, elliptic, or linear, 12–28 × 1–4.2 cm, both surfaces green, abaxially glandular hairy, adaxially glabrescent, margin dentate, apex acute. Middle and upper stem leaves sessile, 5–16 × 1.8–3.2 cm, both surfaces green to purple. Uppermost stem leaves ovate and boat-shaped, 4–6 × 1–2 cm, membranous, half-enclosing synflorescence, both surfaces red to purple, margin entire or serrulate, apex acuminate. Capitula (1 or) 2–9(–13), in a corymbiform synflorescence or rarely solitary, pedunculate. Involucre globose, 1.5–2 cm in diam. Phyllaries in 3 or 4 rows, blackish purple or yellowish with dark margin, villous to glabrescent, apex acuminate; outer phyllaries triangular-ovate, 7.5–10 × 3–4.5 mm; middle phyllaries narrowly triangular-ovate, 9–11 × 2–3 mm; inner phyllaries linear, 12–14 × 1.5–2 mm. Receptacle bristles 3–5(–7.5) mm. Corolla purple, 1.3–1.5 cm, tube 7–8.5 mm, limb 6–7 mm, lobes 3.6–4.5 mm. Achene straw-colored to black, cylindric to obovoid, 3–5.5 mm, indistinctly 5-ribbed. Pappus yellowish; outer bristles 1–7.5 mm; inner bristles 9–10 mm. Fl. and fr. Jul–Oct. $2n = 32^*$.

• Alpine grasslands, thickets, meadows; 3000–4800 m. W Sichuan, NW Yunnan.

50. *Saussurea erubescens* Lipschitz, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 20: 342. 1960.

红柄雪莲 hong bing xue lian

Saussurea globosa F. H. Chen var. *monocephala* Lipschitz; *S. nigrescens* Maximowicz var. *acutisquama* Y. Ling; *S. polycolea* Handel-Mazzetti var. *acutisquama* (Y. Ling) Lipschitz; *S. uniflora* (Candolle) Wallich ex Schultz Bipontinus var. *pumila* Maximowicz.

Herbs 10–30 cm tall, perennial. Caudex simple or few branched. Stems solitary or 2, 1–3 mm in diam., erect, simple. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic, 1.5–10 × 0.7–2(–3.5) cm, both surfaces green, abaxially densely glandular hairy, adaxially glandular hairy but glabrescent, margin sinuate-denticulate, apex acute to acuminate. Middle and upper stem leaves sessile, 2.5–4 × 0.4–0.9 cm, both surfaces green to purple, margin sinuate-denticulate or entire. Uppermost stem leaves sessile, elliptic and boat-shaped, 1.5–3.5 × 0.3–1 cm, both surfaces purple, margin entire, apex acuminate. Capitula (1 or) 2 or 3(–5), in a corymbiform synflorescence or rarely solitary, pedunculate. Involucre obconic, 1.5–2(–3) cm in diam. Phyllaries in 4 or 5 rows, blackish purple, pilose, apex acute; outer phyllaries triangular-ovate, 8–10.5 × 2.5–5.5 mm; middle phyllaries narrowly triangular, 10–12 × 1.5–2.5 mm; inner phyllaries linear, 11–12 × 0.5–1.5 mm.

Receptacle bristles 3–5.5 mm. Corolla purple, 1.1–1.7 cm, tube 5.5–7 mm, limb 6–9 mm, lobes 3.2–5 mm. Achene straw-colored with blackish spots, obovoid to cylindric, 3–4 mm, indistinctly ribbed. Pappus dirty white; outer bristles 1–4.5 mm; inner bristles 8.5–10 mm. Fl. Jul–Aug, fr. Aug–Oct.

• Grassy areas in marshes, by rivers, mountain valleys, meadows; 2400–4900 m. Gansu, Qinghai, NW Sichuan, Xizang.

The type of *Saussurea nigrescens* var. *acutisquama* clearly belongs to this taxon. Unfortunately, the combination of this epithet with *S. polycolea* by Lipschitz (who had no opportunity to check the type) was widely misapplied for an entirely different taxon, *S. acutisquama*, which was recently recognized as a good species.

51. *Saussurea taipaiensis* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 3: 151. 1935.

太白山雪莲 tai bai shan xue lian

Herbs 10–22 cm tall, perennial, caespitose. Caudex stout, branched. Stems solitary or few, 2–4 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic to oblong, 4–10(–20) × 1–2 cm, both surfaces green, blackening when dry, and subglabrous, base attenuate, margin sinuate-dentate to denticulate, apex acute. Middle and upper stem leaves sessile, narrowly ovate to linear and boat-shaped, 1.5–5 × 0.3–1 cm, both surfaces dark purple, abaxially sparsely pilose near base, base semiamplexicaul, margin entire, apex acute to acuminate. Uppermost stem leaves merging into phyllaries, abaxially villous. Capitulum 1(or 2), subsessile. Involucre broadly obconic, 2–2.5 cm in diam. Phyllaries in 4 or 5 rows, blackish purple, densely villous, apex acute to acuminate; outer phyllaries triangular-ovate, 6–7 × 2.5–3.5 mm; middle phyllaries narrowly ovate to elliptic, 8–10 × 1–2 mm; inner phyllaries linear, 10–12 × 1–1.5 mm. Receptacle bristles 2–4 mm. Corolla purple, 1.2–1.3 cm, tube 6–7 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene cylindric, 3–4 mm, smooth. Pappus straw-colored; outer bristles 1–3 mm; inner bristles 0.9–1.1 cm. Fl. Aug, fr. Sep–Oct.

• Alpine grasslands and meadows; 3200–3900 m. S Shaanxi (Taibai Shan).

52. *Saussurea gymnocephala* (Y. Ling) Raab-Straube, Willdenowia 41: 89. 2011.

裸头雪莲 luo tou xue lian

Saussurea obvallata (Candolle) Schultz Bipontinus var. *gymnocephala* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 92. 1949.

Herbs 9–35(–55) cm tall, perennial. Caudex stout, simple or few branched, apically with black fibrous remains of petioles. Stem solitary, 2–4 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic to elliptic, 4–18(–27) × 0.9–2.5(–3.8) cm, both surfaces gland-dotted, abaxially glaucous green and glabrescent, adaxially green and scabrous, base cuneate, margin subentire to minutely denticulate, apex acute to acuminate. Middle stem leaves sessile, narrowly elliptic, 4–10 × 0.8–1.5 cm. Upper stem leaves narrowly elliptic and boat-shaped, 2–6 × 0.5–1.5 cm, half-enclosing synflorescence, both surfaces purple, margin entire. Capitula 1–4,

solitary or in a congested corymbiform synflorescence, shortly pedunculate. Involucre campanulate to obconic, 1.5–2.5 cm in diam. Phyllaries in 4 or 5 rows, straw-colored to purplish but with a dark margin, sparsely pilose, glabrescent, apex acuminate; outer phyllaries triangular-ovate, 8–10 × 3–4 mm; middle phyllaries narrowly ovate-elliptic, 10–14 × 1.5–2.5 mm; inner phyllaries linear, 14–17 × 1–1.5 mm. Receptacle bristles 4–6 mm. Corolla purple, 1.3–1.7 cm, tube 5–9 mm, limb 6–8 mm, lobes 3–5 mm. Achene brown, cylindric, 3–3.5 mm. Pappus straw-colored; outer bristles 2–5 mm; inner bristles 1.1–1.3 cm. Fl. and fr. Jul–Sep.

• Marshlands, wet meadows; 3400–4300 m. Qinghai, W Sichuan, E Xizang.

This species has frequently been confused with *Saussurea erubescens*, due to an unfortunate, questionable synonymization by the monographer of the genus, Lipschitz. It is morphologically quite different from both *S. obvallata* and *S. erubescens*.

53. *Saussurea nigrescens* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 491. 1882.

钝苞雪莲 dun bao xue lian

Herbs 8–50 cm tall, perennial. Stems solitary or few, 1–2 mm in diam., erect, simple. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic, 3–15 × 0.8–2.3 cm, both surfaces green and sparsely villous but glabrescent, margin denticulate, apex acute. Middle and upper stem leaves sessile, narrowly elliptic to linear, 2.8–7.7 × 0.6–1.1 cm, base semiamplexicaul. Uppermost stem leaves sessile, narrowly ovate to linear and boat-shaped, 1.4–3 × 0.2–0.8 cm, not enclosing synflorescence, both surfaces purplish, margin entire, apex acuminate. Capitula 1–3(–6), solitary or in a corymbiform synflorescence, pedunculate. Involucre campanulate to obconic, 1–1.5 cm in diam. Phyllaries in 4 or 5 rows, straw-colored to purple and with a dark margin, sparsely pilose, glabrescent, apex obtuse; outer phyllaries triangular-ovate, 5–6 × 2.5–4 mm; middle phyllaries narrowly ovate, 6.5–12 × 2–3 mm; inner phyllaries linear, 12–16 × 1–2 mm. Receptacle bristles 5–6 mm. Corolla purple, 1.3–1.8 cm, tube 7–9 mm, limb 5.5–9 mm, lobes 3–4 mm. Achene cylindric, ca. 3 mm. Pappus dirty white; outer bristles 1–3 mm; inner bristles 1.2–1.3 cm. Fl. and fr. Jul–Oct. $2n = 32^*$.

• Grasslands; 1900–4000 m. Gansu, W Henan, Qinghai, Shaanxi.

54. *Saussurea iodostegia* Hance, J. Bot. 16: 109. 1878.

紫苞雪莲 zi bao xue lian

Saussurea iodostegia var. *ferruginipes* J. R. Drummond ex Handel-Mazzetti; *S. iodostegia* var. *glandulifera* X. Y. Wu.

Herbs (5–)10–80 cm tall, perennial. Caudex simple or few branched. Stems solitary or 2–4, 1.5–7 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly ovate-elliptic to linear, 8–45 × 0.6–5 cm, both sur-

faces green, sometimes spotted, abaxially glabrescent, adaxially sparsely villous, margin sinuate-dentate, apex acute. Middle and upper stem leaves sessile, ovate and boat-shaped, 3–8 × 0.6–3 cm, both surfaces green to purple, base semiamplexicaul, margin dentate to subentire, apex acuminate. Uppermost stem leaves ovate to elliptic and boat-shaped, 2.5–6.5 × 0.5–2.3 cm, membranous, half-enclosing synflorescence, both surfaces purple, margin subentire. Capitula (1 or)2–10, in a corymbiform synflorescence or rarely solitary, pedunculate. Involucre cylindric to obconic, 0.9–1.7 cm in diam. Phyllaries in 3 or 4 rows, villous, apex obtuse; outer phyllaries elliptic to suborbicular, 4.5–7.5 × 3–4.5 mm; middle phyllaries narrowly elliptic, 6–12 × 2–3 mm; inner phyllaries linear, 12–15 × 1.5–2.5 mm. Receptacle bristles 2.5–6(–10) mm. Corolla purple, 1.3–1.4 cm, tube 6–7 mm, limb 6.5–7.5 mm, lobes 4.2–5 mm. Achene dark brown, obovoid, 4.5–5.5 mm. Pappus pale brown; outer bristles 1–4 mm; inner bristles 1–1.1 cm. Fl. and fr. Jul–Sep.

• Grasslands, meadows, forests on mountain slopes; 1300–3500 m. Gansu, Hebei, Henan, Nei Mongol, Ningxia, Shaanxi, Shanxi.

The proximal part of multicellular flagellate hairs on leaves and peduncles is often remaining when the distal, long, hairlike part of the trichome is shed. These remaining basal parts are sometimes colored and are easily mistaken for glandular hairs. The two varieties of *Saussurea iodostegia*, which have been distinguished based on this misleading character, both from the same locality, are not recognized here.

55. *Saussurea veitchiana* J. R. Drummond & Hutchinson, Bull. Misc. Inform. Kew 1911: 190. 1911.

华中雪莲 hua zhong xue lian

Herbs 20–70 cm tall, perennial. Caudex simple or branched. Stem solitary, 3–6 mm in diam., erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic, ovate, or obovate, 12–36 × 1–3 cm, both surfaces green and appressed pilose, margin undulate to shallowly sinuate-dentate, apex acute to acuminate. Middle stem leaves sessile, narrowly ovate, 8–16 × 1–3 cm, both surfaces green, tinged rose-purple, base semiamplexicaul. Bracts ovate, boat-shaped, 3.5–9 × 0.8–2.5 cm, membranous, half-enclosing synflorescence, both surfaces purple, margin entire or dentate in basal part, apex acuminate. Capitula 2–10, in a corymbiform synflorescence, pedunculate. Involucre campanulate, 1–1.5(–2) cm in diam. Phyllaries in 3–5 rows, straw-colored to purplish brown, sparsely villous, apex acute; outer phyllaries triangular-ovate, 5.5–8.5 × 2.5–4.5 mm; middle phyllaries narrowly ovate, 9–15 × 2–3 mm; inner phyllaries linear, 14–18 × 1.5–2.5 mm. Receptacle bristles 6–9 mm. Corolla dark purplish red, 1.2–1.4 cm, tube 5.5–7 mm, limb 6.5–7.5 mm, lobes 4.2–5.4 mm. Achene light brown with black spots, cylindric to obovoid, 4.4–5.2 mm, obtusely 5-ribbed. Pappus pale brown; outer bristles 0.5–5 mm; inner bristles 8–11 mm. Fl. and fr. Jul–Sep.

• Montane grasslands, meadows, thickets, forest margins; 1600–3000 m. E Chongqing, W Hubei, SE Shaanxi.

3. *Saussurea* subg. *Theodorea* Cassini, Bull. Sci. Soc. Philom. Paris 1818: 168. 1818.

附片风毛菊亚属 fu pian feng mao ju ya shu

Theodorea (Cassini) Cassini.

Herbs, biennial or perennial. Stems usually tall, many branched, leafy. Capitula usually numerous to very numerous, in a corym-

biform or paniculiform synflorescence. Phyllaries imbricate, margin sometimes dentate, all or only middle and inner phyllaries with colored and membranous or green and herbaceous apical appendage; appendage sometimes inconspicuous or apex spiniform-acuminate. Receptacle with subulate or filiform bristles. Corolla limb deeply cleft (more than 2/3–4/5), usually gland-dotted. Achene smooth or ribbed, sometimes wrinkled, glabrous or gland-dotted, without a conspicuous apical crown. Pappus white, straw-colored, or pale brown, always in 2 rows; outer bristles scabrid or rarely plumose.

Twenty species: China, Japan, Kazakhstan, Korea, Kyrgyzstan, Mongolia, Russia, Tajikistan, Uzbekistan; Europe; 17 species (seven endemic) in China.

- 1a. Phyllaries without a conspicuous appendage, apex cartilaginous, spiniform, and usually reflexed.
 - 2a. Capitula numerous; plants biennial or perennial, without woody caudex 66. *S. malitiosa*
 - 2b. Capitulum solitary; plants perennial, with a stout woody caudex 67. *S. jurineoides*
- 1b. Phyllaries with a \pm widened, membranous, or callose-serrulate appendage, apex not spiniform but sometimes needlelike or \pm long acuminate.
 - 3a. Phyllaries or at least inner ones with a small herbaceous callose-serrulate apical appendage.
 - 4a. Leaf blade undivided, margin entire 72. *S. chinampensis*
 - 4b. Leaf blade pinnatisect, pinnately lobed, or margin sinuate-lobate.
 - 5a. Leaf blade adaxially green, sparsely pubescent, abaxially pale grayish green, sparsely arachnoid; inner phyllaries apically not barbellate 70. *S. nematolepis*
 - 5b. Leaf blade green, concolorous, sparsely strigose; inner phyllaries apically densely barbellate 71. *S. ladyginii*
 - 3b. Phyllaries or at least inner ones with a purple membranous apically widened but sometimes inconspicuous appendage.
 - 6a. Outer phyllaries with an apical cartilaginous mucro.
 - 7a. Plants biennial 68. *S. pseudomalitiosa*
 - 7b. Plants perennial.
 - 8a. Stems wingless or wing inconspicuous 62. *S. runcinata*
 - 8b. Stems conspicuously winged.
 - 9a. Basal leaves bipinnately parted; apex of outer phyllaries reflexed 63. *S. laciniata*
 - 9b. Basal leaves pinnately parted to undivided; apex of outer phyllaries not or barely reflexed.
 - 10a. Basal leaves lyrate-pinnately lobed to undivided and with sinuate-dentate or subentire margin 64. *S. grubovii*
 - 10b. Basal leaves pinnately lobed or pinnately parted 65. *S. alata*
 - 6b. Outer phyllaries without an apical cartilaginous mucro.
 - 11a. Outer phyllaries with a long needlelike recurved apex 60. *S. robusta*
 - 11b. Outer phyllaries without a needlelike apex.
 - 12a. Involucre cylindric, narrowly obconic, or narrowly campanulate; outer phyllaries without a membranous appendage.
 - 13a. Stem usually wingless 56. *S. amara*
 - 13b. Stem winged.
 - 14a. Middle and upper stem leaves ovate, base amplexicaul, margin entire and undivided 57. *S. chingiana*
 - 14b. Middle and upper stem leaves narrowly elliptic to linear, base not amplexicaul, margin pinnately lobed or dentate 61. *S. prostrata*
 - 12b. Involucre globose, ovoid, or campanulate; all phyllaries usually with a membranous appendage.
 - 15a. Involucre globose, 10–15 mm in diam.; phyllary appendages showy, 2–3 mm wide, usually overlapping 59. *S. pulchella*
 - 15b. Involucre campanulate, 4–10 mm in diam.; phyllary appendages not showy, 1–2 mm wide, not overlapping.
 - 16a. Stem usually wingless; involucre cylindric to narrowly campanulate; outer phyllaries sometimes without an appendage 58. *S. japonica*
 - 16b. Stem narrowly winged; outer phyllaries with an appendage.
 - 17a. Involucre tubular to narrowly campanulate, 4–6 mm in diam.; capitula numerous in a large corymbiform synflorescence 58. *S. japonica*
 - 17b. Involucre campanulate, 8–10 mm in diam.; capitula solitary or few at branch ends 69. *S. pinnatidentata*

56. *Saussurea amara* (Linnaeus) Candolle, Ann. Mus. Natl. Hist. Nat. 16: 200. 1810.

草地风毛菊 cao di feng mao ju

Herbs 9–70 cm tall, perennial. Stem solitary, 3–7 mm in diam., erect, branched, usually wingless. Lower stem leaves petiolate; leaf blade narrowly elliptic, oblong, or narrowly ovate, 4–20 \times 0.7–6 cm, both surfaces green, sparsely pubescent or

glabrous, and gland-dotted, base cuneate-attenuate, margin entire or obtusely sinuate-dentate, apex acute to obtuse. Middle and upper stem leaves shortly petiolate or sessile, elliptic to narrowly ovate, gradually smaller upward on stem, base cuneate and rarely auriculate. Capitula numerous, in a corymbiform or paniculiform synflorescence, pedunculate. Involucre narrowly campanulate to narrowly obconic, 0.8–1.2 cm in diam. Phyllaries in 4–6 rows, sparsely pubescent, sometimes gland-dotted; outer phyllaries ovate to narrowly ovate, 3–5 × 1–1.5 mm, apex blackish and acuminate or tricuspidate; middle and inner phyllaries narrowly elliptic to linear, 5–14 × 1–1.5 mm, appendage purple, orbicular, 0.5–1.5 mm wide, and membranous or rarely appendage lacking. Receptacle bristles 8–10 mm. Corolla pale purple, rarely white, 1.3–1.8 cm, gland-dotted, tube 8–10 mm, limb 5–7 mm, lobes 3–5 mm. Achene brown, cylindric, 3–3.5 mm, 4-ribbed. Pappus dirty white; outer bristles 1–5 mm; inner bristles 1.2–1.7 cm. Fl. and fr. Jul–Oct. $2n = 26$.

Wastelands, by trails, forest steppes, steppes, saline and alkaline soils, dikes of streams, dunes, river and lake shores, sandy soils; 500–3200 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shanxi, Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan, Uzbekistan; E Europe].

The type of *Saussurea tenuicaulis* has the upper stem leaves with a widened auriculate base, a character not found in typical specimens of *S. amara*. Such plants may deserve separate taxonomic status.

- 1a. Middle and inner phyllaries with a purple appendage; corolla pale purple 56a. var. *amara*
 1b. All phyllaries acuminate at apex and without an appendage; corolla white 56b. var. *exappendiculata*

56a. *Saussurea amara* var. *amara*

草地风毛菊(原变种) cao di feng mao ju (yuan bian zhong)

Serratula amara Linnaeus, Sp. Pl. 2: 819. 1753; *Saussurea amara* var. *glomerata* (Poir.) Trautvetter; *S. amara* f. *microcephala* Franchet; *S. glomerata* Poir.; *S. tenuicaulis* Y. Ling.

Middle and inner phyllaries with a purple membranous appendage. Corolla pale purple.

Wastelands, by trails, forest steppes, steppes, saline and alkaline soils, dikes of streams, dunes, river and lake shores; 500–3200 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shanxi, Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan, Uzbekistan; E Europe].

56b. *Saussurea amara* var. *exappendiculata* H. C. Fu in Ma, Fl. Intramongol., ed. 2, 4: 848. 1993.

尖苞草地风毛菊 jian bao cao di feng mao ju

All phyllaries without an apical appendage, apex acuminate. Corolla white.

- Sandy soils. Nei Mongol (Dalad Qi, Ih Ju Meng).

57. *Saussurea chingiana* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 647. 1937.

抱茎风毛菊 bao jing feng mao ju

Herbs 45–100 cm tall, ?perennial. Stem solitary, 5–10 mm

in diam., erect, apically much branched, narrowly winged. Lower stem leaves petiolate; leaf blade narrowly elliptic to narrowly ovate, 5–20 × 1–4 cm, runcinate-pinnatifid or undivided, both surfaces green, sparsely strigose or glabrescent, and gland-dotted, base decurrent; lateral lobes (if present) narrowly triangular to linear, margin entire, apex acuminate. Middle and upper stem leaves ovate to linear, 1–6 × 0.2–2.5 cm, undivided, base auriculate and amplexicaul, margin entire, apex acuminate. Capitula numerous, clustered at end of branches, in a corymbiform synflorescence, subsessile or pedunculate. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 5 or 6 rows, straw-colored to green, distinctly striate, sparsely arachnoid or glabrous; outer phyllaries narrowly ovate-triangular, 2–3 × 1–1.5 mm, apex acuminate; middle and inner phyllaries narrowly ovate-elliptic to linear, 3–10 × 1–1.7 mm, appendage purple, orbicular, widened, and membranous. Receptacle bristles whitish, to 8 mm. Corolla reddish purple, 1.3–1.4 cm, tube 4–6 mm, limb 7–8 mm, lobes 3–3.5 mm. Achene obovoid, ca. 3 mm, glabrous. Pappus dirty white; outer bristles ca. 3 mm; inner bristles ca. 1.4 cm. Fl. and fr. Jul–Aug.

- Forests, gravelly open soil near rivers, by trails and ditches; ca. 2400 m. Gansu.

Saussurea chingiana is only known from the incomplete type, which lacks basal and underground parts. The plants from Qinghai (S. W. Liu, Fl. Qinghai. 3: 461. 1996) do not belong here but are winged forms of *S. japonica* (see *S. japonica* var. *pterochlada*).

58. *Saussurea japonica* (Thunberg) Candolle, Ann. Mus. Nat. Hist. Nat. 16: 203. 1810.

风毛菊 feng mao ju

Herbs (0.2–)0.5–2 m tall, biennial. Stem solitary, 3–10 mm in diam., erect, much branched. Lower stem leaves petiolate; leaf blade elliptic to narrowly ovate-elliptic, 7–30 × 3.5–9 cm, pinnately lobed, both surfaces green, scabrous, and gland-dotted; lateral lobes 5–8 pairs, obliquely triangular to linear-oblong, margin usually entire, apex obtuse; terminal lobe narrowly ovate-elliptic to linear. Middle and upper stem leaves shortly petiolate or sessile, gradually smaller upward on stem, pinnately lobed or undivided. Capitula very numerous, in a corymbiform or paniculiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–8(–10) mm in diam. Phyllaries in 5 or 6 rows, green with a dark purple midvein, arachnoid to glabrescent, gland-dotted, apical appendage purple, orbicular, 1–2 mm wide, and membranous; outer phyllaries ovate to narrowly triangular-ovate, 2–3 × 1–1.5 mm, apex acute or with a small appendage; middle and inner phyllaries narrowly elliptic to linear, 4–10 × 0.8–1.5 mm, apex with a larger appendage. Receptacle bristles 5–6 mm. Corolla purple, 1–1.4 cm, gland-dotted, tube 6–8 mm, limb 4–6 mm, lobes 4–5 mm. Achene straw-colored with dark spots, cylindric to obconic, 3–4 mm. Pappus dirty white; outer bristles ca. 2 mm; inner bristles 7–9 mm. Fl. and fr. Jun–Nov. $2n = 26, 28$.

Mountain slopes, forests, thickets, loess slopes, roadsides, wastelands, fallow fields; 200–2900 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, Korea, Mongolia].

Saussurea japonica has often been confused with *S. amara* (e.g., S. W. Liu, Fl. Yunnan. 13: 538. 2004), mainly because many herbarium specimens lack underground and basal parts. *Saussurea amara* is a perennial species with undivided basal leaves of steppe and often saline and alkaline soils in N and W parts of the country, whereas *S. japonica* is a very widespread tall biennial plant with pinnatifid to pinnatisect basal leaves in a variety of habitats but usually not on saline soils. *Saussurea japonica* seems to be absent from Xinjiang and Xizang. Plants in the SE part of the country tend to have smaller capitula (matching *S. microcephala*) and may deserve separate taxonomic status.

- 1a. Stem not winged; leaf blade base not
or very shortly decurrent 58a. var. *japonica*
1b. Stem with conspicuous entire or
dentate wings; leaf blade base
decurent 58b. var. *pteroclada*

58a. *Saussurea japonica* var. *japonica*

风毛菊(原变种) feng mao ju (yuan bian zhong)

Serratula japonica Thunberg in Murray, Syst. Veg., ed. 14, 723. 1784; *Saussurea amara* (Linnaeus) Candolle var. *microcephala* (Franchet) Lipschitz (1979), not *S. amara* f. *microcephala* Franchet (1883); *S. glomerata* Poir. var. *chinensis* F. H. Chen; *S. intermedia* Turczaninow; *S. japonica* var. *intermedia* (Turczaninow) Lipschitz; *S. japonica* f. *leucocephala* (Nakai & Kitagawa) Nakai & Kitagawa; *S. japonica* var. *longicephala* Hayata; *S. japonica* var. *maritima* Kitagawa; *S. linearis* Champion ex Benth; *S. microcephala* Franchet; *S. microcephala* var. *aptera* Nakai & Kitagawa; *S. microcephala* f. *leucocephala* Nakai & Kitagawa; *S. taquetii* H. Léveillé & Vaniot.

Stem not winged. Leaf blade base not or very shortly decurrent.

Mountain slopes, forests, thickets, loess slopes, roadsides, wastelands, fallow fields; 200–2800 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, Korea, Mongolia].

58b. *Saussurea japonica* var. *pteroclada* (Nakai & Kitagawa) Raab-Straube, **comb. nov.**

翼茎风毛菊 yi jing feng mao ju

Basionym: *Saussurea microcephala* var. *pteroclada* Nakai & Kitagawa, Rep. Exped. Manchoukuo Sect. IV, 1: 63. 1934; *S. glomerata* f. *alata* F. H. Chen; *S. japonica* f. *alata* (F. H. Chen) Kitagawa; *S. japonica* var. *alata* (F. H. Chen) Nakai & Kitagawa (1936), not (Regel) Komarov (1907).

Stem conspicuously winged; wings entire or dentate. Leaf blade base decurrent.

• Mountain slopes, forests, thickets, loess slopes, roadsides, wastelands, fallow fields; 200–2900 m. Gansu, Hebei, Heilongjiang, Nei Mongol, Ningxia, Qinghai, Shandong, Sichuan.

Saussurea japonica var. *pteroclada* with winged stems is treated under the name *S. japonica* var. *alata* (Regel) Komarov in some provincial floras (H. C. Fu & D. S. Wen in Ma, Fl. Intramongol., ed. 2, 4: 720. 1993; W. Wang & C. Y. Li, Fl. Pl. Herb. Chin. Bor-Orient. 9: 331. 2004; D. Z. Ma et al., eds., Fl. Ningxia. 2: 368. 2007). However, that

name is based on *S. pulchella* var. *alata* Regel, a taxon which clearly belongs to *S. pulchella* and can only be used for the winged variety of that species (see also the discussion under *S. pulchella*). A name for the winged forms of *S. japonica* at the varietal level is not yet available and is therefore validated here. The variety probably has a wider distribution in China than indicated above.

Saussurea chingiana in the sense of S. W. Liu (Fl. Qinghai. 3: 461. 1996) is a misapplied name for this taxon.

59. *Saussurea pulchella* (Fischer) Fischer in Colla, Herb. Pedem. 3: 234. 1834.

美花风毛菊 mei hua feng mao ju

Heterotrichum pulchellum Fischer, Mém. Soc. Imp. Naturalistes Moscou 3: 71. 1812; *Saussurea japonica* (Thunberg) Candolle var. *alata* (Regel) Komarov; *S. japonica* var. *subtomentosa* Komarov; *S. pulchella* var. *alata* Regel; *S. pulchella* f. *subintegra* (Regel) Kitagawa; *S. pulchella* var. *subintegra* Regel; *S. pulchella* f. *subtomentosa* (Komarov) Kitagawa.

Herbs 25–120 cm tall, biennial. Stem solitary, 3–6 mm in diam., erect, apically branched. Basal, lower, and middle stem leaves petiolate; leaf blade oblong to elliptic, 10–25 × 4–14 cm, pinnately lobed to pinnatisect, both surfaces green, scabrous, strigose, and gland-dotted, sometimes abaxially grayish white tomentose; segments 4–8 pairs, narrowly ovate-elliptic to linear, margin entire or dentate, apex acuminate. Upper stem leaves sessile, narrowly ovate-elliptic to linear, 4–12 × 0.1–2 cm, pinnately lobed to pinnatisect or undivided. Capitula numerous, in a corymbiform or paniculiform synflorescence, pedunculate. Involucre globose, 0.8–1.5 cm in diam. Phyllaries in 6 or 7 rows, subglabrous and gland-dotted, all with an apical appendage; appendage purple, orbicular, 2–3 mm wide, membranous; outer phyllaries narrowly triangular-ovate to linear, 2–3 × 0.5–1.5 mm; middle and inner phyllaries narrowly ovate-elliptic to linear, 4–11(–15) × 1–3 mm. Receptacle bristles 4–6 mm. Corolla pale purple, 1.1–1.3 cm, gland-dotted, tube 5–8 mm, limb 4–6.5 mm, lobes 4–5 mm. Achene ivory-colored with dark spots, obconic, 3–5 mm, obtusely 5-angled. Pappus dirty white; outer bristles 0.5–2.5 mm; inner bristles 7–8(–13) mm. Fl. and fr. Aug–Oct. $2n = 26, 28$.

Forest steppes, thickets, meadows; 300–2200 m. Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol, Shanxi [Japan, Korea, Mongolia, Russia (Far East, E Siberia)].

Winged forms of *Saussurea pulchella* (*S. pulchella* var. *alata*) have not been distinguished in China.

60. *Saussurea robusta* Ledebour, Icon. Pl. 1: 16. 1829.

强壮风毛菊 qiang zhuang feng mao ju

Herbs 30–80 cm tall, biennial or perennial. Stem solitary, 5–6 mm in diam., erect, branched, narrowly winged. Basal and lower stem leaves sessile, oblong, 6–20 × 1–6 cm, both surfaces green, scabrous, and gland-dotted, base semamplexicaul and decurrent, margin entire or sparsely dentate, apex acuminate. Middle and upper stem leaves sessile, narrowly ovate-elliptic to linear, 5–8 × 0.5–1.5 cm, margin entire, apex acuminate. Capitula numerous, in a corymbiform or paniculiform synflorescence, pedunculate. Involucre campanulate, (0.6–)1–2(–3) cm in diam. Phyllaries in ca. 5 rows; outer phyllaries narrowly tri-

angular-subulate, 8–11 × 1–2 mm, basally arachnoid lanate, apically glabrous, apex needlelike and reflexed; middle and inner phyllaries subulate to linear, 10–14 × 1–2 mm, densely arachnoid lanate and gland-dotted, appendage narrowly triangular to ovate, 0.5–1 mm wide, and membranous. Receptacle bristles filiform, 7–9 mm, hyaline. Corolla purple, 1.6–1.9 cm, gland-dotted, tube 0.9–1.2 cm, limb 6–7 mm, lobes 3.5–4.5 mm. Achene blackish brown, cylindric to obconic, 3–3.5 mm. Pappus dirty white; outer bristles 1–4 mm; inner bristles 1–1.4 cm. Fl. and fr. Jul–Sep.

Grassy shores, salt marshes, wastelands, saline soils; 700–2000 m. NW Xinjiang [Kazakhstan, Mongolia, Russia (Siberia)].

61. *Saussurea prostrata* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 9: 518. 1886.

展序风毛菊 zhan xu feng mao ju

Herbs 10–60 cm tall, biennial or perennial. Stems solitary or several, procumbent, ascending, or erect, simple or branched in upper half, distinctly winged. Stem leaves narrowly elliptic to linear, 1.5–2.5 × 0.3–0.7 cm, both surfaces green, scabrid, and pilose, base long decurrent, margin pinnately lobed or dentate, apex acute. Capitula 1–8, solitary or clustered in a corymbiform synflorescence, sessile or shortly pedunculate. Involucre campanulate, (0.5–)1–1.5 cm in diam. Phyllaries in 4 or 5 rows, greenish with dark midvein, villous to glabrescent; outer phyllaries narrowly elliptic, 2–4 × 1–2 mm, erect or slightly recurved, apex acuminate; middle phyllaries narrowly elliptic, 4–8 × 1–2 mm, appendage dark, widened, and cuspidate; inner phyllaries linear, 8–11 × 1–1.5 mm, appendage purple, sub-orbicular, widened, membranous, and denticulate. Receptacle bristles 7–8 mm. Corolla purple, 1.7–1.8(–2) cm, tube ca. 1 cm, lobes ca. 5 mm. Achene dark brown, cylindric, ca. 3.5 mm, ribbed, glabrous. Pappus white; outer bristles to 5 mm; inner bristles ca. 1.2 cm. Fl. and fr. Jul–Aug.

Salt meadows, saline and alkaline sandy soils; 500–2500 m. Xinjiang [Kazakhstan, Kyrgyzstan].

62. *Saussurea runcinata* Candolle, Ann. Mus. Natl. Hist. Nat. 16: 202. 1810.

倒羽叶风毛菊 dao yu ye feng mao ju

Herbs (5–)15–60 cm tall, perennial. Stems solitary or few, erect, apically branched, covered with fibrous lacerate remains of petioles at base, wingless or narrowly winged; wings entire or dentate. Basal and lower stem leaves petiolate; petiole 1–5 cm; leaf blade narrowly obovate, narrowly ovate-elliptic, or linear, 4–20 × 0.5–7 cm, lyrate, pinnately parted, pinnatisect, or undivided, both surfaces green and glabrous. Middle and upper stem leaves sessile, narrowly elliptic to linear, undivided, margin entire or basally dentate. Capitula few to numerous, in a corymbiform or paniculiform synflorescence, shortly pedunculate. Involucre tubular to campanulate, 4–10 mm in diam. Phyllaries in 4–6 rows, glabrous or sparsely pubescent; outer phyllaries ovate to narrowly ovate, ca. 3.5 × 1.5 mm, appendage widened, herbaceous, and with a cartilaginous mucro; middle and inner phyllaries narrowly elliptic to linear, 7–10 × 1–1.8 mm, appendage red, widened, membranous, and denticulate. Corolla purplish red, 1–1.5 cm, gland-dotted, tube 7–8 mm,

limb 6–8 mm, lobes 3–4 mm. Achene blackish brown, cylindric, 2–3 mm. Pappus pale yellowish brown; outer bristles 2–3 mm; inner bristles 7–9 mm. Fl. and fr. Jul–Sep.

River and lake shores, rock fissures near moist places, saline lowlands, saline and alkaline soils, salt and alkaline marshes; 700–1300 m. Hebei, Heilongjiang, Jilin, Nei Mongol, Ningxia, Shaanxi, Shanxi [Mongolia, Russia (Siberia)].

- 1a. Basal and lower stem leaves lyrate to pinnatisect; involucre campanulate to tubular-campanulate, 5–10 mm in diam. 62a. var. *runcinata*
- 1b. Basal and lower stem leaves undivided; involucre narrowly tubular, 4–5 mm in diam. 62b. var. *integrifolia*

62a. *Saussurea runcinata* var. *runcinata*

倒羽叶风毛菊(原变种) dao yu ye feng mao ju (yuan bian zhong)

Saussurea alata Candolle var. *runcinata* (Candolle) Herder; *S. crepidifolia* Turczaninow.

Basal and lower stem leaves lyrate, pinnately parted, or pinnatisect; lateral lobes 1–7 pairs, narrowly triangular, elliptic, falcate, or linear, recurved to patent, margin usually entire or sometimes dentate, apex acute to obtuse and with a cartilaginous mucro; terminal lobe narrowly ovate, narrowly triangular, or linear, margin entire or dentate, apex acute to obtuse. Involucre campanulate to tubular-campanulate, 5–10 mm in diam.

River and lake shores, rock fissures near moist places, saline lowlands, saline and alkaline soils; 700–1300 m. Hebei, Heilongjiang, Jilin, Nei Mongol, Ningxia, Shaanxi, Shanxi [Mongolia, Russia (Siberia)].

62b. *Saussurea runcinata* var. *integrifolia* H. C. Fu & D. S. Wen in Ma, Fl. Intramongol. 6: 329. 1982.

全叶石碱地风毛菊 quan ye shi xian di feng mao ju

All leaves undivided, margin entire. Involucre narrowly tubular, 4–5 mm in diam.

- Salt and alkaline marshes. Nei Mongol.

63. *Saussurea laciniata* Ledebour, Icon. Pl. 1: 16. 1829.

裂叶风毛菊 lie ye feng mao ju

Saussurea alata Candolle var. *laciniata* (Ledebour) Herder; *S. laciniata* var. *pygmaea* Lipschitz.

Herbs 15–50 cm tall, perennial. Stems solitary or few, erect, simple or branched from base, narrowly winged; wings dentate. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic, 3–12 × 1.5–2.5 cm, bipinnately parted, both surfaces green, sparsely pubescent, and gland-dotted; primary lobes 5–10 pairs; secondary lobes obliquely triangular, narrowly triangular-ovate, or toothlike, margin dentate; teeth and apex cartilaginous mucronate. Middle and upper stem leaves sessile, narrowly elliptic to linear, pinnately divided, pinnately lobed, or undivided. Capitula numerous, in a corymbiform synflorescence, subsessile to shortly pedunculate. Involucre campanulate, 0.8–1.5 cm in diam. Phyllaries in 4 or 5 rows; outer

phyllaries narrowly ovate, 4–5 × 1.5–2 mm, appendage green, herbaceous, ± reflexed, and mucronate; middle phyllaries narrowly ovate-elliptic, 6–8 × 1.5–2 mm, appendage green, herbaceous, widened, margin dentate, and apex mucronate; inner phyllaries narrowly elliptic to linear, 9–11 × 1.5–2 mm, appendage purplish, membranous, villous and gland-dotted, and margin erose-denticulate. Corolla reddish purple, 1–1.4 cm, tube 6–7 mm, limb 4–6 mm, lobes 3–4 mm. Achene dark brown, cylindric to obconic, (2–)3–4 mm. Pappus yellowish white; outer bristles 1–5 mm, scabrid to plumose; inner bristles 9–10 mm. Fl. and fr. Jul–Aug. $2n = 28$.

Desert steppes, saline and alkaline soils; 1300–2200 m. Gansu, Nei Mongol, Ningxia, Shaanxi, Xinjiang [Kazakhstan, Mongolia, Russia (Siberia)].

64. *Saussurea grubovii* Lipschitz, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 21: 366. 1961.

蒙新风毛菊 meng xin feng mao ju

Saussurea paradoxa Lipschitz.

Herbs 30–80 cm tall, perennial. Stems solitary or few, erect, simple or branched in upper part, narrowly winged. Basal and lower stem leaves petiolate; leaf blade ovate, elliptic, obovate, or oblong, 5–20 × 2.5–5 cm, thick, fleshy, lyrate, pinnately lobed, or undivided, both surfaces green, scabrous, and appressed pubescent, base cuneate, margin sinuate-dentate or entire, apex acute. Middle and upper stem leaves shortly petiolate or sessile, narrowly ovate, obovate, elliptic, or linear, 2.5–5 × 0.5–2 cm, margin entire. Capitula clustered 2–6 at end of stem and branches, in a corymbiform synflorescence, shortly pedunculate. Involucre campanulate, 5–10 mm in diam. Phyllaries in 5 or 6 rows; outer phyllaries narrowly ovate, 2–4 × 1–2 mm, apex acuminate with a cartilaginous mucro; middle and inner phyllaries narrowly elliptic to linear, 3–8 × 1–2 mm, appendage pink, widened, and membranous. Receptacle densely bristly. Corolla pink, 1.2–2 cm, tube 6–12 mm, limb 6–8 mm, lobes ca. 5 mm. Achene light brown, cylindric, ca. 3.5 mm, ribbed. Pappus white; outer bristles 0.5–3 mm; inner bristles [0.8–]1.2–1.4 cm. Fl. and fr. Jul–Sep.

Salt meadows, alkaline soils; 400–1900 m. N Xinjiang [Kazakhstan, Mongolia].

No specimens of *Saussurea grubovii* from China were seen by the present authors. The description here is based on images of the type specimens and on the treatments by Lipschitz (Fl. URSS 27: 506. 1962) and G. M. Shen (Fl. Xinjiang. 5: 272. 1999).

65. *Saussurea alata* Candolle, Ann. Mus. Natl. Hist. Nat. 16: 202. 1810.

具翅风毛菊 ju chi feng mao ju

Saussurea runcinata Candolle var. *dentata* Ledebour.

Herbs, perennial, 20–70 cm tall. Stem solitary, erect, apically branched, winged; wings entire or dentate. Basal leaves petiolate; leaf blade narrowly elliptic, 10–20 × 1–6 cm, lyrate, pinnately lobed, pinnatisect, or rarely undivided, both surfaces green, strigose, and gland-dotted; lateral lobes triangular to narrowly ovate-elliptic, margin sinuate-dentate or entire, apex with cartilaginous mucro. Lower and middle stem leaves petiolate or

sessile, gradually smaller upward on stem. Upper stem leaves sessile, narrowly elliptic to linear, margin entire. Capitula numerous, in a corymbiform or paniculiform synflorescence, sessile or pedunculate. Involucre cylindric to ovoid, 8–10 mm in diam. Phyllaries in ca. 5 rows; outer phyllaries narrowly ovate-elliptic, ca. 4 × 1.5 mm, apex acute to obtuse; middle phyllaries narrowly elliptic, 5–6 × ca. 2 mm, apex obtuse to rounded; inner phyllaries narrowly elliptic to linear, ca. 8 × 2 mm, appendage purple, widened, membranous, and denticulate. Receptacle bristles 4–5 mm. Corolla purplish red, 1.1–1.6 cm, tube ca. 6 mm, limb ca. 8 mm, lobes ca. 3 mm. Achene dark brown, obconic to cylindric, 3–4 mm. Pappus straw-colored; outer bristles 2–5 mm; inner bristles 8–10 mm. Fl. and fr. Jul–Sep.

Salt marshes, fallow and cultivated fields, sandy soils; 500–1200 m. Nei Mongol, Xinjiang [Mongolia, Russia (Siberia)].

66. *Saussurea malitiosa* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 493. 1882.

尖头风毛菊 jian tou feng mao ju

Herbs 10–40 cm tall, biennial or perennial. Stem solitary, 3–10 mm in diam., erect, simple or branched, usually wingless. Basal leaves petiolate; leaf blade narrowly obovate, oblong, or narrowly elliptic, 2–12 × 0.5–2.5 cm, pinnately lobed or pinnatisect, both surfaces green, strigose, gland-dotted, and scabrous; lateral lobes linear, narrowly ovate-elliptic, or narrowly triangular, recurved, margin entire or dentate, apex acute to acuminate and with cartilaginous mucro. Middle and upper stem leaves sessile, base semiamplexicaul. Capitula usually 3–15, clustered in a terminal corymbiform synflorescence or sometimes solitary on lower branch ends, sessile or pedunculate. Involucre campanulate, 1–2 cm in diam. Phyllaries in 5–7 rows, densely villous, apex long acuminate to spiniform and with a cartilaginous tip; outer phyllaries ovate to narrowly ovate-elliptic, 8–12 × 3–4 mm, apical part usually reflexed; middle phyllaries narrowly ovate-elliptic, 10–20 × 2–3 mm, apical part reflexed to patent; inner phyllaries linear, 2–2.5 × 0.1–0.2 cm, appressed. Receptacle bristles 0.8–1.4 cm. Corolla pink, 2–2.5 cm, gland-dotted, tube 1–1.2 cm, limb 1.3–1.4 cm, lobes 5–6 mm. Achene obconic, ca. 2 mm, wrinkled, gland-dotted. Pappus white; outer bristles 1–2 mm; inner bristles 1.8–2 cm. Fl. and fr. Jun–Sep.

• Sandy and gravelly mountain slopes; 3000–4300 m. W Gansu, Qinghai.

67. *Saussurea jurineoides* H. C. Fu in Ma, Fl. Intramongol., ed. 2, 4: 847. 1993.

阿右风毛菊 a you feng mao ju

Herbs 10–20 cm tall, perennial. Caudex stout, densely covered with dark brown remains of petioles. Stems solitary or few, erect, simple. Lower stem leaves petiolate; petiole 2–3 cm; leaf blade elliptic to narrowly ovate-elliptic, 5–8 × 1.5–2 cm, pinnately lobed or pinnatisect, both surfaces green, pilose, and gland-dotted; lateral lobes 4–8, narrowly ovate to linear, margin entire or sparsely dentate, apex acuminate and mucronate; terminal lobe linear to narrowly ovate-elliptic, margin entire, apex acuminate. Middle and upper stem leaves narrowly ovate-elliptic to linear, gradually smaller upward on stem, pinnately lobed

or margin dentate. Capitulum solitary. Involucre broadly campanulate, 1.5–2 cm in diam. Phyllaries in ca. 5 rows, yellowish green, densely villous and gland-dotted, apex spiniform, reflexed, and with a cartilaginous tip; outer phyllaries ovate to narrowly ovate; middle phyllaries narrowly ovate; inner phyllaries narrowly ovate to linear. Receptacle bristly. Corolla purple, ca. 1.8 cm, tube ca. 1 cm, limb ca. 8 mm, lobes ca. 3 mm. Achene brown, cylindric, 3–4 mm, sparsely puberulent and glandular. Pappus white; inner bristles ca. 1.7 cm. Fl. and fr. Jul–Aug.

• Stony mountain slopes; 2400–2500 m. Nei Mongol (Alxa Meng).

No specimens of *Saussurea jurineoides* were seen by the present authors, and the description here is based on the original publication. It is very close to *Saussurea malitiosa*, differing from that species only in the stout caudex and the solitary capitulum with somewhat smaller florets.

68. *Saussurea pseudomalitiosa* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 59(6): 76. 1954.

类尖头风毛菊 lei jian tou feng mao ju

Herbs (7–)25–50 cm tall, biennial. Stems solitary or few, 3–7 mm in diam., erect, simple or branched from base, narrowly winged; wings dentate. Basal and lower stem leaves petiolate; leaf blade narrowly ovate-elliptic to linear, 6–11 × 1–4 cm, runcinate-pinnately lobed or pinnatisect, both surfaces green and sparsely pubescent; lateral lobes triangular to linear, margin entire or dentate, teeth and apex with cartilaginous mucro. Middle and upper stem leaves sessile, base ± decurrent. Capitula very numerous, 3–6 ± clustered at end of branches in a corymbiform or paniculiform synflorescence, subsessile to pedunculate. Involucre campanulate, 0.8–1.5 cm in diam. Phyllaries in 4 or 5 rows, villous and gland-dotted, apically dark purple, apex long acuminate; outer phyllaries narrowly ovate-elliptic, 8–10 × ca. 1 mm, apex acuminate and sometimes recurved; middle phyllaries narrowly elliptic, 10–11 × 1–2 mm, apex acuminate; inner phyllaries linear, 10–12 × 1–2 mm, apical appendage dark purple and somewhat widened. Receptacle bristles 1–2 mm. Corolla purplish red, 1.1–1.5 cm, gland-dotted, tube 5–7 mm, limb 6–7 mm, lobes 3–4 mm. Achene obconic, ca. 3 mm, wrinkled, gland-dotted. Pappus straw-colored; outer bristles 1–2 mm; inner bristles 1–1.1 cm. Fl. and fr. Aug.

• *Juniperus* and *Picea* forests, open mountain slopes; 3300–4200 m. Qinghai.

69. *Saussurea pinnatidentata* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 524. 1972.

羽裂风毛菊 yu lie feng mao ju

Saussurea runcinata Candolle var. *pinnatidentata* (Lipschitz) A. C. Fu & D. C. Wen.

Herbs 20–25(–80) cm tall, biennial. Stem solitary, erect, branched apically or from base, narrowly winged; wings dentate. Basal and lower stem leaves petiolate; leaf blade narrowly ovate-elliptic to narrowly obovate, 5–11 × 0.5–2 cm, pinnately divided, pinnately lobed, or dentate, scabrous, strigose, or glabrous; lateral lobes 1–6 pairs, linear-oblong, margin entire, apex

acuminate and with a cartilaginous mucro; terminal lobe narrowly triangular, apex acute to acuminate. Upper stem leaves sessile, narrowly ovate-elliptic to linear, undivided, margin entire or basally few dentate. Capitula numerous, solitary or few at end of branches in a corymbiform or paniculiform synflorescence, long pedunculate. Involucre campanulate, (5–)8–10 mm in diam. Phyllaries in 4 or 5 rows, sparsely arachnoid, glabrescent; outer phyllaries ovate, ca. 4 × 2 mm, apical appendage herbaceous with a callose-serrulate margin; middle and inner phyllaries narrowly elliptic to linear, 7–10 × 0.8–2 mm, apical appendage purplish red, membranous, and with denticulate margin. Corolla purple, ca. 1.1 cm. Achene only seen as immature. Pappus pale brown; outer bristles short; inner bristles ca. 1 cm. Fl. and fr. Aug–Oct.

• Grasslands on mountain slopes, fields, saline and alkaline soils; 2200–3200 m. Gansu, Nei Mongol, Qinghai.

70. *Saussurea nematolepis* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 67. 1949.

钻状风毛菊 zuan zhuang feng mao ju

Herbs 30–90 cm tall, perennial. Stem erect, apically branched, winged; wings ± dentate. Lower stem leaves unknown. Upper stem leaves sessile, oblong, narrowly elliptic, or linear-oblong, 3–13 × 0.7–2 cm, pinnately lobed or undivided, abaxially pale green to grayish green and sparsely arachnoid, adaxially dark green and sparsely pubescent; lateral lobes 1 or 2 pairs, broadly triangular, base decurrent or auriculate-semiamplexicaul, margin entire or sinuate. Capitula numerous, in a lax paniculiform synflorescence, pedunculate. Involucre campanulate to globose, (0.7–)1–1.5 cm in diam. Phyllaries in 5–7 rows, arachnoid; outer phyllaries narrowly triangular-ovate, 4–5 × ca. 1 mm, apically dark purple, apex subulate and reflexed; middle phyllaries narrowly ovate-elliptic, 5–10 × 1–2 mm, apex acuminate to shortly subulate and erect or reflexed; inner phyllaries linear, 10–13 × ca. 1 mm, appendage herbaceous and villous. Receptacle bristles ca. 5 mm. Corolla pale purple or white, 0.8–1.2 cm, tube 5–6 mm, limb 5–6 mm. Achene brown, obconic, ca. 3.5 mm, angulate, wrinkled. Pappus dirty white; outer bristles ca. 4 mm; inner bristles ca. 8 mm. Fl. and fr. Aug–Oct.

• By trails on mountain slopes; 1500–3800 m. Gansu, Qinghai, NW Sichuan.

71. *Saussurea ladyginii* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 59(6): 77. 1954.

拉氏风毛菊 la shi feng mao ju

Herbs 30–40 cm tall, biennial. Stems solitary or several, erect, usually branched, narrowly winged; wings dentate. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic, 10–15 × 2–3.5 cm, runcinate-pinnately lobed or pinnatisect, both surfaces green, scabrid, sparsely strigose, and gland-dotted, midvein prominent and straw-colored; lateral segments 6–10 pairs, margin entire or few dentate, apex acute. Middle and upper stem leaves sessile, gradually smaller upward on stem, base decurrent. Capitula numerous, clustered at end of branches in a corymbiform synflorescence, shortly pedunculate. Involucre campanulate, 1–1.2 cm in diam. Phyllaries in 4 or 5 rows; outer phyllaries ovate, 3–5 × 1–1.5 mm, apex subulate;

middle and inner phyllaries narrowly ovate to narrowly elliptic, 6–9 × 1.8–2 mm, appendage greenish, herbaceous, gland-dotted, and densely villous. Receptacle bristles ca. 4 mm. Corolla purplish red, 9–10 mm, gland-dotted, tube 3–4 mm, limb ca. 6 mm. Achene dark brown, obconic, 3.5–4 mm. Pappus pale brown; outer bristles 2–3 mm; inner bristles 7–8 mm. Fl. and fr. Aug.

- About 3500 m. Qinghai.

Saussurea ladyginii is only known from the type. It is morphologically very close to *S. pseudomalitiosa* but differs from that species in the shape and color of the phyllaries.

72. *Saussurea chinampoensis* H. Léveillé & Vaniot, Bull. Acad. Int. Géogr. Bot. 20: 145. 1909.

京风毛菊 jing feng mao ju

Saussurea chinampoensis var. *gracilis* H. C. Fu & D. S. Wen; *S. peipingensis* F. H. Chen.

Herbs 10–60(–100) cm tall, biennial. Stem solitary, erect, branched from base. Basal leaves shortly petiolate; leaf blade

linear, narrowly ovate, narrowly elliptic, or narrowly obovate, 4–13 × 0.4–1 cm, thick, scabrous, gland-dotted, base attenuate-cuneate, margin revolute, subentire, mucronulate, apex acute to obtuse. Lower and middle stem leaves sessile, gradually smaller upward on stem, base semiamplexicaul. Capitula solitary or few on ends of branches in a corymbiform or paniculiform synflorescence, pedunculate. Involucre broadly campanulate to hemispheric, 1–2 cm in diam. Phyllaries in 4–6 rows, narrowly ovate-elliptic to linear, green, gland-dotted; outer phyllaries 4–8 × 1.5–2 mm, apex cartilaginous mucronate; middle phyllaries 8–10 × 1.5–2 mm, appendage green, herbaceous, margin and apically cartilaginous mucronate; inner phyllaries 10–13 × 1–1.5 mm, appendage green to purple, herbaceous, brownish tomentose, acuminate, and recurved. Receptacle bristles white, filiform, 6–9 mm. Corolla pale purple, 1.2–1.6 cm, gland-dotted, tube 8–11 mm, limb 5–6 mm, lobes 4–4.5 mm. Achene cylindric, ca. 3 mm, ribbed. Pappus pale yellowish brown; outer bristles 3–5 mm; inner bristles 7–10 mm. Fl. and fr. Jul–Oct.

Salt marshes, moist meadows; near sea level to 1200 m. Hebei, Liaoning, Nei Mongol, N Shaanxi [Korea].

4. *Saussurea* subg. *Saussurea*

风毛菊亚属 feng mao ju ya shu

Perennial herbs or rarely subshrubs, cauliferous or stemless. Leaves undivided or pinnately divided. Uppermost stem leaves herbaceous, green, not densely lanate. Capitula usually in a corymbiform or paniculiform synflorescence or sometimes solitary. Phyllaries usually without an appendage but sometimes with a green herbaceous appendage, apex obtuse, acute, acuminate, or caudate and usually appressed or sometimes reflexed. Receptacle usually densely bristly, rarely paleate, papillose, or naked. Corolla usually glabrous, rarely gland-dotted. Anther tails ± lacerate, lanate, or entire. Achene cylindric, oblong, or fusiform, obtusely 4- or 5-angled, smooth or wrinkled, usually glabrous, rarely gland-dotted or sericeous, usually without a conspicuous apical crown. Pappus dirty white, straw-colored, or yellowish brown, usually in 2 rows; outer bristles scabrid or rarely plumose, rarely lacking.

About 333 species: Asia, C, E, and N Europe, W North America; 217 species (152 endemic) in China.

- 1a. Subshrubs, repeatedly virgately branched from base 1. *S.* sect. *Jurineiformes*
- 1b. Perennial herbs or rarely subshrubs, never virgately branched.
 - 2a. Phyllaries straw-colored, with a black or brown membranous margin; receptacle with paleae as long as or longer than inner phyllaries; pappus bristles in 1 row 2. *S.* sect. *Jacea*
 - 2b. Phyllaries straw-colored, greenish, yellow, brown, purple, or black, without a black or brown membranous margin; receptacle with bristles shorter than inner phyllaries or naked; pappus bristles usually in 2 rows.
 - 3a. Plants stemless or substemless and sometimes forming dense cushions; leaves undivided, usually less than 2 cm wide, if wider then margin dentate or serrate; capitula usually solitary, rarely few or numerous 3. *S.* sect. *Gymnocline*
 - 3b. Plants usually with well-developed stem, if stemless then leaves either pinnately lobed to pinnately divided or leaf blade more than 2 cm wide and with an entire margin; capitula in a corymbiform, paniculiform, or racemiform synflorescence or solitary.
 - 4a. Roots and caudex fibrously split; capitula usually numerous, in a corymbiform or paniculiform synflorescence; involucre cylindric, tubular, or narrowly campanulate, usually less than 1 cm in diam. 4. *S.* sect. *Laguranthera*
 - 4b. Roots and caudex not fibrously split; capitula solitary to numerous; involucre usually campanulate, more than 1 cm in diam.
 - 5a. Anther tails cottony or lanate, rarely lacerate; capitula mostly solitary and usually more than 1.5 cm in diam.
 - 6a. Leaf blade undivided, narrowly linear and grasslike, or narrowly oblong, narrowly ovate-elliptic to narrowly obovate-elliptic 5. *S.* sect. *Lagurostemon*
 - 6b. Leaf blade usually pinnately lobed to pinnately divided, if rarely undivided then not narrowly linear and grasslike but elliptic, obovate, or oblong 6. *S.* sect. *Strictae*
 - 5b. Anther tails ciliate or lacerate, not cottony or lanate; capitula usually numerous and less than 1.5 cm in diam.

- 7a. Plants scapiform or subscapiform; basal leaves rosulate; stem leaves much reduced 7. *S. sect. Rosulascentes*
 7b. Plants not scapiform; basal leaves not rosulate (often withered at anthesis); stem leaves usually well developed 8. *S. sect. Saussurea*

1. *Saussurea* sect. *Jurineiformes* (Lipschitz) Lipschitz in Schischkin & Bobrov, Fl. URSS 27: 512. 1962.

木质风毛菊组 mu zhi feng mao ju zu

Saussurea ser. *Jurineiformes* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 43: 452. 1958.

Subshrubs, virgate, much branched. Leaves few, narrowly elliptic to linear, small. Capitula numerous, in an ample paniculiform synflorescence. Phyllaries sometimes pilose, apex acuminate, cartilaginous, and stiff. Receptacle with dense subulate long bristles. Achene with a short crown, glandular. Pappus in 2 rows, white; outer bristles barbellate or plumose, sometimes lacking.

Three species: Afghanistan, China, N Pakistan, Tajikistan, Uzbekistan; one species in China.

73. *Saussurea chondrilloides* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 169. 1889.

木质风毛菊 mu zhi feng mao ju

Jurinea chondrilloides (C. Winkler) O. Fedtschenko; *Saussurea aphylla* K. H. Rechinger; *S. rupestris* Hemsley & Lace.

Subshrubs 60–80 cm tall. Stem green, erect, strongly and repeatedly branched. Leaves elliptic to linear, 1–7.5 × 0.2–0.5(–1) cm, both surfaces green or glaucous, sparsely pubescent, and gland-dotted, margin entire or with few teeth, apex acute. Uppermost stem leaves linear, ca. 10 × 2–3 mm. Capitula numerous, solitary on branch ends in a lax paniculiform synflorescence. Involucre campanulate to obconic, (3–)6–10 mm in diam. Phyllaries in 5–7 rows, arachnoid tomentose and gland-

dotted, apex acuminate; outer phyllaries triangular-ovate, 2–3 × 1–1.5 mm; middle phyllaries narrowly elliptic, 3–10 × 1.5–2 mm; inner phyllaries linear, 10–12 × 1–1.5 mm. Receptacle bristles silvery, subulate, 6–8 mm. Corolla pale reddish purple, 1.1–1.6 cm, glandular, tube 5–8 mm, limb 6–8 mm, lobes 2.5–3 mm. Achene brown, cylindric, 2.5–6 mm, gland-dotted, ribbed, apex with a dentate and lacerate crown. Pappus white or dirty white; outer bristles 1–4[–6] mm, barbellate to plumose, sometimes lacking; inner bristles ca. 1 cm. Fl. and fr. Jul–Sep.

Stony slopes; 1800–2800 m. W Xinjiang [Afghanistan, N Pakistan, Tajikistan, Uzbekistan].

No specimens of *Saussurea chondrilloides* from China were seen by the present authors. The description here is based on the treatment by G. M. Shen (Fl. Xinjiang. 5: 275. 1999), on material from Afghanistan, and on an image of the type specimen in LE.

2. *Saussurea* sect. *Jacea* Lipschitz, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 16: 441. 1954.

栗缘风毛菊组 li yuan feng mao ju zu

Herbs, perennial. Stem solitary, branched, densely leafy. Capitula numerous or few, solitary at stem and branch ends, supported by uppermost stem leaves. Phyllaries straw-colored, leathery, with brown or black membranous margin. Receptacle paleate; paleae 1–2 cm, approximately as long as inner phyllaries. Anther tails short, undivided. Achene ribbed, glabrous. Pappus bristles in 1 row, plumose, persistent.

Three species: Afghanistan, Bhutan, China, NE and NW India, Kashmir, N Myanmar, Nepal, N Pakistan, Tajikistan; one species in China.

The species of *Saussurea* sect. *Jacea*, including its only Chinese representative, almost certainly do not belong in *Saussurea*. In a cladogram from a recent molecular analysis (Y. J. Wang et al., Biol. J. Linn. Soc. 97: 893–903. 2009), *S. fastuosa* (= *S. forrestii*) was positioned far from the *Saussurea* clade. The affinities of *S. fastuosa* could not be further elucidated, however, and it is treated here under *Saussurea*.

74. *Saussurea fastuosa* (Decaisne) Schultz Bipontinus, Linnaea 19: 331. 1846.

奇形风毛菊 qi xing feng mao ju

Aplotaxis fastuosa Decaisne in Jacquemont, Voy. Inde 4(Bot.): 97. 1843; *A. denticulata* Candolle; *A. denticulata* var. *glabrata* Candolle; *A. denticulata* var. *hypoleuca* Candolle; *Saussurea denticulata* (Candolle) Wallich ex C. B. Clarke (1876), not Ledebour (1829); *S. forrestii* Diels; *S. glabrata* (Candolle) C. Shih; *S. wallichii* Schultz Bipontinus.

Herbs 0.6–1.5 m tall, perennial. Stem solitary, erect, simple or apically branched. Basal and lower stem leaves withered at anthesis. Middle stem leaves petiolate; petiole ca. 5 mm; leaf

blade narrowly ovate-elliptic, 6–15 × 2–4.5 cm, abaxially grayish white and densely tomentose or sometimes glabrescent, adaxially green and glabrous, base rounded to broadly cuneate, margin serrulate, apex acute to acuminate. Upper stem leaves gradually smaller upward on stem. Capitula solitary at end of stem or branches, in a lax corymbiform synflorescence, large, on a ± widened peduncle. Involucre campanulate, 1.5–2.5 cm in diam. Phyllaries in 4 or 5 rows, straw-colored, margin membranous, dark brown, and erose-lacerate, apex rounded; outer phyllaries ovate, 4–8 × 4–5 mm; middle phyllaries elliptic to narrowly elliptic, 7–13 × 2–4 mm; inner phyllaries narrowly elliptic to linear, 13–15 × 1.5–2 mm. Receptacle with paleae but without alveolate bristles; paleae 1.2–1.7 cm. Corolla purple, 1.3–1.4 cm, glabrous, tube 6–8 mm, limb 5–7 mm, lobes 2.5–3

mm. Achene pale brown, obconic, 4–5 mm, ribbed, glabrous. Pappus bristles straw-colored, 7–12 mm. Fl. and fr. Aug–Oct.

Forests, forest or thicket margins, grasslands, moist meadows; 2400–4000 m. SW Sichuan, S Xizang, NW Yunnan [Bhutan, NE and NW India, N Myanmar, Nepal].

This taxon is very variable with respect to the indumentum of the abaxial leaf surface, which ranges from grayish white and densely tomentose to green and glabrous, and to the shape of the peduncles, which

are ± inflated below the capitulum. *Saussurea forrestii*, which has less dense indumentum and barely inflated peduncles, was described from material from Yunnan and accepted by S. W. Liu (Fl. Yunnan. 13: 550. 2004); and *S. glabrata* with glabrous leaves was recognized by C. Shih (FRPS 78(2): 84. 1999). However, as no discontinuous characters could be found that would justify separation of these taxa at species level, a broad species concept is adopted here. While the rank of variety might be appropriate, we refrain from validating a name at this rank, as long as the generic affiliation of this species is not yet clear.

3. *Saussurea* sect. *Gymnocline* Franchet, J. Bot. (Morot) 2: 311. 1888.

无茎风毛菊组 wu jing feng mao ju zu

Herbs, stemless or substemless but sometimes with branched woody caudex and densely caespitose or forming dense cushions. Leaf blade margin entire, serrate, dentate, or sinuate. Capitula usually solitary in center of leaf rosette, large or medium-sized, sometimes several in a clustered synflorescence, sessile or shortly pedunculate. Receptacle with subulate, sometimes very short bristles or naked. Corolla glabrous or sometimes gland-dotted. Anther tails lacerate or lanate. Achene glabrous or glandular, without an apical crown but sometimes with a crenulate rim. Pappus usually in 2 rows; outer bristles scabrid or plumose, rarely very few or lacking.

Twenty species: Bhutan, China, NE and NW India, Japan, Kashmir, Nepal, Tajikistan; 17 species (13 endemic) in China.

Saussurea sect. *Acaules* C. B. Clarke (Compos. Ind. 220. 1876) was lectotypified by Kitamura (Acta Phytotax. Geobot. 24: 22. 1969) with *S. stoliczkae* (= *S. andryaloides*), a species now included in *S. sect. Strictae*. Lipschitz (Rod *Saussurea*, 106. 1979) explicitly excluded this lectotype from his *S. sect. Acaules* and thereby created an illegitimate later homonym (*Vienna Code*, Art. 48.1). The lectotype of *S. sect. Depressae* C. B. Clarke (loc. cit.: 221; chosen by Lipschitz, loc. cit.: 96–97) is *S. andersonii*, now also included in *S. sect. Strictae*. *Saussurea* sect. *Depressae* has often been regarded as highly artificial (Lipschitz, loc. cit.: 97). Moreover, its key character is not even very useful for grouping of species. Naked receptacles can be observed in most other sections as well and may only be used for keying out certain groups within a section. For this reason, *S. sect. Depressae* is merged here with *S. sect. Acaules*. The correct name for this section is *S. sect. Gymnocline*, typified by *S. ciliaris*.

- 1a. Receptacle naked, without bristles; outer phyllaries apically green and reflexed; leaf margin entire; capitulum solitary.
 - 2a. Leaf blade narrowly linear, 1–2 mm wide 77. *S. poochlamys*
 - 2b. Leaf blade narrowly obovate-elliptic to linear, 3–15 mm wide.
 - 3a. Leaf blade adaxially green when dry, glabrous, rigid, and leathery; inner phyllaries acute at apex 78. *S. ciliaris*
 - 3b. Leaf blade adaxially black when dry, puberulent or glabrous, soft, and herbaceous; inner phyllaries obtuse at apex 79. *S. coriolepis*
- 1b. Receptacle with sometimes very shortly subulate bristles; outer phyllaries apically not green or reflexed; leaf margin entire, dentate, or pinnately lobed; capitula solitary or several.
 - 4a. Leaves long petiolate; petiole 1.5–10 cm; leaf blade elliptic, ovate, or obovate, large (more than 1.5 cm wide), margin coarsely dentate or serrate.
 - 5a. Outer pappus bristles reflexed and appressed on achene; capitulum 1 (or 2–4); leaf base cuneate, margin sharply dentate or serrulate 75. *S. katochaete*
 - 5b. Outer pappus bristles neither reflexed nor appressed on achene; capitula 4–18 in a corymbiform synflorescence; leaf base cordate, margin shallowly sinuate-dentate 76. *S. bella*
 - 4b. Leaves shortly petiolate or sessile; petiole 0.1–2 cm; leaf blade spatulate, narrowly ovate, narrowly elliptic, or linear, small (less than 1.5 cm wide), margin entire, denticulate, sinuate-dentate, or pinnately lobed.
 - 6a. Outer pappus bristles plumose but sometimes very few or lacking; leaf blade spatulate, adaxially villous or tomentose.
 - 7a. Leaf blade adaxially green, sparsely villous, abaxially glaucous but glabrescent 82. *S. montana*
 - 7b. Leaf blade adaxially grayish green, sparsely tomentose, abaxially grayish white densely tomentose.
 - 8a. Phyllaries sparsely white or yellowish villous, apex usually acuminate; leaf margin entire 80. *S. spatulifolia*
 - 8b. Phyllaries dark brown or black villous, apex usually obtuse; leaf margin sinuate-dentate with short purple mucros 81. *S. melanotricha*
 - 6b. Outer pappus bristles scabrid; leaf blade narrowly elliptic, linear, sometimes narrowly obovate, adaxially glabrous or sparsely pubescent.
 - 9a. Plants forming dense cushions.
 - 10a. Leaf blade pinnately lobed, apex rounded to subobtusely 90. *S. pulviniformis*
 - 10b. Leaf blade undivided, apex acuminate or spinulose.

- 11a. Leaf blade 2–7 cm, abaxially white and tomentose; capitulum 2–3 cm in diam. 88. *S. columnaris*
 11b. Leaf blade 0.5–1.2 cm, abaxially green and glabrous; capitulum 0.5–0.7 cm in diam. 89. *S. subulata*
 9b. Plants not forming dense cushions but sometimes densely caespitose.
 12a. Leaf blade green on both surfaces, glabrous or with glandular hairs.
 13a. Leaf blade glabrous, margin subentire 86. *S. pumila*
 13b. Leaf blade densely glandular hairy, margin conspicuously sinuate-dentate 87. *S. apus*
 12b. Leaf blade abaxially white and densely tomentose, adaxially green or brown.
 14a. Leaf blade margin dentate, crenate, or pinnate; plants densely caespitose 91. *S. werneroides*
 14b. Leaf blade margin entire or denticulate; plants not caespitose.
 15a. Leaf blade ovate to elliptic, 1–3.5 × 0.5–1.5 cm; capitula 2–5 83. *S. ovatifolia*
 15b. Leaf blade narrowly obovate to linear, 2.5–7 × 0.2–0.6 cm; capitulum solitary.
 16a. Leaf blade spatulate to narrowly obovate, 3–6 mm wide, adaxially
 arachnoid and glandular 84. *S. cochlearifolia*
 16b. Leaf blade linear to narrowly ovate-elliptic, 2–5 mm wide,
 adaxially glabrous 85. *S. minuta*

75. *Saussurea katochaete* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 491. 1882.

重齿风毛菊 *chong chi feng mao ju*

Saussurea anochaete Handel-Mazzetti; *S. katochaete* var. *caulescens* Lipschitz; *S. katochaetoides* Handel-Mazzetti; *S. rohmoana* C. Marquand & Airy Shaw.

Herbs 3–10(–20) cm tall, perennial, stemless or shortly stemmed. Caudex stout, simple or few branched. Rosette leaves petiolate; petiole 1.5–6(–10) cm; leaf blade elliptic, obovate, or ovate, 2.5–11 × 1.5–4.5 cm, abaxially white or grayish white and densely tomentose, adaxially green and glabrous, base cuneate to rounded, margin sharply and narrowly serrate-dentate, apex acuminate, acute, or obtuse. Capitulum 1(or 2–4), in center of leaf rosette, sessile or pedunculate. Involucre broadly campanulate, 2.5–4 cm in diam. Phyllaries in 4 or 5 rows, brown to black, glabrous, apex acute to acuminate; outer phyllaries triangular-ovate, 9–15 × 4–6 mm; middle phyllaries ovate to narrowly ovate-elliptic, 12–15 × 4–6 mm; inner phyllaries narrowly elliptic to linear, 1.5–2 × 0.2–0.4 cm. Receptacle bristles yellowish, subulate, 1–3 mm. Corolla purple, 1.3–1.9 cm, tube 7–12 mm, limb 6–8 mm, lobes 4–5 mm. Achene dark brown, cylindric, 4–6 mm, obtusely 4- or 5-ribbed. Pappus pale brown; outer bristles 3–3.5 mm, usually reflexed and appressed to achene, scabrid; inner bristles 1.3–1.5 cm, erect. Fl. and fr. Jul–Oct.

Alpine meadows and pastures, scree slopes, thicket and forest margins; 2200–4800 m. Gansu, Qinghai, W Sichuan, Xizang, NW Yunnan (Dêqên) [Bhutan, India (Sikkim)].

76. *Saussurea bella* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 87. 1949.

漂亮风毛菊 *piao liang feng mao ju*

Saussurea haoi Y. Ling ex Y. L. Chen, S. Yun Liang & K. Y. Pan.

Herbs 3–10 cm tall, perennial, stemless or shortly stemmed. Caudex long, stout, usually simple. Rosette leaves petiolate; petiole 2–7 cm; leaf blade ovate, elliptic, or suborbicular, 2–7 × 1–4.5 cm, abaxially white and densely arachnoid tomentose, adaxially green and arachnoid but glabrescent, base cordate, truncate, or cuneate, margin sinuate-dentate and some-

times proximally pinnately lobed, apex rounded or obtuse to acuminate. Capitula numerous, 4–18, in a clustered corymbiform synflorescence, pedunculate. Involucre campanulate, 1.2–3 cm in diam. Phyllaries in 4 or 5 rows, green and herbaceous in distal part, arachnoid; outer phyllaries narrowly ovate-elliptic to linear, 10–15 × 3–5 mm, apex with a reflexed spiniform mucro; inner phyllaries linear, 1.6–2 × ca. 0.2 cm, yellowish, apex herbaceous and acuminate. Receptacle bristles subulate, ca. 4 mm. Corolla purple, 1.7–2 cm, tube 0.9–1.1 cm, limb 9–10 mm, lobes 5–5.5 mm. Achene gray, 4–5 mm, 4-angled, glabrous. Pappus straw-colored; outer bristles ca. 2 mm, scabrid; inner bristles ca. 1.6 cm. Fl. and fr. Aug–Sep.

• Alpine pastures, meadows, and scree slopes; 3200–4500 m. Qinghai, E Xizang.

77. *Saussurea poochlamys* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 15. 1925.

革叶风毛菊 *ge ye feng mao ju*

Herbs 2–5 cm tall, perennial, stemless or substemless. Caudex simple or few branched. Rosette leaves sessile, linear, 2–12 × 0.1–0.2(–0.4) cm, leathery, both surfaces green, shiny, and glabrous, margin entire and revolute, apex obtuse. Innermost leaves gradually merging into phyllaries. Capitulum solitary in center of leaf rosette, sessile or on a peduncle to 4 cm. Involucre narrowly campanulate, 0.6–1.5 cm in diam. Phyllaries in 4 or 5 rows; outer phyllaries with straw-colored, leathery proximal part and with a green, herbaceous distal part, glabrous, proximal part ovate, 8–10 × 3–5 mm, distal part linear, 1–4 × 0.1–0.2 cm, margin revolute, apex obtuse; middle phyllaries with gradually reduced herbaceous part, narrowly ovate-elliptic, 11–15 × 2–3 mm, glabrescent, apex acute to obtuse; inner phyllaries narrowly elliptic to linear, 15–17 × 1–2 mm, apically purplish, margin membranous, apex obtuse and mucronate or acuminate. Receptacle usually naked, rarely with 1–2 mm yellowish bristles. Corolla bluish purple, 1.6–2.2 cm, tube 0.8–1.5 cm, limb 5–7 mm, lobes 4.5–5 mm. Achene brown, cylindric, 3.5–4 mm, 5-ribbed, glabrous, tuberculate. Pappus dirty white; outer bristles 4–5 mm, plumose; inner bristles 1.2–1.3 cm. Fl. and fr. Aug–Oct.

• Thickets, alpine meadows and pastures; 3200–4300 m. SW and W Sichuan (Kangding, Muli), NW Yunnan (Lijiang, Zhongdian).

78. *Saussurea ciliaris* Franchet, J. Bot. (Morot) 2: 337. 1888.尖叶风毛菊 *jian ye feng mao ju**Saussurea ciliaris* var. *major* Y. Ling.

Herbs 2.5–6 cm tall, perennial, stemless or shortly stemmed. Caudex short, simple or few branched. Rosette leaves sessile, narrowly obovate-elliptic to linear, 1.5–13 × 0.3–1.2 cm, rigid and leathery, glabrous, abaxially pale green, adaxially green and shiny, base cuneate-attenuate, margin entire, revolute, and ciliate, apex acute. Uppermost leaves gradually merging into phyllaries. Capitulum solitary, in center of leaf rosette, sessile. Involucre campanulate, 1–2.5 cm in diam. Phyllaries in 4 or 5 rows; outer phyllaries with brown leathery basal part and a green herbaceous reflexed apical part, glabrous, basal part ovate and 7–10 × 3–5 mm, apical part linear-oblong and 0.7–3 × 0.4–1 cm, margin revolute and ciliate, apex acute; middle phyllaries ovate-elliptic, 10–15 × 3–5 mm, with a gradually reduced herbaceous apical part, apex acute; inner phyllaries narrowly elliptic to linear, 12–18 × 2–3 mm, brown but apically purple, apex acuminate. Receptacle without bristles. Corolla bluish purple to blackish purple, 1.5–1.7(–2) cm, tube 8–9(–12) mm, limb 7–8 mm, lobes 4.5–5 mm. Achene brown, cylindric, ca. 4 mm, glabrous. Pappus pale brown; outer bristles 4–8 mm, plumose; inner bristles 1.2–1.3 cm. Fl. and fr. Aug–Sep.

• Alpine meadows and pastures, thickets, scree slopes; 2600–4400 m. W Sichuan, NW Yunnan (Eryuan, Lijiang, Zhongdian).

79. *Saussurea coriolepis* Handel-Mazzetti, Oesterr. Bot. Z. 89: 60. 1940.硬苞风毛菊 *ying bao feng mao ju*

Herbs 2–3 cm tall, perennial, stemless. Caudex short, simple. Rosette leaves sessile, narrowly obovate-oblong to linear, 3.5–6 × 0.6–1.5 cm, herbaceous, abaxially pale green and glabrous, adaxially green, black when dry and sparsely pubescent or glabrescent, margin entire, revolute, and densely ciliate, apex obtuse. Uppermost leaves usually merging into phyllaries. Capitulum solitary, in center of leaf rosette, sessile. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 3 or 4 rows, purple, glabrous, margin ciliate, apex obtuse; outer phyllaries elliptic, 8–10 × ca. 4 mm, basal part purple and leathery, apical part green and leaflike; middle phyllaries elliptic to narrowly ovate, 10–14 × 3–4 mm, purple; inner phyllaries narrowly ovate-elliptic to linear, 13–16 × 2–3 mm, purple, apex obtuse. Receptacle without bristles. Corolla bluish purple, 1.3–1.7 cm, tube 9–10 mm, limb 4–8 mm, lobes 3–5 mm. Achene ca. 3 mm, ribbed, glabrous. Pappus straw-colored; outer bristles short, scabrid; inner bristles 1.1–1.5 cm. Fl. and fr. Aug.

• Mountain slopes; ca. 4000 m. Sichuan (Baoping).

80. *Saussurea spatulifolia* Franchet, J. Bot. (Morot) 2: 338. 1888.维西风毛菊 *wei xi feng mao ju*

Herbs 2–4 cm tall, perennial, stemless, sometimes laxly caespitose. Caudex simple or branched with several sterile and flowering leaf rosettes. Leaves petiolate; petiole purple, to 1 cm; leaf blade spatulate to oblong-spatulate, 0.5–3 × 0.5–1 cm,

abaxially white and densely tomentose, adaxially grayish green and tomentose, base cuneate, margin entire, apex rounded and with a small mucro. Capitulum solitary, in center of leaf rosette. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in ca. 4 rows, pale brown to blackish purple, sparsely white or yellowish villous, apex acute to acuminate; outer phyllaries ovate, 8–10 × 4–5 mm; middle phyllaries narrowly ovate-elliptic, 10–12 × 3–4 mm; inner phyllaries narrowly elliptic to linear, 12–14 × 2–3 mm. Receptacle bristles brownish, subulate, 0.5–1.5 mm. Corolla purple, 1.3–1.6 cm, sparsely gland-dotted, tube 7–8 mm, limb 6–8 mm, lobes 5–6 mm. Achene dark brown, cylindric to obconic, 4–4.5 mm, transversely rugose, glabrous or with few sessile glands, apex with a crenulate rim. Pappus dirty white to pale brown; outer bristles very few or sometimes lacking, 2–3 mm, plumose; inner bristles 1.2–1.4 cm. Fl. and fr. Jul–Oct.

• Alpine meadows and pastures, scree slopes; 3000–4600 m. SW Sichuan, NW Yunnan.

81. *Saussurea melanotricha* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 61: 204. 1924.黑苞风毛菊 *hei bao feng mao ju**Saussurea xanthotricha* Handel-Mazzetti.

Herbs 1.5–5 cm tall, perennial, stemless or substemless, laxly caespitose. Caudex usually branched with several sterile and flowering leaf rosettes. Leaves petiolate; petiole purple, to 1.5 cm; leaf blade elliptic to spatulate-elliptic, 1–3.5 × 0.4–1 cm, abaxially white, densely tomentose, and with a conspicuous midvein, adaxially grayish green and densely villous, base cuneate-attenuate, margin entire or obtusely sinuate-dentate with purple mucronulate teeth, apex rounded to obtuse with a short mucro. Capitulum solitary, in center of leaf rosette. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in ca. 4 rows, purplish brown and dark brown to blackish villous in distal part, apex acute to obtuse; outer phyllaries ovate, 9–11 × 4–6 mm; middle phyllaries narrowly ovate-elliptic, 12–13 × 3–4 mm; inner phyllaries narrowly elliptic-linear, 12–14 × 2–3 mm. Receptacle bristles few, triangular-subulate, to 1 mm. Corolla purple, 1.2–1.6 cm, sparsely gland-dotted, tube 5–8 mm, limb 6–8 mm, lobes 3.5–4 mm. Achene cylindric, 3–5 mm, gland-dotted. Pappus pale brown; outer bristles 3–5 mm, plumose; inner bristles 1.2–1.4 cm. Fl. and fr. Sep.

• Alpine scree slopes, open rocky mountain slopes; 3500–4700 m. SW Sichuan, NW Yunnan.

Saussurea melanotricha is very close to *S. spatulifolia* and probably not clearly separated at species level. The type specimen of *S. xanthotricha* from Sichuan holds an intermediate position between *S. spatulifolia* and *S. melanotricha*, combining the acuminate phyllaries with yellowish indumentum of the former with the sinuate-dentate leaf margins with purple mucros of the latter.

82. *Saussurea montana* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 208. 1934.山地风毛菊 *shan di feng mao ju*

Herbs 3–5 cm tall, perennial, stemless, caespitose. Caudex stout, usually branched at ground level, with several sterile and

flowering leaf rosettes. Leaves petiolate; petiole purple, to 5 mm; leaf blade narrowly obovate or narrowly elliptic, 1–3 × 0.4–1 cm, abaxially glaucous and sparsely villous but glabrescent, adaxially green and villous, base cuneate-attenuate, margin entire, apex obtuse to rounded and with a short mucro. Capitulum solitary, in center of leaf rosette, sessile. Involucre campanulate, 0.8–1.2 cm in diam. Phyllaries in ca. 4 rows, purple and yellowish to brownish villous in distal part, apex usually obtuse; outer phyllaries ovate, 6–7 × 3–4 mm; middle phyllaries narrowly ovate-elliptic, 7–11 × 2–3 mm, apex acute to obtuse; inner phyllaries narrowly elliptic to linear, 11–15 × 1.5–3 mm, apex acute. Receptacle bristles subulate, ca. 1.5 mm. Corolla purple, 1.6–1.7 cm, gland-dotted, tube 7–10 mm, limb 6–10 mm, lobes 5–6 mm. Achene cylindric, 4–5 mm, wrinkled, glabrous, apically with a crenulate rim. Pappus straw-colored; outer bristles few, 3–6 mm, plumose, often lacking; inner bristles 1–1.5 cm. Fl. and fr. Aug–Oct.

• Alpine pastures; 3600–4600 m. SW Sichuan (Muli), NW Yunnan (Lijiang).

Like *Saussurea melanotricha*, *S. montana* is also very close to *S. spatulifolia* and probably not clearly separated at species level. However, the indumentum is clearly very different, and no transient forms have been observed.

83. *Saussurea ovatifolia* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 102. 1981.

青藏风毛菊 qing zang feng mao ju

Herbs 2–6 cm tall, perennial, stemless or shortly stemmed. Caudex elongate, 2–3 mm in diam., simple or few branched, covered with dark brown remains of petioles. Rosette leaves petiolate; petiole 3–10 mm; leaf blade ovate to elliptic, 1–3.5 × 0.5–1.5 cm, abaxially white and densely tomentose, adaxially grayish green and sparsely arachnoid, base rounded to cuneate, margin sparsely denticulate or entire, apex acute, acuminate, or obtuse. Capitula (1 or) 2–5, in a hemispherically condensed corymbiform synflorescence or rarely solitary, subsessile. Involucre campanulate, 6–10 mm in diam. Phyllaries in 3–5 rows, brownish or greenish yellow, villous, apex acute to acuminate; outer phyllaries narrowly ovate, 4–6 × 2–3 mm; middle phyllaries narrowly ovate-elliptic, 5–8 × 1.5–2 mm; inner phyllaries linear, 8–10 × 1–1.5 mm. Receptacle bristles 1–2 mm. Corolla purplish red, 1.2–1.5 cm, tube 4–6 mm, limb 5–5.5 mm, lobes ca. 3 mm. Achene 3–4 mm, glabrous. Pappus basally pale brown, apically dirty white; outer bristles scabrid. Fl. and fr. Aug–Sep.

• Alpine meadows, riverbanks; 4200–5200 m. Qinghai, Xizang.

Saussurea ovatifolia may be very closely related to the geographically distant *S. elliptica*, known from the Karakorum range and attributed to *S. sect. Saussurea*. Records of *S. ovata* in the sense of S. W. Liu (Fl. Qinghai. 3: 469. 1996) are probably referable to *S. ovatifolia*.

84. *Saussurea cochleariifolia* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 104. 1981.

匙叶风毛菊 shi ye feng mao ju

Herbs ca. 2 cm tall, perennial, stemless. Caudex stout, few branched. Rosette leaves petiolate; petiole 1–1.5 cm; leaf blade

spatulate to narrowly obovate-oblong, 2.5–4 × 0.3–0.6 cm, abaxially grayish green and densely tomentose, adaxially green, glandular hairy, and sparsely arachnoid, base attenuate, margin entire, apex acute. Capitulum solitary, in center of leaf rosette, sessile. Involucre narrowly campanulate, 0.8–1.2 cm in diam. Phyllaries in 3 or 4 rows, margin and distally purplish black, sparsely arachnoid, apex acuminate; outer phyllaries narrowly triangular-ovate, 5–8 × 2–3 mm; middle phyllaries narrowly ovate-elliptic, 8–12 × 1–2 mm; inner phyllaries linear, 12–14 × ca. 1 mm. Receptacle not seen. Corolla purple, 1.5–1.6 cm, tube 7–8 mm, limb 7–8 mm, lobes ca. 5 mm. Achene ca. 1.5 mm, transversely rugose. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Aug–Sep.

• Moraines, alpine meadows; ca. 4000 m. S Xizang (Yadong) [India (Sikkim)].

Saussurea cochleariifolia may occur in India (Sikkim) (see Grierson & Springate, Fl. Bhutan 2(3): 1441. 2001).

85. *Saussurea minuta* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 243. 1894.

小风毛菊 xiao feng mao ju

Saussurea lancifolia Handel-Mazzetti.

Herbs 2.5–7 cm tall, perennial, stemless or shortly stemmed. Caudex 2–3 mm in diam., creeping, usually few branched, with several sterile and flowering leaf rosettes. Rosette leaves petiolate; leaf blade narrowly elliptic to linear, 3–7 × 0.2–0.5 cm, abaxially white and densely tomentose, adaxially green and glabrous, base attenuate, margin revolute and entire, apex acute. Stem leaves (if present) similar to rosette leaves but gradually shorter upward on stem; uppermost leaves sessile, subtending and overtopping capitulum. Capitulum solitary, in center of leaf rosette or terminal on a short stem. Involucre narrowly campanulate, 0.8–1.2 cm in diam. Phyllaries in 3 or 4 rows, purple; outer phyllaries triangular-ovate, 9–11 × 3–5 mm, glabrous, apex acute; middle phyllaries ovate, 12–14 × 3–4 mm, glabrous, apex acute; inner phyllaries narrowly ovate-linear, 14–16 × 2–3 mm, apically densely villous, apex obtuse. Receptacle bristles subulate-filiform, 7–8 mm. Corolla purple, 1.2–1.4 cm, tube 5–6 mm, limb 6–7 mm, lobes 3–4 mm. Achene only seen as immature. Pappus dirty white; outer bristles ca. 2 mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Jul–Sep.

• Alpine scree slopes; 3500–4900 m. Gansu, Qinghai, W Sichuan.

86. *Saussurea pumila* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 244. 1894.

矮小风毛菊 ai xiao feng mao ju

Herbs 2–4(–8) cm tall, perennial, stemless or shortly stemmed. Caudex 1–3 mm in diam., simple or few branched. Rosette leaves shortly petiolate; leaf blade narrowly ovate-elliptic, narrowly spatulate, or linear-elliptic, 0.8–3(–5) × 0.2–0.7(–1) cm, both surfaces green and glabrous, base cuneate-attenuate, margin subentire to minutely denticulate-serrulate, apex acute to obtuse and mucronate. Stem leaves (if present) similar to rosette leaves. Capitulum 1(–3), in center of leaf rosette or terminal on stem. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 4 or 5 rows, blackish brown or straw-

colored with dark midvein and margin, sometimes tinged purple, glabrous or sparsely villous, apex acute to acuminate; outer phyllaries narrowly ovate-triangular, 7–11 × 3–5 mm; middle phyllaries narrowly ovate-elliptic, 8–13 × 2–3 mm; inner phyllaries narrowly elliptic-linear, 13–15 × ca. 2 mm. Receptacle bristles 3–5 mm. Corolla purple, 1–1.3 cm, tube 5–7 mm, limb 5–6 mm, lobes 3–3.5 mm. Achene brown, cylindric, ca. 3 mm, glabrous. Pappus straw-colored; outer bristles 1–3 mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Jul–Sep. $2n = 30^*$ (as *Saussurea apus* but see discussion below).

• Alpine meadows, in turf; 3600–4700 m. Qinghai, Sichuan, Xizang.

Saussurea pumila has often been confused with *S. apus*. The two taxa are probably closely related. *Saussurea apus* differs from *S. pumila* by the usually larger size and always densely glandular, distinctly dentate leaves.

87. *Saussurea apus* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 490. 1882.

无梗风毛菊 wu geng feng mao ju

Saussurea humilis Ostenfeld; *S. koslowii* C. Winkler.

Herbs 2–6(–10) cm tall, perennial, caespitose, shortly stemmed. Caudex branched, with many sterile and flowering leaf rosettes. Rosette leaves shortly petiolate; leaf blade narrowly elliptic to linear, 2–7 × 0.2–1.5 cm, both surfaces green and densely glandular hairy, abaxially with a prominent straw-colored midvein, base cuneate-attenuate, margin sharply sinuate-dentate, apex acuminate. Stem leaves (if present) similar to rosette leaves. Uppermost stem leaves sometimes tinged purple, subtending capitulum. Capitulum solitary, in center of leaf rosette or terminal on stem, sessile. Involucre campanulate, 1.2–2(–3) cm in diam. Phyllaries in 3–5 rows, blackish purple, villous but glabrescent, apex acute to acuminate; outer phyllaries narrowly ovate, 7–12 × 3–4 mm; middle phyllaries narrowly elliptic, 10–14 × 2–3 mm; inner phyllaries narrowly elliptic-linear, 13–15 × 1–2 mm. Receptacle bristles 1.5–3 mm. Corolla purple, 1.2–1.5 cm, tube 6–8 mm, limb 5–7 mm, lobes 3.5–4.5 mm. Achene cylindric, 2–3.5 mm, glabrous. Pappus dirty white; outer bristles 1–2(–3) mm, scabrid; inner bristles 0.9–1.1(–1.3) cm. Fl. and fr. Jul–Sep.

• Alpine steppes and pastures; 4000–5400 m. Gansu, Qinghai, Xizang.

Some populations of this taxon have purplish leaves subtending the capitulum, thereby showing similarity and possible relationship with *S. bracteata* from SW Xizang, a member of *S.* subg. *Amphilaena*.

88. *Saussurea columnaris* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 652. 1937.

柱茎风毛菊 zhu jing feng mao ju

Herbs 4–10 cm tall, perennial, stemless or shortly stemmed. Caudex 1–1.5 cm in diam., usually much branched, with many sterile and flowering leaf rosettes forming large cushions, densely covered with persistent withered leaves. Rosette leaves sessile, linear, 2–7 × 0.1–0.2(–0.3) cm, abaxially grayish white and densely tomentose-sericeous, adaxially green to dark brown, shiny, and glabrous, base enlarged, sheathing,

and white villous, margin entire and revolute, apex acute. Uppermost leaves merging into phyllaries. Capitulum solitary, in center of leaf rosette or terminal on stem, sessile. Involucre campanulate, 2–3 cm in diam. Phyllaries in ca. 5 rows, apex acuminate to caudate; outer phyllaries narrowly ovate-triangular, 10–16 × 3–4 mm, basal part blackish purple, apical part greenish or brown, shiny, glabrous, and reflexed; middle and inner phyllaries narrowly ovate-triangular to narrowly elliptic-linear, 11–15 × 2–4 mm, basal part pale yellow, apical part blackish purple, villous, and erect. Receptacle bristles 7–8 mm. Corolla purplish red, 1.3–1.5 cm, tube 7–8 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene dark brown, conic, ca. 3 mm, glabrous. Pappus in 2 rows; outer bristles white, 2–4 mm, scabrid; inner bristles pale brown, 9–10 mm. Fl. and fr. Aug–Oct.

Alpine meadows, rocky mountain slopes; 3000–4700 m. SW Sichuan, SE Xizang (Zayü), NW Yunnan [Bhutan].

The record of *Saussurea columnaris* in Bhutan (see Grierson & Springate, Fl. Bhutan 2(3): 1441. 2001) is now confirmed by more recent collections.

89. *Saussurea subulata* C. B. Clarke, Compos. Ind. 226. 1876.

钻叶风毛菊 zuan ye feng mao ju

Saussurea setifolia Klatt.

Herbs 1.5–10 cm tall, perennial, caespitose. Caudex much branched, with numerous sterile and flowering leaf rosettes forming dense cushions. Leaves sessile; leaf sheath purple, 1–1.2 cm, apically densely villous at margin; leaf blade subulate-linear, 5–12 × 0.5–1 mm, leathery, both surfaces green and glabrous, margin revolute and entire, apex with a white cartilaginous mucro to 1 mm. Uppermost leaves merging into phyllaries. Capitulum solitary, in center of leaf rosettes, very shortly pedunculate. Involucre campanulate, 5–7 mm in diam. Phyllaries in ca. 4 rows, glabrous, apex acuminate; outer phyllaries ovate, 10–14 × 3–5 mm, basal part brownish or purple, apical part green, leaflike, and subulate, apex with a white cartilaginous mucro; middle phyllaries narrowly ovate-elliptic, 6–9 × 2–3 mm, basal part pale yellow, apical part purple; inner phyllaries narrowly elliptic to linear, 6–9 × 1–2 mm. Receptacle bristles brown, to 1 mm. Corolla purplish red, 1–1.2 cm, tube 5–6 mm, limb 4–5 mm, lobes 2.5–3 mm. Achene cylindric, 1.5–3.5 mm, smooth, glabrous. Pappus brown; outer bristles 2–3 mm, scabrid; inner bristles 7–8(–12) mm. Fl. and fr. Jul–Sep.

Gravelly and moist places near rivers, alpine grasslands and meadows, saline or alkaline sandy soils; 4100–5300 m. Gansu, Qinghai, Xinjiang, Xizang [NW India, Kashmir].

The erroneous record of *Saussurea subulata* from Yunnan by H. Léveillé (Cat. Pl. Yun-Nan, 50. 1916) must be referable to *S. werneroides*. Although S. W. Liu (Fl. Yunnan, 13: 543–544. 2004) listed *S. subulata* for this province as well, he mentioned that he did not see any specimens from there. Consequently, this species should be excluded from the flora of Yunnan.

90. *Saussurea pulviniformis* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 377. 1891.

垫状风毛菊 dian zhuang feng mao ju

Herbs to 3.5 cm tall, perennial, caespitose. Caudex thick, much branched, with many sterile and flowering leaf rosettes forming dense cushions, with fibrously split bark, densely covered with remains of leaves. Rosette leaves petiolate; petiole sheathing at base; leaf blade narrowly elliptic to obovate in outline, 1.5–2.5 × 0.3–0.8 cm, pinnately lobed, both surfaces green and glabrous; lateral lobes 3–6, ovate-elliptic to suborbicular, margin entire or obtusely dentate, apex obtuse; terminal lobe orbicular or oblong-elliptic, larger than lateral ones, apex obtuse to rounded. Capitula solitary, sessile. Involucre campanulate, 5–8 mm in diam. Phyllaries in 5 or 6 rows, straw-colored, glabrous; outer phyllaries ovate, apex subobtusate; inner phyllaries narrowly ovate-elliptic, apex subobtusate or with a short cusp. Receptacle with short bristles. Corolla pale to deep red, 1.2–1.4 cm, tube 5–7 mm, limb 6–7 mm, lobes to 4 mm. Achene brown, obconic, to 5 mm, 4-angled, glabrous. Pappus dirty white to pale brown; outer bristles 1–5 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Aug.

• Alpine grasslands and stony slopes; 2100–3500 m. NW Xinjiang (Tian Shan).

91. *Saussurea werneroides* Schultz Bipontinus ex J. D. Hooker, Fl. Brit. India 3: 367. 1881.

4. *Saussurea* sect. *Laguranthera* (C. A. Meyer ex Endlicher) Lipschitz, Bot. Mater. Gerb. Inst. Bot. Akad. Nauk Uzbeksk. S.S.R. 15: 17. 1959.

纤维风毛菊组 *xian wei feng mao ju zu*

Saussurea [unranked] *Laguranthera* C. A. Meyer ex Endlicher, Gen. Pl. 468. 1838; *Heterotrichum* M. Bieberstein.

Perennial herbs or subshrubs, sometimes densely caespitose, with well-developed stems. Rootstock or caudex distinctly fibrous or with woody bark split in fibers. Stems solitary or several, erect or sometimes procumbent or ascending, usually branched, leafy. Leaves fleshy or herbaceous, undivided to pinnatisect. Capitula usually numerous, rarely solitary or few, solitary or in a corymbiform or paniculiform synflorescence, narrowly campanulate, tubular, or cylindric, usually not more than 1 cm in diam. Phyllaries imbricate, appressed, margin entire, without an apical appendage, apex acute to obtuse and sometimes with a mucro or an erect or reflexed cusp. Receptacle usually with filiform or subulate bristles, rarely without bristles. Corolla glabrous or minutely gland-dotted. Anther tails lanate. Achene glabrous or rarely gland-dotted, with or without a short apical crown. Pappus always in 2 rows; outer bristles usually scabrid; inner bristles plumose.

Sixty-four species: C, E, and SW Asia, E Europe; 49 species (30 endemic) in China.

1a. Leaf blade thick, fleshy; plants usually on saline or alkaline soils.

2a. Flowering stems procumbent to ascending; receptacle usually naked 92. *S. famintziniana*

2b. Flowering stems erect; receptacle with bristles.

3a. Leaf blade bipinnately divided or pinnatisect, secondary segments linear.

4a. Leaf blade glabrous or hispidulous; capitula 6–10 mm in diam.; outer phyllaries glabrous, apex acuminate 93. *S. lacostei*

4b. Leaf blade strigose or arachnoid; capitula 4–5 mm in diam.; outer phyllaries pubescent, apex subobtusate 94. *S. turgaiensis*

3b. Leaf blade pinnately divided, pinnately lobed, lyrate-pinnately lobed, or undivided with a sinuate-dentate margin.

5a. Plants grayish green; achene with a short crown.

6a. Capitula numerous, in a densely congested corymbiform hemispheric synflorescence; stem 4–20(–30) cm tall; leaves to 3 cm wide 97. *S. daurica*

6b. Capitula solitary or few on branch ends; stem 15–50 cm tall; leaves 0.4–1.5 cm wide.

7a. Leaf blade ovate, rhombic, obovate, or elliptic 95. *S. pseudosalsa*

7b. Leaf blade linear or narrowly elliptic 96. *S. aerjingsensis*

5b. Plants green; achene without a crown.

8a. Lower stem leaves pinnately cleft or pinnately divided; outer pappus bristles persistent 99. *S. kaschgarica*

8b. Lower stem leaves lyrate-pinnately lobed or lyrate-pinnately divided; outer pappus bristles caducous.

锥叶风毛菊 *zhui ye feng mao ju*

Herbs 1–3 cm tall, perennial, caespitose, stemless. Caudex stout, fibrous, much branched, with many sterile and flowering leaf rosettes. Rosette leaves petiolate; petiole to 4 mm; leaf blade narrowly obovate or elliptic, 8–15 × 1–4 mm, abaxially grayish white and densely tomentose, adaxially green and glabrous, base cuneate-attenuate, margin with 2 or 3 acute lobes or teeth, apex acuminate. Uppermost leaves merging into phyllaries. Capitula solitary, in center of leaf rosettes, sessile. Involucre campanulate, 0.8–1.5 cm in diam. Phyllaries in 3 or 4 rows, apex acuminate; outer phyllaries narrowly triangular-ovate, 7–15 × 2–5 mm, basal part brownish or purple, glabrous, apical part leaflike and tomentose; middle phyllaries narrowly ovate-elliptic, 6–10 × 1.5–3 mm, purplish brown, apically arachnoid; inner phyllaries linear, 8–10 × 1–1.5 mm, glabrous, apically purple. Receptacle bristles light brown, 1–3 mm. Corolla purplish red, 9–10(–16) mm, tube 4–5(–8) mm, limb 4.5–5(–8) mm, lobes 3–3.5 mm. Achene pale brown, cylindric, 2–3 mm, glabrous. Pappus pale brown; outer bristles 3–5 mm, scabrid; inner bristles 6–7(–10) mm. Fl. and fr. Aug–Oct. $2n = 32$.

Alpine pastures, meadows, and scree slopes; 4200–5400 m. W Sichuan, S Xizang, NW Yunnan (Dêqên) [Bhutan, India (Sikkim), Nepal].

- 9a. Terminal lobe of leaf blade large, triangular, sagittate, or hastate 98. *S. salsa*
- 9b. Terminal lobe of leaf blade smaller, narrowly ovate to elliptic 100. *S. maximowiczii*
- 1b. Leaf blade thin, not fleshy; plants not on saline or alkaline soils.
 - 10a. Leaf sheath and base of petiole adaxially densely white lanate 101. *S. pulvinata*
 - 10b. Leaf sheath and base of petiole adaxially glabrous.
 - 11a. Achene transversely rugose; capitula large, broadly obconic, 1–2 cm in diam.; corolla more than 1.8 cm 102. *S. pulchra*
 - 11b. Achene not transversely rugose; capitula smaller, cylindric to narrowly campanulate, usually less than 1 cm in diam.; corolla usually less than 1.5 cm.
 - 12a. Phyllaries with apex acuminate and with a long conspicuous mucro.
 - 13a. Leaf blade green and glabrous on both surfaces; capitula pendent 105. *S. alberti*
 - 13b. Leaf blade abaxially grayish green, arachnoid or tomentose; capitula erect.
 - 14a. Leaf blade narrowly ovate or narrowly ovate-oblong, pinnately lobed, or undivided and margin sinuate-dentate 106. *S. larionowii*
 - 14b. Leaf blade linear, undivided, margin entire 107. *S. mucronulata*
 - 12b. Phyllaries with apex obtuse, acute, or shortly acuminate or with a short mucro.
 - 15a. Perennial herbs, densely or laxly caespitose, or subshrubs; caudex or rootstock woody, branched; stems several to many.
 - 16a. Leaf blade pinnately lobed, pinnatisect, or bipinnatisect.
 - 17a. Leaf blade clearly bipinnatisect; segments 11–13 pairs 119. *S. deserticola*
 - 17b. Leaf blade pinnatisect or pinnately lobed; segments 2–5 pairs.
 - 18a. Leaf blade segments subulate, linear, or narrowly triangular.
 - 19a. Leaf blade of lower stem leaves sparsely gland-dotted on both surfaces otherwise glabrous; leaf blade segments 2 or 3 pairs, subulate; phyllaries in 7 or 8 rows 117. *S. yabulaiensis*
 - 19b. Leaf blade of lower stem leaves sparsely arachnoid and glandular on both surfaces; leaf blade segments 3–5 pairs, linear or narrowly triangular; phyllaries in 5 or 6 rows 118. *S. mae*
 - 18b. Leaf blade segments ovate, elliptic, or triangular-ovate.
 - 20a. Involucre cylindric, 4–5 mm in diam. 110. *S. kanzanensis*
 - 20b. Involucre campanulate, 7–10 mm in diam.
 - 21a. Leaf blade elliptic, pinnately lobed to pinnatisect 109. *S. blanda*
 - 21b. Leaf blade obovate, pinnately dentate to lyrate-pinnately lobed 115. *S. salemannii*
 - 16b. Leaf blade undivided, margin entire, sinuate-dentate, dentate, or denticulate.
 - 22a. Capitula solitary or 2, at end of stem or branches 116. *S. popovii*
 - 22b. Capitula few, in a corymbiform synflorescence.
 - 23a. Leaf blade grayish white and tomentose on both surfaces.
 - 24a. Leaf margin entire 112. *S. cana*
 - 24b. Leaf margin sinuate-dentate 114. *S. canescens*
 - 23b. Leaf blade abaxially green and subglabrous or grayish white tomentose, adaxially green and subglabrous.
 - 25a. Leaf blade linear or narrowly linear, 5 mm wide or less.
 - 26a. Leaf blade narrowly linear, 1–4 mm wide, margin dentate 113. *S. petrovii*
 - 26b. Leaf blade linear, 2–5 mm wide, margin entire 120. *S. salicifolia*
 - 25b. Leaf blade narrowly elliptic, narrowly ovate, or oblong, more than 10 mm wide.
 - 27a. Phyllaries not with a dark margin, apex acuminate and shortly mucronate; leaf blade abaxially pale or grayish green and glabrous or pubescent 108. *S. coronata*
 - 27b. Phyllaries with a narrow dark margin, apex obtuse to rounded; leaf blade abaxially grayish white and densely arachnoid tomentose 121. *S. lomatolepis*
 - 15b. Perennial herbs, not caespitose, without a woody caudex or rootstock, rhizomatous; stem solitary.
 - 28a. Leaf blade green, concolorous or abaxially paler green, abaxially sparsely strigose or glabrous.
 - 29a. Leaf blade pinnately dentate to pinnatisect.
 - 30a. Leaf blade pinnately lobed or pinnately dentate 135. *S. tianshuiensis*

- 30b. Leaf blade pinnatisect.
 - 31a. Involucre tubular, 5–8 mm in diam. 133. *S. acrourea*
 - 31b. Involucre campanulate to globose, 10–15 mm in diam. 134. *S. megaphylla*
- 29b. Leaf blade undivided.
 - 32a. Plants shortly stemmed, at most ca. 0.2 m tall 103. *S. ovata*
 - 32b. Plants with tall stems, 0.3–2 m tall.
 - 33a. Plants 1–2 m tall; stem ca. 1 cm in diam. at base 111. *S. elata*
 - 33b. Plants to 1.4 m tall; stem less than 1 cm in diam. at base.
 - 34a. Middle stem leaves triangular-ovate with a truncate base; phyllaries arachnoid lanate, apex reflexed and herbaceous 127. *S. sutchuenensis*
 - 34b. Middle stem leaves elliptic or narrowly elliptic; phyllaries glabrous, sparsely arachnoid, or only apically bearded and surface scarious, apex erect and not herbaceous.
 - 35a. Leaves sessile; leaf blade narrowly ovate-elliptic to narrowly elliptic, 1–2 cm wide 124. *S. zhuxiensis*
 - 35b. Leaves petiolate; leaf blade elliptic, 3–7 cm wide.
 - 36a. Capitula in a diffuse corymbiform-paniculiform synflorescence, long pedunculate 128. *S. dolichopoda*
 - 36b. Capitula clustered at end of branches, in congested corymbiform synflorescence, shortly pedunculate 129. *S. saligna*
 - 28b. Leaf blade abaxially grayish white or grayish green and densely tomentose, arachnoid, or pubescent, adaxially green.
 - 37a. Leaf blade pinnately lobed, pinnatisect, or lyrate.
 - 38a. Leaf blade lyrate-pinnatisect; plants less than 15 cm tall 140. *S. bartholomewii*
 - 38b. Leaf blade not lyrate-pinnatisect; plants more than 15 cm tall.
 - 39a. Stem and petioles winged 136. *S. pteridophylla*
 - 39b. Stem and petioles unwinged.
 - 40a. Stem usually with short sterile axillary shoots 132. *S. elegans*
 - 40b. Stem without short sterile axillary shoots.
 - 41a. Leaf blade bipinnately divided 139. *S. chrysanthemoides*
 - 41b. Leaf blade pinnately lobed to pinnatisect.
 - 42a. Middle stem leaves with 2 or 3 pairs of lobes, abaxially white and densely tomentose; involucre obconic, 6–8 mm in diam. 137. *S. compta*
 - 42b. Middle stem leaves with 4–14 pairs of lobes, abaxially grayish green and thinly arachnoid; involucre tubular, ca. 5 mm in diam. 138. *S. variiloba*
 - 37b. Leaf blade undivided and margin entire or dentate.
 - 43a. Leaf blade ovate, ovate-elliptic, elliptic, or oblong, more than 3 cm wide.
 - 44a. Leaves shortly petiolate (to 1 cm); leaf blade broadly ovate, margin sharply serrate; synflorescence supported by uppermost stem leaves 104. *S. licentiana*
 - 44b. Leaves long petiolate (2.5–5 cm); leaf blade ovate, elliptic, or narrowly ovate-elliptic, margin denticulate or sinuate-dentate; synflorescence not supported by uppermost stem leaves.
 - 45a. Petiole unwinged; involucre narrowly cylindric, (3–)5–8 mm in diam.; phyllaries straw-colored, subglabrous, without a dark mucro 130. *S. conyzoides*
 - 45b. Petiole winged; involucre narrowly campanulate, 8–10 mm in diam.; phyllaries whitish, arachnoid, with a dark mucro 131. *S. flexuosa*
 - 43b. Leaf blade narrowly oblong, narrowly ovate-elliptic, narrowly elliptic, or linear, less than 3 cm wide.
 - 46a. Leaf blade linear, less than 1 cm wide 126. *S. integrifolia*

- 46b. Leaf blade narrowly ovate to narrowly elliptic, 1.5–3 cm wide.
 47a. Stem winged; leaf base decurrent, margin usually entire 125. *S. virgata*
 47b. Stem unwinged; leaf base not decurrent, margin sinuate-dentate.
 48a. Plants 60–100 cm tall; middle stem leaves petiolate; capitula very numerous, in an ample paniculiform-corymbiform synflorescence 122. *S. polycephala*
 48b. Plants 30–75 cm tall; middle stem leaves sessile; capitula 10–20, in a compact corymbiform synflorescence 123. *S. chinensis*

92. *Saussurea famintziniana* Krasnov, Bot. Zap. 2(1): 71. 1887.

中新风毛菊 zhong xin feng mao ju

Saussurea colorata C. Winkler.

Herbs 2–12 cm tall, perennial, densely caespitose. Rootstock stout, with fibrously split bark. Caudex stout, much branched, densely covered with remains of petioles, with many sterile and flowering leaf rosettes. Stem solitary, prostrate or ascending, simple or apically branched. Rosette and lower stem leaves petiolate; petiole 0.5–2.5 cm; leaf blade narrowly ovate, 2–4(–10) × 0.3–0.5(–1.2) cm, slightly fleshy, pinnately lobed or subentire, scabrid, arachnoid or subglabrous, margin coarsely dentate. Upper stem leaves sessile, base weakly amplexicaul. Capitula 3–7, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–12 mm in diam. Phyllaries in 4 or 5 rows, arachnoid to glabrescent, apex obtuse; outer phyllaries ovate, 4–5 × 2–3 mm; middle phyllaries narrowly ovate-elliptic, 5–8 × 1.5–2.5 mm; inner phyllaries narrowly elliptic-linear, 8–11 × 1–1.5 mm. Receptacle with few bristles or naked. Corolla pale purple, 1.3–1.4 cm, gland-dotted, tube 6–7 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene ca. 4 mm, smooth, glabrous, apex with a short crown. Pappus dirty white; outer bristles 3–6 mm, plumose; inner bristles 1–1.1 mm. Fl. and fr. Aug.

Saline sands, stony slopes, moraines, alpine steppes; ca. 3700[–4200] m. W Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan].

No specimens of *Saussurea famintziniana* from China were seen by the present authors. The description here is based on specimens from outside the Flora area and on the treatments by Lipschitz (Fl. URSS 27: 510. 1962) and G. M. Shen (Fl. Xinjiang. 5: 278. 1999).

93. *Saussurea lacostei* Danguy, J. Bot. (Morot) 21: 52. 1908.

高盐地风毛菊 gao yan di feng mao ju

Herbs 10–25 cm tall, perennial. Caudex stout, densely covered with remains of old leaves. Stems solitary or several, erect, branched from middle. Rosette leaves petiolate; petiole 2–4(–7.5) cm; leaf blade narrowly elliptic, 5–8 × 1–3 cm, bipinnately divided, both surfaces green and sparsely hispidulous; primary lobes 5–12 pairs, narrowly ovate to narrowly elliptic; secondary lobes 1–4 pairs, margin dentate, teeth and apex mucronate. Stem leaves similar to basal leaves, gradually smaller upward on stem. Capitula 1–6, on stem and branch ends, solitary or in a corymbiform synflorescence; peduncle 1–5 mm. Involucre obconic to narrowly campanulate, 6–10 mm in diam. Phyllaries in 4 or 5 rows, greenish or straw-colored, purplish in apical part, glabrous; outer phyllaries ovate, 4–5 × 2–3 mm,

apex acuminate; middle phyllaries narrowly elliptic, 5–10 × 2–2.5 mm, apex acute; inner phyllaries narrowly elliptic to linear, 10–12 × 1.5–2 mm, apex acute. Receptacle bristles subulate, 6–8 mm. Corolla pale purple, 1.2–2.1(–2.4) cm, tube 5.5–10(–16) mm, limb 6.5–8 mm, lobes 2.5–4 mm. Achene brown, oblong, ca. 5 mm, glabrous. Pappus dirty white; outer bristles 1–3 mm; inner bristles 0.9–1.3 cm. Fl. and fr. Jul–Sep.

• Rocky dry mountain slopes, alpine saline soils; 2600–3000 m. W Xinjiang.

94. *Saussurea turgaiensis* B. Fedtschenko, Repert. Spec. Nov. Regni Veg. 8: 497. 1910.

太加风毛菊 tai jia feng mao ju

Herbs 20–50 cm tall, perennial, caespitose. Caudex stout, branched, with many sterile and flowering leaf rosettes. Stems several, erect, branched from middle or above. Rosette and lower stem leaves shortly petiolate; leaf blade linear-oblong, 3–10 × 0.5–1.5(–2) cm, pinnately divided or bipinnately divided, both surfaces green to grayish green, scabrid, and shortly strigose or arachnoid; lobes ovate to linear, apex acute. Middle and upper stem leaves gradually smaller upward on stem; uppermost leaves linear, undivided, margin dentate to almost entire. Capitula 2–8, on stem and branch ends, in a corymbiform synflorescence, shortly pedunculate. Involucre cylindric or narrowly campanulate, 4–5 mm in diam. Phyllaries in ca. 4 rows, often reddish, pubescent or glabrescent, apex subobtusate; outer phyllaries ovate, 3–5 × 2–3 mm; middle phyllaries narrowly ovate-elliptic, 5–8 × 1.5–2.5 mm; inner phyllaries linear-oblong, 8–10 × 1–2 mm. Receptacle with subulate bristles. Corolla reddish purple or pink, ca. 1.2 cm, tube ca. 7 mm, limb ca. 5 mm. Achene light brown, cylindric, ca. 2.5 mm, smooth. Pappus white or light brown; outer bristles to 5 mm; inner bristles ca. 9 mm. Fl. and fr. Jul–Sep.

Saline meadows; 200–700 m. Xinjiang [Kazakhstan, Kyrgyzstan, Russia, Tajikistan].

95. *Saussurea pseudosalsa* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 59(6): 79. 1954.

假盐地风毛菊 jia yan di feng mao ju

Herbs or subshrubs, 10–60 cm tall, perennial. Rootstock apically branched. Stems solitary or several, erect or ascending, simple or much branched. Lower stem leaves petiolate; petiole to 1.5 cm; leaf blade oblong, elliptic, rhombic, or narrowly ovate, 0.4–3.5(–10) × 0.2–1.2(–4) cm, fleshy, both surfaces grayish green and scabrid, base cuneate, margin dentate, denticulate, or entire, apex acute. Middle and upper stem leaves sessile, narrowly obovate, elliptic, or linear-oblong, margin en-

ture. Capitula 1–5, on stem and branch ends, solitary or in a corymbiform synflorescence, shortly pedunculate. Involucre obconic, 6–8 mm in diam. Phyllaries in 5 or 6 rows, straw-colored, purple in apical part, villous, apex acuminate; outer phyllaries ovate-elliptic, $2-3 \times 1.5-2$ mm; middle phyllaries narrowly ovate-elliptic, $3-7 \times 1.5-2$ mm; inner phyllaries narrowly elliptic to linear, $7-8 \times 1-1.5$ mm. Receptacle bristles subulate, 7–8 mm. Corolla purplish red, 1.3–1.5 cm, tube 7–8 mm, limb 7–8 mm. Achene ca. 4 mm, apex with a short crown. Pappus straw-colored; outer bristles ca. 3 mm; inner bristles 9–10 mm. Fl. and fr. Jun–Aug.

Saline soils and gravelly shores near rivers and lakes; 2700–2800 m. NW Gansu, Nei Mongol, Qinghai, Xinjiang [Mongolia].

96. *Saussurea aerjingsensis* K. M. Shen, Acta Phytotax. Sin. 36: 275. 1998.

阿尔金风毛菊 *a er jin feng mao ju*

Herbs 8–40 cm tall, perennial. Rootstock stout, apically branched, densely covered with remains of leaf sheaths. Stems solitary or 2 or 3, ca. 5 mm in diam., erect, simple or branched from base. Leaves petiolate; petiole to 2 cm; leaf blade narrowly elliptic to linear, $5-10 \times 0.2-0.8$ cm, thick, fleshy, both surfaces green and gland-dotted but otherwise glabrous or sparsely pubescent, base attenuate, margin entire or remotely denticulate, apex acute to acuminate. Capitula 1–4, at end of stem or branches and sometimes also axillary, solitary or in a congested corymbiform or racemiform synflorescence, subsessile. Involucre campanulate, 8–10 mm in diam. Phyllaries in ca. 4 rows, pilose, gland-dotted, apex acute; outer phyllaries ovate, $6-7 \times 4-5$ mm; middle phyllaries narrowly elliptic, $7-10 \times 1.5-4$ mm; inner phyllaries linear, $10-11 \times 1-1.5$ mm. Receptacle bristles to 2 mm. Corolla purple, 0.9–1.1 cm, gland-dotted, tube 4–6 mm, limb 4–5 mm. Achene obconic, ca. 3 mm, apex with a denticulate crown. Pappus brownish to reddish; outer bristles 2–3 mm; inner bristles ca. 1 cm. Fl. and fr. Aug–Sep.

• Salt marshes; 1900–3000 m. SE Xinjiang (Ruoqiang).

No specimens of *Saussurea aerjingsensis* were seen by the present authors. The description here is based on the original description and on the treatment by G. M. Shen (Fl. Xinjiang. 5: 294–296, 478–479. 1999).

97. *Saussurea daurica* Adams, Nouv. Mém. Soc. Imp. Naturalistes Moscou 3: 251. 1834.

达乌里风毛菊 *da wu li feng mao ju*

Saussurea crassifolia Candolle var. *papposa* (Turczaninow ex Candolle) Ledebour; *S. papposa* Turczaninow ex Candolle; *S. salsa* (Pallas) Sprengel var. *papposa* (Turczaninow ex Candolle) Ledebour.

Herbs 4–20(–30) cm tall, perennial. Taproot slender, 2–4 mm in diam. Stems solitary or several, ascending, erect, or sometimes procumbent, branched from base or apically. Basal leaves petiolate; petiole 0.5–3 cm; leaf blade narrowly ovate to narrowly elliptic, $2-10 \times 0.5-3$ cm, fleshy, both surfaces grayish green, gland-dotted, and scabridulous but glabrescent, base cuneate, margin entire, sinuate-dentate, runcinate-pinnately lobed, or pinnately parted, apex acute to subobtusate. Lower stem leaves similar to basal leaves but smaller, margin

sinuate-dentate or entire. Upper stem leaves sessile, narrowly elliptic to broadly linear. Capitula usually numerous, in a globose condensed corymbiform synflorescence. Involucre cylindric, (3–)5–6 mm in diam. Phyllaries in 6 or 7 rows, purplish red in apical part, subglabrous, margin pubescent, apex acute to obtuse; outer phyllaries ovate to elliptic, $2-4 \times 1-1.5$ mm; middle phyllaries narrowly elliptic, $4-9 \times 1-1.5$ mm; inner phyllaries linear, $9-11 \times$ ca. 1 mm. Corolla pink, 1.3–1.8 cm, tube 8–11 mm, limb 6–7 mm, lobes 3–3.5 mm. Achene cylindric, 2–3 mm, ribbed, glabrous, apex with a short crown. Pappus white; outer bristles 1–3 mm, scabrid; inner bristles 1.1–1.2 cm. Fl. and fr. Jul–Sep. $2n = 28^*$.

Salt meadows and marshes, alkaline moist soils near rivers and lakes, riverbeds; 1000–3600 m. W Gansu, Heilongjiang, Nei Mongol, Ningxia, Qinghai, Xinjiang [Mongolia, Russia].

98. *Saussurea salsa* (Pallas) Sprengel, Syst. Veg. 3: 381. 1826.

盐地风毛菊 *yan di feng mao ju*

Serratula salsa Pallas, Reise Russ. Reich. 3: 607. 1776; *Heterotrichum salsum* (Pallas) M. Bieberstein; *S. crassifolia* Candolle.

Herbs 15–50 cm tall, perennial. Stems solitary or several, branched above middle. Basal and lower stem leaves petiolate; leaf blade ovate to broadly elliptic, $5-30 \times 2-6(-12)$ cm, fleshy, lyrate-pinnately parted or pinnately lobed, both surfaces green, abaxially gland-dotted, adaxially sparsely strigose or glabrous; lateral lobes elliptic to triangular, margin entire or subentire; terminal lobe triangular, sagittate, or hastate, large, margin sinuate-dentate or entire. Middle and upper stem leaves sessile, oblong, linear-oblong, or narrowly ovate, margin entire or sparsely dentate. Capitula numerous, in a corymbiform synflorescence, pedunculate. Involucre narrowly cylindric, 4–5 mm in diam. Phyllaries in 5–7 rows, arachnoid, glabrescent, apex obtuse to subacute; outer phyllaries ovate, $2-3 \times 2-2.5$ mm; middle phyllaries narrowly ovate, $3-10 \times 1.5-2$ mm; inner phyllaries narrowly ovate-elliptic, $10-12 \times 1-2$ mm. Receptacle bristles subulate, 4–4.5 mm. Corolla pale purple, (1–)1.3–1.6 cm, tube 7–9 mm, limb 6–7 mm. Achene reddish brown, cylindric, 2.5–3 mm, glabrous. Pappus white; outer bristles ca. 3 mm; inner bristles (0.9–)1.3–1.5 cm. Fl. and fr. Jul–Sep. $2n = 28$.

Saline grasslands, alkaline steppes and meadows; 100–3300 m. Gansu, Nei Mongol, Ningxia, Qinghai, Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan, Uzbekistan, SW Asia, E Europe].

The basionym, *Serratula salsa*, was validated by Pallas in the third volume of his *Reise*. In the text, he gave a reference to the short description of a *Serratula* (without specific epithet) from the second volume (Reise Russ. Reich. 2: 444. 1773); and in the unpaginated “Zweytes Register über die lateinischen Anhänge aller drey Theile” [second index of the Latin appendices of all three volumes] *S. salsa* was given as a name belonging to the description of a “*Planta salsa ambigui generis*” previously published in the first volume (Reise Russ. Reich. 1: 502. 1771).

99. *Saussurea kaschgarica* Ruprecht, Mém. Acad. Imp. Sci. Saint Pétersbourg, Sér. 7, 14(4): 54. 1869.

喀什风毛菊 *ka shi feng mao ju*

Herbs 14–25 cm tall, perennial. Caudex stout, apically branched, covered with dark brown remains of leaf sheaths. Stems several, ascending to erect, few branched. Basal and lower stem leaves petiolate; leaf blade narrowly obovate-elliptic, to 10×2.5 cm, pinnately lobed or pinnately divided, scabrid, hispid; lobe margins dentate, apex acute. Middle and upper stem leaves similar to lower leaves, gradually smaller upward on stem, shortly petiolate to subsessile; leaf blade small, not decurrent. Capitula in a densely corymbiform synflorescence. Involucre 6–10 mm in diam. Phyllaries in ca. 4 rows, apically purple and densely pubescent to glabrescent; outer phyllaries ovate, 3–4 mm, apex subobtusate; middle and inner phyllaries narrowly ovate-elliptic to linear, 4–12 mm, apex subacute. Receptacle with subulate bristles. Corolla pale purplish red, 1.4–1.6 cm, tube 6–8 mm, limb 7–8 mm. Achene pale brown, cylindric, 5–6 mm, glabrous. Pappus dirty white; outer bristles 3–5 mm, rigid, serrulate, persistent; inner bristles 1–1.2 cm. Fl. and fr. Jul–Aug.

Gravelly riverbanks in high mountain valleys, saline soils; ca. 3200 m. W Xinjiang (Wuqia) [Kyrgyzstan].

No specimens of *Saussurea kaschgarica* were seen by the present authors, and the description here is based on the treatments by Lipschitz (Fl. URSS 27: 509. 1962) and G. M. Shen (Fl. Xinjiang. 5: 280. 1999).

100. *Saussurea maximowiczii* Herder, Bull. Soc. Imp. Naturalistes Moscou 41(3): 14. 1868.

羽叶风毛菊 *yu ye feng mao ju*

Saussurea hakonensis Franchet & Savatier; *S. maximowiczii* f. *serrata* (Nakai) Kitamura; *S. maximowiczii* var. *serrata* Nakai; *S. maximowiczii* var. *triceps* (H. Léveillé & Vaniot) Kitamura; *S. triceps* H. Léveillé & Vaniot.

Herbs 40–100 cm tall, perennial. Rhizome stout, with many fibrous roots. Stem solitary, erect, apically branched, unwinged. Basal and lower stem leaves petiolate; petiole 5–13(–20) cm; leaf blade oblong to obovate in outline, (10–)20–50(–70) \times (3–)7–10(–15) cm, thick, pinnately divided or pinnately lobed, both surfaces green, scabrid, and hispid; lateral lobes 4–8 pairs, narrowly obovate-elliptic to oblong, margin serrate, dentate, or entire, apex acuminate; terminal lobe narrowly ovate to elliptic. Middle stem leaves gradually smaller upward on stem. Upper stem leaves sessile, narrowly elliptic to linear, undivided. Capitula numerous, in a corymbiform-paniculiform synflorescence. Involucre cylindric to narrowly campanulate, 6–7 mm in diam. Phyllaries in 4 or 5 rows, sparsely arachnoid; outer phyllaries ovate, 3–4 \times ca. 2 mm, apex acuminate; middle phyllaries oblong, 4–9 \times 1.5–2 mm, apex subobtusate and mucronate; inner phyllaries narrowly elliptic, 9–11 \times 1–1.5 mm, apex obtuse. Receptacle bristles to 7 mm. Corolla purple, 1.1–1.5 cm, tube 6–9 mm, limb 5–6 mm, lobes 3–3.5 mm. Achene yellowish brown to black, obconic, 5–7 mm, obtusely ribbed, glabrous. Pappus white; outer bristles 2–5 mm; inner bristles ca. 1 cm. Fl. and fr. Aug–Oct. $2n = 26$.

Forest margins, thickets, meadows; near sea level to 1000 m. Heilongjiang, Jilin, Liaoning, Nei Mongol [Japan, Korea, Russia (Far East)].

101. *Saussurea pulvinata* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 493. 1882.

甘青风毛菊 *gan qing feng mao ju*

Saussurea ruoqiensis K. M. Shen.

Herbs 8–20 cm tall, perennial, densely caespitose. Caudex stout, much branched, with many leaf rosettes and flowering shoots, densely covered with remains of leaf sheaths, forming hard cushions. Stem solitary, 2–3 mm in diam., erect, simple. Rosette leaves petiolate; petiole to 2 cm, base and sheath adaxially densely white lanate; leaf blade narrowly elliptic to linear, 2–6 \times 0.3–0.5 cm, both surfaces green, abaxially villous, adaxially sparsely villous but glabrescent, base cuneate-attenuate, margin revolute, entire, or crenulate, apex acute or obtuse. Stem leaves similar to rosette leaves, sessile, gradually smaller upward on stem. Capitula 5–12, in a densely congested corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 8–10 mm in diam. Phyllaries in 4 or 5 rows, straw-colored, apically densely villous, apex acuminate to acute; outer phyllaries narrowly triangular-ovate, 5–7 \times 3–4 mm, apex acuminate; middle and inner phyllaries narrowly ovate-elliptic to linear, 7–10 \times 1.5–3 mm, apex acute. Receptacle bristles ca. 1 mm. Corolla pale red, 0.9–1.3 cm, tube 4–7 mm, limb 4–6 mm, lobes 2.5–3 mm. Achene brown, 3–5 mm, transversely rugose. Outer pappus bristles white, 2–3 mm, barbellate; inner bristles grayish brown, 8–9 mm. Fl. Jul–Aug, fr. Aug–Sep.

• Alpine scree slopes, rocky dry mountain slopes; 2900–4300 m. Gansu, Qinghai, SE Xinjiang (Ruoqiang).

102. *Saussurea pulchra* Lipschitz, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 19: 389. 1959.

美丽风毛菊 *mei li feng mao ju*

Hemisteptia pulchra (Lipschitz) Soják.

Herbs 8–27(–60) cm tall, perennial. Caudex stout, apically branched, densely covered with brown remains of old leaves. Stems 1–4, erect, simple or branched from middle. Rosette and lower stem leaves sessile, linear, 1.5–5 \times 0.1–0.4 cm, abaxially grayish white and densely tomentose, adaxially glaucous green and glabrous, margin revolute and entire or with a few obtuse teeth, apex acute to obtuse. Middle and upper stem leaves linear, 5–10 mm. Capitula solitary or 2 or 3, on branch ends, in a corymbiform synflorescence, pedunculate. Involucre turbinate, 1–2 cm in diam. Phyllaries in 4–6 rows, purple, sparsely villous, apex acuminate and with a cartilaginous mucro; outer phyllaries ovate-elliptic, 4–6 \times 1.5–2 mm; middle phyllaries narrowly ovate-elliptic to oblong, 6–15 \times 1.5–2 mm; inner phyllaries linear-elliptic to linear, 15–19 \times 1.8–2 mm. Receptacle bristles subulate, 5–6 mm. Corolla rose-purple, 1.8–2.5 cm, tube 1–1.2 cm, limb 1–1.2 cm, lobes 4–5 mm. Achene blackish green, cylindric, 5–5.5 mm, 4-angled, transversely rugose, gland-dotted, apex with a short crown. Pappus white; outer bristles ca. 3 mm, scabrid; inner bristles 1.5–1.6 cm. Fl. and fr. Aug–Oct.

• Sandy river valleys; 1900–3100 m. Gansu, Qinghai.

When Lipschitz published the name *Saussurea pulchra*, he intended it to be a replacement name for his earlier “*S. bella*” (Lipschitz, Byull. Moskovsk. Obshch. Isp. Priro., Otd. Biol. 59(6): 83. 1954), which he evidently thought was illegitimate as a later homonym of *S. bella* Y.

Ling (1949). However, because Lipschitz published "*Hemisteptia bella*" and "*S. bella*" simultaneously as alternative names, neither of them was validly published (*Vienna Code*, Art. 34.2). Lipschitz therefore inadvertently published *S. pulchra* as the name of a new species by reference to the Latin description of "*H. bella*" and "*S. bella*."

103. *Saussurea ovata* Benth in G. Henderson & Hume, Lahore to Yarkand, 325. 1873.

卵叶风毛菊 luan ye feng mao ju

Saussurea pseudocolorata Danguy.

Herbs 1.5–15 cm tall, perennial. Caudex slender, 2–3 mm in diam., simple or few branched. Stem solitary, erect or ascending, simple. Basal and lower stem leaves petiolate; petiole 1–5 cm, winged; leaf blade ovate, elliptic, obovate, or suborbicular, 1.5–6 × 1.2–4 cm, both surfaces green, glabrescent or arachnoid villous, and glandular hairy at margin, margin sinuate-dentate, apex rounded to acuminate and mucronate. Upper stem leaves similar to lower ones, gradually smaller upward on stem; uppermost stem leaf narrowly elliptic to linear, subtending synflorescence. Capitula 3–15(–25), in a densely condensed globose or lax corymbiform synflorescence. Involucre campanulate, 8–9 mm in diam. Phyllaries in ca. 4 rows, purple and villous in apical part, apex subacute; outer phyllaries broadly triangular-ovate, 2–3 × ca. 2 mm; middle and inner phyllaries narrowly ovate-elliptic, 3–10 × ca. 2 mm. Receptacle without bristles. Corolla purplish red, 1.2–1.3 cm, glabrous, tube 6–7 mm, limb ca. 6 mm, lobes ca. 3 mm. Achene brown, 2–2.5 mm, ribbed, glabrous. Pappus white; outer bristles 4–5 mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Aug.

Alpine meadows, gravelly mountain slopes, moist riverbeds, sand dunes; 2400–4300 m. SW Xinjiang [Tajikistan].

104. *Saussurea licentiana* Handel-Mazzetti, Oesterr. Bot. Z. 85: 222. 1936.

川陕风毛菊 chuan shan feng mao ju

Saussurea salicifolia (Linnaeus) Candolle var. *shensiensis* Y. Ling.

Herbs 40–80 cm tall, perennial. Rhizomes procumbent, with many black fibrous roots. Stem solitary, erect, simple or apically few branched. Basal and lower stem leaves withered at anthesis. Middle stem leaves petiolate; petiole to 1 cm; leaf blade ovate, obovate, narrowly ovate-elliptic, or elliptic, 4–13 × 2.5–8 cm, abaxially grayish white and densely tomentose, adaxially green and sparsely strigose, base cuneate, margin serrate, apex acuminate to caudate. Upper stem leaves similar to middle stem leaves but gradually smaller upward on stem, subtending synflorescence. Capitula few to numerous, in a paniculiform or corymbiform synflorescence, pedunculate. Involucre narrowly campanulate to cylindric, 4–5 mm in diam. Phyllaries in 4 or 5 rows, straw-colored or brown, glabrous; outer phyllaries broadly ovate, 1.5–3 × 1–1.5 mm, apex acute; middle phyllaries elliptic, 3–6 × 1–1.5 mm, apex obtuse; inner phyllaries elliptic to broadly linear, 6–8 × 1–1.5 mm, apex obtuse. Corolla purple, 7–8 mm, tube 4–5 mm, limb 2.5–3 mm, lobes 1.5–2 mm. Achene pale brown, ca. 4 mm, glabrous. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles 6–8 mm. Fl. and fr. Aug–Sep.

• Grassy slopes, montane forests; 1900–3300 m. Gansu, Hubei, Shaanxi, Sichuan.

105. *Saussurea alberti* Regel & C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 6: 298. 1880.

新疆风毛菊 xin jiang feng mao ju

Herbs, perennial. Stem apically branched, slightly winged. Basal leaves petiolate; leaf blade narrowly ovate-elliptic, to 7 × 2–3 cm, both surfaces green and glabrous, base cuneate, margin sinuate-dentate or runcinate and scabrous, apex acute. Stem leaves narrower than basal leaves, base decurrent to stem wing, margin subentire. Capitula numerous, at ends of flexuous or apically nodding branches, in an ample corymbiform synflorescence, pedunculate, with 19–20 florets. Involucre obconic, ca. 1 cm in diam. Phyllaries in 5 or 6 rows, arachnoid, glabrescent, apex acute and mucronate; outer phyllaries ovate; middle phyllaries narrowly ovate-oblong; inner phyllaries sublinear. Receptacle bristles to 8 mm. Corolla rose-pink, ca. 1.3 cm, tube 6–7 mm, limb 6–7 mm. Achene cylindric to oblong, ribbed, apex with a short crown. Pappus in 2 rows; outer bristles short, scabrid; inner bristles ca. 4 × as long as outer ones. Fl. and fr. Aug–Sep.

Scree slopes; 2700–2900 m. Xinjiang (Tian Shan) [Kyrgyzstan].

No specimens of *Saussurea alberti* from China were seen by the present authors. This description is based on an image of the cultivated type specimen (LE), on the original description, and on the account by Lipschitz (Fl. URSS 27: 426. 1962).

106. *Saussurea larionowii* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 376. 1891.

天山风毛菊 tian shan feng mao ju

Saussurea takhtadganii Lipschitz.

Herbs 10–40(–60) cm tall, perennial. Caudex fibrous, branched, with several sterile and flowering leaf rosettes. Stems solitary or several, erect, simple or branched, slightly winged. Lower stem leaves petiolate; petiole 2–3(–5) cm; leaf blade narrowly ovate, ovate-oblong, or narrowly ovate-elliptic, 5–10 × (0.4–)1.5–4.5 cm, undivided, pinnately cleft, or pinnately lobed, abaxially grayish white and arachnoid tomentose, adaxially green, scabrous, and spinulose-strigose, margin sinuate or dentate. Middle and upper stem leaves sessile, gradually smaller upward on stem, base decurrent. Capitula in a densely congested corymbiform synflorescence, erect, shortly pedunculate, with 10–13 florets. Involucre narrowly cylindric, 4–9 mm in diam. Phyllaries in 4 or 5 rows, apically reddish, arachnoid, glabrescent, with a conspicuous midvein, apex acuminate and with a straight or weakly curved cusp; outer phyllaries ovate; inner phyllaries narrowly ovate-oblong. Receptacle bristles subulate, to 8 mm. Corolla rose-pink, 1.4–1.5 cm, sometimes sparsely glandular, tube 7–8 mm, limb 7–8 mm. Achene ca. 3 mm, glabrous, apex with a short crown. Pappus white or basally pale brown; outer bristles 2–4 mm; inner bristles 1.1–1.2 cm. Fl. and fr. Jul–Oct.

Forests, scree slopes, alpine and subalpine meadows; 1800–3800 m. Xinjiang (Tian Shan) [Kazakhstan, Kyrgyzstan].

Saussurea larionowii may be conspecific with the insufficiently known *S. alberti*, which has been described from a cultivated plant. Further studies in the field are needed to clarify the taxonomic status of these species.

107. *Saussurea mucronulata* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 59(6): 80. 1954.

小尖风毛菊 xiao jian feng mao ju

Herbs 8–30 cm tall, perennial, densely caespitose. Rootstock and caudex strongly fibrous, branched, with many sterile and flowering leaf rosettes. Stems solitary or several, erect or ascending, simple or apically few branched. Rosette and lower stem leaves narrowly elliptic-linear, $3-5 \times 0.2-0.5$ cm, both surfaces grayish white and with a prominent midvein, abaxially densely arachnoid tomentose, adaxially sparsely arachnoid tomentose, margin entire or denticulate and subrevolute, apex acute. Middle and upper stem leaves sessile, gradually smaller upward on stem, linear, $10-25 \times 1-3$ mm, base subamplexicaul, apex acuminate. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate to cylindric, 6–7 mm in diam. Phyllaries in 4 or 5 rows, blackish purple, apex acuminate, with a long \pm reflexed cusp; outer phyllaries ovate, $3-5 \times 1.5-2$ mm; inner phyllaries linear-oblong, $5-8 \times 1-1.5$ mm. Receptacle with bristles. Corolla red, $1.3-1.5$ cm, tube 5–6 mm, limb 8–10 mm. Achene brown, 2.5–3 mm, glabrous, apex with a short rim. Pappus dirty white to pale brown; outer bristles 2–3 mm, scabrid; inner bristles 1–1.2 cm. Fl. and fr. Aug.

• Scree slopes; 2100–3000 m. Xinjiang (Tian Shan).

108. *Saussurea coronata* Schrenk, Bull. Cl. Phys.-Math. Acad. Imp. Sci. Saint-Petersbourg 3: 107. 1845.

副冠风毛菊 fu guan feng mao ju

Saussurea dshungarica Iljin.

Herbs or subshrubs, 25–40 cm, perennial. Roots fibrously branched. Caudex much branched, with many flowering shoots. Stems erect or ascending, simple or apically branched, distinctly woody at base. Lower and middle stem leaves petiolate; leaf blade oblong to narrowly ovate-oblong, $5-10 \times 1-2.5$ cm, leathery, abaxially green or grayish, pubescent to almost glabrous, and gland-dotted, adaxially green, margin entire or crenate, apex acute to acuminate. Upper stem leaves gradually smaller upward on stem, narrowly ovate-elliptic, margin almost entire. Capitula [3–]7–10, in a \pm condensed corymbiform synflorescence. Involucre narrowly campanulate, 7–10 mm in diam. Phyllaries in ca. 5 rows, green, apically purple, arachnoid or almost glabrous, gland-dotted, apex acuminate with a straight, not recurved cusp; outer phyllaries ovate, $2-3 \times 1.5-2$ mm; middle phyllaries $3-8 \times 1-2$ mm; inner phyllaries $8-10 \times 1-1.5$ mm. Receptacle bristles subulate, to 8 mm. Corolla purplish red, 1.2–1.6 cm, gland-dotted, tube 7–9 mm, limb 5–7 mm, lobes 2.5–3 mm. Achene cylindric, to 5 mm, with a short crown. Pappus white; outer bristles 1–5 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Aug.

Rocky mountain slopes; 1400–2100 m. NW Xinjiang (Huocheng) [Kazakhstan, Mongolia].

109. *Saussurea blanda* Schrenk, Bull. Sci. Acad. Imp. Sci. Saint-Petersbourg 10: 354. 1842.

绿风毛菊 lü feng mao ju

Saussurea konuroba Saposhnikow.

Herbs or subshrubs, 10–30 cm tall, perennial, caespitose. Roots fibrous. Caudex much branched, with several leaf rosettes and flowering shoots. Stem erect or ascending, simple or apically branched, woody at base. Lower and middle stem leaves petiolate; petiole ca. 2 cm; leaf blade narrowly obovate to oblong, $3-7 \times 2-2.5$ cm, pinnately lobed to pinnatisect, both surfaces green and gland-dotted; lateral lobes 2–5 pairs, triangular-ovate, margin entire or dentate, apex acute to obtuse. Upper stem leaves sessile, gradually smaller upward on stem, pinnately lobed or pinnatisect. Capitula 1–5, solitary or in a corymbiform or paniculiform synflorescence, pedunculate. Involucre campanulate, 7–10 mm in diam. Phyllaries in ca. 5 rows, green or purple, glabrous or sparsely arachnoid, gland-dotted, apex acute; outer phyllaries ovate, $5-6 \times 1.5-2.5$ mm; middle phyllaries elliptic, $6-9 \times$ ca. 2 mm; inner phyllaries linear-oblong, $9-10 \times 1-1.5$ mm. Receptacle bristles subulate, 5–6 mm. Corolla purple, 1.2–1.4 cm, gland-dotted, tube 5–6 mm, limb 7–8 mm, lobes ca. 3 mm. Achene ca. 4 mm, ribbed, glabrous, apex with a short crown. Pappus white; outer bristles 3–5 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Aug.

Rocky mountain slopes; ca. 1600 m. N Xinjiang (Toli) [Kazakhstan].

110. *Saussurea kanzanensis* Kitamura, Acta Phytotax. Geobot. 8: 75. 1939.

台湾风毛菊 tai wan feng mao ju

Herbs 6–14 cm tall, perennial. Stem solitary, ca. 1 mm in diam., slender, erect, simple, woody at base. Basal leaves withered at anthesis. Stem leaves petiolate; petiole 1–2.5 cm, narrowly winged, sometimes decurrent on stem; leaf blade narrowly elliptic to oblong, $2-4.5(-10) \times 1-2(-4)$ cm, pinnately lobed to pinnatisect, both surfaces green and pubescent, base truncate to cuneate; lateral lobes 3–5 pairs, triangular to oblong, apex acute. Upper stem leaves smaller; uppermost stem leaves linear, subtending capitula. Capitula 1–3, solitary or in a corymbiform synflorescence, pedunculate. Involucre narrowly cylindric, 4–5 mm in diam. Phyllaries in ca. 4 rows, margin arachnoid, apex acuminate; outer phyllaries ovate; middle phyllaries oblong; inner phyllaries linear, ca. 8 mm. Receptacle bristles few, subulate, 5–6 mm. Corolla red, 9–10 mm, tube 4–5 mm, limb 4–5 mm. Achene brownish purple, cylindric, ca. 3.5 mm, glabrous. Pappus white, basally pale brown; outer bristles ca. 2 mm, scabrid; inner bristles ca. 7.5 mm. Fl. Aug–Sep, fr. Oct.

• Sunny rocky slopes, semishaded *Abies* forests; ca. 3500 m. Taiwan.

111. *Saussurea elata* Ledebour, Icon. Pl. 1: 20. 1829.

高风毛菊 gao feng mao ju

Herbs 1–2 m tall, perennial. Stem solitary, ca. 1 cm in diam., erect, branched from middle or apically, hollow. Basal

leaves usually withered at anthesis, petiolate. Middle stem leaves sessile or subsessile; leaf blade oblong-elliptic to narrowly ovate-elliptic, $6-15 \times 1-4$ cm, both surfaces green and strigose, abaxially glandular, margin entire or irregularly dentate, apex acute to acuminate. Upper stem leaves narrowly ovate-elliptic to linear. Capitula numerous, in a long and spreading corymbiform-paniculiform synflorescence. Involucre cylindric to narrowly campanulate, 5–7 mm in diam. Phyllaries greenish, colored in apical part, pubescent, apex subobtuse to obtuse; outer phyllaries ovate to ovate-oblong; inner phyllaries linear-oblong. Receptacle bristles ca. 3 mm. Corolla bluish purple, ca. 1.4 cm, tube ca. 7 mm, limb ca. 7 mm. Achene smooth, 7–8 mm. Pappus dirty white; outer bristles ca. 3 mm; inner bristles 8–10 mm. Fl. and fr. Jun–Aug.

Steppe meadows, thickets. N Xinjiang (Tacheng) [Kazakhstan].

No specimens of *Saussurea elata* from China have been seen by the present authors. The description here is based on plants from outside the Flora area, as well as on the treatments by Lipschitz (Fl. URSS 27: 422. 1962) and G. M. Shen (Fl. Xinjiang, 5: 285. 1999).

112. *Saussurea cana* Ledebour, Icon. Pl. 1: 18. 1829.

灰白风毛菊 hui bai feng mao ju

Saussurea cana var. *angustifolia* Ledebour; *S. fruticulosa* Karelin & Kirilov.

Herbs 8–25 cm tall, perennial, densely caespitose. Caudex much branched, with many leaf rosettes and flowering shoots. Stems erect, simple or apically branched. Rosette and lower stem leaves petiolate; petiole 1.5–3 cm; leaf blade narrowly elliptic, linear-oblong, or linear, $1.5-10 \times 0.2-1.5$ cm, abaxially grayish white and densely tomentose, adaxially grayish green and sparsely tomentose, margin entire, dentate, or pinnately lobed; lateral lobes or lateral teeth few, small, apex acuminate. Middle and upper stem leaves petiolate or sessile; leaf blade gradually smaller upward on stem. Uppermost stem leaves sessile, linear. Capitula 4–20, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly cylindric, 4–8 mm in diam. Phyllaries in 4–7 rows, apically purplish red, sparsely arachnoid, apex acute to obtuse; outer phyllaries ovate, $3-3.5 \times$ ca. 2 mm; middle phyllaries ovate to narrowly elliptic, $3.5-9 \times$ 1.5–2 mm; inner phyllaries linear, $9-10 \times$ ca. 1.5 mm. Receptacle bristles subulate, to 8 mm. Corolla pale red, 1.2–1.3 cm, gland-dotted, tube 6–7 mm, limb 6–7 mm. Achene brown, cylindric, 4–7 mm, glabrous. Pappus white; outer bristles 2–3 mm; inner bristles 7–11 mm. Fl. and fr. Jul–Sep.

River valleys, rocky and dry mountain slopes; 800–2800 m. Gansu, Nei Mongol, Ningxia, Qinghai, Shanxi, Sichuan, Xinjiang [Kazakhstan, Russia (Siberia)].

113. *Saussurea petrovii* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 524. 1972.

西北风毛菊 xi bei feng mao ju

Saussurea petrovii var. *latifolia* H. C. Fu.

Herbs 5–30 cm tall, perennial. Roots woody, fibrous. Caudex branched, covered with remains of leaf sheaths. Stem 1.5–2 mm in diam., erect, simple or apically branched. Lower and middle stem leaves sessile, linear, linear-oblong, or oblong, 2–

$11 \times 0.1-0.4$ cm, abaxially grayish white and densely tomentose, adaxially green and glabrous, base attenuate, margin revolute and entire or with 1–5 pairs of remote teeth, apex acute to acuminate. Upper stem leaves narrowly linear, $1-4 \times$ ca. 0.1 cm. Capitula 2–6, in a corymbiform synflorescence, pedunculate. Involucre cylindric, 5–8 mm in diam. Phyllaries in 4 or 5 rows, greenish yellow to straw-colored, apically purple, sparsely arachnoid, gland-dotted, apex shortly acuminate; outer phyllaries ovate, $2-3 \times 1-2$ mm; middle phyllaries oblong, $3-7 \times 1-2$ mm; inner phyllaries narrowly elliptic to linear, $7-9 \times 1-2$ mm. Receptacle with bristles. Corolla purple, (0.8–)1–1.4 cm, minutely gland-dotted, tube 5–7 mm, limb 5–7 mm, lobes 3–3.5 mm. Achene brown, cylindric, 3–4 mm, obtusely 4-angled, glabrous. Pappus white; outer bristles 2–3 mm, scabrid; inner bristles (0.7–)0.9–1.1 cm. Fl. and fr. Jun–Sep.

• Mountain slopes; 1700–2500 m. Gansu, Nei Mongol, Ningxia.

Saussurea cana and *S. petrovii* are very closely related and may even be conspecific. Further studies are needed to clarify if the characters that distinguish *S. petrovii* fall within the variation range of *S. cana*.

114. *Saussurea canescens* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 168. 1889.

伊宁风毛菊 yi ning feng mao ju

Saussurea canescens var. *major* C. Winkler.

Herbs 1.5–20 cm tall, perennial, caespitose. Rootstock stout, fibrously split. Caudex much branched, with many leaf rosettes and flowering shoots, covered with remains of leaf sheaths. Stem solitary, ascending or erect, simple. Rosette and lower stem leaves petiolate; leaf blade narrowly elliptic or narrowly obovate, $1.5-7 \times 0.2-0.6$ cm, both surfaces grayish green to grayish white and densely arachnoid tomentose, margin sinuate-dentate or pinnately lobed. Upper stem leaves subsessile, linear to subulate, 0.6–2 cm. Capitula 1–3, solitary or in a condensed corymbiform synflorescence, slightly nodding, shortly pedunculate. Involucre campanulate, (5–)7–10 mm in diam. Phyllaries in ca. 5 rows, apically purple, arachnoid pubescent, glabrescent, apex acuminate; outer phyllaries ovate; inner phyllaries narrowly ovate-elliptic to linear. Receptacle with bristles. Corolla pink, 1.1–1.3 cm, tube 5–6 mm, limb ca. 7 mm. Achene brown, cylindric, 2–3 mm, with a short crown. Pappus basally pale brown, apically white; outer bristles 2–3 mm; inner bristles 1–1.1 cm. Fl. and fr. Jul–Aug.

Rocky mountain slopes; 1600–2500 m. Xinjiang [Kazakhstan].

115. *Saussurea salemannii* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 166. 1889.

倒卵叶风毛菊 dao luan ye feng mao ju

Herbs 15–25 cm tall, perennial. Roots stout, fibrous. Caudex branched, with several leaf rosettes and flowering shoots. Stem solitary, erect, simple or branched. Basal and lower stem leaves petiolate; leaf blade obovate, $7-8 \times 1.5-2$ cm, pinnately lobed, pinnately dentate, or lyrate-pinnately lobed, both surfaces green, strongly scabrous, hispid, apex rounded. Middle and upper stem leaves sessile, gradually smaller upward on stem, narrowly ovate-elliptic, base amplexicaul, margin pin-

nately dentate, apex acuminate. Capitula 1 to few, solitary or in a corymbiform synflorescence, sessile or shortly pedunculate. Involucre obconic, 7–10 mm in diam. Phyllaries in 4–6 rows, pubescent, apex attenuate into a short cusp; outer phyllaries ovate; inner phyllaries narrowly ovate-elliptic to linear. Receptacle with bristles. Corolla pale red, 1.4–1.5 cm, tube ca. 7 mm, limb ca. 8 mm, lobes ca. 4 mm. Achene cylindric, 4–5 mm, glabrous. Pappus white; outer bristles 1–5 mm; inner bristles 1.2–1.3 cm. Fl. and fr. Jun–Aug.

Mountain steppes and rock crevices; 1600–2200 m. NW Xinjiang (Bole, Huoqiang) [Kazakhstan].

116. *Saussurea popovii* Lipschitz, Byull. Moskovsk. Obshch. Isp. Priir., Otd. Biol. 59(6): 82. 1954.

寡头风毛菊 *gua tou feng mao ju*

Herbs or subshrubs, 20–50(–100) cm tall, perennial, densely caespitose. Rootstock stout and fibrous. Caudex much branched. Stems very numerous, 1.5–2 mm in diam., ascending or erect, virgately branched from base, woody at base. Rosette and lower stem leaves shortly petiolate; leaf blade linear, 4.5–5.5 × 0.5–0.6 cm, thick, both surfaces grayish green, abaxially arachnoid and gland-dotted, margin entire or sparsely dentate, apex mucronate. Middle and upper stem leaves gradually smaller upward on stem, 3–30 × 1–3 mm. Capitula solitary or to 3 clustered on end of branches in a corymbiform synflorescence, pedunculate. Involucre narrowly campanulate to tubular, 3–6 mm in diam. Phyllaries in 4–6 rows, straw-colored, apically purplish, pubescent, gland-dotted, glabrescent, apex obtuse to shortly acuminate; outer phyllaries broadly ovate, 1–2 × 0.5–1 mm; middle and inner phyllaries narrowly ovate to linear, 2–7 × ca. 1 mm. Receptacle bristles subulate, to 8 mm. Corolla pink, ca. 1.6 cm, gland-dotted, tube ca. 6 mm, limb ca. 1 cm, lobes ca. 4 mm. Achene dark brown, 5–6 mm, 4-ribbed. Pappus white; outer bristles 1–4 mm; inner bristles 1–1.1 cm. Fl. and fr. Aug–Sep.

Gravelly shores, saline deserts; ca. 600 m. Xinjiang [W Mongolia].

117. *Saussurea yabulaiensis* Y. Y. Yao, Fl. Desert. Reipubl. Popularis Sin. 3: 472. 1992.

雅布赖风毛菊 *ya bu lai feng mao ju*

Herbs 12–35 cm tall, perennial. Rootstock stout. Stems many, erect or ascending, apically few branched, base densely covered with yellowish white or yellowish brown remains of leaf petiole and rachis. Lower stem leaves 2–15 cm, irregularly pinnately parted; segments 2 or 3, distant, needlelike, 3–20 × 0.5–3 mm, both surfaces sparsely gland-dotted otherwise glabrous, base widened and semiamplexicaul, margin entire, apex acuminate or sometimes obtuse and mucronate. Middle and upper stem leaves gradually smaller upward on stem, filiform, 1.5–3 cm, undivided. Capitula 1–4, solitary or in a lax corymbiform synflorescence. Involucre obconic, obovoid, or campanulate, 5–8 mm in diam. Phyllaries yellowish green, in 7 or 8 rows, glandular hairy, apex acute to acuminate and mucronate; outer phyllaries ovate; middle phyllaries narrowly ovate; inner phyllaries linear. Receptacle bristles subulate, 2–2.5 mm. Corolla purple, 1.2–1.5 cm, gland-dotted, tube 7–8 mm, limb 5–7

mm. Achene cylindric to ovoid, 4- or 5-angled, sparsely glandular. Pappus white; outer bristles 2–3 mm; inner bristles 9–10 mm. Fl. and fr. Aug–Sep.

• Desert areas; 1300–1400 m. Nei Mongol (Alxa Meng).

No specimens of *Saussurea yabulaiensis* were seen by the present authors. The description here is based on the original publication and on the treatment by H. C. Fu (in Ma, Fl. Intramongol., ed. 2, 4: 749. 1993).

This species is close to and may be conspecific with *Saussurea catharinae* Lipschitz from Mongolia, which was described as having always undivided leaves.

118. *Saussurea mae* H. C. Fu in Ma, Fl. Intramongol., ed. 2, 4: 848. 1993.

毓泉风毛菊 *yu quan feng mao ju*

Herbs 4–15 cm tall, perennial. Caudex stout, much branched. Stems many, erect or ascending, base densely covered with brown remains of old petioles. Basal and lower stem leaves 3–7 cm, pinnately divided; segments 3–5, linear to narrowly ovate-linear, 3–10 × 0.5–2 cm, both surfaces sparsely arachnoid and glandular, margin entire or denticulate, apex acute to subobtuse and mucronate. Middle and upper stem leaves gradually smaller upward on stem, pinnately parted or undivided. Capitula 1–3, solitary or in a corymbiform synflorescence. Involucre campanulate, 8–10 mm in diam. Phyllaries in 5 or 6 rows, purplish, arachnoid, glandular; outer phyllaries ovate, apex acute; inner phyllaries narrowly ovate to linear, apex acuminate. Receptacle with bristles. Corolla rose, 1.3–1.6 cm, tube 6–7 mm, limb 7–9 mm. Achene cylindric, ca. 4 mm, 4- or 5-angled, rugose, densely glandular. Pappus white; inner bristles 1.1–1.2 cm. Fl. and fr. Jul–Aug.

• Stony mountain slopes; ca. 2400 m. Nei Mongol (Alxa Meng, Longshou Shan).

No specimens of *Saussurea mae* were seen by the present authors, and the treatment here is based on the original description.

119. *Saussurea deserticola* H. C. Fu, J. Inner Mongolia Inst. Agric. Anim. Husb. 1: 50. 1981.

荒漠风毛菊 *huang mo feng mao ju*

Herbs 30–40 cm tall, perennial. Caudex stout, apically covered with blackish brown remains of old petioles. Stem solitary, erect, apically branched. Lower stem leaves petiolate; petiole 1–2 cm, winged, base semiamplexicaul; leaf blade ovate to narrowly ovate-elliptic in outline, 5–9 × 1.5–2 cm, bipinnately parted; segments 11–13 pairs, linear, needlelike, 2–12 × 1–3 mm, both surfaces arachnoid and densely glandular, apex obtuse to acute. Middle and upper stem leaves gradually smaller upward on stem, linear, undivided, margin subentire to dentate. Capitula many, in a paniculiform or corymbiform synflorescence, pedunculate. Involucre campanulate, 7–12 mm in diam. Phyllaries in 5–7 rows, apical half and margin purple, arachnoid pubescent, midvein dark; outer phyllaries ovate, apex obtuse or mucronate; middle phyllaries oblong-elliptic, apex acute; inner phyllaries narrowly elliptic to linear, apex obtuse. Receptacle bristles 1.5–6 mm. Corolla rose-purple, ca. 1.4 cm, tube ca. 6 mm, limb ca. 8 mm. Achene dark green, obconic, 3.5–4 mm, 4-angled, sparsely glandular, apically squamulose, apex with an

obtusely dentate crown. Pappus white; outer bristles short; inner bristles 1–1.1 cm. Fl. Sep.

- Desert areas; 1300–1400 m. Nei Mongol (Ih Ju Meng).

No specimens of *Saussurea deserticola* were seen by the present authors, and the description here is based on the treatment by H. C. Fu (in Ma, Fl. Intramongol., ed. 2, 4: 749. 1993).

120. *Saussurea salicifolia* (Linnaeus) Candolle, Ann. Mus. Natl. Hist. Nat. 16: 200. 1810.

柳叶风毛菊 liu ye feng mao ju

Serratula salicifolia Linnaeus, Sp. Pl. 2: 817. 1753.

Herbs 15–50 cm tall, perennial, caespitose. Roots stout, fibrous. Caudex much branched near ground level. Stems usually numerous, erect, simple or branched. Leaves shortly petiolate or sessile; leaf blade narrowly elliptic to linear, 2–10 × 0.2–0.5 cm, abaxially white and densely tomentose, adaxially green and glabrous or sparsely pubescent, base cuneate-attenuate, margin entire or rarely basally dentate and usually revolute, apex acuminate. Capitula numerous to few, in a corymbiform synflorescence, pedunculate. Involucre cylindric, 4–7 mm in diam. Phyllaries in 4 or 5 rows, purplish red; outer phyllaries ovate, 1.5–2 × 1–1.5 mm, apex acute to obtuse; middle phyllaries ovate to narrowly ovate-elliptic, 2–6 × 1–1.5 mm, apex acute; inner phyllaries narrowly ovate-elliptic to linear, 6–8 × 1–2 mm, apex acute. Receptacle bristles 6–8 mm. Corolla pink, 1.2–1.5 cm, tube 6–8 mm, limb 6–7 mm. Achene brown, 3.5–4.5 mm, glabrous. Pappus white; outer bristles ca. 2 mm; inner bristles 1–1.1 cm. Fl. and fr. Jun–Sep.

Thickets, meadows, moist places in gullies; 1600–3800 m. Gansu, Heilongjiang, Nei Mongol [Mongolia, Russia (Siberia)].

121. *Saussurea lomatolepis* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 59(6): 80. 1954.

纹苞风毛菊 wen bao feng mao ju

Herbs 15–35 cm tall, perennial. Roots woody, fibrous. Caudex branched, with several flowering shoots. Stem erect or ascending, simple or rarely branched from base. Basal and lower stem leaves shortly petiolate; leaf blade ovate-elliptic to oblong, 8–10 × 1.5–2 cm, abaxially grayish white and densely arachnoid tomentose, adaxially green, almost glabrous, and scabrous, margin sinuate-dentate to pinnately cleft. Upper stem leaves sessile, gradually smaller upward on stem, usually with sterile shoots in axils. Capitula 2–5, in a condensed corymbiform synflorescence, pedunculate. Involucre campanulate, 8–10 mm in diam. Phyllaries in 4 or 5 rows, straw-colored, pubescent, margin distinct, narrow, and brown or black, apex obtuse to rounded; outer phyllaries ovate; inner phyllaries oblong. Receptacle bristles subulate, to 8 mm. Corolla dark red, ca. 1.2 cm, gland-dotted, tube ca. 6 mm, limb ca. 6 mm. Achene dark brown, cylindric, 4–6 mm, glabrous. Pappus white; outer bristles 1.5–3 mm; inner bristles 1–1.1 cm. Fl. and fr. Jul–Oct.

- Mountain steppes, meadows; 1300–2700 m. Xinjiang.

122. *Saussurea polycephala* Handel-Mazzetti, Acta Horti Gothob. 12: 313. 1938.

多头风毛菊 duo tou feng mao ju

Saussurea thibetica Franchet, J. Bot. (Morot) 8: 338. 16 Oct 1894, not *S. tibetica* C. Winkler (1894); *S. leucota* Handel-Mazzetti.

Herbs 60–100 cm tall, perennial. Rhizome stout. Stem solitary, erect, much branched in apical part, unwinged. Basal and lower stem leaves withered at anthesis. Middle stem leaves petiolate; petiole 4–7 mm; leaf blade narrowly ovate to narrowly elliptic, 10–18 × 1.5–3 cm, abaxially white and densely tomentose, adaxially green and sparsely strigose, base cuneate, margin denticulate, apex acuminate. Upper stem leaves narrowly ovate-elliptic, gradually smaller upward on stem. Capitula very numerous, in an ample corymbiform-paniculiform synflorescence, pedunculate. Involucre cylindric, 5–6 mm in diam. Phyllaries in 5 or 6 rows; outer phyllaries ovate, 2–3 × 1.5–2 mm, sparsely arachnoid, apex acuminate; middle phyllaries narrowly elliptic, 3–6 × 1–1.5 mm, densely villous, apex acute; inner phyllaries narrowly elliptic, 6–9 × 1–1.5 mm, sparsely villous, apex obtuse. Receptacle bristles to 5 mm. Corolla purple, 0.9–1.1 cm, tube 5–6 mm, limb 4–5 mm, lobes 2.5–3 mm. Achene brown, ca. 3 mm, ribbed. Pappus white; outer bristles ca. 2 mm; inner bristles ca. 8 mm. Fl. and fr. Aug–Sep.

- Forests, forest margins, near mountain trails, mountain slopes; 1200–2200(–4600) m. Hubei, Sichuan.

Saussurea leucota, described from W Sichuan, is preliminarily included here as a synonym; it may deserve separate taxonomic status. It is certainly not conspecific with *S. salicifolia*.

123. *Saussurea chinensis* (Maximowicz) Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 51: 1496. 1966.

中华风毛菊 zhong hua feng mao ju

Saussurea salicifolia (Linnaeus) Candolle var. *chinensis* Maximowicz, Bull. Soc. Imp. Naturalistes Moscou 54(1): 28. 1879; *S. denticulata* Ledebour var. *chinensis* (Maximowicz) Y. Ling.

Herbs 30–75 cm tall, perennial. Stem solitary, simple or apically branched. Basal leaves withered at anthesis. Lower stem leaves sessile, narrowly ovate-elliptic to narrowly elliptic, 9–10 × 1.5–2.5 cm, abaxially white, densely tomentose, and gland-dotted, adaxially green and glabrous, base cuneate, margin denticulate, apex long acuminate. Middle stem leaves sessile, narrowly ovate-elliptic, 9–12 × 1.5–2.5 cm, base semi-amplexicaul, margin denticulate, apex acuminate. Upper stem leaves sessile, narrowly elliptic to linear, margin entire. Capitula 10–20, in a compact corymbiform synflorescence, pedunculate. Involucre cylindric, 4–5 mm in diam. Phyllaries in 4 or 5 rows, greenish yellow, apically purple, sparsely pubescent; outer phyllaries ovate, 2–3 × 1–1.5 mm, sparsely arachnoid, apex acuminate; middle phyllaries narrowly elliptic to linear, 3–8 × 1–2 mm, apically densely appressed villous; inner phyllaries linear, 7–8 × 1–1.5 mm, apex obtuse to acute. Receptacle bristles 2–3 mm. Corolla pale purple, 8–9 mm, tube 3–4 mm, limb 4–5 mm, lobes 2–2.5 mm. Achene brown, ca. 2 mm, glabrous. Pappus straw-colored; outer bristles 1–3 mm; inner bristles 5–7 mm. Fl. and fr. Aug–Sep.

- Grasslands on mountain slopes; 1900–2300 m. Hebei (Xiaowutai Shan).

Saussurea chinensis is very close to *S. polycephala*, only differing by fewer capitula in a smaller and more compact synflorescence.

124. *Saussurea zhuxiensis* Y. S. Chen & Q. L. Gan, J. Syst. Evol. 49: 160. 2011.

竹溪风毛菊 zhu xi feng mao ju

Herbs 30–50 cm tall, perennial. Rhizome stout, with numerous fibrous roots. Stems solitary or 3–5, erect, apically branched. Basal and lower stem leaves sessile, narrowly ovate-elliptic, 5–15 × 1–2 cm, abaxially light green and puberulent, adaxially green and puberulent, base attenuate, margin sparsely dentate or incised, apex acuminate and mucronate. Middle stem leaves narrowly ovate-elliptic, margin usually entire or sometimes minutely denticulate. Upper stem leaves smaller upward on stem, margin entire. Capitula numerous, in a lax corymbiform synflorescence, shortly pedunculate. Involucre campanulate, 8–10 mm in diam. Phyllaries in ca. 5 rows; outer phyllaries green, narrowly ovate-oblong, 4–5 × ca. 1 mm, sparsely arachnoid, apex acute; inner phyllaries light green, narrowly ovate-elliptic, 10–12 × 1–1.5 mm, glabrous, apex acuminate. Receptacle bristles filiform, 5–6 mm. Corolla purplish red, ca. 1.4 cm, tube ca. 7 mm, limb ca. 7 mm. Achene ellipsoid, ca. 3 mm. Pappus bristles in 1 row, grayish white, ca. 1 cm, plumose. Fl. Aug.

• Rock crevices, sandy places along streams; ca. 900 m. Hubei (Zhuxi).

125. *Saussurea virgata* Franchet, J. Bot. (Morot) 8: 340. 1894.

帚状风毛菊 zhou zhuang feng mao ju

Herbs 20–90 cm tall, perennial. Stem solitary, 5–7 mm in diam., erect, apically branched, winged, densely leafy. Lower and middle stem leaves shortly petiolate or sessile; leaf blade narrowly ovate-elliptic, 6–10 × 1–2 cm, abaxially grayish white or grayish green and arachnoid, adaxially green and glabrous or with short glandular hairs, base decurrent, margin entire, crenate, or apically denticulate, apex acute to acuminate. Upper stem leaves linear, 1–5 × 0.1–0.3 cm, margin entire. Capitula numerous, clustered at end of branches, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly obovoid, 5–8 mm in diam. Phyllaries in ca. 5 rows, narrowly ovate-elliptic to linear, arachnoid, apex acute; outer phyllaries ovate-elliptic, 5–6 × 2–2.5 mm, apical part herbaceous and reflexed, apex acuminate to caudate; middle and inner phyllaries 7–11 × 1–2 mm, apically and near margin purplish red, scarious, apex acute and erect. Receptacle bristles 4–7 mm. Corolla purplish red, ca. 9 mm. Achene glabrous. Pappus pale brown; outer bristles scabrid; inner bristles ca. 8 mm. Fl. and fr. Jul–Sep.

• Grasslands on mountain slopes; 2800–3400 m. Yunnan (Dali, Huize).

126. *Saussurea integrifolia* Handel-Mazzetti, Acta Horti Gothob. 12: 313. 1938.

全缘叶风毛菊 quan yuan ye feng mao ju

Herbs 30–100 cm tall, perennial. Stem erect, simple or branched in apical part. Basal and lower stem leaves withered at anthesis. Middle stem leaves sessile or subsessile; leaf blade narrowly ovate-elliptic to linear, 5–12 × 0.6–0.7 cm, abaxially white and densely tomentose, adaxially green and slightly sca-

brid, base cuneate-attenuate, margin entire and revolute, apex long acuminate. Upper stem leaves similar to middle stem leaves, gradually smaller upward on stem. Capitula numerous, in a corymbose-paniculate synflorescence, shortly pedunculate. Involucre narrowly campanulate, ca. 5 mm in diam. Phyllaries in 5 or 6 rows, dark purple, sparsely pubescent, glabrescent; outer phyllaries ovate, ca. 3 × 1–1.5 mm, apex acute to obtuse; middle phyllaries elliptic, ca. 7 × 2 mm, apex obtuse; inner phyllaries narrowly linear-elliptic, 7–8 × ca. 1 mm, apex acute to obtuse. Corolla purple, ca. 9 mm, tube ca. 4 mm, limb ca. 5 mm. Achene brown, ca. 3 mm. Pappus straw-colored; outer bristles ca. 3 mm; inner bristles ca. 9 mm. Fl. and fr. Aug–Sep.

• Thickets in mountain valleys, grasslands, by trails on mountain slopes; 2000–3500 m. NW Sichuan, ?NW Yunnan (Dêqên).

It is not clear if the much smaller specimens of *Saussurea integrifolia* from Yunnan (10–18 cm tall) with fewer (3–7) but slightly larger capitula really belong to the same taxon as the plants from NW Sichuan.

127. *Saussurea sutchuenensis* Franchet, J. Bot. (Morot) 8: 353. 1894.

四川风毛菊 si chuan feng mao ju

Saussurea dutaillyana Franchet var. *macrocephala* (Y. Ling) X. Y. Wu; *S. dutaillyana* var. *shensiensis* Y. Y. Pai; *S. rufostrigillosa* Y. Ling; *S. rufostrigillosa* var. *macrocephala* Y. Ling.

Herbs 40–100 cm tall, perennial. Rhizome stout. Stem solitary, erect, apically branched. Basal and lower stem leaves petiolate; petiole 10–25 cm; leaf blade ovate to triangular-ovate, ca. 14 × 10 cm, both surfaces green and glabrous or strigillose, base truncate to cordate, margin sharply dentate, apex acuminate. Median stem leaves petiolate; petiole 1.5–3.5 cm; leaf blade gradually smaller upward on stem, ovate to triangular-ovate, 4–6 × 2–4 cm. Upper stem leaves petiolate; leaf blade narrowly ovate, base cuneate-attenuate. Capitula numerous, clustered 3–6 at end of branches in a corymbiform-paniculiform synflorescence, pedunculate. Involucre campanulate to obconic, 5–9(–15) mm in diam. Phyllaries in 6 or 7 rows, arachnoid lanate; outer and middle phyllaries narrowly ovate to narrowly ovate-elliptic, 3–10 × 1–2 mm, margin apically crenate-dentate, apex herbaceous, acute, and reflexed; inner phyllaries linear, 8–10 × 1.5–2 mm, apex obtuse and erect. Receptacle bristles subulate, 4–6 mm. Corolla purple or white, 1–1.2(–1.5) cm, tube 6–7 mm, limb 5–5.5 mm, lobes 3–3.5 mm. Achene brown, ca. 3 mm, smooth, glabrous. Pappus straw-colored; outer bristles 2–4 mm; inner bristles 7–9 mm. Fl. and fr. Jul–Sep.

• Forests, forest margins; 700–2000 m. N Chongqing (Chengkou), Henan (Lushi), ?Hubei, Shaanxi.

128. *Saussurea dolichopoda* Diels, Bot. Jahrb. Syst. 29: 623. 1901.

长梗风毛菊 chang geng feng mao ju

Saussurea saligniformis Handel-Mazzetti; *S. wilsoniana* Handel-Mazzetti.

Herbs 0.6–1.4 m tall, perennial. Rhizome stout. Stems solitary or few, (2–)5–8 mm in diam., erect, apically much branched, apically flexuous. Basal leaves withered at flowering

time. Lower and middle stem leaves petiolate; petiole 1.5–5 cm; leaf blade narrowly ovate to oblong, 8–19 × 2–6.5 cm, both surfaces green, abaxially with a few isolated articulate hairs, adaxially glabrous, base cordate to rounded, margin denticulate and sparsely ciliate, apex acuminate to caudate. Upper stem leaves gradually smaller upward on stem; petiole 0.5–1.5 cm; leaf blade narrowly elliptic, base cuneate to rounded. Capitula numerous, in a diffuse corymbiform-paniculiform synflorescence, pedunculate. Involucre campanulate, 6–8(–13) mm in diam. Phyllaries in 4–6 rows, straw-colored, sometimes apically tinged purple, glabrous or apically bearded, apex obtuse to subacute; outer phyllaries ovate, 1.5–3 × 1–2 mm; middle phyllaries narrowly ovate, 3–10 × 1.5–2 mm; inner phyllaries narrowly elliptic to linear, 10–14 × 1–1.5 mm. Receptacle bristles brownish, subulate, 4–8 mm. Corolla purple, 1–1.3 cm, tube 4.5–7 mm, limb 5–6.5 mm, lobes 3–3.5 mm. Achene blackish brown, cylindric, 3–5 mm, smooth, glabrous. Pappus pale brown; outer bristles 2–4 mm; inner bristles (0.8–)1–1.1 cm. Fl. and fr. Jul–Oct.

• Forests, forest margins, montane meadows, rocky slopes; 1400–3700 m. Gansu, Guizhou, Henan, Hubei, Shaanxi, Sichuan, NW Yunnan (Lijiang, Zhongdian).

129. *Saussurea saligna* Franchet, J. Bot. (Morot) 8: 345. 1894.

尾尖风毛菊 *wei jian feng mao ju*

Herbs 70–120 cm tall, perennial. Stem solitary, 5–7 mm in diam., erect, apically much branched. Lower and middle stem leaves petiolate; petiole 1–3 cm; leaf blade narrowly ovate-elliptic to oblong, 10–20 × 3–4 cm, both surfaces green and glabrous or subglabrous, base rounded to truncate, margin denticulate, apex caudate-acuminate. Upper stem leaves shortly petiolate; leaf blade narrowly ovate-elliptic, 7–15 × 1–3 cm. Capitula numerous, clustered 5–7 at end of branches in a congested corymbiform synflorescence, shortly pedunculate. Involucre campanulate to obconic, 6–10 mm in diam. Phyllaries in 5–7 rows, straw-colored with green veins, subglabrous, scarious, apically bearded, apex obtuse; outer phyllaries ovate, 2–3 × 1–1.5 mm; middle phyllaries oblong to narrowly elliptic, 3–8 × 1–1.5 mm; inner phyllaries narrowly obovate-elliptic to linear, 8–10 × 1–1.5 mm. Receptacle bristles subulate, 5–7 mm. Corolla white or purple, 9–10 mm, tube 4–6 mm, limb 4–5 mm, lobes 3–3.5 mm. Achene cylindric, 4–5 mm, ribbed, glabrous. Pappus dirty white; outer bristles 2–3 mm; inner bristles 8–10 mm. Fl. and fr. Jul–Oct.

• Mountain slopes, forests; 1200–2500 m. N Chongqing (Chengkou), Shaanxi.

130. *Saussurea conyzoides* Hemsley, J. Linn. Soc., Bot. 29: 309. 1892.

假蓬风毛菊 *jia peng feng mao ju*

Saussurea oppositicolor H. Léveillé & Vaniot; *S. rosthornii* Diels var. *oppositicolor* (H. Léveillé & Vaniot) F. H. Chen ex Handel-Mazzetti; *S. silvestrii* Pampanini.

Herbs 0.9–1.2 m tall, perennial. Stem solitary, ca. 5 mm in diam., erect, branched from middle. Middle stem leaves petiolate; petiole to 2.5 cm; leaf blade elliptic to ovate, 7.5–15(–20)

× 5–6 cm, abaxially grayish green to grayish white and densely tomentose, adaxially green and sparsely strigose but glabrescent, base cuneate-attenuate, margin denticulate, shallowly crenate, or entire, apex acuminate. Upper leaves similar, gradually smaller upward on stem, narrowly elliptic, 8–15 × 1.5–3 cm. Uppermost stem leaves narrowly elliptic to linear. Capitula numerous, in a corymbiform-paniculiform synflorescence, sessile or shortly pedunculate. Involucre narrowly cylindric, 3–5 mm in diam. Phyllaries in 5 or 6 rows, yellowish green, sparsely arachnoid or glabrescent; outer phyllaries oblong, 1.5–2 × 0.5–0.8 mm, apex acute and mucronate; middle phyllaries ovate to narrowly elliptic, 2–7 × 0.8–1.5 mm, apex acute to obtuse and without a mucro; inner phyllaries narrowly elliptic to linear, 7–9 × 0.5–1 mm, apically bearded, apex obtuse. Receptacle bristles 4–5 mm. Corolla purple, 0.9–1.1 cm, tube 4–5 mm, limb 5–6 mm, lobes 3.5–4 mm. Achene (immature) ca. 2 mm, glabrous. Pappus dirty white; outer bristles 3–4 mm; inner bristles 8–9 mm. Fl. Jul–Aug.

• Forests; 1000–2300 m. Guizhou, Henan, Hubei, Shaanxi, Sichuan.

131. *Saussurea flexuosa* Franchet, J. Bot. (Morot) 8: 341. 1894.

城口风毛菊 *cheng kou feng mao ju*

Saussurea flexuosa var. *penicillata* Franchet; *S. tsinlingensis* Handel-Mazzetti.

Herbs 50–100 cm tall, perennial. Rhizome stout. Stem solitary, erect, apically branched. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 2–7 cm, winged and usually with a pair of lobes; leaf blade ovate, elliptic, or narrowly ovate-elliptic, 6–17 × 4–9 cm, abaxially grayish white and densely arachnoid tomentose, adaxially green, scabrid, and sparsely strigose, base cordate, truncate, or cuneate, margin serrulate or sinuate-dentate, apex acuminate. Upper stem leaves shortly petiolate; leaf blade gradually smaller upward on stem, narrowly elliptic, base cuneate, margin denticulate or entire. Capitula numerous or few, in a laxly corymbiform or paniculiform synflorescence, pedunculate. Involucre narrowly campanulate, 7–10 mm in diam. Phyllaries in 4 or 5 rows, apically red to blackish purple, sparsely arachnoid lanate; outer phyllaries ovate, 2–3 × 1–1.5 mm, apex acute, with a black straight mucro; middle phyllaries ovate-elliptic, 3–7 × 1.5–2 mm, apex acute; inner phyllaries narrowly elliptic to linear, 7–10 × 1.5–2 mm, apex acute to obtuse. Corolla red, 1–1.1 cm, tube 4–5 mm, limb ca. 6 mm. Achene brown, cylindric, ca. 4 mm, glabrous. Pappus pale brown; outer bristles 2–4 mm, scabrid; inner bristles 9–10 mm. Fl. and fr. Jul–Sep.

• Forests, forest margins, thickets, near trails, meadows; 1300–2000 m. Chongqing, Gansu, Henan, W Hubei, S Shaanxi, Sichuan.

132. *Saussurea elegans* Ledebour, Icon. Pl. 1: 19. 1829.

优雅风毛菊 *you ya feng mao ju*

Saussurea amoena Karelina & Kirilov; *S. elegans* var. *latifolia* Karelina & Kirilov; *S. elegans* var. *nivea* Lipschitz; *S. salicifolia* (Linnaeus) Candolle var. *elegans* (Ledebour) Trautvetter; *S. tenuis* Ledebour.

Herbs 10–70 cm tall, perennial. Roots fibrous. Stems solitary or few, erect, apically branched, usually with short sterile shoots in leaf axils. Basal and lower stem leaves petiolate; petiole 1.5–6 cm; leaf blade oblong to ovate-oblong, to 15 × 1.5–4 cm, pinnately lobed or lyrate-pinnately lobed, abaxially grayish white or green, arachnoid tomentose or glabrous, and gland-dotted, adaxially green, scabrous, and strigose or glabrous. Middle stem leaves shortly petiolate or sessile; leaf blade ovate to elliptic, 3–10 × 0.5–3 cm, undivided, margin entire or dentate, apex acuminate. Upper stem leaves narrowly ovate-elliptic to linear, 3–8 mm wide. Capitula numerous, in a corymbiform or paniculiform synflorescence. Involucre cylindric, 5–8 mm in diam. Phyllaries in 5 rows, yellowish green, apically purple, sparsely arachnoid, gland-dotted; outer phyllaries ovate, 2–3 × 1.5–2 mm, apex shortly acuminate; middle phyllaries narrowly ovate, 3–8 × 1.5–3 mm, apex shortly acuminate; inner phyllaries linear, 8–10 × 1.5–2 mm, apex obtuse. Receptacle bristles to 7 mm. Corolla purple, 1.1–1.4 cm, tube 6–8 mm, limb 5–6 mm, lobes 2.5–4 mm. Achene brown, cylindric, 3–5 mm, glabrous. Pappus white; outer bristles 2–4 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Sep.

Grassy or stony mountain slopes, forest meadows, fields; 1100–3200 m. Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Russia (Siberia), Tajikistan, Uzbekistan].

133. *Saussurea acroua* Cummins, Bull. Misc. Inform. Kew 1908: 19. 1908.

川甘风毛菊 *chuan gan feng mao ju*

Herbs 30–80 cm tall, perennial. Stem solitary, 2–4 mm in diam., erect, branched from middle. Lower stem leaves petiolate; petiole to 5 cm; leaf blade oblong, 4–15 × 2–6 cm, pinnatisect, both surfaces green, abaxially sparsely arachnoid pubescent and gland-dotted, adaxially scabrid and strigose; lateral segments 4–10 pairs, linear-oblong, to 3 × 0.7 cm, margin entire or with a single tooth and revolute, apex mucronate. Middle and upper stem leaves gradually smaller upward on stem, base auriculate-amplexicaul. Uppermost stem leaves linear, undivided or with 1–4 segments. Capitula numerous, in a paniculiform-corymbiform synflorescence, pedunculate. Involucre tubular to narrowly campanulate, 5–8 mm in diam. Phyllaries in ca. 4 rows, apically ± villous; outer phyllaries ovate, 2–3 × 1–1.5 mm, apex acuminate; middle phyllaries narrowly elliptic, 3–7 × 1–1.2 mm, apex acute to obtuse; inner phyllaries linear, 7–8(–11) × 0.8–1 mm, apex obtuse. Receptacle bristles 2–3 mm. Corolla pink, 8–9 mm, glabrous, tube 2.5–3.5 mm, limb 5–6 mm, lobes 2.5–3 mm. Achene brown, obconic to cylindric, 3–3.5 mm, gland-dotted, with a short crown. Pappus light brown; outer bristles 2–2.5 mm; inner bristles 8–10 mm. Fl. and fr. Aug.

• Riverbanks, grassy slopes, clay soil at roadsides; 2100–3600 m. Gansu, Sichuan.

134. *Saussurea megaphylla* (X. Y. Wu) Y. S. Chen, J. Syst. Evol. 49: 160. 2011.

秦岭风毛菊 *qin ling feng mao ju*

Saussurea carduiiformis Franchet var. *megaphylla* X. Y. Wu, Fl. Tsinling. 1(5): 423. 1985.

Herbs to 45 cm tall, perennial. Stem solitary, 4–5 mm in diam., erect, simple. Stem leaves petiolate, usually arranged around middle of stem; petiole 0.7–1.8 cm; leaf blade oblong, 6–20 × 2.5–6 cm, pinnatipartite, abaxially pale green and densely glandular hairy, adaxially green and sparsely shortly glandular hairy; lateral lobes 13–17 pairs, oblong, narrowly ovate-elliptic, or linear, 0.6–3 × 0.1–0.5 cm, usually curved downward, margin entire, apex acuminate. Capitula usually 10–14, in a laxly corymbiform synflorescence, long pedunculate. Involucre globose to campanulate, 1–1.5 cm in diam. Phyllaries in 5 or 6 rows, brownish, leathery; outer phyllaries ovate, ca. 5 × 2 mm; inner phyllaries apically black, narrowly oblong, 10–12 × ca. 2 mm, tomentose, apex long acuminate and recurved. Receptacle bristles yellowish brown, 5–6 mm. Corolla pink, 1–1.2 cm, glabrous, tube 5–6 mm, limb 5–6 mm, lobes ca. 4 mm. Achene brown, cylindric, ca. 5 mm, glabrous. Pappus yellowish white; outer bristles 3–4 mm; inner bristles ca. 8 mm. Fl. Aug–Sep, fr. Sep–Oct.

• Montane meadows, margins of mixed forests; 1800–2000 m. Shaanxi (Huxian).

135. *Saussurea tianshuiensis* X. Y. Wu, Fl. Loess-Plat. Sin. 5: 520. 1989.

天水风毛菊 *tian shui feng mao ju*

Herbs ca. 1.5 m tall, perennial. Stem solitary, erect, apically branched, unwinged. Basal and lower stem leaves petiolate; petiole 1–2 cm; leaf blade narrowly ovate, elliptic, or obovate, 10–21 × 3–7 cm, pinnately lobed or pinnately parted, both surfaces green, abaxially glabrous, adaxially scabrid, glandular, or glabrescent, base cuneate, margin sinuate-dentate, apex acute; main segments or lobes 3–5 pairs, triangular to narrowly triangular-ovate, margin entire or dentate, apex acute and mucronate. Middle and upper stem leaves gradually smaller upward on stem, narrowly elliptic, undivided, margin dentate, apex long acuminate. Capitula 1–4, on end of branch apices, solitary or in a corymbiform synflorescence, long pedunculate. Involucre tubular-campanulate, 5–8 mm in diam. Phyllaries in 5 or 6 rows, apex acute to subobtusely; outer phyllaries triangular-ovate, ca. 5 mm; middle phyllaries narrowly elliptic, 0.6–1.5 cm; inner phyllaries narrowly elliptic to linear, 1–1.8 cm. Corolla purple, ca. 1.3 cm, tube ca. 6 mm, limb ca. 4 mm. Achene ca. 4 mm, glabrous. Pappus white or yellowish brown; outer bristles 2–5 mm; inner bristles ca. 1 cm. Fl. Aug–Sep.

• Montane meadows, forest margins, thickets; 1800–2500 m. SE Gansu, S Ningxia, Shaanxi.

No specimens of *Saussurea tianshuiensis* or *S. tianshuiensis* var. *huxianensis* were seen by the present authors. The descriptions here are based on the original publication.

- 1a. Involucre tubular-campanulate,
ca. 8 mm in diam.; inner
phyllaries 1.3–1.8 cm 135a. var. *tianshuiensis*
- 1b. Involucre turbinate to campanulate-
turbinate, 5–7 mm in diam.; inner
phyllaries ca. 1 cm 135b. var. *huxianensis*

135a. *Saussurea tianshuiensis* var. *tianshuiensis*

天水风毛菊(原变种) *tian shui feng mao ju* (yuan bian zhong)

Involucre tubular-campanulate, ca. 8 mm in diam. Inner phyllaries to 1.8 cm.

• Montane meadows, forest margins, thickets; 1800–2500 m. SE Gansu, S Ningxia, SW Shaanxi.

135b. *Saussurea tianshuiensis* var. *huxianensis* X. Y. Wu, Fl. Loess-Plat. Sin. 5: 521. 1989.

户县风毛菊 *hu xian feng mao ju*

Involucre turbinate to campanulate-turbinate, 5–7 mm in diam. Inner phyllaries to 1 cm.

• Montane meadows, forest margins, thickets; 2300–2400 m. Shaanxi (Huxian).

136. *Saussurea pteridophylla* Handel-Mazzetti, Symb. Sin. 7: 1149. 1936.

延翅风毛菊 *yan chi feng mao ju*

Herbs 60–90 cm tall, perennial. Rhizome stout, apically branched. Stem solitary, erect, apically branched, partly winged. Basal and stem leaves petiolate; petiole to 2.5 cm, winged; leaf blade elliptic to narrowly elliptic, 10–16 × 2.5–4(–6) cm, pinnately lobed to pinnatisect, abaxially light green and with articulate hairs, adaxially dark green, scabrous, and with short spinulose prickles; lateral lobes 6–10 pairs, ovate to narrowly ovate-elliptic, 1–3 × 0.2–0.5 cm, margin ciliate and dentate or entire, apex acute and mucronate. Uppermost leaves linear-subulate, 5–15 × ca. 1 mm. Capitula numerous, in a laxly paniculiform synflorescence, pedunculate, with 5–10 florets. Involucre narrowly campanulate to tubular, 4–6 mm in diam. Phyllaries in ca. 6 rows, straw-colored, apically dark purple, sparsely arachnoid; outer phyllaries ovate, 2–3 × ca. 1 mm, apex acuminate; middle phyllaries narrowly ovate-oblong, 3–7 × 1–1.5 mm, apex acute; inner phyllaries narrowly oblong to obovate, 7–9 × 1–1.5 mm, apex obtuse and barbellate. Receptacle bristles 2–5 mm. Corolla red, 7–8(–10) mm, tube 2–3 mm, limb 4–5 mm, lobes 2–2.5 mm. Achene obconic, 2.5–3 mm, glabrous. Pappus pale brown; outer bristles 2–3 mm; inner bristles 5–7 mm. Fl. and fr. Oct.

• Thickets; ca. 3000 m. SW Sichuan (Yanyuan).

137. *Saussurea compta* Franchet, J. Bot. (Morot) 10: 422. 1896.

华美风毛菊 *hua mei feng mao ju*

Herbs 30–80 cm tall, perennial. Stem solitary, ca. 3 mm in diam., simple or apically branched. Basal and lower stem leaves withered at anthesis. Middle stem leaves shortly petiolate; leaf blade narrowly elliptic, 4–7 × 1–2 cm, pinnately lobed, abaxially white and densely tomentose, adaxially green, scabrous, and sparsely hispid; lateral segments 2 or 3 pairs, oblong to narrowly triangular-ovate, margin entire or with a pair of lobes, apex acute to obtuse; terminal segment caudate. Upper stem leaves sessile or subsessile, similar to middle stem leaves, gradually smaller upward on stem; lateral lobes 1 or 2 pairs. Capitula 3–15, in a corymbiform synflorescence, pedunculate. Involucre narrowly obconic, 6–8 mm in diam. Phyllaries in 5 or 6 rows, apically sparsely pubescent to villous; outer phyllaries ovate, 2–3 × 1–1.5 mm, apex acute; middle phyllaries narrowly

elliptic, 3–7 × 1–1.5 mm, apex obtuse; inner phyllaries narrowly elliptic-linear, 7–10 × 1–1.5 mm, apex obtuse. Corolla purple, 7–8 mm, tube 4–5 mm, limb 2.5–3 mm, lobes 1.5–2 mm. Achene blackish brown, 2.5–3 mm. Pappus dirty white; outer bristles ca. 2 mm; inner bristles ca. 1 cm. Fl. Aug–Sep, fr. Sep–Nov.

• Montane steppes; 2300–2600 m. W Sichuan (Kangding).

The record of this species from Yunnan (S. W. Liu, Fl. Yunnan. 13: 572. 2004) must be referable to *Saussurea chrysanthemoides* (which was cited as a synonym).

138. *Saussurea variiloba* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 71. 1949.

变裂风毛菊 *bian lie feng mao ju*

Herbs 40–100 cm tall, perennial. Rhizome short and stout, with many fibrous roots. Stem solitary, ca. 6 mm in diam., erect, apically branched. Lower stem leaves withered at anthesis. Middle stem leaves shortly petiolate to sessile; leaf blade narrowly elliptic, 4–18 × 2–6 cm, pinnately lobed, lyrate-pinnately lobed, or undivided and sinuate-dentate, abaxially pale green and thinly arachnoid, adaxially green and strigose, base ± decurrent, apex ± long acuminate; lateral lobes 4–14 pairs, ovate-oblong, 5–13 × 2–6 mm. Upper stem leaves narrowly elliptic to linear, base decurrent, margin dentate, teeth broadly triangular, apex long acuminate and mucronate. Uppermost stem leaves linear, margin entire. Capitula several, in a corymbiform synflorescence, pedunculate or sessile. Involucre narrowly campanulate or tubular, ca. 5 mm in diam. Phyllaries in ca. 6 rows, apically purplish red, sparsely arachnoid; outer phyllaries ovate, apex acute; inner phyllaries narrowly elliptic to linear, to 9 mm, apically densely arachnoid villous, apex subobtuse. Receptacle bristles subulate, ca. 4 mm. Corolla purple, 8–11 mm, tube 4–4.5 mm, limb 4–4.5 mm, lobes ca. 3 mm. Achene grayish brown, ca. 4 mm, glabrous. Pappus pale yellowish brown; outer bristles 2–3 mm; inner bristles 8–9 mm. Fl. and fr. Aug–Sep.

• Mountain slopes; 1900–2700 m. S Gansu, E Qinghai (Xunhua), N Sichuan.

No specimens of *Saussurea variiloba* were seen by the present authors, and the description here is based on the original publication and the treatments by X. Y. Wu (Fl. Loess-Plat. Sin. 5: 446. 1989) and S. W. Liu (Fl. Qinghai. 3: 481. 1996). This species is similar to *S. compta* but differs in the decurrent leaf bases, thinly arachnoid abaxial leaf surface, and higher number of lateral leaf lobes. The application of the name is problematic because the type material seems to be lost (Lipschitz, Rod *Saussurea*, 251. 1979). Lipschitz's choice of a neotype (loc. cit.), which seems even closer to *S. compta* and may well be conspecific with that taxon, is not entirely in accordance with the original description.

139. *Saussurea chrysanthemoides* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 6: 97. 1935 [*“chrysanthemumoides”*].

菊状风毛菊 *ju zhuang feng mao ju*

Herbs 30–60 cm tall, perennial. Rootstock stout, fibrously split. Stem solitary, 2–3 mm in diam., erect, apically branched, densely covered at base with fibrous remains of petioles. Basal and lower stem leaves petiolate; petiole 4–10 cm; leaf blade ovate to elliptic, 8–12 × 2–5 cm, bipinnately divided, abaxially white, with conspicuous veins, arachnoid tomentose, and gland-

dotted, adaxially green, scabrous, sparsely strigose, and gland-dotted; primary segments 8–10 pairs, elliptic, apex obtuse and mucronate; secondary lobes 1–3 pairs, obliquely triangular-ovate. Upper stem leaves shortly petiolate to sessile, pinnatisect to pinnately lobed; lateral segments 4–6 pairs. Capitula few, in a corymbiform synflorescence, long pedunculate. Involucre campanulate, 6–10 mm in diam. Phyllaries in 5 or 6 rows, arachnoid, gland-dotted; outer phyllaries ovate, 2–3 × 1–2 mm, apex acuminate; middle phyllaries narrowly elliptic, 3–10 × 1–2 mm, apex acute; inner phyllaries narrowly elliptic-linear, 10–12 × 1–1.5 mm, apex acute. Receptacle bristles subulate, 2–3 mm. Corolla purple, 1–1.1 cm, gland-dotted, tube 4–5 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene blackish brown, 2.5–3 mm. Pappus straw-colored; outer bristles 2–3 mm; inner bristles 9–10 mm. Fl. and fr. Aug–Oct.

• Open stony meadows, thickets; ca. 4000 m. NW Yunnan (Lijiang).

Saussurea chrysanthemoides is apparently only known from the type collection and is clearly different from *S. compta* in leaf division and shape and size of the capitula.

140. *Saussurea bartholomewii* S. W. Liu & T. N. Ho, Novon 20: 172. 2010.

玉树风毛菊 yu shu feng mao ju

Herbs 7–12 cm tall, perennial. Caudex simple, densely covered with fibrous remains of petioles. Stem solitary, 2–3 mm in diam., erect, apically branched. Lower and middle stem leaves petiolate; petiole 3–5 cm; leaf blade narrowly obovate-elliptic, 4–8 × 1.5–4.5 cm, lyrate-pinnatisect, abaxially grayish green, sparsely arachnoid tomentose, and gland-dotted, adaxially green, strigose, and gland-dotted; lateral segments 1–3 pairs, triangular-ovate, margin entire or denticulate, apex acute to obtuse; terminal segment large, margin dentate, apex obtuse. Upper stem leaves petiolate; leaf blade narrowly obovate-elliptic, 2–5 × 0.4–2 cm, undivided, margin entire or sinuate-dentate. Capitula numerous, in a laxly corymbiform synflorescence, pedunculate. Involucre tubular-campanulate, 7–10 mm in diam. Phyllaries in 5 or 6 rows, apically blackish, villous; outer and middle phyllaries ovate to ovate-oblong, 3–10 × 1.5–2 mm, apex obtuse to rounded; inner phyllaries narrowly ovate-elliptic, 10–15 × 1–1.5 mm, apex obtuse to acute. Receptacle bristles ca. 1.5 mm. Corolla bluish purple, 1.2–1.5 cm, gland-dotted, tube 6–7 mm, limb 5–8 mm, lobes 3.5–4 mm. Achene cylindric, ca. 3 mm, 4-ribbed, apex with a short crown. Outer pappus bristles white, 7–12 mm, barbellate; inner pappus bristles pale brown, 1–1.2 cm. Fl. and fr. Aug–Sep.

• *Picea* forests; ca. 3600 m. S Qinghai (Yushu).

5. *Saussurea* sect. *Lagurostemon* (Cassini) Candolle, Prodr. 6: 532. 1838.

全叶风毛菊组 quan ye feng mao ju zu

Lagurostemon Cassini in Cuvier, Dict. Sci. Nat. 53: 466. 1828.

Herbs, perennial, sometimes densely caespitose, usually with developed stems, sometimes substemless. Stem usually simple, erect, rarely apically branched. Leaf blade often narrowly linear and grasslike or narrowly ovate-elliptic, narrowly elliptic, narrowly oblong, or linear, almost always undivided. Capitula (1–)1.5–3 cm in diam., usually solitary but sometimes ± numerous and in a racemiform or corymbiform synflorescence. Receptacle with apiculate papillae or with subulate bristles. Corolla glabrous or gland-dotted. Anther tails usually lanate. Achene glabrous or sometimes densely sericeous, apically with a short and entire or denticulate crown. Pappus always in 2 rows; outer bristles usually scabrid.

About 24 species: C, E, and S Asia, C Europe; 21 species (14 endemic) in China.

Saussurea sect. *Pycnocephala*, the name used by Lipschitz (Rod *Saussurea*, 143. 1979) and typified with *S. baicalensis*, is not the earliest legitimate name for this taxon at sectional rank. Lipschitz included the type of *S. sect. Lagurostemon*, *S. pygmaea* (Jacquin) Sprengel (not present in China), in his *S. sect. Pycnocephala*.

- 1a. Leaf blade ovate, elliptic, narrowly ovate-elliptic, or oblong, 0.8–7 cm wide, margin sinuate-dentate or denticulate; capitula usually several.
 - 2a. Capitula in a racemiform or lax corymbiform synflorescence; leaf blade usually more than 2 cm wide.
 - 3a. Stem densely leafy; leaf blade narrowly ovate-elliptic, 1–3 cm wide; capitula in a dense racemiform synflorescence, sessile or shortly pedunculate; receptacle with short papillae or few short bristles to 3 mm 155. *S. baicalensis*
 - 3b. Stem with distant leaves; leaf blade ovate to elliptic, 2–7 cm wide; capitula in a lax corymbiform or racemiform synflorescence, pedunculate; receptacle with dense bristles 5–7 mm 161. *S. sordida*
 - 2b. Capitula in a corymbiform synflorescence; leaf blade 0.8–2 cm wide.
 - 4a. Leaf blade abaxially grayish green and densely sericeous-tomentose, adaxially green 158. *S. souliei*
 - 4b. Leaf blade concolorous, green, abaxially not sericeous-tomentose.
 - 5a. Stem not winged.
 - 6a. Plants 10–50 cm tall; stem ca. 0.5 cm in diam.; involucre campanulate, less than 2 cm in diam. 154. *S. krylovii*
 - 6b. Plants 60–70 cm tall; stem 1–1.5 cm in diam.; involucre hemispheric-campanulate, more than 2 cm in diam. 160. *S. megacephala*
 - 5b. Stem winged.
 - 7a. Leaf blade retrorsely denticulate, apex obtuse to acute; lower stem leaves petiolate 156. *S. sylvatica*

- 7b. Leaf blade coarsely sinuate-dentate, apex acuminate; lower stem leaves sessile.
 - 8a. Capitula pedunculate; involucre 2–3.5 cm in diam.; middle stem leaves ovate to narrowly ovate 157. *S. sobarocephala*
 - 8b. Capitula subsessile; involucre 1.5–2 cm in diam.; middle stem leaves narrowly ovate-triangular to linear 159. *S. semifasciata*
- 1b. Leaf blade narrowly linear or narrowly elliptic, 0.1–1 cm wide, margin entire or inconspicuously dentate; capitula solitary or rarely 2.
 - 9a. Capitula obconic; uppermost leaves and phyllaries dark purple 142. *S. tibetica*
 - 9b. Capitula campanulate; uppermost leaves green and phyllaries straw-colored, brown, or green, sometimes purplish tinged.
 - 10a. Phyllaries villous, with brown and white hairs.
 - 11a. Achene glabrous; plants 7–45 cm tall 148. *S. brunneopilosa*
 - 11b. Achene densely white villous; plants 2–6 cm tall.
 - 12a. Leaves abaxially white, densely villous, adaxially green, sparsely pilose 149. *S. pubescens*
 - 12b. Leaves concolorous, grayish white, densely sericeous 150. *S. sericea*
 - 10b. Phyllaries white lanate, villous, or glabrous, without brown hairs.
 - 13a. Leaf blade with stalked glandular hairs 141. *S. schlagintweitii*
 - 13b. Leaf blade without stalked glandular hairs.
 - 14a. Stem base densely covered with fibrously lacerate remains of old leaves 144. *S. romuleifolia*
 - 14b. Stem base not densely covered with fibrously lacerate remains of old leaves.
 - 15a. Leaf blade concolorous, grayish white, lanate, sericeous, or pubescent.
 - 16a. Outer phyllaries reflexed; leaf apex obtuse 147. *S. loriformis*
 - 16b. Outer phyllaries erect and appressed; leaf apex acuminate 152. *S. leucophylla*
 - 15b. Leaf blade abaxially subglabrous, lanate, or tomentose, adaxially green, glabrous or sparsely arachnoid and glabrescent.
 - 17a. Stem densely and fluffily lanate; base of basal and lower stem leaves widened into a membranous sheath 145. *S. graminifolia*
 - 17b. Stem glabrous, appressed tomentose, or pilose; base of basal and lower stem leaves not widened into a membranous sheath.
 - 18a. Achene densely gland-dotted; corolla white or pink; leaf blade sometimes pinnately lobed 151. *S. cinerea*
 - 18b. Achene glabrous; corolla purple; leaf blade always undivided.
 - 19a. Leaf blade narrowly elliptic, 3–5 mm wide; involucre 1–1.2 cm in diam. 143. *S. rockii*
 - 19b. Leaf blade narrowly linear, 1–3 mm wide; involucre 1.5–2.5 cm in diam.
 - 20a. Leaf blade abaxially grayish white and lanate tomentose 146. *S. graminea*
 - 20b. Leaf blade abaxially green, glabrous or glabrescent 153. *S. schanginiana*

141. *Saussurea schlagintweitii* Klatt, Sitzungsber. Math.-Phys. Cl. Königl. Akad. Wiss. München 8: 94. 1878.

腺毛风毛菊 xian mao feng mao ju

Saussurea glanduligera Schultz Bipontinus ex J. D. Hooker.

Herbs 10–20 cm tall, perennial, sometimes caespitose. Caudex branched, with several sterile leaf rosettes and flowering stems. Stem solitary, erect, simple, covered at base with remains of petioles. Rosette and basal stem leaves petiolate; petiole adaxially densely white lanate or sericeous at base; leaf blade narrowly elliptic to linear, 2–10 × 0.7–1.2 cm, both surfaces green and densely glandular hairy, margin sinuate-dentate. Middle and upper stem leaves similar to lower ones. Capitulum solitary, terminal on stem, usually surrounded by uppermost linear leaves. Involucre broadly campanulate, 2.5–3.5 cm in diam. Phyllaries in 3 or 4 rows, narrowly triangular-ovate to subulate, densely villous, apex acuminate; outer phyllaries green, 12–20 × 2–3 mm; middle and inner phyllaries purple, 1.8–2 × 0.1–0.2 cm. Corolla purplish red, 1.5–1.7(–2.5) cm,

tube 7–8 mm, limb 8–9 mm, lobes 4–5 mm. Achene cylindric or obconic, 4–5 mm, 4-angled, apically with glands. Pappus pale brown or purplish; outer bristles 1–4 mm; inner bristles 1.2–1.4 cm. Fl. and fr. Jul–Sep.

Scree slopes, grasslands, rock crevices; 4700–5500 m. SW Xinjiang (Yecheng), W Xizang [NW India, Kashmir].

142. *Saussurea tibetica* C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 242. 1894.

西藏风毛菊 xi zang feng mao ju

Herbs 8–25 cm tall, perennial. Caudex simple or few branched. Stem solitary, erect, simple. Rosette and basal leaves petiolate; leaf blade linear, 3–12 × 0.1–0.7(–1) cm, abaxially grayish green and white tomentose, adaxially green or purplish, glabrous, base attenuate, margin revolute and entire or very shallowly crenate, apex acute or obtuse. Stem leaves few, similar to basal leaves, but sessile, base amplexicaul. Uppermost stem leaves usually dark purple. Capitula solitary or 2, terminal on stem. Involucre obconic, 1.5–2 cm in diam. Phyllaries in 3 or 4 rows, dark purple, densely to sparsely villous, apex acumi-

nate; outer phyllaries narrowly triangular-ovate, 8–10 × 3–5 mm; middle phyllaries narrowly ovate-elliptic, 10–12 × 2–3 mm; inner phyllaries linear, 12–14 × 1–2 mm. Corolla purple, 0.9–1.2 cm, glabrous, tube 5–7 mm, limb 4–6 mm, lobes 2.5–4 mm. Achene narrowly obconic, 3.5–4 mm, glabrous, 5-angled, apex with a short crown. Pappus dirty white to pale yellowish brown; outer bristles 1–4 mm; inner bristles 7–11 mm. Fl. and fr. Jul–Aug. $2n = 36^*$.

• Alpine pastures and meadows; 3400–4700 m. Qinghai, NW Sichuan (Sérxü), N Xizang.

143. *Saussurea rockii* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 211. 1934.

显鞘风毛菊 xian qiao feng mao ju

Herbs 10–15 cm tall, perennial, caespitose. Caudex stout, branched, densely covered with blackish brown remains of petioles, sterile leaf rosettes, and flowering stems. Stem ca. 4 mm in diam., erect, simple. Rosette and basal leaves sessile, narrowly elliptic to linear, 5–9 × 0.2–0.5 cm, abaxially grayish green and densely tomentose, adaxially green or yellowish green, sparsely pilose, glabrescent, and nitid, base widened and sheathing, margin revolute and entire or denticulate, apex acute. Stem leaves few, similar to basal leaves. Uppermost stem leaves subtending and exceeding capitulum, merging into phyllaries. Capitulum solitary, terminal on stem. Involucre turbinate-campanulate, 1.5–2 cm in diam. Phyllaries in 4 or 5 rows, sparsely to densely villous, apex acuminate; outer phyllaries narrowly ovate, 12–13 × 2.5–3 mm; middle phyllaries narrowly elliptic, 12–13(–16) × 2–3 mm; inner phyllaries broadly linear, 14–15 × 1.5–2 mm. Corolla dark purple, 0.9–1.1(–1.5) cm, tube 4–5 mm, limb 5–6 mm, lobes 2.5–3 mm. Achene brown, ca. 2.5 mm, glabrous, apex with a short crown. Pappus pale brown; outer bristles 1.5–3 mm; inner bristles 7–8 mm. Fl. and fr. Sep–Oct.

• Rocky slopes; 2700–3900 m. NW Yunnan (Gongshan, Lijiang).

144. *Saussurea romuleifolia* Franchet, J. Bot. (Morot) 2: 339. 1888.

鸾尾叶风毛菊 yuan wei ye feng mao ju

Herbs 10–40 cm tall, perennial, rarely almost stemless. Caudex fusiform, densely covered with many fibrous remains of leaves. Stem solitary, erect, simple. Leaves sessile, narrowly linear, (3–)15–25(–45) × 0.1–0.2(–0.5) cm, longer than stem, rigid, abaxially grayish white and sparsely pubescent, adaxially green and glabrous, margin revolute and entire, apex acute. Capitulum solitary, terminal on stem. Involucre turbinate-campanulate, 2–2.5(–3.5) cm in diam. Phyllaries in ca. 5 rows, apically purple, sericeous, margin entire or denticulate, apex long acuminate; outer phyllaries narrowly triangular-ovate, 13–20 × 3–5 mm; middle phyllaries narrowly ovate-elliptic, 2–2.5 × 0.2–0.4 cm; inner phyllaries linear, 2.5–3.2 × 0.1–0.2 cm. Corolla purple, 1.8–2.5(–3) cm, gland-dotted, tube 0.6–2 cm, limb 0.9–1.2 cm, lobes 6–7 mm. Achene 4–5 mm, apex with a short crown. Pappus dirty white; outer bristles 1–5 mm; inner bristles 1.9–2.2 cm. Fl. and fr. Jul–Aug.

• Grasslands on mountain slopes, forests, forest margins; 2200–4000 m. W Sichuan, SE Xizang (Zayü), NW Yunnan.

145. *Saussurea graminifolia* Wallich ex Candolle, Prodr. 6: 536. 1838.

密毛风毛菊 mi mao feng mao ju

Herbs 7–20 cm tall, perennial. Caudex branched, with sterile leaf rosettes and flowering stems. Stem solitary, erect, simple, densely white lanate. Basal leaves sessile, narrowly linear, 3–14 × 0.1–0.2 cm, abaxially grayish white and densely lanate, adaxially green and glabrous, base widened and sheathlike, margin revolute and entire, apex acuminate. Stem leaves similar to basal leaves, reflexed, basally widened to a purple membranous sheath. Capitulum solitary, terminal on stem. Involucre subglobose, 1.8–2.5 cm in diam. Phyllaries in 4 or 5 rows, lanate; outer phyllaries narrowly ovate-elliptic, 7–15 × 2–4 mm, apically purple, apex long acuminate and reflexed; middle phyllaries narrowly ovate-elliptic, 9–15 × 1.5–3 mm; inner phyllaries linear, 10–15 × 1–2 mm. Corolla purple, 1.1–1.2 cm, glabrous, tube 4–5 mm, limb 6–7 mm, lobes 3–3.5 mm. Achene cylindric, ca. 3 mm, glabrous, apex with a short crown. Pappus pale yellowish brown; outer bristles 1–3 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Sep. $2n = 32^*$.

Grasslands on mountain slopes, grasslands near gravel beaches; 4500–4700 m. S Xizang [Bhutan, NW India, Kashmir, Nepal].

146. *Saussurea graminea* Dunn, J. Linn. Soc., Bot. 35: 509. 1903.

禾叶风毛菊 he ye feng mao ju

Herbs 3–40 cm tall, perennial, caespitose, often in large clumps. Caudex much branched, apically covered with fibrous remains of old leaf bases, sterile leaf rosettes, and flowering stems. Stem erect, simple, densely sericeous or pubescent. Basal leaves sessile, narrowly linear, 3–15 × 0.1–0.3 cm, abaxially densely tomentose, adaxially sparsely pubescent to subglabrous, base sheathing stem, margin revolute and entire, apex acuminate. Stem leaves few, gradually smaller upward on stem. Capitulum solitary, terminal on stem. Involucre campanulate, 1.5–1.8 cm in diam. Phyllaries in 4 or 5 rows, sparsely to densely to sericeous-villous; outer phyllaries narrowly ovate, 10–12 × 2–3 mm, apically reflexed or erect, apex long acuminate; middle phyllaries narrowly ovate-elliptic, ca. 12 × 2 mm; inner phyllaries linear, ca. 12 × 1 mm. Corolla purple, 1.4–1.6 cm, sometimes gland-dotted, tube 6–8 mm, limb 6–9 mm, lobes 4–4.5 mm. Achene cylindric, 3–4 mm, glabrous, apex with a short crown. Pappus pale yellowish brown; outer bristles 1–3 mm; inner bristles ca. 9 mm. Fl. and fr. Jul–Sep. $2n = 32^*$.

• Alpine and montane grasslands and steppes, meadows, thickets; 3000–5400 m. Gansu, Nei Mongol, Ningxia, Qinghai, W Sichuan, Xizang, NW Yunnan.

- 1a. Outer phyllaries densely lanate, apically reflexed 146a. var. *graminea*
- 1b. Outer phyllaries sparsely pubescent, apically erect 146b. var. *ortholepis*

146a. *Saussurea graminea* var. *graminea*

禾叶风毛菊(原变种) he ye feng mao ju (yuan bian zhong)

Saussurea geraeocephala Diels; *S. lanicaulis* Handel-Mazzetti; *S. poophylla* Diels.

Outer phyllaries densely lanate, apically reflexed.

• Alpine and montane grasslands and steppes, meadows, thickets; 3000–4400 m. Gansu, Nei Mongol, Ningxia (Liupan Shan), W Sichuan, NW Yunnan (Ninglang, Zhongdian).

146b. *Saussurea graminea* var. *ortholepis* Handel-Mazzetti, *Acta Horti Gothob.* 12: 339. 1938.

直鳞禾叶风毛菊 zhi lin he ye feng mao ju

Saussurea romuleifolia Franchet var. *ortholepis* (Handel-Mazzetti) Handel-Mazzetti ex S. Y. Hu.

Outer phyllaries appressed, sparsely pubescent, apically erect.

• Alpine and montane steppes; 3300–5400 m. Gansu, Qinghai, W Sichuan, Xizang.

In S. W. Liu (Fl. Qinghai. 3: 465 1996) this taxon was treated under *Saussurea eopygmaea*. Plants from S Qinghai (Chindu, Nangqên, Yushu) often have several (2–4) clustered heads and usually grow taller (10–40 cm); they may deserve separate taxonomic status.

147. *Saussurea loriformis* W. W. Smith, *Notes Roy. Bot. Gard. Edinburgh* 8: 114. 1913.

带叶风毛菊 dai ye feng mao ju

Herbs 10–15 cm tall, perennial, caespitose. Caudex thick, densely covered with dark brown remains of leaf sheaths. Stem erect, simple, grayish white, lanate. Basal and stem leaves sessile, linear, 2–8 × 0.2–0.4 cm, abaxially grayish white and densely lanate, adaxially brownish or yellowish and lanate, base widened and sheathing stem, margin entire, apex obtuse. Capitulum solitary, terminal on stem. Involucre campanulate, 2–3 cm in diam. Phyllaries in 4 or 5 rows, narrowly ovate-elliptic to linear, densely villous, apex acuminate; outer phyllaries ca. 8 × 2 mm, apically reflexed; middle phyllaries ca. 13 × 2 mm, apically reflexed; inner phyllaries ca. 13 × 2 mm, apex acuminate. Corolla pale reddish purple, 1.1–1.2 cm, tube 8–9 mm, limb ca. 3 mm. Achene black, ca. 2.6 mm, apex with a short crown. Pappus white; outer bristles ca. 2 mm; inner bristles ca. 1 cm. Fl. and fr. Jun–Sep.

• Alpine scree slopes, grassy slopes, thickets; 4100–5100 m. W Sichuan, Xizang, NW Yunnan (Dêqên, Lijiang, Zhongdian).

148. *Saussurea brunneopilosa* Handel-Mazzetti, *Notizbl. Bot. Gart. Berlin-Dahlem* 13: 651. 1937.

异色风毛菊 yi se feng mao ju

Saussurea brunneopilosa var. *eopygmaea* (Handel-Mazzetti) Lipschitz; *S. eopygmaea* Handel-Mazzetti.

Herbs 7–45 cm tall, perennial. Caudex branched, covered with fibrous remains of leaf sheaths, sterile leaf rosettes, and flowering stems. Stem solitary, erect, simple. Rosette and basal leaves sessile, narrowly linear, 3–10(–15) × ca. 0.1 cm, abaxially white and densely sericeous, adaxially green and glabrous, basally widened and sheathing stem, margin revolute and entire. Stem leaves similar to basal leaves. Capitulum solitary, terminal on stem. Involucre broadly campanulate, ca. 2 cm in diam. Phyllaries in ca. 4 rows, apically purple, densely brown and white villous; outer phyllaries ovate-elliptic, 7–8 × 2–3 mm,

apically usually reflexed, apex long acuminate; middle phyllaries narrowly ovate-elliptic, 8–10 × 2–3 mm; inner phyllaries narrowly ovate to linear, 10–12 × 1–1.5 mm. Receptacle bristles 4–5 mm. Corolla purple to pink, 1.2–1.4 cm, sometimes gland-dotted, tube 6–7 mm, limb 5–7 mm, lobes 3.5–4 mm. Achene obconic, 3.5–4 mm, glabrous, apex with a denticulate crown. Pappus yellowish brown; outer bristles 1–2 mm, barbellate to plumose; inner bristles 0.9–1.1 cm. Fl. and fr. Jul–Sep. $2n = 30^*$.

• Alpine pastures and meadows, grassy slopes among rocks; 2900–4900 m. Gansu, Qinghai.

The plants treated as *Saussurea eopygmaea* by S. W. Liu (Fl. Qinghai. 3: 465 1996) usually lack the typical brown hairs on the phyllaries and belong to *S. graminea*. The type specimen of *S. eopygmaea* is intermediate between *S. brunneopilosa* and *S. graminea* var. *ortholepis*.

149. *Saussurea pubescens* Y. L. Chen & S. Yun Liang, *Acta Phytotax. Sin.* 19: 95. 1981.

毛果风毛菊 mao guo feng mao ju

Herbs to 6 cm tall, perennial. Caudex branched, apically covered with brown remains of leaf sheaths, sterile leaf rosettes, and flowering stems. Stem erect, simple, densely white lanate. Basal leaves sessile, linear, 3–8 × 0.2–0.3 cm, abaxially densely lanate and with a conspicuous midvein, adaxially sparsely pilose, base somewhat widened, sheathing stem, and densely lanate, margin revolute, apex acute to acuminate. Stem leaves few, shorter. Capitula 1 or 2, terminal on stem. Involucre campanulate, (0.6–)1.5–2 cm in diam. Phyllaries in 3 or 4 rows, densely brown villous; outer phyllaries green, narrowly ovate, ca. 10 × 2 mm, apically reflexed, apex long acuminate; inner phyllaries basally straw-colored but apically purplish red, linear, 13–15 × 1–2 mm. Corolla dark pink, 1.2–1.3 cm, tube 5–6 mm, limb ca. 7 mm, lobes ca. 3 mm. Achene cylindric, ca. 2 mm, densely white villous. Pappus pale brown but basally purplish. Fl. and fr. Jul–Sep.

• Mountain slopes; ca. 4900 m. SC Xizang (Namling).

Saussurea pubescens is only known from the type collection.

150. *Saussurea sericea* Y. L. Chen & S. Yun Liang, *Acta Phytotax. Sin.* 19: 96. 1981.

绢毛风毛菊 juan mao feng mao ju

Herbs 2–3 cm tall, perennial, caespitose. Caudex branched, covered with brown remains of leaf sheaths. Stem erect, simple, white sericeous. Leaves sessile, linear, 1–2.5 × 0.2–0.3 cm, both surfaces grayish white, densely sericeous, and with a conspicuous midvein, base somewhat widened and sheathing stem, apex acute. Capitulum solitary, terminal on stem. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 3 or 4 rows, densely brown villous; outer phyllaries green, narrowly ovate-elliptic, 8–10 × 2–2.5 mm, apically reflexed; middle and inner phyllaries basally yellowish green and apically purplish red, linear, 10–12 × 1–2 mm. Corolla purplish red, 0.9–1.3(–1.6) cm, usually gland-dotted, tube 4–6(–9.5) mm, often with hairs, limb 5–7 mm, lobes 3–4.5 mm. Achene cylindric, 2–3 mm, densely white villous. Pappus straw-colored; outer bristles 0.5–2 mm, inner bristles basally purple, 1–1.2 cm. Fl. and fr. Jul–Sep.

• Mountain slopes, scree slopes, alpine mats; 5000–5200 m. SC Xizang (Lhünzê).

The reported records of *Saussurea sericea* from Bhutan and India (Sikkim) (Grierson & Springate, Fl. Bhutan 2(3): 1442. 2001) do not belong here because the achenes from these collections are glabrous and not white villous.

151. *Saussurea cinerea* Franchet, Bull. Mus. Hist. Nat. (Paris) 3: 324. 1897.

昆仑风毛菊 kun lun feng mao ju

Saussurea pusilla Lipschitz.

Herbs 3–7(–9) cm tall, perennial, stemless or shortly stemmed. Caudex long and thin, ascending, apically branched, covered with brownish remains of leaf sheaths. Stems solitary or few, erect, simple, arachnoid tomentose. Basal leaves indistinctly petiolate; leaf blade narrowly linear, 1–7 × 0.1–0.4 cm, undivided or pinnately lobed, abaxially grayish white and arachnoid tomentose, adaxially grayish green and arachnoid, margin revolute and entire or sparsely dentate, apex acute. Stem leaves few, shortly petiolate; petiole basally widened, semiamplexicaul; leaf blade gradually smaller upward on stem. Capitula solitary or 2, terminal on stem. Involucre cylindric to campanulate, (0.6–)1–1.5 cm in diam. Phyllaries in 4 or 5 rows, pale green, densely lanate, apex acuminate; outer phyllaries ovate to narrowly ovate, ca. 5 × 2 mm; middle phyllaries narrowly ovate-elliptic, 5–10 × 2–2.5 mm; inner phyllaries narrowly elliptic to linear, 10–13 × 1.5–2 mm. Receptacle naked or with very short papillae but without bristles. Corolla pink or white, 1.5–1.7 cm, sparsely gland-dotted, tube 8–9 mm, limb 6–8 mm, lobes 2.5–3 mm. Achene brown, cylindric, 3–5 mm, ribbed, densely gland-dotted. Pappus dirty white; outer bristles 0.5–3.5 mm, plumose; inner bristles 1.2–1.4 cm. Fl. and fr. Jul–Aug.

• Alpine stony slopes, scree slopes, grazed areas, silt or mud; 3000–3800 m. S Xinjiang (Kunlun Shan).

152. *Saussurea leucophylla* Schrenk, Bull. Sci. Acad. Imp. Sci. Saint-Petersbourg 10: 354. 1842.

白叶风毛菊 bai ye feng mao ju

Herbs 3–12 cm tall, perennial, caespitose. Caudex branched, with many sterile leaf rosettes and flowering stems, covered with brown fibrous remains of old leaf sheaths. Stem erect, simple, purple and densely sericeous. Rosette and basal stem leaves sessile, narrowly linear, 3–8 × 0.1–0.2 cm, both surfaces grayish white and lanate, base widened and sheathing stem, margin revolute and entire, apex acuminate. Capitulum solitary, terminal on stem. Involucre obconic, 2.5–3.5 cm in diam. Phyllaries in 3 or 4 rows, purple, white villous; outer phyllaries ovate, 10–12 × 4–5 mm, apex acuminate to caudate; middle phyllaries narrowly ovate-elliptic, 12–15 × 2–4 mm; inner phyllaries linear, 14–15 × 1–2 mm. Corolla rose-purple, 1.6–1.8 cm, tube 9–10 mm, limb 7–9 mm, lobes 5–6 mm. Achene brown, cylindric, ca. 2 mm, apex with a short crown. Pappus yellowish brown; outer bristles 1–3 mm; inner bristles 1.1–1.5 cm. Fl. and fr. Jul–Aug.

Alpine pastures and meadows, mountain slopes; 2600–4000 m. Xinjiang [Kazakhstan, Kyrgyzstan, W Mongolia, Russia (Siberia), Tajikistan].

153. *Saussurea schanginiana* (Wydler) Fischer ex Sergievskaya in Krylov, Fl. Zapadnoi Sibiri 11: 2906. 1949.

暗苞风毛菊 an bao feng mao ju

Lagrostemon pygmaeus (Jacquin) Cassini var. *schanginianus* Wydler, Linnaea 5: 427. 1830 [*Schanginiana*]; *Saussurea pygmaea* (Jacquin) Sprengel var. *schanginii* Candolle, nom. illeg. superfl.

Herbs [4–]10–34 cm tall, perennial. Stems solitary or few, erect, simple. Leaves sessile, narrowly elliptic to linear, 4–20 × 0.1–0.5(–1) cm, both surfaces dark green and sparsely villous to subglabrous, margin entire or sparsely denticulate, apex acute to acuminate. Capitulum solitary, terminal on stem. Involucre campanulate, 1–2 cm in diam. Phyllaries in ca. 3 rows, villous, subequal in length; outer and middle phyllaries ovate-triangular to narrowly elliptic, 14–15 × 3–4 mm; inner phyllaries narrowly elliptic to linear, 14–15 × 1–1.5 mm. Receptacle bristles 3–5 mm. Corolla violet, 1.4–1.6 cm, tube 7–9(–10) mm, limb 6–7 mm, lobes 3–5 mm. Achene brown, cylindric, 5–6 mm, ribbed, apex with a short crown. Pappus dirty white to light brown; outer bristles 1–4 mm; inner bristles 1–1.2 cm. Fl. and fr. Jul–Aug. $2n = 36$.

Alpine meadows, tundra, scree and rocky slopes; 2100–2800 m. N Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Russia (Siberia)].

154. *Saussurea krylovii* Schischkin & Sergievskaya, Sist. Zametki Mater. Gerb. Krylova Tomsk. Gosud. Univ. Kuybysheva 1944(1): 1. 1944.

阿尔泰风毛菊 a er tai feng mao ju

Herbs 10–50 cm tall, perennial. Stem solitary, erect, simple. Basal and lower stem leaves shortly petiolate; leaf blade narrowly elliptic to linear, 10–20 × 0.6–1.5 cm, both surfaces green and scabrid, margin sinuate-dentate, apex acuminate. Middle and upper stem leaves sessile, gradually smaller upward on stem. Capitula (1 or) 2–4, in a corymbiform synflorescence, shortly pedunculate. Involucre campanulate, to 2 cm in diam. Phyllaries in ca. 3 rows; outer phyllaries ovate to narrowly elliptic; inner phyllaries narrowly elliptic, apex long acuminate. Receptacle bristles to 5 mm. Corolla dirty violet, 1.3–1.4(–1.6) cm, tube 7–8 mm, limb 5–6 mm, lobes ca. 3 mm. Achene brown, cylindric, (3–)5–7 mm. Pappus dirty white; outer bristles 1–2 mm; inner bristles 1–1.1 cm. Fl. and fr. Jul–Sep.

Alpine meadows, forest margins; 2300–2800 m. N Xinjiang [Kazakhstan, Mongolia, Russia (W Siberia)].

155. *Saussurea baicalensis* (Adams) B. L. Robinson, Proc. Amer. Acad. Arts 47: 216. 1911.

大头风毛菊 da tou feng mao ju

Liatris baicalensis Adams, Mém. Soc. Imp. Naturalistes Moscou 5: 115. 1817; *Saussurea calobotrys* Diels; *S. pycnocephala* Ledebour.

Herbs 30–45(–60) cm tall, perennial. Stem solitary, 0.8–1.5 cm in diam., erect, simple, covered at base with lacerate remains of leaf sheaths. Leaves shortly petiolate; leaf blade narrowly ovate to narrowly elliptic, 10–20 × 1–3 cm, both surfaces

green and scabrous, abaxially glabrous, adaxially sparsely villous to subglabrous, base cuneate, margin dentate, apex acute to acuminate. Capitula 7–16, in a dense racemiform 10–25 cm synflorescence, sessile or shortly pedunculate, subtended by narrowly triangular-ovate herbaceous bracts. Involucre campanulate, 1.5–2.5(–3) cm in diam. Phyllaries in 3 or 4 rows, green but dark on midvein and apically, narrowly triangular-ovate, 1.5–2.2 × 0.2–0.4 cm, villous, apex acute to acuminate. Receptacle with apiculate papillae or short to 3 mm bristles. Corolla purple, 1.5–1.7 cm, tube 8–9 mm, limb 7–8 mm, lobes 4–4.5 mm. Achene brown, cylindric, 5–6 mm, ribbed, apex with a short crown. Pappus straw-colored; outer bristles 2–5 mm; inner bristles 1.3–1.4 cm. Fl. and fr. Jun–Jul. $2n = 26, 36$.

Alpine meadows, around exposed ledges and boulders; 2000–3200 m. Hebei (Dongling Shan, Xiaowutai Shan) [Mongolia, Russia (Siberia)].

Material of *Saussurea baicalensis* from both known localities in China has receptacle bristles to 3 mm.

156. *Saussurea sylvatica* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 495. 1882.

林生风毛菊 lin sheng feng mao ju

Saussurea hsiaowutaishanensis F. H. Chen; *S. sylvatica* var. *hsiaowutaishanensis* (F. H. Chen) Lipschitz.

Herbs 20–80 cm tall, perennial. Stem 2–4 mm in diam., erect, simple or apically branched, with dentate wings, covered at base with fibrous remains of petioles. Lower stem leaves petiolate; petiole 1–5 cm; leaf blade narrowly elliptic, obovate, or narrowly ovate, (3–)7–13 × 0.8–2 cm, abaxially glaucous, adaxially green and glabrous or sparsely pubescent, base cuneate, margin denticulate, apex rounded to subacute. Middle and upper stem leaves sessile, narrowly ovate-elliptic, 3.5–12 × 0.5–1.5 cm, base decurrent, apex acute. Uppermost stem leaves narrowly triangular to subulate-linear, 2–4 × 0.1–0.5 cm. Capitula 1–6, in a ± condensed corymbiform synflorescence, sessile to long pedunculate. Involucre campanulate, 1.2–2 cm in diam. Phyllaries in 4 or 5 rows, blackish purple, pilose-sericeous to glabrescent, apex acute to acuminate; outer phyllaries ovate-triangular, 6–7 × 2–4 mm; middle and inner phyllaries narrowly triangular-ovate to linear, 7–15 × 2–3 mm. Corolla purple, 1.5–1.6 cm, tube 8–8.5 mm, limb 7–7.5 mm, lobes 3–3.5 mm. Achene brown, cylindric, 5–5.5 mm, 4- or 5-angled, glabrous, with a short crown. Pappus brown; outer bristles (2–)3–5 mm; inner bristles 1.2–1.3 cm. Fl. and fr. Jun–Sep. $2n = 30^*$.

• Alpine and montane grasslands, thickets, forest margins; 1900–4500 m. Gansu, Hebei (Xiaowutai Shan), Qinghai, Shaanxi, Shanxi, Sichuan.

157. *Saussurea sobarocephala* Diels, Bot. Jahrb. Syst. 36(Beibl. 82): 108. 1905.

昂头风毛菊 ang tou feng mao ju

Herbs 20–60 cm tall, perennial. Stem solitary, erect, simple or apically branched, winged, covered at base with numerous fibrous remains of old petioles. Basal and lower stem leaves sessile, ovate to oblong, 8–12 × 1–2 cm, both surfaces green and glabrous, base decurrent, margin serrulate, apex acute.

Middle and upper stem leaves ovate to narrowly ovate, gradually smaller upward on stem, 4–7 × 1–1.5 cm, apex long acuminate. Capitula 2–11, in a corymbiform synflorescence, sessile to pedunculate. Involucre campanulate to hemispheric, 2–3.5 cm in diam. Phyllaries in 4 or 5 rows, usually black, apex acuminate; outer phyllaries narrowly ovate-triangular, 10–15 × 2–3(–5) mm; middle and inner phyllaries narrowly elliptic to linear, (10–)15–20 × 1–3(–4) mm. Corolla purple, 1.6–1.7 cm, glabrous, tube 9–10 mm, limb 5–6 mm, lobes 3.5–4 mm. Achene cylindric, 5–6 mm, ribbed, apex with a short crown. Pappus pale yellowish brown; outer bristles 1–5 mm, scabrid; inner bristles ca. 1.2 cm. Fl. and fr. Jul–Aug. $2n = 34^*$.

• Forest margins, grasslands on mountain slopes; 1900–3600 m. Hebei, Henan, Shaanxi, Shanxi, Sichuan.

Saussurea sobarocephala has often been confused with *S. sylvatica*.

158. *Saussurea souliei* Franchet, Bull. Annuel Soc. Philom. Paris, sér. 8, 3: 147. 1891.

披针叶风毛菊 pi zhen ye feng mao ju

Herbs 35–55 cm tall, perennial. Stem solitary, 3–5 mm in diam., erect, simple, winged, covered at base with lacerate remains of leaf sheaths. Leaves sessile, narrowly ovate-elliptic, 7–10 × 1.5–2 cm, abaxially grayish white and sericeous-tomentose, adaxially dark green and pubescent, base decurrent, margin dentate, apex acute. Capitula 10–20(–30), in a subglobose, densely congested corymbiform synflorescence 4–5 cm in diam., shortly pedunculate. Involucre campanulate to globose, 0.8–1.2 cm in diam. Phyllaries in 6–8 rows, basally brown to straw-colored, apically green, villous, apex acute to acuminate; outer phyllaries narrowly triangular-ovate, 4–6 × ca. 2 mm; middle phyllaries narrowly ovate-elliptic, 6–8 × 2–3 mm; inner phyllaries linear, 8–12 × 1.5–2 mm. Corolla purple, ca. 1.2 cm, tube ca. 6 mm, limb ca. 6 mm, lobes ca. 3 mm. Pappus dirty white; inner bristles ca. 8 mm. Fl. Aug.

• W Sichuan (Kangding).

159. *Saussurea semifasciata* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 60: 100. 1923.

锯叶风毛菊 ju ye feng mao ju

Herbs 15–100 cm tall, perennial. Stem solitary, 6–8 mm in diam., erect, simple or apically branched, with sinuate-lobate, dentate wings, covered at base with fibrous remains of leaf sheaths. Leaves sessile, narrowly ovate-triangular, 5–18 × 0.8–2 cm, abaxially green and glabrous, adaxially dark green and sparsely arachnoid, base decurrent, margin sinuate-lobate and doubly dentate, apex acute to long acuminate. Capitula 8–25, in a basally lax but apically clustered corymbiform synflorescence, long pedunculate to subsessile. Involucre broadly campanulate to subglobose, 1.5–2 cm in diam. Phyllaries in 4 or 5 rows, basally brown or straw-colored, apically green with a blackish to black margin, pilose, apex acute; outer phyllaries narrowly triangular-ovate, 8–10 × 2–3 mm; middle phyllaries narrowly elliptic, 10–13 × 1.5–2 mm; inner phyllaries linear, 13–14 × 1–1.5 mm. Corolla red, 1.1–1.5 cm, tube 6–9 mm, limb 5–6 mm, lobes 3–3.5 mm. Achene dark brown, cylindric, ca. 3 mm, obtusely 4-angled, glabrous, apex with a short crown.

Pappus light brown; outer bristles ca. 2 mm; inner bristles 1–1.2 cm. Fl. and fr. Aug–Sep.

• Forests, thickets, near rivers; 3800–4800 m. Gansu, Qinghai, Sichuan, NW Yunnan (Dêqên, Zhongdian).

160. *Saussurea megacephala* C. C. Chang ex Y. S. Chen, Ann. Bot. Fenn. 48: 142. 2011.

察隅风毛菊 cha yu feng mao ju

Herbs 60–70 cm tall, perennial. Stem solitary, 1–1.7 cm in diam. at base, erect, simple, hollow. Basal and lower stem leaves petiolate; petiole 1–6 cm; leaf blade narrowly elliptic, 13–16 × 1–2.5 cm, both surfaces green and glabrous, base decurrent, margin coarsely sinuate-dentate, apex acute. Middle and upper stem leaves sessile, gradually smaller upward on stem, 4–9 × 0.2–1.2 cm, margin denticulate or entire, apex acuminate. Uppermost stem leaves linear, 10–15 × ca. 1 mm. Capitula 3 or 4, in a clustered corymbiform synflorescence, sessile. Involucre globose, 2–2.5 cm in diam. Phyllaries in 6 or 7 rows, brown, densely villous, apex acuminate; outer phyllaries triangular-oblong, 9–10 × 2.8–3 mm; middle phyllaries ovate-oblong, 8–10 × 2.5–2.8 mm; inner phyllaries narrowly ovate, 14–15 × ca. 2 mm. Receptacle bristles yellowish brown, 5–6 mm. Corolla dark purple, 1.4–1.5 cm, glabrous, tube ca. 7 mm, limb 7–8 mm, lobes ca. 3 mm. Achene brown, cylindric, 2.8–3(–4) × 0.5–1 mm, glabrous. Pappus yellowish white; outer bristles 5–6 mm; inner bristles 1.1–1.4 cm. Fl. Aug.

• *Juniperus* forests; ca. 3500 m. SE Xizang (Zayü).

Saussurea megacephala is only known from the type and is very close to *S. semifasciata*, from which it differs by its petiolate lower leaves, non-decurrent stem leaves, and sessile and glomerate capitula.

161. *Saussurea sordida* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 389. 1842.

污花风毛菊 wu hua feng mao ju

Saussurea pycnocephala Ledebour var. *sordida* (Karelin & Kirilov) Herder; *S. russowii* C. Winkler; *S. sordida* var. *oligocephala* C. Winkler ex Lipschitz; *S. tuoliensis* K. M. Shen.

Herbs 40–100 cm tall, perennial. Stem solitary, erect, simple or apically branched, covered at base with fibrous remains of leaf sheaths. Lower stem leaves petiolate; petiole to 10 cm, winged; leaf blade ovate to narrowly ovate-elliptic, 15–40 × 2–7 cm, both surfaces green, abaxially pilose but glabrescent, adaxially scabrid, margin serrulate-dentate, apex acuminate. Middle and upper stem leaves sessile, elliptic to narrowly ovate-elliptic, gradually smaller upward on stem. Capitula solitary to numerous, in a lax corymbiform or racemiform synflorescence, pedunculate. Involucre broadly campanulate, 2–2.5 cm in diam. Phyllaries in 4 or 5 rows, blackish brown or straw-colored with a dark margin, triangular-ovate to narrowly triangular-ovate, pilose but later glabrescent, apex acuminate; outer phyllaries 9–12 × 3–4 mm; middle phyllaries narrowly elliptic, 13–15 × 2–3 mm; inner phyllaries 15–18 × 1.5–2 mm. Corolla purple, 1.2–1.5 cm, tube 5–8 mm, limb 5–9 mm, lobes 2–4 mm. Achene brown with dark spots, cylindric, 5–6 mm, obtusely 4- or 5-angled, glabrous, apex with a short crown. Pappus straw-colored; outer bristles 1–5 mm; inner bristles 1–1.5 cm. Fl. and fr. Jul–Sep.

Meadows, gravelly mountain slopes; 2000–2800 m. C and NW Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

According to Lipschitz (Fl. URSS 27: 402. 1962), *Saussurea sordida* is a widespread and very variable taxon, including larger plants from China that had been described as *S. russowii*. Following this wide concept, we also include *S. tuoliensis* here, which perfectly matches *S. russowii*.

6. *Saussurea* sect. *Strictae* C. B. Clarke, Compos. Ind. 221. 1876.

羽裂风毛菊组 yu lie feng mao ju zu

Aplotaxis Candolle; *Cyathidium* Lindley ex Royle; *Eriostemon* Lessing (1832), not Smith (1798).

Herbs, perennial, stemless, substemless, or with developed leafy or scapiform stems. Leaves usually pinnately dentate, pinnately lobed, or pinnatisect, rarely undivided. Capitula usually relatively large, solitary, sometimes 2 or 3 in center of leaf rosette or terminal on stem, rarely numerous in a clustered corymbiform synflorescence. Phyllaries in many rows, imbricate, often subequal in length. Receptacle usually with subulate bristles, rarely naked. Anther tails usually lanate or villous. Achene ribbed, smooth or transversely rugose, glabrous. Pappus usually in 2 rows, white, straw-colored, or brown; outer bristles short, deciduous, scabrid, rarely plumose or barbellate, rarely lacking; inner bristles long, plumose.

About 44 species: Bhutan, China, NE and NW India, Kashmir, Nepal; 36 species (27 endemic) in China.

Saussurea sect. *Strictae* occurs mainly on the Qinghai-Xizang Plateau and in the Hengduan Shan region.

Saussurea sect. *Cyathidium*, the name used by Lipschitz (Rod *Saussurea*, 154. 1979) for both stemless and cauliferous species with predominantly pinnately divided and often dandelion-like leaves, is not the earliest legitimate name for this taxon at sectional rank. *Saussurea taraxacifolia*, the type species of the genus *Cyathidium*, was included in *S. sect. Strictae* by C. B. Clarke (loc. cit.) and chosen as a lectotype of that section by Lipschitz (loc. cit.: 155). *Saussurea andersonii*, the lectotype species of *S. sect. Depressae*, is considered here to be a member of *S. sect. Strictae* as well. *Saussurea* sect. *Acaules*, lectotypified by Kitamura (Acta Phytotax. Geobot. 24: 22. 1969) with *S. stoliczkae* (= *S. andryaloides*), is also a synonym of this section. See also the discussion under *S. sect. Gymnocline*.

1a. Plants stemless or shortly stemmed, less than 10 cm tall; capitula usually in center of leaf rosette, exceeded by leaves.

2a. Leaf blade undivided with margin entire, shallowly crenate, or sinuate-dentate.

3a. Leaf blade 1–4 cm; involucre narrowly campanulate, 1–1.5 cm in diam. 185. *S. dschungdienensis*

- 3b. Leaf blade 3–11 cm; involucre broadly campanulate, 2–3.5 cm in diam.
 - 4a. Leaf blade narrowly elliptic to linear, 0.4–1.2 cm wide; inner phyllaries to 1.5 cm; achene transversely rugose 172. *S. lhunzhubensis*
 - 4b. Leaf blade elliptic, 1–3.5 cm wide; inner phyllaries 2–2.5 cm; achene smooth 184. *S. arenaria*
- 2b. Leaf blade bipinnatisect, pinnatisect, pinnately lobed, or pinnately dentate.
 - 5a. Leaf blade bipinnatisect or pinnatisect with split segments.
 - 6a. Leaf blade narrowly elliptic, 6–15 cm; involucre campanulate, 2–2.5 cm in diam. 180. *S. colpodes*
 - 6b. Leaf blade narrowly elliptic-linear, 3–5 cm; involucre cylindric to narrowly campanulate, 1–1.5 cm in diam. 186. *S. lavrenkoana*
 - 5b. Leaf blade simply pinnatisect, pinnately lobed to pinnately dentate, or lyrate-pinnately lobed.
 - 7a. Leaf blade adaxially grayish green, \pm arachnoid tomentose.
 - 8a. Involucre 2–3 cm in diam.; receptacle without bristles; leaf blade obovate-oblong to elliptic, 2–4 cm wide; phyllaries whitish, with a purple mucro 178. *S. porphyroleuca*
 - 8b. Involucre 1–2 cm in diam.; receptacle with bristles; leaf blade narrowly ovate-elliptic, 0.3–1.5 cm wide; phyllaries purplish red, without a purple mucro 187. *S. andryaloides*
 - 7b. Leaf blade adaxially green, glabrous, scabrid and strigose, or sparsely arachnoid.
 - 9a. Capitula several in a clustered or lax corymbiform synflorescence; involucre ovoid or campanulate, 0.5–1.2 cm in diam.
 - 10a. Plants usually stemless, 1–5 cm tall; leaf blade narrowly elliptic to linear, 0.5–1.5 cm wide; capitula usually 3–10, in a clustered synflorescence; pappus brown, in 1 row 183. *S. salwinensis*
 - 10b. Plants with a \pm developed stem, 5–10(–15) cm tall; leaf blade obovate to narrowly obovate, 1–3 cm wide; capitula usually 2–5, in a lax synflorescence; pappus dirty white, in 2 rows 191. *S. nimborum*
 - 9b. Capitula always solitary; involucre usually campanulate, 1–4 cm in diam.
 - 11a. Leaf blade abaxially pale green, subglabrous, sparsely pilose on veins and margin 188. *S. andersonii*
 - 11b. Leaf blade abaxially grayish green or grayish white, densely tomentose or thinly to moderately lanate.
 - 12a. Outer pappus bristles 8–11 mm, plumose; leaf blade abaxially thinly to moderately lanate 197. *S. donkiah*
 - 12b. Outer pappus bristles 1–6 mm, scabrid; leaf blade abaxially densely tomentose.
 - 13a. Leaf blade adaxially smooth, sparsely arachnoid 195. *S. leiocarpa*
 - 13b. Leaf blade adaxially scabrid, strigose or glandular, or glabrous but not arachnoid.
 - 14a. Leaf blade linear, 0.3–0.8 cm wide.
 - 15a. Leaf blade pinnately lobed or pinnately dentate; involucre broadly campanulate, 2–2.5 cm in diam. 189. *S. purpurascens*
 - 15b. Leaf blade runcinately pinnatisect; involucre narrowly campanulate, 0.6–1 cm in diam. 190. *S. nyalamensis*
 - 14b. Leaf blade narrowly elliptic, oblong, or obovate, 0.8–4 cm wide.
 - 16a. Leaf blade narrowly elliptic, oblong, or broadly linear, pinnatisect; leaf blade lateral lobes 8–20 pairs.
 - 17a. Achene smooth; leaf blade 4–30 \times 1–4 cm; leaf blade lateral lobes 8–20 pairs; involucre 2–4 cm in diam.; phyllaries sparsely pilose 194. *S. kansuensis*
 - 17b. Achene transversely rugose; leaf blade 3–18 \times 0.8–2.5 cm; leaf blade lateral lobes 8–12 pairs; involucre 1–3 cm in diam.; phyllaries glabrous 193. *S. leontodontoides*
 - 16b. Leaf blade obovate or narrowly obovate, lyrate or pinnately lobed; leaf blade lateral lobes 3–8 pairs.
 - 18a. Plants stemless, to 3 cm tall; leaf blade obovate-elliptic, 1.5–4.5 \times 0.8–1.5 cm 192. *S. ceterach*
 - 18b. Plants stemless or shortly stemmed, 3–10 cm tall; leaf blade obovate to narrowly obovate, 3–12 \times 1–3 cm.
 - 19a. Leaf blade shallowly pinnately lobed; involucre ovoid, 0.5–1.2 cm in diam. 191. *S. nimborum*
 - 19b. Leaf blade lyrate-pinnately lobed; involucre campanulate, 1.2–1.5 cm in diam. 196. *S. brachylepis*
- 1b. Plants with well-developed flowering stems, usually more than 10 cm tall; capitula usually solitary and terminal on stem or sometimes several in a corymbiform or paniculiform synflorescence.
 - 20a. Capitula several, in a paniculiform or corymbiform synflorescence.

- 21a. Capitula 4–15, in a paniculiform synflorescence, pedunculate; leaf blade green and glabrous on both surfaces 162. *S. incisa*
- 21b. Capitula 2–20, clustered in corymbiform synflorescence, subsessile; leaf blade abaxially grayish white and densely tomentose, adaxially green.
- 22a. Capitula 2–5(–8); involucre campanulate, 1–1.5 cm in diam.; phyllaries subglabrous, inner ones 1.3–1.6 cm 181. *S. lingulata*
- 22b. Capitula 3–20; involucre ovoid to globose, 0.6–1 cm in diam.; phyllaries sparsely villous, inner ones to 1 cm 182. *S. przewalskii*
- 20b. Capitulum solitary, or rarely 2 or 3, terminal on stem.
- 23a. Leaf blade green on both surfaces, glabrous or subglabrous.
- 24a. Leaf blade pinnatisect, lateral segments linear, margin entire 163. *S. henryi*
- 24b. Leaf blade runcinate-pinnately lobed, lateral lobes narrowly triangular-falcate, semiorbicular, or triangular, margin dentate.
- 25a. Stem and petioles subglabrous or whitish pubescent; leaf blade adaxially subglabrous; involucre 0.8–1.7 cm in diam.; outer pappus bristles plumose 164. *S. eriostemon*
- 25b. Stem and petioles densely covered with pale brown multicellular articulate hairs; leaf blade adaxially scabrid, strigose; involucre 1.5–2.5 cm in diam.; outer pappus bristles scabrid 165. *S. scabrida*
- 23b. Leaf blade abaxially grayish green or grayish white and densely tomentose, arachnoid, or lanate, adaxially green and glabrous, subglabrous, or sparsely arachnoid.
- 26a. Leaf blade bipinnately lobed or bipinnatisect 167. *S. centiloba*
- 26b. Leaf blade not bipinnately lobed or bipinnatisect but rather simply pinnately lobed, pinnatisect, or rarely undivided.
- 27a. Leaf blade undivided with margin entire, sinuate, denticulate, or dentate.
- 28a. Leaf blade linear to narrowly elliptic, less than 1 cm wide (if wider then leaf blade pinnatisect) 168. *S. yunnanensis*
- 28b. Leaf blade elliptic, obovate, or oblong, 1–2 cm wide.
- 29a. Outer phyllaries reflexed; corolla ca. 2 cm 173. *S. paleacea*
- 29b. Outer phyllaries not reflexed; corolla ca. 1.5 cm 174. *S. limprichtii*
- 27b. Leaf blade runcinate-pinnately lobed, or pinnatisect.
- 30a. Leaf blade adaxially grayish green and \pm arachnoid tomentose, lyrate pinnately lobed; receptacle without bristles; phyllaries whitish, densely arachnoid tomentose, with purple mucro 178. *S. porphyroleuca*
- 30b. Leaf blade adaxially green and glabrous, pubescent, glandular, or strigose, pinnately lobed to pinnatisect; receptacle with bristles; phyllaries not arachnoid, without purple mucro.
- 31a. Leaf blade adaxially glabrous or subglabrous.
- 32a. Stem ca. 5 mm in diam. at base; capitula large; involucre 2.5–3.5 cm in diam.; phyllaries densely villous 177. *S. wardii*
- 32b. Stem 2–3 mm in diam. at base; capitula small; involucre 1.5–2.5 cm in diam.; phyllaries sparsely villous or glabrous.
- 33a. Leaf blade runcinately pinnatisect; leaf blade segments narrowly triangular-linear, strongly reclinate, margin revolute 168. *S. yunnanensis*
- 33b. Leaf blade pinnately lobed; leaf blade lobes obliquely triangular, patent or recurved, margin not revolute.
- 34a. Leaf blade 5–15 \times 1–2.5 cm; leaf blade lobes 5–7 pairs 166. *S. taraxacifolia*
- 34b. Leaf blade 2–6.5 \times 0.6–1.7 cm; leaf blade lobes 2–5 pairs 169. *S. leptolepis*
- 31b. Leaf blade adaxially scabrid, pubescent, glandular hairy, strigose, or sparsely arachnoid.
- 35a. Outer phyllaries usually reflexed, apical part green and herbaceous.
- 36a. Leaf blade lyrate, pinnately lobed, or subpinnatisect; involucre 1.5–2 cm in diam.; basal leaves usually shorter than flowering stem 175. *S. semilyrata*
- 36b. Leaf blade pinnatisect; segments coarsely dentate; involucre 2–3.5 cm in diam.; basal leaves usually longer than flowering stem 179. *S. pachyneura*

- 35b. Outer phyllaries erect, appressed, apical part straw-colored or brownish to blackish purple and not herbaceous.
- 37a. Leaf blade runcinate-pinnately lobed, sometimes lyrate; leaf blade lobes 3–8 pairs, obliquely triangular; capitula large; involucre 2.5–3.5 cm; outer phyllaries narrowly triangular-subulate 176. *S. subulisquama*
- 37b. Leaf blade pinnatisect; leaf blade lobes 7–13 pairs, narrowly oblong or narrowly triangular-ovate; capitula medium-sized; involucre 1–2.5 cm in diam.; outer phyllaries narrowly ovate-triangular.
- 38a. Lateral leaf blade lobes 7–13 pairs, narrowly oblong, apex rounded and mucronate 170. *S. polypodioides*
- 38b. Lateral leaf blade lobes 10–20 pairs, narrowly triangular-ovate, apex acuminate 171. *S. coriacea*

162. *Saussurea incisa* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 6: 96. 1935.

锐裂风毛菊 rui lie feng mao ju

Herbs 15–20 cm tall, perennial. Stem solitary, 1–2 mm in diam., erect, branched. Basal and lower stem leaves long petiolate; leaf blade ovate-triangular, 4–10 × 3–6 cm, abaxially pale green and glabrous, adaxially dark green, base cordate-hastate, margin incised-dentate, teeth wide and triangular, apex acuminate. Upper stem leaves narrowly elliptic to linear, 1–3 × 0.2–0.8 cm. Capitula 4–15, in a paniculiform synflorescence, pedunculate. Involucre ovoid to obconic, 5–10 mm in diam. Phyllaries in ca. 4 rows, glabrous or sparsely arachnoid near margin, apex acuminate; outer phyllaries narrowly ovate, 2–4 × 0.5–1.5 mm; middle phyllaries narrowly elliptic, 4–7 × 1–1.5 mm; inner phyllaries linear, 7–9 × 0.5–1 mm, with conspicuous green veins. Corolla 0.9–1.1 cm, tube 4–5 mm, limb 4–5 mm, lobes 3–3.5 mm. Achene grayish brown with blackish dots, cylindric, 4–5 mm, glabrous. Pappus white; outer bristles 1–3 mm; inner bristles 7–8 mm. Fl. and fr. Aug–Oct.

• Meadows, thickets. Hebei (Changli, Xiaowutai Shan).

163. *Saussurea henryi* Hemsley, J. Linn. Soc., Bot. 29: 311. 1892.

巴东风毛菊 ba dong feng mao ju

Herbs 12–80 cm tall, perennial. Stem solitary, 1–2 mm in diam., erect, usually simple. Basal and lower stem leaves petiolate; petiole 2–9 cm; leaf blade narrowly elliptic, 5–12.5 × 2–4.5 cm, pinnatisect, both surfaces green, abaxially glabrous, adaxially sparsely strigose; lateral segments 6–11 pairs, linear, 10–20 × 3–6 mm, margin revolute and entire, apex acute and mucronate; terminal segment linear, 5–20 × 2–3 mm. Middle stem leaves much smaller and with fewer segments. Upper stem leaves linear-filiform, 1–2 × 0.2–0.4 cm, margin entire, apex caudate. Capitulum solitary, sometimes 2 or 3, terminal on stem. Involucre obconic, 1.3–1.6 cm in diam. Phyllaries in ca. 5 rows, sparsely arachnoid tomentose, glabrescent, apex long acuminate; outer phyllaries narrowly ovate-elliptic, 5–6 × 1–2 mm, basally straw-colored, apically green; middle phyllaries narrowly ovate-elliptic, 8–13 × 1.5–2 mm; inner phyllaries narrowly elliptic, 12–14 × 1–1.5 mm, apically brown. Corolla purple, 1.4–1.6 cm, tube 7–8 mm, limb 6.5–7 mm, lobes 4.5–5

mm. Achene blackish brown, obconic, ca. 3 mm, glabrous. Pappus straw-colored; outer bristles 2–4 mm, scabrid, sometimes very few; inner bristles 1–1.1 cm. Fl. and fr. Jul–Aug.

• Forests, rocky slopes; 2000–2800 m. Chongqing, Hubei, Shaanxi, ?Sichuan.

164. *Saussurea eriostemon* Wallich ex C. B. Clarke, Compos. Ind. 229. 1876.

尼泊尔风毛菊 ni bo er feng mao ju

Centaurea taraxacifolia D. Don, Prodr. Fl. Nepal. 167. 1825, not *Saussurea taraxacifolia* (Lindley ex Royle) Wallich ex Candolle (1838); *Aplotaxis nepalensis* Candolle, nom. illeg. superfl.; *Eriostemon taraxacifolius* (D. Don) Lessing; *Saussurea chapmannii* C. E. C. Fischer; *S. nepalensis* Sprengel, nom. illeg. superfl.

Herbs 20–30 cm tall, perennial. Stems solitary or 2, erect, simple, covered at base with fibrously lacerate remains of petioles. Basal and lower stem leaves petiolate; petiole 1–7 cm; leaf blade oblong to narrowly obovate-elliptic, 4–18 × 1–3 cm, runcinate-pinnately lobed, abaxially pale green, subglabrous, adaxially green; lateral lobes 4–10 pairs, narrowly triangular to semiorbicular, 3–15 × 3–18 mm, margin mucronate-dentate, apex acute. Middle and upper stem leaves 1 or 2, smaller than lower leaves. Capitulum solitary, terminal on stem. Involucre campanulate, 0.8–1.7 cm in diam. Phyllaries in 5 or 6 rows, apically blackish green to purple, apex acute to acuminate; outer phyllaries narrowly triangular-ovate, ca. 10 × 4 mm; inner phyllaries ca. 1.9 × 0.3 cm. Receptacle bristles 5–11 mm. Corolla purple, 1.8–2.3 cm, lobes 3.5–6 mm. Achene cylindric, 3.5–4.5[–6] mm, ribbed, smooth, glabrous, apex with a short crown. Pappus brown; outer bristles 2–3(–6) mm, plumose; inner bristles 1.3–1.8 cm. Fl. and fr. Aug–Oct. 2n = 32.

Alpine grasslands, thickets, river valleys, by trails; 3500–4200 m. S Xizang (Yadong) [Bhutan, India (Sikkim), Nepal].

Saussurea nepalensis is illegitimate because Sprengel cited *Centaurea taraxacifolia* in synonymy but did not take up the epithet, which was at that time still available in *Saussurea*. Candolle also should have used the earlier epithet, “*taraxacifolia*,” when he transferred the name to *Aplotaxis*. When C. B. Clarke validated the nomen nudum *S. eriostemon* by Wallich, another nomen nudum, *S. taraxacifolia*, used for a different taxon by Wallich, had already been validated by Candolle, so the earliest epithet “*taraxacifolia*” was no longer available in *Saussurea*.

165. *Saussurea scabrida* Franchet, Bull. Annuel Soc. Philom. Paris, sér. 8, 3: 146. 1891.

糙毛风毛菊 *cao mao feng mao ju*

Saussurea leontodon Dunn; *S. pseudoleontodon* F. H. Chen.

Herbs 30–60 cm tall, perennial. Stem solitary, erect, simple, densely covered with pale brown articulate hairs. Basal and lower stem leaves shortly petiolate; leaf blade narrowly elliptic, 10–23 × 1.5–4.5 cm, green, concolorous, scabrid, with multicellular articulate hairs, base cuneate-attenuate, margin runcinate-pinnately lobed; lateral lobes 3–12 pairs, triangular, margin mucronate-dentate. Middle and upper stem leaves gradually smaller upward on stem. Uppermost stem leaves sessile, usually narrowly ovate-elliptic, undivided, base semiamplexicaul, margin dentate. Capitulum solitary, terminal on stem. Involucre campanulate, 1.5–2.5 cm in diam. Phyllaries in ca. 5 rows, densely villous or with articulate hairs, apex acuminate; outer phyllaries narrowly triangular-ovate, ca. 16 × 3–4 mm; middle phyllaries narrowly elliptic, ca. 15 × 3.5 mm; inner phyllaries linear, ca. 18 × 1–1.5 mm. Corolla purple, ca. 1.1 cm, tube ca. 8 mm, limb ca. 3 mm. Achene brown, cylindric, ca. 6 mm, glabrous. Pappus pale brown; outer bristles 3.5–5 mm, scabrid; inner bristles ca. 1.3 cm. Fl. and fr. Jul–Sep.

• Thickets, forests, forest margins, meadows; 2700–4200 m. W Sichuan, SE Xizang (Zayü, Zogang), NW Yunnan (Dêqên, Zhongdian).

166. *Saussurea taraxacifolia* (Lindley ex Royle) Wallich ex Candolle, Prodr. 6: 532. 1838.

蒲公英风毛菊 *pu gong ying feng mao ju*

Cyathidium taraxacifolium Lindley ex Royle, Ill. Bot. Himal. Mts. 251, t. 56, f. 2. 1835.

Herbs 15–50 cm tall, perennial. Stem solitary, erect, simple. Basal and lower stem leaves petiolate; petiole 4–6 cm; leaf blade narrowly elliptic or narrowly obovate, 5–15 × 1–2.5 cm, runcinate, pinnately lobed to pinnatisect, abaxially grayish green and densely tomentose, adaxially green and glabrous; lateral lobes 5–7 pairs, triangular-ovate, 6–10 × 4–10 mm, reclinate, margin entire or dentate with 1 or 2 teeth on distal side, apex acute to obtuse and mucronate; terminal lobe triangular, 1–1.5(–2.5) × 0.5–1.5 cm. Upper stem leaves narrowly elliptic to linear, margin dentate. Capitulum usually solitary, terminal on stem. Involucre campanulate, (1–)2.5–3 cm in diam. Phyllaries in 4 or 5 rows, sparsely pilose, apically blackish green, apex long acuminate; outer phyllaries narrowly ovate-elliptic, 9–10 × 1–2 mm; middle phyllaries narrowly ovate-linear, 10–14 × 1–2 mm; inner phyllaries broadly linear, 14–16 × 1–1.5 mm. Corolla purple, 1.5–1.6 cm, tube 7–8 mm, limb 7–8 mm, lobes 4–5 mm. Achene cylindric, 4–4.5 mm, glabrous, apex with a small crown. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles 1.1–1.2 cm. Fl. and fr. Jul–Sep.

Thickets; 3800–4700 m. Xizang, NW Yunnan (Gongshan) [Bhutan, NE and NW India, Kashmir, Nepal].

167. *Saussurea centiloba* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 57: 144. 1920.

百裂风毛菊 *bai lie feng mao ju*

Saussurea leveillei F. H. Chen; *S. vaniotii* H. Léveillé.

Herbs 10–50 cm tall, perennial. Caudex simple, apically covered with fibrous remains of petioles. Stem solitary, erect, simple. Basal leaves petiolate; petiole 1–6 cm; leaf blade narrowly elliptic, 8–21 × 1.3–4.5 cm, bipinnately lobed or bipinnatisect, abaxially grayish white and densely tomentose, adaxially green and sparsely arachnoid; primary lobes 10–28 pairs. Stem leaves few, similar to basal leaves. Capitulum solitary, terminal on stem. Involucre broadly campanulate, 1.5–2 cm in diam. Phyllaries in 5–7 rows, purple, yellowish tomentose, apex obtuse or acute; outer phyllaries narrowly ovate-elliptic, 6–7 × 1–2 mm; middle phyllaries narrowly ovate, 7–14 × 1.5–2 mm; inner phyllaries narrowly ovate-elliptic, 14–16 × 1–1.5 mm. Corolla purplish red, 1.4–1.7 cm, tube 0.9–1.2 cm, limb 5–7 mm, lobes 3–4 mm. Achene brown, cylindric, 4–5 mm, smooth, glabrous, apex with short crenulate crown. Pappus straw-colored; outer bristles 1.5–4 mm, scabrid; inner bristles 1.2–1.3(–1.7) cm. Fl. and fr. Jul–Aug.

• Forest margins, thickets, grasslands; 3200–4200 m. SW Sichuan (Muli), NW Yunnan.

168. *Saussurea yunnanensis* Franchet, J. Bot. (Morot) 2: 340. 1888.

云南风毛菊 *yun nan feng mao ju*

Saussurea mairei H. Léveillé; *S. vaginata* Dunn; *S. yunnanensis* var. *integrifolia* Franchet; *S. yunnanensis* var. *runcinata* Franchet; *S. yunnanensis* var. *sessilifolia* J. Anthony.

Herbs 10–40 cm tall, perennial. Stem solitary, erect, simple, covered at base with fibrous remains of petioles. Basal and lower stem leaves petiolate; petiole 1.5–4 cm; leaf blade elliptic, narrowly elliptic, or linear, 3–20 × 0.2–2(–4) cm, undivided, runcinate-pinnately lobed, or pinnatisect, abaxially grayish white and arachnoid tomentose, adaxially green and glabrous, margin entire, apex acute to acuminate; lateral lobes 1–7 pairs, linear or obliquely narrowly triangular, strongly reclinate; terminal lobe linear. Middle and upper stem leaves gradually smaller upward on stem. Capitulum solitary, terminal on stem. Involucre campanulate, ca. 2 cm in diam. Phyllaries in ca. 5 rows, apically purplish red, apex long acuminate; outer phyllaries triangular-subulate, ca. 12 × 1 mm; middle phyllaries narrowly ovate-elliptic, 10–13 × ca. 1.5 mm; inner phyllaries narrowly elliptic, ca. 15 × 1.5–2 mm. Corolla purple, ca. 1.5 cm, tube ca. 9 mm, limb ca. 6 mm. Achene cylindric, ca. 4 mm, glabrous. Pappus dirty white; outer bristles ca. 4 mm, plumose; inner bristles ca. 1.3 cm. Fl. and fr. Jul–Oct.

• Stone cliffs, grasslands, gravelly mountain slopes, forests; 2300–4300 m. SW Sichuan (Muli), NW Yunnan (Dêqên, Lijiang).

169. *Saussurea leptolepis* Handel-Mazzetti, Acta Horti Gothob. 12: 337. 1938.

薄苞风毛菊 *bao bao feng mao ju*

Saussurea handeliana Y. Ling; *S. inconspicua* Handel-Mazzetti; *S. modesta* Handel-Mazzetti.

Herbs 3–20 cm tall, perennial. Stem solitary, purple, slender, erect, densely or sparsely villous. Basal leaves petiolate; petiole to 2 cm; leaf blade narrowly elliptic, 2.5–6.5 × 0.6–1.7

cm, pinnately lobed, abaxially grayish white and densely tomentose, adaxially green to purple and glabrous; lateral lobes 2–5 pairs, triangular, apex obtuse and mucronate. Stem leaves 1 or 2, narrowly elliptic to linear, margin irregularly triangular-dentate. Capitulum solitary, terminal on stem. Involucre obconic, ca. 1.7 cm in diam. Phyllaries in ca. 5 rows, apically sparsely villous, apex long acuminate; outer phyllaries narrowly ovate-elliptic, ca. 11×1 mm; middle phyllaries ovate-elliptic, ca. 13×3 mm; inner phyllaries narrowly ovate-elliptic, ca. 1.9×0.2 cm. Corolla purplish red, ca. 1 cm, tube ca. 7 mm, limb ca. 3 mm. Achene purplish red, cylindric, ca. 5 mm, glabrous. Pappus yellowish brown; outer bristles 2–3 mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Aug.

- Alpine meadows; 4200–4400 m. W Sichuan.

170. *Saussurea polypodioides* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 209. 1934.

水龙骨风毛菊 *shui long gu feng mao ju*

Herbs 10–20 cm tall, perennial. Stem solitary, erect, simple. Basal leaves petiolate; petiole 2–5 cm; leaf blade narrowly elliptic, $5\text{--}12 \times 1\text{--}3$ cm, pinnatisect, abaxially grayish white and densely tomentose, adaxially green and sparsely pubescent; lateral lobes (4–)7–15 pairs, oblong, patent, margin entire or with 1 or 2 teeth, apex rounded or obtuse and mucronate; terminal lobe triangular-ovate, apex acute. Stem leaves few or almost absent, sessile, linear, ca. 4×0.2 cm. Capitulum solitary, terminal on stem. Involucre campanulate, 1.5–2.5 cm in diam. Phyllaries in ca. 4 rows, sparsely villous, apex long acuminate; outer phyllaries subulate, ca. 10×2 mm; middle phyllaries narrowly elliptic, ca. 15×2 mm; inner phyllaries narrowly elliptic, ca. 17×2 mm. Corolla purple, ca. 1.2 cm, tube ca. 7 mm, limb ca. 5 mm. Achene cylindric, ca. 3 mm, transversely rugose. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 9 mm. Fl. and fr. Aug–Nov.

- Alpine grasslands, thickets; 2700–4300 m. SE Xizang (Zayü), NW Yunnan (Dali, Dêqên, Lijiang).

171. *Saussurea coriacea* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 101. 1981.

黄苞风毛菊 *huang bao feng mao ju*

Herbs 15–20 cm tall, perennial, laxly caespitose. Caudex stout, simple or apically few branched, apically covered with blackish brown remains of petioles, with sterile leaf rosettes and flowering stems. Stem solitary, purplish red, erect, simple, arachnoid lanate. Rosette leaves petiolate; petiole purplish red, to 2.5 cm, arachnoid lanate; leaf blade narrowly oblong, $5\text{--}10 \times 1\text{--}1.5$ cm, pinnatisect or pinnately lobed, abaxially grayish white and densely tomentose, adaxially green and glandular; lateral lobes 10–20 pairs, narrowly ovate-triangular, margin revolute and mucronate-dentate, apex acuminate. Capitulum solitary, terminal on stem. Involucre campanulate, 1.2–2 cm in diam. Phyllaries in 4 or 5 rows, narrowly ovate-elliptic, basally yellowish brown, apically dark purplish red, margin arachnoid lanate and leathery, apex acuminate. Receptacle bristles 3.5–4 mm. Corolla purple, 2–2.4 cm, tube 1–1.3 cm, limb 0.9–1.1 cm, lobes 5–6 mm. Achene blackish, cylindric, ca. 4 mm, apex with a short crown. Pappus pale yellowish brown, in 2 rows. Fl. and

fr. Jul–Aug.

- Scree slopes, river terraces; 3600–4400 m. W Sichuan, Xizang.

172. *Saussurea lhunzhubensis* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 100. 1981.

林周风毛菊 *lin zhou feng mao ju*

Herbs 4–6 cm tall, perennial, caespitose, shortly stemmed. Caudex branched, apically covered with brown remains of petioles, with several sterile rosettes and flowering stems. Stem erect, simple, arachnoid. Basal leaves petiolate; petiole purplish red, 1.5–2 cm, base enlarged; leaf blade narrowly elliptic to narrowly obovate, $5\text{--}8 \times 0.4\text{--}1.2$ cm, abaxially grayish white and densely tomentose, adaxially green and densely arachnoid pubescent, margin entire or sinuate-lobate, apex acute and mucronate. Stem leaves linear, smaller than basal leaves. Capitulum solitary, terminal on stem. Involucre broadly campanulate, 2–3 cm in diam. Phyllaries in ca. 4 rows, straw-colored to pale brown, apically greenish or purplish red, arachnoid; outer phyllaries narrowly ovate-elliptic, pale brown; inner phyllaries linear. Receptacle bristles 2–2.5 mm. Corolla purplish red, ca. 2 cm, tube 9–10 mm, limb 8–9 mm. Achene oblong, 3–5 mm, transversely rugose, apex with a short crown. Pappus pale brown; outer bristles scabrid. Fl. and fr. Jul–Aug.

- Alpine grasslands, on sandy soils; 4000–4600 m. C Xizang.

173. *Saussurea paleacea* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 99. 1981.

糠秕风毛菊 *kang bi feng mao ju*

Herbs 5–12 cm tall, perennial. Caudex branched, apically covered with brown remains of petioles, with sterile leaf rosettes and flowering stems. Stem solitary, erect, simple, with glandular hairs. Basal leaves petiolate; petiole 2–3.5 cm; leaf blade oblong, $5\text{--}8 \times 1.4\text{--}2$ cm, abaxially grayish white and densely tomentose, adaxially green and strigose, margin subentire, sinuate, or rarely coarsely dentate with mucronate teeth, apex acuminate. Stem leaves similar to basal leaves. Capitulum solitary, terminal on stem. Involucre broadly campanulate, ca. 2 cm in diam. Phyllaries in ca. 5 rows, yellowish green or slightly purplish red, with dark purple margin, densely pubescent; outer phyllaries narrowly ovate-elliptic, ca. 10×3 mm, apically herbaceous and reflexed; inner phyllaries linear, ca. 14×2 mm. Corolla purple, ca. 2 cm, tube 1.2–1.3 cm, limb ca. 7 mm, lobes 4–4.5 mm. Achene cylindric, 3–3.5 mm, smooth, glabrous. Pappus pale brown; outer bristles scabrid. Fl. and fr. Jul–Aug.

- Alpine grasslands; 4300–4400 m. E Xizang (Qamdo).

Saussurea paleacea is apparently only known from the type collection. This taxon may be conspecific with *S. limprichtii*.

174. *Saussurea limprichtii* Diels, Repert. Spec. Nov. Regni Veg. Beih. 12: 512. 1922.

巴塘风毛菊 *ba tang feng mao ju*

Herbs to 15 cm tall, perennial. Stem solitary, erect, simple. Leaves petiolate; petiole 2.5–5 cm; leaf blade narrowly obovate or narrowly elliptic, $6\text{--}9 \times 1\text{--}1.5$ cm, abaxially grayish white, gland-dotted, and tomentose, adaxially green, gland-dotted, and

scabrid with short articulate hairs, base attenuate, margin subentire and repand to sinuate-dentate, apex acute and mucronate. Uppermost stem leaves narrowly elliptic to linear, $3.5-6 \times 0.2-0.8$ cm. Capitulum solitary, terminal on stem. Involucre campanulate, 1.5–2 cm in diam. Phyllaries in 4 or 5 rows, narrowly triangular-linear, sparsely villous, apex acuminate. Corolla purple, 1.4–1.5 cm, tube 9–10 mm, limb ca. 5 mm, lobes ca. 3 mm. Achene brown, cylindric, ca. 3 mm, glabrous. Pappus pale yellow; outer bristles scabrid to barbellate, 1–3 mm; inner bristles 1.1–1.2 cm. Fl. and fr. Jul–Sep.

- Alpine grasslands; ca. 5100 m. W Sichuan (Batang).

Saussurea limprichtii has long been misunderstood because the type was thought to be lost. This description is based on the rediscovered type material of H. Limpricht (at WRS�). The specimens from NW Yunnan (S. W. Liu, Fl. Yunnan. 13: 576. 2004) treated under *S. limprichtii* are clearly different from the type specimen from W Sichuan. They either belong to *S. semilyrata* or to a yet undescribed species. The real *S. limprichtii* is apparently only known from the type collection and may be conspecific with *S. paleacea*, described from adjacent E Xizang.

175. *Saussurea semilyrata* Bureau & Franchet, J. Bot. (Morot) 5: 76. 1891.

半琴叶风毛菊 ban qin ye feng mao ju

Saussurea lanata Y. L. Chen & S. Yun Liang; *S. stoetzneriana* Diels; *S. viridibracteata* F. H. Chen.

Herbs 20–50 cm tall, perennial. Caudex apically covered with remains of petioles. Stem solitary, erect, simple, white arachnoid. Basal and lower stem leaves petiolate; petiole to 5 cm; leaf blade oblong to narrowly elliptic, $7-15(-30) \times 1.5-4$ cm, lyrate or pinnately lobed, abaxially grayish white and densely tomentose, adaxially green; lateral lobes 6–10 pairs, ovate-triangular, margin coarsely dentate or entire, apex obtuse to acuminate. Middle and upper stem leaves sessile, gradually smaller upward on stem. Uppermost stem leaves subtending capitulum; leaf blade linear, undivided, margin entire or dentate. Capitula solitary or 2, terminal on stem. Involucre campanulate, 1.5–2(–2.5) cm in diam. Phyllaries in 4–6 rows, basally straw-colored, apically purplish brown, sparsely villous, apex acuminate; outer phyllaries narrowly triangular, $10-12 \times$ ca. 2 mm, apical part green, herbaceous, and usually reflexed; middle phyllaries narrowly ovate-elliptic, $9-10 \times 2-3$ mm; inner phyllaries linear, $11-13 \times 1-2$ mm. Receptacle with bristles. Corolla purple, 1.2–1.6 cm, tube 4–8 mm, limb ca. 8 mm. Achene brown, cylindric, ca. 4 mm, glabrous. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 1.2 cm. Fl. and fr. Jul–Sep.

- Montane forests, forest margins, thickets, grasslands; 3200–4800 m. W Sichuan, SE Xizang (Bomi, Mainling), NW Yunnan.

176. *Saussurea subulisquama* Handel-Mazzetti, Acta Horti Gothob. 12: 326. 1938.

钻苞风毛菊 zuan bao feng mao ju

Saussurea kokonorensis Y. Ling.

Herbs 4–18(–30) cm tall, perennial. Caudex slender, apically densely covered with blackish brown sometimes fibrously

lacerate remains of petioles. Stem erect, densely arachnoid, sometimes glabrescent. Rosette leaves petiolate; petiole to 7 cm; leaf blade narrowly elliptic, $5-23 \times 2.5-4$ cm, pinnately parted or pinnately lobed, abaxially grayish white and arachnoid tomentose, adaxially green and glabrous; lateral lobes 3–8 pairs, ovate to triangular, margin entire or dentate, apex acute to obtuse and mucronate; terminal lobe triangular. Stem leaves 1–3, shortly petiolate; leaf blade same in division as basal leaves. Capitulum solitary, terminal on stem. Involucre campanulate, 2–3.5 cm in diam. Phyllaries in 5 or 6 rows, sparsely arachnoid, apex acuminate; outer phyllaries narrowly triangular-subulate, $12-14 \times$ ca. 3 mm; middle phyllaries subulate-linear, $15-17 \times$ ca. 3 mm; inner phyllaries linear, ca. 2.2×0.2 cm. Corolla purple, ca. 1.8(–2.5) cm, tube ca. 1.4 cm, limb ca. 4 mm. Achene cylindric, ca. 4 mm, smooth, glabrous. Pappus pale brown; outer bristles ca. 2 mm, scabrid; inner bristles ca. 1.5 cm. Fl. and fr. Jul–Sep.

- Montane grasslands, thickets, forests; 2400–4600 m. Gansu, Qinghai, W Sichuan.

177. *Saussurea wardii* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 216. 1934.

川滇风毛菊 chuan dian feng mao ju

Saussurea bomiensis Y. L. Chen & S. Yun Liang; *S. graminicola* F. H. Chen.

Herbs 18–40 cm tall, perennial. Caudex apically covered with blackish remains of petioles. Stem solitary, purple, ca. 5 mm in diam., erect, simple, arachnoid. Basal and lower stem leaves petiolate; petiole 2.5–6 cm; leaf blade narrowly elliptic to narrowly obovate, $6-15 \times 1-4$ cm, runcinate-pinnately lobed or pinnately dentate, abaxially grayish green and densely arachnoid tomentose, adaxially green and glabrous; lateral lobes 3–6 pairs, semiorbicular, ovate, or obliquely triangular, base cuneate-attenuate, margin entire or with 1 or 2 small teeth, apex acute to rounded. Middle and upper stem leaves narrowly elliptic to linear, smaller than basal and lower stem leaves, margin pinnately dentate. Uppermost stem leaves subtending capitulum, linear, margin entire. Capitulum solitary, terminal on stem. Involucre hemispheric, 2.5–3.5 cm in diam. Phyllaries in 5 or 6 rows, densely villous, apex acuminate; outer phyllaries narrowly triangular-subulate, $9-12 \times$ ca. 2 mm, apically green, herbaceous, and usually reflexed; middle and inner phyllaries subulate-linear, $13-18 \times 1-2$ mm. Corolla purple, (1–)1.2–1.5 cm, tube 6–8 mm, limb 6–7 mm, lobes 3–4 mm. Achene brown, cylindric, 3–4.5 mm, smooth, glabrous. Pappus brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 9 mm. Fl. and fr. Aug–Nov.

- Alpine meadows, thickets, *Larix* forests; 3500–4800 m. Qinghai, W Sichuan, SE Xizang (Bomi, Mainling, Nyingchi), NW Yunnan (Dêqên, Weixi, Zhongdian).

The type material of *Saussurea bomiensis* and other material at PE perfectly match *S. wardii*.

178. *Saussurea porphyroleuca* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 15. 1925.

紫白风毛菊 zi bai feng mao ju

Herbs 4–12 cm tall, perennial, shortly stemmed. Caudex short, covered with remains of petioles. Stem solitary, erect, simple, arachnoid tomentose. Basal leaves petiolate; petiole 2–4 cm; leaf blade obovate-oblong to elliptic, 4–11 × 2–4 cm, lyrate, pinnately lobed, or undivided and margin obtusely dentate, abaxially grayish white and densely tomentose, adaxially green and sparsely arachnoid but glabrescent; lateral lobes 2–5 pairs, ovate, obliquely triangular, or semiorbicular, margin sinuate, apex obtuse to rounded and usually mucronate; terminal lobe ovate to narrowly ovate, large, margin subserrate or sinuate. Stem leaves absent or very few, narrowly linear. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre campanulate, 2–3 cm in diam. Phyllaries in ca. 4 rows, apically whitish, arachnoid tomentose, apex acute; outer phyllaries linear, ca. 12 × 1 mm; middle phyllaries narrowly ovate-elliptic, 14–17 × 2.5–3 mm, apically dull purple; inner phyllaries broadly linear, ca. 2.2 × 0.2 cm. Corolla dark purple, ca. 1.8 cm, tube ca. 1 cm, limb ca. 8 mm. Achene cylindric, ca. 2 mm, transversely rugose. Pappus pale brown; outer bristles ca. 2 mm, scabrid; inner bristles ca. 1.5 cm. Fl. and fr. Aug–Sep.

• Grasslands on mountain slopes; 3000–4200 m. NW Yunnan (Dêqên, Lijiang).

179. *Saussurea pachyneura* Franchet, J. Bot. (Morot) 8: 354. 1894.

东俄洛风毛菊 *dong e luo feng mao ju*

Saussurea bodinieri H. Lévillé; *S. kunthiana* C. B. Clarke var. *caulescens* Kitamura; *S. kunthiana* var. *major* J. D. Hooker; *S. sikangensis* F. H. Chen.

Herbs 5–30 cm tall, perennial. Caudex simple or branched, densely covered with dark brown remains of petioles. Stem solitary, erect, simple, with brown glandular hairs or glabrous. Basal leaves petiolate; petiole purplish red, 2–9 cm, arachnoid; leaf blade elliptic to narrowly obovate, 5–30 × 1.5–4 cm, pinnatisect, abaxially grayish white and densely tomentose, adaxially green and glandular hairy; lateral segments 6–12 pairs, elliptic to ovate, margin coarsely triangular-dentate. Stem leaves 1–3, similar and same in division as basal leaves but smaller. Capitulum solitary, terminal on stem. Involucre campanulate, 2–3.5 cm in diam. Phyllaries in 5 or 6 rows, rigid, sparsely pubescent, basally straw-colored, apically green, margin purple, apex acuminate; outer phyllaries oblong to narrowly elliptic, ca. 7 × 2 mm, apically herbaceous, green, reflexed; middle phyllaries narrowly ovate, 1.5–1.7 × ca. 0.5 cm; inner phyllaries narrowly ovate-elliptic, ca. 2 × 0.3 cm. Corolla purple to violet, ca. 1.8 cm, tube ca. 1.1 cm, limb ca. 7 mm. Achene brown, oblong, 3–3.5 mm, transversely rugose. Pappus white or brownish; outer bristles ca. 2 mm, scabrid; inner bristles ca. 1.5 cm. Fl. and fr. Aug–Sep.

Rhododendron thickets, alpine meadows, scree slopes; 3000–4700 m. Guizhou, W Sichuan, SE Xizang, NW Yunnan [Bhutan, India (Sikkim), N Myanmar, E Nepal].

180. *Saussurea colpodes* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 104. 1981.

鞘基风毛菊 *qiao ji feng mao ju*

Herbs 3–7 cm tall, perennial, shortly stemmed. Caudex

simple, covered with dark brown remains of petioles. Stem solitary, erect, simple. Rosette leaves petiolate; petiole 2–3.5 cm; leaf blade narrowly elliptic, 6–15 × 1.5–2 cm, bipinnatisect, abaxially whitish and densely lanate, adaxially green and with articulate glandular hairs; primary segments 10–15 pairs, ovate; secondary lobes 1–3 pairs, triangular, margin revolute, apex acute and mucronate. Capitulum solitary, terminal on stem. Involucre broadly campanulate, 2.2–2.5 cm in diam. Phyllaries in 4 or 5 rows, pale brown or yellowish green, scarious, glabrous, apex acuminate; outer phyllaries narrowly triangular-ovate, apically green and reflexed; inner phyllaries linear, erect. Receptacle bristles subulate, ca. 2 mm. Corolla bluish purple, 2.2–2.5 cm, tube 1–1.2 cm, limb 8–10 mm, lobes 5–6 mm. Achene brown, cylindric, 3–4.5 mm, glabrous, apex with a short crown. Pappus pale brown; outer bristles 1.1–1.2 cm, plumose; inner bristles 1.5–1.7 cm. Fl. and fr. Jul–Aug.

• Forest margins, by trails; 3300–3400 m. S Xizang (Nyalam).

181. *Saussurea lingulata* Franchet, J. Bot. (Morot) 10: 423. 1896.

小舌风毛菊 *xiao she feng mao ju*

Herbs (6–)10–50 cm tall, perennial. Caudex simple or branched, densely covered with dark brown remains of petioles. Stem simple, purplish red, 1–4 mm in diam., erect, arachnoid. Basal leaves petiolate; petiole 2–7 cm, narrowly winged; leaf blade elliptic to narrowly elliptic, 3–15 × 1–2.5 cm, runcinate-pinnately lobed or undivided and margin obtusely dentate, abaxially grayish white and densely arachnoid tomentose, adaxially green and glabrous; lateral lobes 4–9 pairs, obliquely triangular, margin entire, apex obtuse to acute and mucronate; terminal lobe triangular, margin entire, apex acute. Stem leaves few, sessile or subsessile, similar and same in division as basal leaves. Capitula 2–5(–8), clustered in a corymbiform synflorescence or rarely solitary, subsessile. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in ca. 5 rows, green, glabrous, apex long acuminate; outer and middle phyllaries narrowly ovate-elliptic, 4–13 × 1–2 mm; inner phyllaries linear, 14–16 × 1–1.5 mm. Receptacle bristles 4–6 mm. Corolla blackish purple, 1.2–1.4 cm, tube 6–8 mm, limb ca. 6 mm. Achene cylindric, ca. 2.5 mm. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles 9–10 mm. Fl. and fr. Jul–Oct.

• Rocky slopes, grassy slopes; 3000–4200 m. W Sichuan, NW Yunnan.

182. *Saussurea przewalskii* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 494. 1882.

弯齿风毛菊 *wan chi feng mao ju*

Saussurea cirsioides Hemsley; *S. giraldii* Diels; *S. likiangensis* Franchet; *S. likiangensis* var. *integrifolia* Handel-Mazzetti; *S. likiangensis* var. *siningensis* Handel-Mazzetti.

Herbs (6–)10–80 cm tall, perennial. Caudex stout, covered with remains of petioles. Stem solitary, blackish purple, erect, simple, arachnoid lanate. Basal leaves petiolate; petiole 4–8 cm, winged; leaf blade narrowly elliptic, 6–18 × 1–3 cm, pinnately lobed, abaxially grayish white or rarely green, golden gland-dotted, densely arachnoid tomentose, and sometimes glabrescent, adaxially green and sparsely arachnoid or glabrous;

lateral lobes 4–6 pairs, triangular, margin denticulate, apex mucronate; terminal lobe triangular, apex acute to obtuse. Stem leaves 2–5, shortly petiolate to sessile, gradually smaller upward on stem. Uppermost stem leaves subtending synflorescence, sessile, narrowly elliptic to linear, pinnately lobed to pinnately cleft. Capitula 3–20, clustered in a corymbiform or globose synflorescence, subsessile. Involucre ovoid to globose, 6–10 mm in diam. Phyllaries in ca. 5 rows, apically blackish purple, sparsely villous; outer phyllaries narrowly ovate-elliptic, 5–6 × 2–3 mm, apex long acuminate; middle phyllaries elliptic, 6–8 × 1.5–2 mm apex acute; inner phyllaries narrowly elliptic, 8–9 × 1–1.5 mm. Corolla purple, 8–9(–15) mm, tube 4–5(–10) mm, limb 4–5 mm. Achene cylindric, 2.5–4 mm, glabrous. Pappus pale brown; outer bristles ca. 2 mm, scabrid; inner bristles ca. 7 mm. Fl. and fr. Jul–Sep. $2n = 32^*$.

Alpine grasslands, scree slopes, thickets, forest margins; 3000–5100 m. Gansu, Qinghai, Shaanxi, W Sichuan, SE Xizang, NW Yunnan [Bhutan].

183. *Saussurea salwinensis* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 211. 1934.

怒江风毛菊 nu jiang feng mao ju

Saussurea ochrochlaena Handel-Mazzetti.

Herbs 1–5 cm tall, perennial, caespitose, stemless or shortly stemmed. Caudex densely covered with remains of petioles, sterile leaf rosettes, and flowering stems. Rosette leaves petiolate; petiole to 2.5 cm; leaf blade narrowly obovate, narrowly elliptic, or broadly linear, 2–7 × 0.5–1.5 cm, abaxially grayish white or rarely yellowish and arachnoid tomentose, adaxially green and glabrous, margin pinnately lobed, sinuate-dentate, or rarely entire; lateral lobes or teeth 4 or 5 pairs, triangular, apex acute and mucronate. Stem leaves if present few, narrowly elliptic to linear. Capitula 3–10, clustered in a corymbiform or hemispheric synflorescence or rarely solitary, shortly pedunculate. Involucre ovoid, 6–8 mm in diam. Phyllaries in 3 or 4 rows, basally straw-colored, apically green, sparsely villous, apex long acuminate; outer phyllaries narrowly ovate-elliptic, 6–7 × ca. 3 mm; middle phyllaries narrowly ovate-elliptic, 9–10 × 3–4 mm; inner phyllaries elliptic, 7–9 × 1–2 mm. Corolla pale purple, ca. 9 mm, tube ca. 5 mm, limb ca. 4 mm. Achene brown, cylindric, 2–4 mm, smooth, glabrous. Pappus in 1 row, brown, bristles 8–10 mm, plumose. Fl. and fr. Aug–Sep.

• Thickets, alpine meadows, grasslands, scree slopes; 3500–4900 m. SE Xizang (Zayü), NW Yunnan (Dêqên, Gongshan, Weixi).

184. *Saussurea arenaria* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 490. 1882.

沙生风毛菊 sha sheng feng mao ju

Herbs 3–10 cm tall, perennial, stemless or shortly stemmed. Caudex simple or branched, apically covered with fibrously lacerate remains of petioles. Stem if present solitary, very short, erect, simple, densely white tomentose. Rosette leaves petiolate; petiole 1.5–4 cm; leaf blade narrowly elliptic, 3–11 × 1–3.5 cm, abaxially grayish white and densely tomentose, adaxially green, densely gland-dotted, and arachnoid, margin entire or sinuate-dentate, apex acute to acuminate. Capitulum

solitary, in center of leaf rosette or terminal on stem. Involucre broadly campanulate to ovoid, 2–3.5 cm in diam. Phyllaries in 5 or 6 rows, apically purplish, gland-dotted, sparsely tomentose, apex acuminate; outer phyllaries narrowly ovate-elliptic, 15–16 × ca. 4 mm; middle phyllaries narrowly elliptic, 1.6–2 × ca. 0.2 cm; inner phyllaries linear, 2–2.5 × ca. 0.1 cm. Corolla purple, 1.5–2.2 cm, tube 1–1.4 cm, limb 5–8 mm. Achene cylindric, ca. 3 mm, smooth, glabrous. Pappus dirty white; outer bristles ca. 1 mm; inner bristles ca. 1.3 cm. Fl. and fr. Jun–Sep. $2n = 30^*$.

• Mountain slopes, mountaintops, meadows, sandy areas, dry riverbeds; 2800–4500 m. Gansu, Qinghai, E Xizang.

Saussurea arenaria is similar to *S. andryaloides*, which differs by smaller capitula, denser leaf indumentum, and lyrate or pinnately lobed leaves. Some specimens are intermediate between the two species.

185. *Saussurea dschungdienensis* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 61: 205. 1924.

中甸风毛菊 zhong dian feng mao ju

Herbs 2–4 cm tall, perennial, stemless or shortly stemmed. Caudex slender, usually branched, apically covered with brown remains of petioles. Rosette leaves petiolate; petiole 1–1.5 cm; leaf blade narrowly elliptic to obovate, 1–4 × 0.8–1.7 cm, sublyrate with 5–8 pairs of lobes or undivided and margin shallowly crenate or subentire, abaxially grayish white and densely tomentose, adaxially green and glabrous, apex obtuse to rounded and mucronate. Capitula solitary or rarely 2, in center of leaf rosette or terminal on stem. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 3 or 4 rows, apically pale purple, glabrous, apex acuminate; outer phyllaries narrowly triangular, 7–10 × ca. 2 mm; middle phyllaries narrowly elliptic, ca. 12 × 2 mm; inner phyllaries broadly linear, ca. 15 × 2 mm. Receptacle naked. Corolla purple, ca. 1.5 cm, tube 9–10 mm, limb ca. 6 mm. Achene cylindric, ca. 3 mm, transversely rugose, glabrous. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 1.5 cm. Fl. and fr. Aug–Oct.

• Forest margins, grasslands by small streams, gravelly mountain slopes; 3000–4000 m. SW Sichuan (Muli), NW Yunnan (Dêqên, Zhongdian).

186. *Saussurea lavrenkoana* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 532. 1972.

双齿风毛菊 shuang chi feng mao ju

Herbs 1–6 cm tall, perennial, stemless or shortly stemmed. Rootstock fibrously split. Caudex simple or few branched, covered with fibrously lacerate remains of petioles. Stem if present straw-colored, 1–3 cm, sparsely arachnoid, leafless or with 1 single leaf. Rosette leaves petiolate; leaf blade narrowly elliptic-linear, 3.5–5 × 0.6–1 cm, pinnatisect, abaxially white tomentose, adaxially green and glabrous; lateral segments 10–20 pairs, split in 2 unequal lobes or simple, linear, 3–5 × 0.8–1.5 mm, margin revolute, apex acuminate. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre cylindric to narrowly campanulate, 1–1.5 cm in diam. Phyllaries in 4 or 5 rows, straw-colored or brown, glabrescent, apex acute to acuminate; outer phyllaries narrowly ovate-triangular, 9–10 × 2–3.5 mm; middle phyllaries narrowly ovate, 10–13 × 2–2.5 mm;

inner phyllaries linear, 13–17 × 1–1.5 mm. Receptacle bristles subulate, 1–2.5 mm. Corolla purple, 1.5–1.7 cm, tube 0.9–1.1 cm, limb 5.5–7 mm, lobes 3–4 mm. Achene straw-colored, gray, or ivory white, 3–4 mm, glabrous, apex with a short crenulate crown. Pappus in 1 row, light brown, bristles 1.3–1.5 cm and plumose. Fl. and fr. Sep–Oct.

- Alpine grasslands; ca. 4000 m. SW Sichuan (Muli).

187. *Saussurea andryaloides* (Candolle) Schultz Bipontinus, *Linnaea* 19: 331. 1846.

吉隆风毛菊 *ji long feng mao ju*

Apilotaxis andryaloides Candolle, *Prodr.* 6: 542. 1838; *Saussurea stoliczkae* C. B. Clarke.

Herbs 2–6 cm tall, perennial, stemless or shortly stemmed. Caudex simple or few branched, apically covered with remains of petioles. Stem if present simple, whitish, erect, densely tomentose. Rosette leaves shortly petiolate or sessile, exceeding capitula; petiole to 2 cm; leaf blade broadly linear to narrowly ovate-elliptic, 2–8.5 × 0.3–1.5 cm, lyrate to runcinate-pinnately lobed, or undivided and margin sinuate-dentate, grayish green to grayish white and ± concolorous, abaxially densely tomentose, adaxially densely arachnoid pubescent; lateral lobes 2–5 pairs, obliquely triangular, apex acute and mucronate; terminal lobe narrowly triangular, apex acuminate to caudate. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre campanulate, 1–2 cm in diam. Phyllaries in 3–6 rows, purplish red, sparsely to densely tomentose, apex acuminate; outer phyllaries narrowly ovate-triangular, 11–12 × 3–4 mm; middle phyllaries narrowly ovate-elliptic, 12–17 × 3–4 mm; inner phyllaries narrowly elliptic, 15–20 × 1–3 mm. Corolla purplish red, 0.9–1.8 cm, tube 5–12 mm, limb 4–6 mm. Achene brown, cylindric, 2.5–4.5 mm, ribbed, smooth, glabrous. Pappus pale brown; outer bristles 0.5–4 mm, scabrid; inner bristles 1.4–1.5 cm. Fl. and fr. Aug–Oct.

Scree slopes, steppes, meadows, thickets; 3200–5400 m. Qinghai, Xinjiang, Xizang [NW India, Kashmir].

Saussurea andryaloides is very widespread in the W and C parts of the Qinghai-Xizang Plateau. In Chinese provincial floras of Xizang and Xinjiang, it has been treated as *S. stoliczkae*. It is not quite clear if the records of *S. stoliczkae* from Qinghai belong to this species, to *S. arenaria*, or to *S. leiocarpa*. In the Hengduan Shan area (W Sichuan and NW Yunnan), records of *S. stoliczkae* mostly are misidentifications of *S. leiocarpa*, which is more closely related to *S. leontodontoides*.

188. *Saussurea andersonii* C. B. Clarke, *Compos. Ind.* 226. 1876.

卵苞风毛菊 *luan bao feng mao ju*

Saussurea flavovirens Y. L. Chen & S. Yun Liang.

Herbs 2–5[–15] cm tall, perennial, stemless or shortly stemmed. Caudex slender, simple or few branched, covered with dark brown remains of petioles. Rosette leaves petiolate; petiole 5–10 mm, base enlarged to an ovate sheath; leaf blade linear, 2.5–6[–11] × 0.2–0.5[–1.5] cm, pinnately lobed or pinnately dentate, abaxially pale green and sparsely pilose on veins and margin, adaxially green and glabrous; lateral lobes or teeth 3–7 pairs, obliquely triangular, recurved, margin entire or den-

tate, apex acuminate. Capitulum solitary, in center of leaf rosette or terminal on a short stem. Involucre campanulate, [0.6–]1–1.5 cm in diam. Phyllaries in 4 or 5 rows, yellowish green, glabrous, apex acuminate; outer phyllaries narrowly ovate, 8–11 × 3–4[–5] mm, apically green, apex reflexed; middle and inner phyllaries narrowly elliptic-linear, 10–15[–18] × 1–3 mm, apically purplish red. Receptacle naked or with few short bristles. Corolla purplish red, 2–2.3 cm, tube 1–1.2 cm, limb 8–11 mm, lobes 5–5.5 mm. Achene cylindric, 3–4 mm, transversely rugose, apex with a short crown. Pappus reddish brown; outer bristles short, scabrid, sometimes very few or absent; inner bristles 1.5–1.8 cm. Fl. and fr. Aug–Oct.

Alpine meadows, thickets; 3500–4300 m. S Xizang (Yadong), NW Yunnan (Fugong, Gongshan) [India (Sikkim)].

189. *Saussurea purpurascens* Y. L. Chen & S. Yun Liang, *Acta Phytotax. Sin.* 19: 105. 1981.

紫苞风毛菊 *zi bao feng mao ju*

Herbs to 5 cm tall, perennial, shortly stemmed. Caudex covered with brown remains of petioles. Stem solitary, erect, simple, pubescent. Rosette leaves sessile or shortly petiolate; leaf blade linear, 4–9 × 0.3–0.8 cm, runcinate pinnately lobed, abaxially grayish green and densely tomentose, adaxially green and glabrous; lateral lobes 8–15 pairs, narrowly triangular, apex acute and mucronate. Capitulum solitary, terminal on stem. Involucre broadly campanulate, 2–2.5 cm in diam. Phyllaries in ca. 4 rows, glabrous, apex acuminate; outer phyllaries narrowly ovate-elliptic, 13–14 × ca. 4 mm, apically green, herbaceous, and reflexed; inner phyllaries linear, ca. 17 × 2 mm, basally pale green, apically purple and erect. Receptacle bristles ca. 2 mm. Corolla purplish red, 1.5–1.8 cm, tube 8–10 mm, limb 7–9 mm, lobes 4–5 mm. Achene brown, cylindric, ca. 2 mm, smooth, glabrous, apically with a short crown. Pappus pale brown; outer bristles 8–10 mm; inner bristles ca. 1.2 cm. Fl. and fr. Jul–Aug.

- Thickets on mountain slopes; ca. 4200 m. S Xizang (Yadong) [?Bhutan].

Saussurea purpurascens is only known from the type and may well be only a variety of *S. andersonii* with developed short stems and adaxially tomentose leaves.

190. *Saussurea nyalamensis* Y. L. Chen & S. Yun Liang, *Acta Phytotax. Sin.* 19: 103. 1981.

聂拉木风毛菊 *nie la mu feng mao ju*

Herbs 2–3 cm tall, perennial, usually caespitose. Caudex simple or few branched, covered with brown fibrous remains of petioles. Rosette leaves petiolate; petiole base widened to a purplish red sheath; leaf blade linear, 2.5–4.5 × 0.3–0.7 cm, runcinately pinnatisect, abaxially grayish white and densely tomentose, adaxially densely pilose with articulate hairs; lateral lobes 6–9 pairs, triangular, margin revolute and usually entire, apex acuminate and mucronate. Capitulum solitary, in center of leaf rosette, sessile. Involucre narrowly campanulate, 6–10 mm in diam. Phyllaries in 3 or 4 rows, narrowly ovate-elliptic, yellowish brown to yellowish green, margin and apically dark purplish red. Receptacle bristles subulate, 1–2 mm. Corolla purplish red, 1.2–1.4 cm, tube 4–7 mm, limb ca. 7 mm. Achene ca.

2 mm, transversely rugose. Pappus yellowish brown; outer bristles scabrid. Fl. and fr. Jul–Aug.

• Alpine grasslands, scree slopes; ca. 4700 m. S Xizang (Nyalam, Zhongba).

191. *Saussurea nimborum* W. W. Smith, J. Proc. Asiat. Soc. Bengal 7: 73. 1911.

倒披针叶风毛菊 *dao pi zhen ye feng mao ju*

Herbs 5–10(–15) cm tall, perennial. Caudex usually simple, apically covered with fibrous remains of petioles. Leaves petiolate; petiole 1–7 cm; leaf blade obovate to narrowly obovate, 3.5–12 × 1–3 cm, shallowly pinnately lobed or undivided and margin sinuate-dentate, abaxially grayish white and densely arachnoid tomentose, adaxially green, scabrid, and densely covered with articulate hairs; lateral lobes 4–6 pairs, triangular-ovate to almost orbicular, 3–8 × 5–10 mm, margin denticulate, apex acute and mucronate. Capitula solitary or 2–5, in a corymbiform synflorescence, sessile or pedunculate. Involucre ovoid-campanulate, 5–12 mm in diam. Phyllaries in 3 or 4 rows, straw-colored with dark margin, sparsely arachnoid to subglabrous, apex acuminate; outer phyllaries ovate-elliptic, 5–7 × 1.5–2 mm; middle phyllaries narrowly ovate-elliptic, 7–12 × 1.5–2 mm; inner phyllaries linear, 12–15 × 1–1.5 mm. Receptacle with bristles. Corolla pale purplish red, 1.6–1.8 cm, tube 9–10 mm, limb 7–8 mm, lobes 4–5 mm. Achene cylindric, 2–3 mm, transversely rugose, glabrous. Pappus dirty white; outer bristles 2–5 mm, barbellate; inner bristles 1.2–1.4 cm. Fl. and fr. Aug–Sep.

Alpine grasslands on slopes, near rivers; [3000–]4500–5000 m. ?SC Xizang [Bhutan, India (Sikkim)].

Specimens of *Saussurea nimborum* in PE do not match the type material of *S. nimborum* at K but belong to different *Saussurea* species. The presence of *S. nimborum* in China is doubtful.

192. *Saussurea ceterach* Handel-Mazzetti, Acta Horti Gothob. 12: 323. 1938.

康定风毛菊 *kang ding feng mao ju*

Herbs 2–2.5 cm tall, perennial, stemless. Caudex slender, usually branched, apically covered with remains of petioles. Rosette leaves petiolate; petiole 1–1.5 cm; leaf blade elliptic to obovate-elliptic, 1.5–4.5 × 0.8–1.5 cm, pinnately lobed, abaxially grayish white and densely tomentose, adaxially dull green, scabrid, and with articulate hairs; lateral lobes 4–8 pairs, ovate, oblong, or semiorbicular, margin entire or denticulate, apex rounded and mucronate. Capitulum solitary, in center of leaf rosette. Involucre campanulate, 0.8–1.3 cm in diam. Phyllaries in 3 or 4 rows, apically and near margin greenish or purple, pubescent; outer and middle phyllaries narrowly ovate-elliptic, 8–10 × 1.5–2 mm, apex long acuminate; inner phyllaries linear, 12–15 × ca. 1.5 mm, apex acute to subobtusate. Receptacle bristles to 1.5 mm. Corolla purplish red, 1.6–1.8 cm, tube 1.2–1.4 cm, limb ca. 4 mm. Achene cylindric, ca. 2 mm, transversely rugose. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 1.3 cm. Fl. and fr. Aug–Sep. $2n = 30^*$.

• Thickets, alpine grasslands; 3800–4900 m. Qinghai, W Sichuan, Xizang.

193. *Saussurea leontodontoides* (Candolle) Schultz Bipontinus, Linnaea 19: 330. 1846.

狮牙草状风毛菊 *shi ya cao zhuang feng mao ju*

Aplotaxis leontodontoides Candolle, Prodr. 6: 539. 1838; *Saussurea irregularis* Y. L. Chen & S. Yun Liang; *S. kunthiana* C. B. Clarke; *S. kunthiana* var. *filicifolia* J. D. Hooker; *S. leontodontoides* var. *filicifolia* (J. D. Hooker) Handel-Mazzetti; *S. rhytidocarpa* Handel-Mazzetti; *S. sungpanensis* Handel-Mazzetti.

Herbs 3–15 cm tall, perennial, stemless or shortly stemmed. Caudex usually branched, densely covered with remains of petioles, often with several leaf rosettes and flowering shoots. Stem if present simple, grayish white, arachnoid lanate, glabrescent. Rosette leaves petiolate; petiole 1–4 cm; leaf blade linear-oblong to narrowly elliptic, 3–18 × (0.4–)0.8–2.5 cm, pinnatisect, abaxially grayish white and densely tomentose, adaxially green, scabrid, strigose, and sometimes glabrescent; segments (5–)8–12 pairs, elliptic, semiorbicular, quadrangular, obliquely ovate, or subtriangular, 4–15 × 2–10 mm, margin entire, apex rounded to obtuse and mucronate. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre campanulate, 1–3 cm in diam. Phyllaries in 4–6 rows, straw-colored or yellowish green, green or purplish at margin, glabrous; outer and middle phyllaries narrowly ovate-triangular, 9–12 × 0.5–3 mm, apex acuminate; inner phyllaries narrowly elliptic to linear, 14–15 × 1.5–2 mm, apex acute. Receptacle bristles 2–3 mm. Corolla purplish red, (1.4–)1.7–2.2 cm, tube 1–1.4 cm, limb to 7–8 mm, lobes 4–5 mm. Achene cylindric, 2–4 mm, transversely rugose, glabrous. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles 1–1.6 cm. Fl. and fr. Aug–Nov. $2n = 30^*$.

Scree slopes, forests, forest margins, thickets; 3200–5500 m. Qinghai, W Sichuan, Xizang, NW Yunnan [NE and NW India, Kashmir, Nepal].

Saussurea irregularis, described from a single specimen and not recorded again, is said to differ from *S. leontodontoides* by glabrous (not scabrid and strigose) leaf surface and remote, irregularly placed leaf lobes. We think it is only a slightly deviating form of the widespread and vegetatively very variable *S. leontodontoides*.

194. *Saussurea kansuensis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 648. 1937.

甘肃风毛菊 *gan su feng mao ju*

Herbs 3–5 cm tall, perennial, stemless or shortly stemmed. Caudex usually branched, apically covered with remains of petioles. Stem if present simple, purplish brown, densely covered with articulate hairs. Rosette leaves petiolate; petiole 0.5–3 cm; leaf blade narrowly elliptic-oblong, 4–20(–30) × 1–4 cm, pinnatisect, abaxially grayish white, gland-dotted, and densely tomentose, adaxially green, scabrid, and densely strigose with articulate hairs; lateral segments 8–20 pairs, obliquely triangular-ovate, ovate, or elliptic, 0.5–2 × 0.5–1.8 cm, margin entire or dentate. Capitulum solitary, in center of leaf rosette. Involucre campanulate, 2–4 cm in diam. Phyllaries in 4 or 5 rows, straw-colored with narrow dark margin, sparsely pilose but glabrescent, apically green and herbaceous, apex long acuminate;

outer phyllaries narrowly ovate-triangular, (1.4–)1.8–2(–3) × 0.4–0.5 cm; middle phyllaries narrowly elliptic, 1.5–2.2 × 0.3–0.4 cm; inner phyllaries linear, 2.3–2.6 × 0.1–0.2 cm. Receptacle bristles yellowish brown, subulate, 3–4 mm. Corolla dark purple, 2.5–3 cm, tube 1.7–2 cm, limb 8–10 mm, lobes 5–6 mm. Achene brown, cylindric, 4.5–5 mm, smooth, glabrous, apex with a short crown. Pappus dirty white; outer bristles 4–6 mm, scabrid; inner bristles 2–2.2 cm. Fl. and fr. Aug–Oct.

• Alpine grasslands and steppes, in sandy soils; 3400–4300 m. Gansu, Qinghai, NW Sichuan.

195. *Saussurea leiocarpa* Handel-Mazzetti, *Acta Horti Gothob.* 12: 330. 1938.

光果风毛菊 *guang guo feng mao ju*

Herbs 2–6 cm tall, perennial, stemless or shortly stemmed. Stem if present simple, 1–2 mm in diam., erect, covered at base with remains of petioles. Rosette leaves petiolate; petiole to 2 cm; leaf blade linear-oblong to narrowly elliptic, 3–8 × 0.5–1.5 cm, pinnatisect, abaxially grayish white and densely tomentose, adaxially green and sparsely arachnoid; lateral segments 6–15 pairs, obliquely quadrangular or triangular, 3–6 × 2–6 mm, margin and apex mucronulate. Stem leaves 1–3, similar to basal leaves, 1.5–2.5 × 0.3–0.6 cm; lateral segments 3–6 pairs. Uppermost stem leaves linear, undivided, margin dentate. Capitulum solitary, terminal on stem. Involucre campanulate, 1.5–2 cm in diam. Phyllaries in ca. 5 rows, sparsely pilose, apically ± reflexed, apex acuminate; outer phyllaries ovate-elliptic, 7–8 × 2–2.5 mm; middle phyllaries narrowly ovate-elliptic, 7–12 × 2.5–3 mm; inner phyllaries narrowly elliptic to linear, 12–14 × 1.5–2 mm, erect. Receptacle bristles subulate, 2–5 mm. Corolla dark purple, (1–)1.3–1.5 cm, tube 7–8 mm, limb 6–7 mm, lobes 3.5–4.5 mm. Achene cylindric, ca. 4.5 mm, smooth, glabrous. Pappus light brown; outer bristles 1–1.5(–2) mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Jul–Oct.

• Alpine grasslands; 3800–4500 m. W Sichuan, Xizang, NW Yunnan (Zhongdian).

Saussurea leiocarpa is very close to *S. leontodontoides*, only differing in the smooth, not transversely rugose, achene and in the arachnoid, not scabrid-strigose, indumentum on the adaxial leaf surface. Intermediate forms do occur. *Saussurea leiocarpa* is different from *S. stoliczkae* from W Xizang, with which it has been synonymized and confused in the literature.

196. *Saussurea brachylepis* Handel-Mazzetti, *Acta Horti Gothob.* 12: 326. 1938.

短苞风毛菊 *duan bao feng mao ju*

Herbs 3–5 cm tall, perennial, stemless or shortly stemmed. Caudex usually branched, covered with fibrous remains of peti-

oles. Stem very short, simple. Rosette leaves petiolate; petiole to 2 cm; leaf blade narrowly obovate or elliptic, 3.5–9 × 0.8–3 cm, lyrate-pinnately lobed, abaxially white and densely tomentose, adaxially green, strigose, gland-dotted, and sparsely arachnoid floccose; lateral lobes 3–6 pairs, ovate, obliquely oblong, or triangular, margin entire or denticulate, apex rounded to obtuse and mucronate. Uppermost stem leaves subtending capitulum, linear, 1.5–3 × 0.1–0.2 cm, margin entire or denticulate. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre campanulate, 1.2–1.5 cm in diam. Phyllaries in 5 or 6 rows, leathery, straw-colored, sparsely arachnoid, apex acuminate; outer phyllaries ovate-triangular, 6–8 × 2.5–3.5 mm; middle phyllaries narrowly ovate-elliptic, 8–12 × 1.5–2.5 mm; inner phyllaries narrowly elliptic, 14–16 × 0.5–1.5 mm. Receptacle bristles to 4 mm. Corolla purple, 1.4–1.5 cm, tube 7–8 mm, limb 7–8 mm, lobes 4–4.5 mm. Achene brown, obovoid, 2–3 mm, smooth, glabrous, apically with a short crown. Pappus pale brown; outer bristles 2.5–6 mm, scabrid; inner bristles 1.3–1.5 cm. Fl. and fr. Aug–Oct.

• Mountain slopes; ca. 3600 m. W Sichuan (Dawu).

197. *Saussurea donkiah* C. B. Clarke ex Springate, *Edinburgh J. Bot.* 57: 405. 2000.

亚东风毛菊 *ya dong feng mao ju*

Herbs, perennial, caespitose, stemless or shortly stemmed. Stem if present to 1 cm. Basal leaves narrowly oblong-elliptic to narrowly obovate, 3.5–11 × 0.8–2.2 cm, pinnatisect, abaxially gland-dotted and sparsely arachnoid lanate with articulate hairs, adaxially green, gland-dotted, and sparsely pilose with articulate hairs; lateral segments 8–13 pairs, ovate-triangular to obovate, to 1 × 1 cm, margin denticulate, apex mucronulate. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre campanulate, 0.8–1.6 cm in diam. Phyllaries in ca. 5 rows, apically purplish and villous, glabrescent; outer phyllaries ovate to narrowly triangular-ovate, 13–15 × 3.5–5.5 mm, apically reflexed, apex acuminate; middle phyllaries narrowly ovate-elliptic, 16–18 × 2–2.5 mm, apically reflexed; inner phyllaries ca. 1.5 mm wide, erect. Receptacle bristles 6–9 mm. Corolla purple, 1.4–1.9 cm, with few small capitate hairs, tube 7.5–10 mm, limb 6.5–9 mm, lobes 3.7–4.5 mm. Achene obovoid, smooth, apically with a prominent crown of many narrow scales. Pappus outer bristles 8–11 mm, plumose; inner bristles 1.1–1.3 cm. Fl. and fr. Sep.

Alpine meadows, stony slopes, scree slopes; ca. 4500 m. S Xizang (Yadong) [?Bhutan, India (Sikkim), E Nepal].

No specimens of *Saussurea donkiah* from China were seen by the present authors, and the description here is based on the protologue, which cites a specimen from S Xizang (Yadong).

7. *Saussurea* sect. *Rosulascentes* (Kitamura) Lipschitz, *Rod Saussurea*, 171. 1979.

莲座风毛菊组 *lian zuo feng mao ju zu*

Saussurea subsect. *Rosulascentes* Kitamura, *Acta Phytotax. Geobot.* 24: 22. 1969.

Herbs, perennial, rhizomatous, with well-developed, simple or branched flowering stems. Basal and lower stem leaves rosulate or subrosulate, present at anthesis. Middle and upper stem leaves few, much reduced. Capitula solitary or several, sometimes supported by uppermost stem leaves. Involucre campanulate, ovoid, cylindric, funnel-shaped, turbinate, or subglobose. Phyllaries

imbricate, margin entire, apex obtuse or acuminate. Receptacle with bristles. Anther tails ciliate or lacerate. Achene usually ribbed, glabrous, sometimes with a small crown. Pappus usually in 2 rows; outer bristles scabrid, rarely lacking.

About 17 species: China, Korea, Russia (Far East, Siberia); nine species (eight endemic) in China.

Saussurea sect. *Rosulascentes* is rather ill-defined as there are many species with few and reduced stem leaves, which have been placed in other sections, and some of the following species can have a number of stem leaves as well. *Saussurea alatipes* and *S. huashanensis* are very similar to *S. fargesii*, so they have been placed in this section. However, these three species may also be placed in *S. sect. Saussurea*.

- 1a. Petiole of basal leaves broadly winged, wings dentate or lobed.
 - 2a. Petiole to 11 cm, with 1–6 pairs of lobes or teeth; leaf blade papery; capitula in ± clustered, corymbiform synflorescence; phyllaries papery, apex purple, shortly acuminate, reflexed 198. *S. alatipes*
 - 2b. Petiole to 6 cm, with 1–3 pairs of lobes or teeth; leaf blade leathery; capitula in lax synflorescence; phyllaries leathery, apical part green, herbaceous, reflexed 200. *S. fargesii*
- 1b. Petiole of basal leaves wingless or narrowly winged.
 - 3a. Leaf blade usually lyrate-pinnately lobed; plants 60–100 cm tall 203. *S. kungii*
 - 3b. Leaf blade not lyrate, pinnately lobed or undivided; plants 10–60 cm tall.
 - 4a. Leaf blade pinnately dentate, pinnately lobed to pinnatisect.
 - 5a. Stem simple; capitulum solitary at end of stem; leaf blade pinnately lobed or with large triangular teeth 201. *S. acrophila*
 - 5b. Stem apically few branched, capitula solitary or 2, at end of branches; leaf blade deeply pinnately lobed to pinnatisect 202. *S. paucijuga*
 - 4b. Leaf blade undivided, margin entire, sinuate-dentate, denticulate, or shallowly crenate.
 - 6a. Capitula solitary or rarely 2, terminal on stem.
 - 7a. Leaves green on both surfaces, concolorous 252. *S. superba* (see *S. sect. Saussurea*)
 - 7b. Leaves abaxially grayish white, densely tomentose, adaxially green 206. *S. tomentosa*
 - 6b. Capitula several (2–10), in corymbiform synflorescence.
 - 8a. Leaf blade obovate to narrowly obovate, 2–4.5 cm wide 204. *S. oligocephala*
 - 8b. Leaf blade ovate or elliptic, usually more than 5 cm wide.
 - 9a. Leaf blade usually ovate or triangular-ovate; leaf base cordate or truncate 199. *S. huashanensis*
 - 9b. Leaf blade usually elliptic; leaf base cuneate-attenuate 205. *S. oblongifolia*

198. *Saussurea alatipes* Hemsley, J. Linn. Soc., Bot. 29: 308. 1892.

翼柄风毛菊 *yi bing feng mao ju*

Herbs 15–40 cm tall, perennial. Rhizome oblique-ascending, covered with blackish brown remains of petioles. Stem solitary, 1–3 mm in diam., erect, simple or branched. Rosette and lower stem leaves petiolate; petiole winged, 3–11 cm, with 1–6 obliquely triangular lobes or large teeth; leaf blade ovate to narrowly ovate-elliptic, 6–10 × 3.5–8 cm, abaxially grayish to greenish white, gland-dotted, and densely tomentose, adaxially green, scabrid, and strigose, base cordate to rounded, margin sinuate-dentate, apex acuminate. Middle and upper stem leaves sessile, narrowly elliptic to linear, 2–7 × 0.1–1 cm. Capitula several, solitary or in groups of 3 on end of branches in a corymbiform synflorescence, pedunculate. Involucre cylindric to campanulate, 0.7–1.3 cm in diam. Phyllaries in 5–7 rows, pale green, arachnoid tomentose to glabrescent, apex acuminate to acute; outer phyllaries triangular-ovate, 3–4 × 1–2 mm, apex dark purple; middle phyllaries narrowly ovate-elliptic, 4–9 × 2–2.5 mm; inner phyllaries narrowly elliptic to linear, 9–12 × 1–1.5 mm, apically bearded. Corolla pale purple, 1–1.2 cm, tube 5–6 mm, limb 5.5–6.5 mm. Achene cylindric, ca. 5 mm, 5-ribbed, glabrous. Pappus white; outer bristles 1.5–2.5 mm; inner bristles 8–10(–13) mm. Fl. and fr. Jul–Aug.

• Forests, grasslands, beside trails; 1500–2600 m. N and NE Chongqing (Chengkou, Wu Shan, Wuxi), W Hubei (Badong, Shennongjia).

199. *Saussurea huashanensis* (Y. Ling) X. Y. Wu, Fl. Tsinling. 1(5): 365. 1985.

华山风毛菊 *hua shan feng mao ju*

Saussurea eriolepis Bunge ex Candolle var. *huashanensis* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 3: 163. 1935; *S. alatipes* Hemsley var. *huashanensis* (Y. Ling) Y. Ling; *S. nivea* Turczaninow var. *huashanensis* (Y. Ling) S. Y. Hu.

Herbs 40–60 cm tall, perennial. Rhizome stout, simple, apically covered with brown residue of petioles. Stem solitary, erect, apically branched, arachnoid lanate. Basal and lower stem leaves petiolate; petiole 8–11 cm, wingless or narrowly winged, 1–3-lobed or dentate; leaf blade ovate to elliptic, 7–18 × 4–10 cm, papery, abaxially grayish green and densely tomentose, adaxially green and glabrous, base cordate to rarely truncate, margin sinuate to sinuate-lobate, apex acute to acuminate. Middle and upper stem leaves few; petiole 1–4 cm; leaf blade ovate to elliptic, gradually smaller upward on stem. Capitula numerous, in a paniculiform or corymbiform synflorescence, pedunculate. Involucre narrowly campanulate, 8–10 mm in diam. Phyllaries in 6 or 7 rows, arachnoid, apex black, acuminate to acute, and mucronate; outer phyllaries ovate, ca. 2 × 2 mm; middle phyllaries oblong to narrowly elliptic, ca. 8 × 3 mm; inner phyllaries linear, ca. 11 × 2 mm. Corolla pale purple, 1.4–1.6 cm. Achene cylindric, ca. 6 mm, ribbed, glabrous, apex with a short crenulate crown. Pappus white; outer bristles ca. 5 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Aug–Sep.

• Tallgrass meadows, thickets; 1800–2100 m. W Henan, E Shaanxi (Hua Shan).

Saussurea huashanensis is very close to *S. alatipes* but differs by the unwinged or narrowly winged petioles. *Saussurea huashanensis* seems to replace *S. alatipes* in the E part of the Qin Ling range.

200. *Saussurea fargesii* Franchet, J. Bot. (Morot) 8: 344. 1894.

川东风毛菊 chuan dong feng mao ju

Herbs 50–60 cm tall, perennial. Rhizome stout, simple. Stem solitary, erect, apically branched, sparsely strigose. Rosette and lower stem leaves petiolate; petiole 3–6 cm, broadly winged, wing sinuate and decurrent on stem; leaf blade broadly ovate, 16–20 × 7–10 cm, leathery, abaxially grayish white and densely tomentose, adaxially green and sparsely strigose, base cordate, truncate, or obtuse, margin shallowly crenate, apex shortly acuminate. Upper stem leaves 2, sessile, ovate-elliptic, 7–10 × 2.5–4.5 cm, base decurrent, margin subentire, apex acuminate. Uppermost stem leaves linear, 2.5–5 × 0.1–0.3 cm. Capitula 1–4, at end of branches, in a lax racemiform synflorescence. Involucre broadly campanulate, 1–2 cm in diam. Phyllaries in 4 or 5 rows, leathery, straw-colored with brown margin, villous; outer phyllaries suborbicular to broadly ovate, 8–10 × 3–5 mm, apical part green, herbaceous, and erect or reflexed, apex acuminate; inner phyllaries oblong, 10–12 × 1.5–2 mm, apex obtuse. Receptacle bristles 2–5 mm. Corolla purple, 1–1.2 cm, tube 5–6 mm, limb 5–6 mm, lobes 3–3.5 mm. Achene obconic, 2.5–3 mm, glabrous. Pappus in 1 row, 8–9 mm, plumose.

● N Chongqing (Chengkou).

Saussurea fargesii is apparently only known from the type and may be conspecific with *S. alatipes*.

201. *Saussurea acrophila* Diels, Bot. Jahrb. Syst. 36(Beibl. 82): 108. 1905.

破血丹 po xue dan

Herbs 10–20 cm tall, perennial. Rhizome apically covered with brown residue of petioles. Stem solitary, erect, simple, apically white arachnoid, glabrescent. Basal and lower stem leaves petiolate; petiole 2–4.5 cm; leaf blade elliptic to obovate, 2.5–6.5 × 1–3 cm, papery, both surfaces green and glabrous, base cuneate, margin with large triangular teeth or rarely pinnately lobed, apex acute; lateral lobes 3 or 4 pairs, broadly triangular. Middle stem leaves petiolate; petiole 1–2.5 cm; leaf blade obovate-elliptic to linear, base cuneate, margin sinuate or entire. Upper stem leaves linear, small, margin entire. Capitulum solitary, terminal on stem. Involucre broadly campanulate to campanulate, 1–2 cm in diam. Phyllaries in 4 or 5 rows, glabrous or sparsely arachnoid lanate, apex acute to obtuse; outer phyllaries ovate, ca. 3 × 2 mm; middle phyllaries narrowly elliptic, ca. 7 × 3 mm; inner phyllaries linear, ca. 11 × 2 mm. Corolla purple, ca. 1.1 cm, tube ca. 5 mm, limb ca. 6 mm. Achene pale brown, cylindric, ca. 3 mm, glabrous, apex with denticulate crown. Pappus pale brown; outer bristles ca. 2 mm; inner bristles ca. 1 cm. Fl. and fr. Jul–Oct.

● Montane forests; 2800–3100 m. S Shaanxi (Qin Ling).

202. *Saussurea paucijuga* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 88. 1949.

深裂风毛菊 shen lie feng mao ju

Herbs 10–32 cm tall, perennial. Rhizome short, apically covered with dull brown remains of petioles. Stem solitary, slender, erect, simple or few branched, sparsely white arachnoid lanate. Basal and lower stem leaves petiolate; petiole 1.5–4 cm; leaf blade narrowly elliptic to obovate-elliptic, 3–11 × 0.9–2 cm, papery, pinnately lobed to pinnatisect, abaxially pale green and sparsely arachnoid, adaxially green and glabrous, apex acute to shortly acuminate; lateral lobes 3–6 pairs, elliptic-ovate to triangular, margin entire, apex acuminate and long mucronate; terminal lobe triangular. Middle and upper stem leaves very few, narrowly elliptic to linear, ca. 10 × 2 mm. Capitula 1 or 2, at end of branches, long pedunculate. Involucre campanulate to funnel-shaped, 7–12 mm in diam. Phyllaries in ca. 4 rows, straw-colored, apically green or purple, and arachnoid, glabrescent, apex acuminate with a cartilaginous mucro; outer phyllaries ovate, 3–4 × ca. 2 mm; middle phyllaries narrowly elliptic, 4–6 × 2–3 mm; inner phyllaries narrowly obovate-elliptic to linear, 6–8 × 1–2 mm. Corolla purple, 1–1.1 cm, tube 4–5 mm, limb ca. 6 mm. Achene pale brown, cylindric, ca. 3 mm, glabrous. Pappus dirty white; outer bristles ca. 2 mm; inner bristles 7–8 mm. Fl. Aug–Oct.

● Mountain slopes; 2400–2800 m. S Shaanxi (Qin Ling).

Saussurea paucijuga is very close to and probably conspecific with *S. acrophila*.

203. *Saussurea kungii* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 3: 158. 1935.

洋县风毛菊 yang xian feng mao ju

Herbs 60–100 cm tall, perennial. Rhizome stout, obliquely ascending. Stem solitary, brownish purple, slender, erect, apically branched, arachnoid, basally glabrescent. Basal leaves petiolate; petiole 2–3.5 cm; leaf blade narrowly obovate-elliptic, 15–20 × 3–6 cm, thinly papery, lyrate-pinnately lobed, abaxially pale green and glabrous, adaxially green or purple and glabrous; lateral lobes 1–4 pairs, margin entire or subentire; terminal lobe narrowly ovate-triangular to narrowly elliptic, large, apex acute to acuminate. Middle and upper stem leaves 1 or 2, narrowly elliptic to linear, 1.5–3 × 0.2–0.5 cm, margin entire, apex acute. Capitula few to numerous, in a corymbiform synflorescence. Involucre turbinate, 5–12 mm in diam. Phyllaries in 4 or 5 rows, arachnoid; outer phyllaries triangular-ovate, ca. 11 × 3 mm, green, apex acute; middle phyllaries oblong to narrowly elliptic, ca. 9 × 1–2 mm, herbaceous, purple, apex rounded to obtuse; inner phyllaries linear, ca. 11 × 1 mm, apex acute. Receptacle bristles 5–8 mm. Corolla purple, ca. 1.3 cm. Achene oblong, ca. 4 mm, ribbed, glabrous. Pappus dirty white; outer bristles ca. 3 mm; inner bristles 6–8 mm. Fl. and fr. Sep–Oct.

● Forests on mountain slopes; 1800–1900 m. S Shaanxi (Qin Ling).

204. *Saussurea oligocephala* (Y. Ling) Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 83. 1949.

少头风毛菊 shao tou feng mao ju

Saussurea acrophila Diels var. *oligocephala* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 3: 155. 1935.

Herbs 10–60 cm tall, perennial. Rhizome obliquely ascending, apically covered with remains of petioles. Stem solitary, slender, erect, apically branched, sparsely arachnoid, glabrescent. Basal leaves petiolate; leaf blade obovate to narrowly obovate-elliptic, 4–12 × 2–4.5 cm, thinly papery, abaxially purplish red and subglabrous, adaxially green and with multicellular articulate hairs, base cuneate-attenuate, margin sinuate or dentate, apex acute to obtuse. Stem leaves few, linear, small, margin entire. Capitula solitary or 2–9 in a lax corymbiform synflorescence. Involucre turbinate to narrowly campanulate, 6–9 mm in diam. Phyllaries in 4 or 5 rows, arachnoid; outer phyllaries ovate, ca. 3 × 2 mm, apex obtuse; middle phyllaries elliptic, ca. 8 × 1.8 mm, apex obtuse; inner phyllaries narrowly ovate-elliptic to broadly linear, ca. 11 × 1 mm, apex obtuse. Corolla purple, ca. 1.2 cm, tube ca. 6 mm, limb ca. 6 mm. Achene oblong, ca. 3 mm, ribbed, glabrous, apex with a short crown. Pappus white; outer bristles 2–3 mm; inner bristles ca. 7 mm. Fl. and fr. Sep–Oct.

- Forests, thickets; 2000–3000 m. S Shaanxi (Qin Ling).

205. *Saussurea oblongifolia* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 6: 99. 1935.

长圆叶风毛菊 *chang yuan ye feng mao ju*

Herbs 40–50 cm tall, perennial. Rhizome simple. Stem solitary, erect, apically branched, arachnoid. Basal and lower stem leaves long petiolate; petiole to 5 cm; leaf blade ovate to elliptic, 12–15 × 5–6 cm, abaxially pale green and sparsely arachnoid, adaxially green and scabrid, base cuneate-attenuate, margin denticulate, apex acute. Middle and upper stem leaves sessile, narrowly elliptic, base attenuate, apex acuminate. Capitula 5–10, in a lax corymbiform synflorescence, pedunculate. Involucre campanulate or subglobose, 1–2 cm in diam. Phyllaries in 4–6 rows, yellowish brown with brown margin,

sparsely pubescent; outer phyllaries ovate, 3–5 × 2–3.5 mm, apex acute; inner phyllaries narrowly elliptic, 5–10 × 1–2 mm, apex acuminate. Corolla ca. 1.2 cm. Achene immature. Pappus dirty white; outer bristles scabrid; inner bristles ca. 1 cm. Fl. Sep.

- NW Yunnan (Binchuan).

206. *Saussurea tomentosa* Komarov, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 2: 135. 1921.

高岭风毛菊 *gao ling feng mao ju*

Saussurea alpicola Kitamura; *S. eriophylla* Nakai var. *alpina* Nakai.

Herbs 10–30 cm tall, perennial. Stem erect, simple, sparsely tomentose. Basal and lower stem leaves petiolate; petiole 2–4 cm; leaf blade triangular to triangular-ovate, 3–12 × 1–3.5 cm, abaxially grayish white and densely tomentose, adaxially green and sparsely arachnoid tomentose to subglabrous, base cordate, truncate, or cuneate, margin sharply dentate or entire, apex acuminate, acute, or sometimes obtuse. Middle and upper stem leaves few, narrowly elliptic to linear, margin sharply dentate or entire. Capitula solitary or 2, terminal on stem, usually subtended by 1 or 2 linear leaves. Involucre campanulate, 2–2.5 cm in diam. Phyllaries in 4 or 5 rows, whitish, tomentose, apex acute; outer phyllaries ovate, 5–7 × 2.5–3 mm; middle phyllaries narrowly ovate-elliptic, 7–10 × 2.5–3.5 mm; inner phyllaries narrowly ovate-elliptic, 10–12 × 1.5–2 mm. Corolla purple, 1.2–1.4 cm, tube 6–8 mm, limb ca. 6 mm. Achene pale brown tinged purple, cylindric, ca. 5 mm, ribbed, apex with a denticulate crown. Pappus pale brown; outer bristles 2–3 mm; inner bristles 1–1.1 cm. Fl. and fr. Jul–Sep.

By waterfalls, grasslands, rock crevices; 1500–2600 m. Jilin (Changbai Shan) [Korea, Russia (Far East)].

8. *Saussurea* sect. *Saussurea*

风毛菊组 *feng mao ju zu*

Herbs, perennial, often rhizomatous, usually with well-developed stems, rarely caespitose. Stems solitary, rarely few, ascending to erect, simple to branched, usually leafy. Leaves petiolate or sessile; leaf blade very varied, mostly undivided, sometimes pinnately lobed to pinnatisect, base auriculate, cordate, rounded, truncate, or cuneate, margin entire of dentate, apex rounded to acuminate. Capitula usually several to numerous, in a lax or dense corymbiform, racemiform, or paniculiform synflorescence or sometimes solitary. Involucre cylindric, narrowly to broadly campanulate, or obconic, medium-sized. Phyllary margin entire or rarely pectinate. Receptacle with subulate bristles. Corolla pink, purple, red, or rarely white, usually glabrous. Anther tails lacinate. Achene smooth, sometimes ribbed, glabrous. Pappus usually in 2 rows, rarely outer row lacking.

About 160 species: mainly in high mountains and boreal to arctic regions of Asia, Europe, and W North America; 83 species (60 endemic) in China.

1a. Phyllary margins pectinate, with 2–5 pairs of teeth.

2a. Involucre 5–8 mm in diam.; phyllaries with 2 or 3 pairs of teeth; leaves with 8–17 pairs of lobes, lobes

oblong to narrowly elliptic-linear 207. *S. odontolepis*

2b. Involucre 8–12 mm in diam.; phyllaries with 3–5 pairs of teeth; leaves with 4–9 pairs of lobes, lobes

ovate to narrowly ovate-elliptic 208. *S. pectinata*

1b. Phyllary margins entire or subentire.

3a. Basal and lower stem leaves with a shallowly or deeply cordate base.

4a. Leaf blade adaxially green, abaxially grayish white or grayish green and densely tomentose, arachnoid, or lanate.

5a. Basal and lower stem leaves narrowly ovate-elliptic, 0.7–2.5 cm wide 226. *S. graciliformis*

5b. Basal and lower stem leaves 2–17 cm wide.

- 6a. Lower stem leaves triangular-ovate, base cordate or hastate.
 - 7a. Leaf blade leathery, adaxially pale green or grayish green, sparsely arachnoid floccose, glabrescent; involucre narrowly campanulate, 4–7 mm in diam. 225. *S. firma*
 - 7b. Leaf blade papery, adaxially white or grayish white, densely tomentose; involucre campanulate, 6–12 mm in diam. 227. *S. nivea*
- 6b. Lower stem leaves ovate, ovate-elliptic, or reniform.
 - 8a. Apex of phyllaries without a mucro.
 - 9a. Stem much branched; capitula in paniculiform synflorescence; involucre cylindric, 0.7–0.9 cm in diam. 233. *S. pinetorum*
 - 9b. Stem apically few branched; capitula in racemiform or lax corymbiform synflorescence; involucre campanulate-obconic, 1.2–1.5 cm in diam. 235. *S. chetchozensis*
 - 8b. Apex of phyllaries with a black mucro.
 - 10a. Stem densely leafy; capitula numerous, in paniculiform to lax corymbiform synflorescence 229. *S. vestitifomis*
 - 10b. Stem with few leaves; capitula few or numerous, in clustered corymbiform synflorescence.
 - 11a. Stem with brown multicellular articulate hairs 230. *S. baroniana*
 - 11b. Stem white arachnoid or lanate.
 - 12a. Leaf blade 2.5–6 × 2–5 cm; stem slender; involucre obconic to cylindric, 5–6 mm in diam. 231. *S. flaccida*
 - 12b. Leaf blade 3–11 × 7–10(–17) cm; stem stout; involucre campanulate, 6–10 mm in diam. 232. *S. acromelaena*
- 4b. Leaf blade green, concolorous or abaxially paler green, abaxially glabrous or glabrescent.
 - 13a. Capitulum usually solitary, terminal on stem, sometimes 2–5, solitary on end of branches; involucre 2–2.5 cm in diam. 209. *S. populifolia*
 - 13b. Capitula usually numerous or few, rarely solitary; involucre usually less than 2 cm in diam.
 - 14a. Apical part of phyllaries either herbaceous or leathery and saber-shaped, usually patent or reflexed.
 - 15a. Apical part of phyllaries leathery, saber-shaped and reflexed, apex long acuminate.
 - 16a. Leaf blade undivided but margin dentate 212. *S. subtriangulata*
 - 16b. Leaf blade pinnately lobed or pinnately dentate.
 - 17a. Capitula numerous, shortly pedunculate; involucre narrowly campanulate, 5–7 mm in diam. 210. *S. mongolica*
 - 17b. Capitula few, long pedunculate; involucre obconic, 10–15 mm in diam. 211. *S. sinuata*
 - 15b. Apical part of phyllaries herbaceous, not saber-shaped, reflexed, patent, or erect, apex shortly acuminate.
 - 18a. Leaf blade hastate or narrowly cordate, longer than wide.
 - 19a. Capitula 6–12, in paniculiform to corymbiform synflorescence; involucre narrowly campanulate, 0.7–1 cm in diam. 215. *S. stricta*
 - 19b. Capitula 1–3, long pedunculate, in corymbiform synflorescence; involucre campanulate, 1–2 cm in diam. 216. *S. hylophila*
 - 18b. Leaf blade cordate or broadly cordate, ± as long as wide.
 - 20a. Lower and middle stem leaves broadly cordate, 8–20 × 7–18 cm; stem glabrous 213. *S. cordifolia*
 - 20b. Lower and middle stem leaves ovate-cordate, 5–11 × 5–11 cm; stem with sparse articulate hairs but glabrescent 214. *S. oligantha*
 - 14b. Apical part of phyllaries neither herbaceous nor leathery and saber-shaped, erect, usually appressed.
 - 21a. Involucre ca. 5 mm in diam.; corolla ca. 8 mm; inner pappus bristles 6–7 mm 221. *S. tenerifolia*
 - 21b. Involucre 5–15 mm in diam.; corolla 10–16 mm; inner pappus bristles 7–13 mm.
 - 22a. Involucre campanulate to globose, 10–15 mm in diam.
 - 23a. Phyllaries long acuminate 223. *S. hwangshanensis*
 - 23b. Phyllaries acute to obtuse and sometimes mucronate.
 - 24a. Leaf blade sparsely strigose on both surfaces 222. *S. grandifolia*
 - 24b. Leaf blade abaxially thinly arachnoid tomentose but glabrescent, adaxially sparsely strigose 219. *S. bullockii*
 - 22b. Involucre tubular to campanulate, 5–10 mm in diam.
 - 25a. Leaf blade leathery, abaxially grayish green and sparsely arachnoid floccose but glabrescent 225. *S. firma*
 - 25b. Leaf blade papery, abaxially pale green and subglabrous.
 - 26a. Involucre campanulate, 8–10 mm in diam.
 - 27a. Phyllaries appressed, not patent or recurved 220. *S. pseudobullockii*
 - 27b. Phyllaries apically patent to recurved 234. *S. paleata*
 - 26b. Involucre tubular to narrowly campanulate, 5–8 mm in diam.
 - 28a. Plants 30–40 cm tall; stem simple or apically few branched; capitula 3–5, subsessile in a clustered corymbiform synflorescence 218. *S. triangulata*

- 28b. Plants 50–120 cm tall; stem much branched; capitula more numerous, shortly or long pedunculate.
- 29a. Capitula shortly pedunculate, clustered at end of branches in a corymbiform synflorescence 224. *S. ussuriensis*
- 29b. Capitula long pedunculate, in a paniculiform synflorescence 217. *S. manshurica*
- 3b. Basal and lower leaves with an attenuate, cuneate, rounded, truncate, or auriculate-amplexicaul base.
- 30a. Leaf blade base auriculate and amplexicaul.
- 31a. Capitula ca. 5, sessile, clustered in a hemispheric synflorescence 236. *S. lyratifolia*
- 31b. Capitula either few and long pedunculate or numerous and shortly pedunculate, in a corymbiform synflorescence.
- 32a. Capitula 1–4, large, long pedunculate, not in a clustered corymbiform synflorescence; involucre 1.2–2 cm in diam.
- 33a. Leaf blade ovate to narrowly ovate-elliptic, 1.5–5 cm wide 237. *S. neofranchetii*
- 33b. Leaf blade narrowly oblong to linear, 1–1.5 cm wide 238. *S. caudata*
- 32b. Capitula numerous, small or medium-sized, shortly pedunculate, in a clustered corymbiform synflorescence; involucre 0.4–1 cm in diam.
- 34a. Leaf blade base inconspicuously auriculate.
- 35a. Stem winged; leaf blade abaxially grayish green or grayish white, densely arachnoid tomentose 239. *S. leclerei*
- 35b. Stem wingless; leaf blade abaxially green, puberulent only on veins 240. *S. merinoi*
- 34b. Leaf blade base broadly auriculate and amplexicaul.
- 36a. All leaves sessile; leaf blade elliptic, 8–23 × 2.5–6 cm 241. *S. macrota*
- 36b. Lower stem leaves petiolate; leaf blade narrowly ovate-elliptic, 6–9 × 2.5–4 cm 242. *S. semiamplexicaulis*
- 30b. Leaf blade base not auriculate or amplexicaul.
- 37a. Leaf blade lyrate or lyrate pinnatifid; petiole with 1 or several pairs of lobes.
- 38a. Receptacle without bristles 178. *S. porphyroleuca* (see *S. sect. Strictae*)
- 38b. Receptacle with bristles.
- 39a. Leaf blade decurrent on stem; stem winged.
- 40a. Leaf blade glabrous or subglabrous on both surfaces.
- 41a. Outer phyllaries acute to obtuse 243. *S. peduncularis*
- 41b. Outer phyllaries apically with a 3–4 mm subulate awn 244. *S. frondosa*
- 40b. Leaf blade adaxially green and glabrous or pubescent, abaxially grayish white and arachnoid or lanate.
- 42a. Involucre campanulate, 1–1.7 cm in diam. 245. *S. eriocephala*
- 42b. Involucre ovoid or campanulate, 0.5–0.8 cm in diam.
- 43a. Plants 5–15 cm tall 261. *S. kiraisiensis*
- 43b. Plants 20–90 cm tall.
- 44a. Stem wings entire; leaf blade ovate, undivided 228. *S. dimorphaea*
- 44b. Stem wings sinuate-dentate; leaf blade narrowly ovate-elliptic, runcinate-pinnately lobed 246. *S. dzeurensis*
- 39b. Leaf blade not decurrent on stem; stem wingless.
- 45a. Leaf blade adaxially green and glabrous, abaxially grayish white or grayish green and arachnoid tomentose.
- 46a. Terminal lobe of leaf blade ovate, base cuneate to subtruncate 131. *S. flexuosa* (see *S. sect. Laguranthera*)
- 46b. Terminal lobe of leaf blade ovate-triangular or ovate, base conspicuously cordate.
- 47a. Stem with few reduced leaves; basal leaves numerous, in a basal rosette 198. *S. alatipes* (see *S. sect. Rosulascentes*)
- 47b. Stem with many well-developed leaves; basal leaves few, usually withered at anthesis 250. *S. lampsanifolia*
- 45b. Leaf blade green, ± concolorous, glabrous or subglabrous.
- 48a. Capitulum solitary, terminal on stem, or 2–4; phyllaries long acuminate, reflexed 249. *S. morifolia*
- 48b. Capitula numerous, in a racemiform or corymbiform synflorescence; phyllaries not reflexed.
- 49a. Involucre hemispheric, 2–2.5 cm in diam. 247. *S. carduiformis*
- 49b. Involucre narrowly campanulate, 0.4–0.9 cm in diam. 248. *S. mutabilis*
- 37b. Leaf blade undivided or pinnately lobed but not lyrate; petiole without lobes.
- 50a. Leaf blade pinnately lobed or coarsely pinnately dentate.
- 51a. Plants 15–35 cm tall; capitulum solitary 286. *S. grosseserrata*
- 51b. Plants 40–100 cm tall; capitula 3–5 in a clustered corymbiform synflorescence 289. *S. recurvata*
- 50b. Leaf blade undivided, margin entire, denticulate, or shallowly sinuate-dentate.
- 52a. Leaf blade adaxially green, smooth, and glabrous or scabrous and strigose, abaxially white, grayish white, or grayish green and densely tomentose or thinly arachnoid.

- 53a. Plants stemless or shortly stemmed, 3–8 cm tall; capitulum solitary; involucre 2–2.5 cm in diam. 272. *S. woodiana*
- 53b. Plants always with a developed stems, more than 10 cm tall; capitula usually several; involucre less than 1.5 cm in diam.
- 54a. Capitula 1–6.
- 55a. Stem and leaf petioles wingless.
- 56a. Plants 40–65 cm tall; involucre 0.8–1 cm in diam. 270. *S. iodoleuca*
- 56b. Plants 10–30 cm tall; involucre 1–1.2 cm in diam. 275. *S. alaschanica*
- 55b. Stem and leaf petioles distinctly winged.
- 57a. Plants 30–40 cm tall; leaf blade ovate to elliptic 271. *S. smithiana*
- 57b. Plants 10–35 cm tall; leaf blade broadly ovate to orbicular.
- 58a. Involucre narrowly campanulate to cylindric, 5–7 mm in diam. 273. *S. komarnitzkii*
- 58b. Involucre ovoid to obconic, ca. 13 mm in diam. 274. *S. rotundifolia*
- 54b. Capitula numerous, in a racemiform, paniculiform, or corymbiform synflorescence.
- 59a. Stem wingless.
- 60a. Leaf blade orbicular to broadly ovate, abaxially white and densely tomentose 281. *S. bullata*
- 60b. Leaf blade ovate, elliptic, or oblong to narrowly elliptic, abaxially grayish green and arachnoid.
- 61a. Plants to 1.2 m tall; capitula in a paniculiform to lax corymbiform synflorescence 285. *S. undulata*
- 61b. Plants to 70 cm tall; capitula in a clustered corymbiform synflorescence.
- 62a. Leaf blade ovate to elliptic, adaxially grayish green, and arachnoid floccose 283. *S. elliptica*
- 62b. Leaf blade narrowly ovate-elliptic to narrowly elliptic, adaxially green and glabrous.
- 63a. Plants 30–70 cm tall; leaves and phyllaries usually without glands 282. *S. alpina*
- 63b. Plants 10–20 cm tall; leaves and phyllaries abaxially densely gland-dotted 284. *S. pseudoalpina*
- 59b. Stem winged.
- 64a. Capitula 4–10, in a lax racemiform synflorescence 276. *S. polygonifolia*
- 64b. Capitula usually more numerous, in a clustered or lax corymbiform or paniculiform synflorescence.
- 65a. Stem stout, much branched; leaf blade oblong to narrowly elliptic, less than 2 cm wide 278. *S. platypoda*
- 65b. Stem slender, simple or apically few branched; leaf blade ovate to narrowly elliptic, usually more than 2 cm wide.
- 66a. Middle stem leaves 2–4 cm wide, apex acuminate.
- 67a. Middle stem leaves narrowly elliptic to linear, 10–20 cm 280. *S. amurensis*
- 67b. Middle stem leaves ovate to elliptic, 5–8 cm 228. *S. dimorphaea*
- 66b. Middle stem leaves 3–7.5 cm wide, apex acute to obtuse.
- 68a. Phyllaries yellowish green, apically purplish, densely arachnoid pubescent; outer phyllaries acuminate but without a black mucro; leaf blade apex obtuse to subacute 277. *S. vestita*
- 68b. Phyllaries straw-colored, brownish, or purple, pubescent or arachnoid; outer phyllaries with a long black mucro; leaf blade apex acute 279. *S. cauloptera*
- 52b. Leaf blade green, concolorous, glabrous, sparsely pubescent, or glandular hairy.
- 69a. Capitulum solitary, terminal on stem.
- 70a. Leaf blade margin coarsely sinuate-dentate.
- 71a. Phyllaries not reflexed; leaf blade obovate-elliptic, apex rounded to acute and mucronate 286. *S. grosseserrata*
- 71b. Phyllaries reflexed; leaf blade ovate, narrowly ovate-elliptic, or triangular, apex acuminate 288. *S. tunglingensis*
- 70b. Leaf blade margin entire or inconspicuously denticulate.
- 72a. Plants stemless or with a developed stem; involucre 1.5–4 cm in diam. 252. *S. superba*
- 72b. Plants always with a developed stem; involucre 1–2 cm in diam.
- 73a. Leaf blade oblong to broadly linear, margin sinuate 287. *S. pratensis*
- 73b. Leaf blade narrowly obovate, narrowly ovate, or narrowly elliptic, margin entire or denticulate.
- 74a. Leaf blade narrowly oblong to linear, glabrous; phyllaries reflexed 257. *S. micradenia*
- 74b. Leaf blade narrowly ovate-elliptic to narrowly elliptic, sparsely villous; phyllaries not reflexed.
- 75a. Involucre obconic; phyllaries glabrous; leaf blade margin denticulate 254. *S. acutisquama*
- 75b. Involucre campanulate; phyllaries villous; leaf blade margin entire and densely ciliate.

- 76a. Leaf blade base oblique and rounded or cuneate, apex obtuse to acute; phyllaries densely villous; corolla 1.8–2.4 cm 251. *S. hieracioides*
- 76b. Leaf blade base attenuate, apex acute to acuminate; phyllaries sparsely villous; corolla 1.2–1.4 cm 253. *S. tatsienensis*
- 69b. Capitula 2–6 or numerous, in a corymbiform synflorescence.
- 77a. Capitula 2–6.
- 78a. Leaf blade margin retrorsely dentate or serrate 258. *S. retroserrata*
- 78b. Leaf blade margin entire or dentate to serrate but not retrorsely so.
- 79a. Leaf blade broadly ovate to narrowly elliptic, more than 3 cm wide, margin dentate to serrate.
- 80a. Middle and upper stem leaves narrowly ovate to narrowly elliptic 256. *S. hultenii*
- 80b. Middle and upper stem leaves broadly ovate to ovate-elliptic 255. *S. euodonta*
- 79b. Leaf blade narrowly ovate, narrowly elliptic, narrowly oblong, or linear, 0.8–2.5 cm wide, margin entire or denticulate.
- 81a. Leaf blade narrowly oblong to linear, glabrous; phyllaries reflexed 257. *S. micradenia*
- 81b. Leaf blade narrowly ovate-elliptic to narrowly elliptic, sparsely villous; phyllaries not reflexed.
- 82a. Involucre campanulate; phyllaries villous; leaf blade margin entire and densely ciliate 253. *S. tatsienensis*
- 82b. Involucre obconic; phyllaries glabrous; leaf blade margin denticulate 254. *S. acutisquama*
- 77b. Capitula numerous.
- 83a. Phyllaries apically saber-shaped.
- 84a. Stem and petioles wingless 262. *S. epilobioides*
- 84b. Stem and petioles narrowly winged.
- 85a. Leaf blade margin denticulate; involucre 5–6 mm in diam. 259. *S. acuminata*
- 85b. Leaf blade margin dentate; involucre ca. 10 mm in diam. 263. *S. umbrosa*
- 83b. Phyllaries apically not saber-shaped.
- 86a. Stem and petioles wingless; leaf blade triangular-ovate to ovate 268. *S. dielsiana*
- 86b. Stem and petioles distinctly winged; leaf blade obovate to elliptic or narrowly so.
- 87a. Leaf blade abaxially glandular; involucre ca. 3 mm in diam.; phyllaries acuminate 260. *S. glandulosa*
- 87b. Leaf blade abaxially not glandular; involucre 5–8 mm in diam.; phyllaries acute to obtuse.
- 88a. Leaf blade 3–9 cm wide.
- 89a. Leaf blade green, concolorous; lower stem leaves with base cordate and apex acute to acuminate 267. *S. latifolia*
- 89b. Leaf blade adaxially green, abaxially glaucous-green; lower stem leaves with base attenuate and apex very long acuminate 269. *S. neoserrata*
- 88b. Leaf blade 1–4 cm wide.
- 90a. Outer phyllaries with apex acuminate 266. *S. candolleana*
- 90b. Outer phyllaries with apex obtuse or subacute.
- 91a. Leaf blade of middle stem leaves ovate, base abruptly narrowed into a winged petiole to 5.5 cm; leaf blade adaxially smooth; phyllaries usually yellowish green ... 264. *S. hemsleyi*
- 91b. Leaf blade of middle stem leaves narrowly elliptic, base attenuate into a petiole to 1(–2) cm; leaf blade adaxially scabrid; phyllaries usually dark purple 265. *S. parviflora*

207. *Saussurea odontolepis* Schultz Bipontinus ex Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 29: 176. 1883.

齿苞风毛菊 *chi bao feng mao ju*

Saussurea aspera Handel-Mazzetti; *S. pectinata* Bunge ex Candolle var. *amurensis* Maximowicz; *S. ussuriensis* Maximowicz var. *odontolepis* Herder, nom. illeg. superfl.

Herbs 20–100 cm tall, perennial. Stem solitary, erect, apically branched. Basal, lower, and middle stem leaves petiolate; petiole 5–14 cm; leaf blade narrowly ovate-elliptic, 7–21 × 3–12 cm, pinnately lobed to pinnatisect, both surfaces green, abaxially sparsely strigose on veins and usually gland-dotted, adaxially scabrid and densely strigose; lateral lobes 8–17 pairs, oblong to linear-elliptic, margin entire or with 1 or 2 teeth, apex acute; terminal lobe narrowly triangular. Upper stem leaves

shortly petiolate, gradually smaller upward on stem. Capitula several, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–8(–10) mm in diam. Phyllaries in 5–7 rows, arachnoid lanate, apex acute to obtuse; outer phyllaries narrowly ovate-triangular, 4–5 × 1–2 mm, usually reflexed, margin with 2 or 3 dark purple subulate teeth; middle phyllaries narrowly ovate-elliptic, 5–7 × 1.5–2 mm, margin entire or with 1 or 2 teeth; inner phyllaries narrowly elliptic-linear, 7–11 × 1.5–2 mm, margin entire. Receptacle bristles 6–7 mm. Corolla purple, 1–1.3 cm, tube 5–7 mm, limb 5–6 mm, lobes 4–5 mm. Achene purplish brown with dark spots, cylindrical, 3–5 mm, glabrous. Pappus dirty white; outer bristles 1.5–3 mm; inner bristles (6–)8–9 mm. Fl. and fr. Aug–Oct. $2n = 26$.

Forest margins, grasslands; 100–700 m. Heilongjiang, Jilin, Liaoning, Nei Mongol, Shanxi [Korea, Mongolia, Russia (Far East)].

The validation of *Saussurea odontolepis* was effected by Maximowicz, not by Herder who treated the name as a synonym of his illegitimate *Saussurea ussuriensis* var. *odontolepis*.

208. *Saussurea pectinata* Bunge ex Candolle, Prodr. 6: 538. 1838.

篦苞风毛菊 *bi bao feng mao ju*

Saussurea davidii Franchet; *S. davidii* var. *macrocephala* Franchet; *S. pectinata* var. *macrocephala* (Franchet) Handel-Mazzetti; *S. pectinata* var. *pekinensis* Maximowicz.

Herbs 20–100 cm tall, perennial. Stem solitary, erect, apically branched. Basal and lower stem leaves petiolate; petiole 3.5–9.5(–17) cm; leaf blade ovate, ovate-oblong, or elliptic, 5–22 × 2–12 cm, pinnately lobed, abaxially pale green, gland-dotted, and strigose especially on veins but glabrescent, adaxially green, scabrid, and strigose; lateral lobes 4–9 pairs, ovate to narrowly ovate-elliptic, margin sinuate or lobed-dentate, apex acute to obtuse and mucronate. Middle and upper stem leaves shortly petiolate; leaf blade pinnately lobed or undivided and margin entire. Capitula several, in a corymbiform synflorescence, usually long pedunculate. Involucre campanulate, 0.8–1.2(–2) cm in diam. Phyllaries in 4 or 5 rows, apically arachnoid; outer phyllaries narrowly ovate, 10–13 × 3–4 mm, usually reflexed, margin pectinate with 3–5 teeth; middle phyllaries narrowly ovate-elliptic, 11–13 × 1.5–2.5 mm, margin pectinate; inner phyllaries purple, linear, 13–14 × 1–1.5 mm, margin entire. Corolla purple, 1.2–1.4 cm, tube 5–8 mm, limb 6–7 mm, lobes 4–5 mm. Achene blackish brown with black spots, cylindric, 3–5 mm, glabrous. Pappus dirty white; outer bristles 3–4 mm; inner bristles 8–10 mm. Fl. and fr. Aug–Oct.

• Forests, forest margins, trailsides, steppes, ravines; 300–1900 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi.

209. *Saussurea populifolia* Hemsley, J. Linn. Soc., Bot. 29: 311. 1892.

杨叶风毛菊 *yang ye feng mao ju*

Saussurea acropilina Diels.

Herbs 25–90 cm tall, perennial. Stems solitary or sometimes 2, erect, simple or apically branched. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 2–8 cm, not winged, glabrous; leaf blade broadly ovate, 5–11 × 3–8 cm, abaxially pale green and glabrous, adaxially dark green, scabrid, and strigose, base cordate to rounded, margin dentate, apex acuminate. Upper stem leaves shortly petiolate or sessile, gradually smaller upward on stem; leaf blade ovate to narrowly ovate-elliptic, base cuneate, apex acuminate. Capitulum usually solitary, terminal on stem or sometimes 2–5 in a lax corymbiform synflorescence, long pedunculate. Involucre broadly campanulate, 2–2.5 cm in diam. Phyllaries in 5–7 rows, straw-colored, tinged purple, puberulent; outer phyllaries ovate, 8–18 × 2–3 mm, apical part green, herbaceous, long acuminate, and reflexed; middle phyllaries narrowly ovate, 8–12 × 2.5–3 mm, apical part patent to reflexed; inner phyllaries linear, 14–16 × 1–1.5 mm, apex acuminate and erect. Receptacle bristles 6–8 mm. Corolla purple, 1.4–1.5 cm, tube 8–9 mm,

limb 5–6 mm, lobes 3–3.5 mm. Achene brown, subcylindric, ca. 5 mm, glabrous. Pappus pale brown; outer bristles 1–3 mm, scabrid; inner bristles 1.1–1.3 cm. Fl. and fr. Jul–Oct.

• Grasslands on mountain slopes, marshes; 1700–3600 m. Chongqing, Gansu, Henan, Hubei, Shaanxi, Sichuan, ?SE Xizang, ?NW Yunnan.

The records of *Saussurea populifolia* from SE Xizang and NW Yunnan are doubtful. These records may belong to one-headed specimens of *S. cordifolia* or *S. oligantha*.

210. *Saussurea mongolica* (Franchet) Franchet, Bull. Herb. Boissier 5: 539. 1897.

蒙古风毛菊 *meng gu feng mao ju*

Saussurea ussuriensis Maximowicz var. *mongolica* Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 6: 61. 1883; *S. hopeiensis* F. H. Chen; *S. matsumurae* Nakai; *S. mongolica* var. *rigidior* Handel-Mazzetti; *S. mongolica* f. *shansiensis* (F. H. Chen) Y. Ling; *S. sinuata* Komarov var. *shansiensis* F. H. Chen.

Herbs 30–90 cm tall, perennial. Stem solitary, erect, apically branched, glabrous or sparsely strigose. Lower stem leaves petiolate; petiole 5–16 cm; leaf blade ovate-triangular to ovate, 5–20 × 2–9 cm, pinnately lobed or basal half pinnately lobed and apical part coarsely dentate, abaxially pale green and glabrescent, adaxially green and sparsely strigose but glabrescent, base cordate, apex acute; lateral lobes 1–3 pairs, oblong-elliptic, margin dentate or entire, apex acute to obtuse. Middle and upper stem leaves oblong to narrowly ovate-elliptic, margin coarsely dentate. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–7 mm in diam. Phyllaries in 5–7 rows, sparsely arachnoid, apical part saber-shaped and reflexed, apex long acuminate; outer phyllaries ovate, ca. 3 × 1 mm; middle phyllaries narrowly ovate, 7–8 × ca. 2 mm; inner phyllaries narrowly elliptic to linear, ca. 10 × 2 mm. Corolla purplish red, 0.9–1.3 cm, tube 5–6 mm, limb 4–7 mm. Achene brown, cylindric, 4–5 mm, glabrous. Pappus basally pale brown, apically white; outer bristles ca. 3 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Jul–Oct. $2n = 26^*$.

Mountain slopes, forests, thickets, trailsides, grassy slopes; 500–2900 m. Gansu, Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi [Korea, Mongolia].

Saussurea mongolica var. *rigidior* was described as having pectinate phyllaries just like *S. pectinata*. For these plants from Hebei (Xiaowutai Shan), Handel-Mazzetti (Acta Horti Gothob. 12: 321. 1938) postulated hybrid origin, with *S. mongolica* and *S. pectinata* as parents.

211. *Saussurea sinuata* Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 25: 735. 1907.

林风毛菊 *lin feng mao ju*

Saussurea aristata Lipschitz; *S. stenolepis* Nakai.

Herbs 40–80(–110) cm tall, perennial. Stem solitary, erect, apically branched. Basal and lower stem leaves usually withered at anthesis. Middle stem leaves petiolate; petiole to 14 cm; leaf blade narrowly triangular-cordate, triangular-ovate, or ovate, 5–15 × 3–8 cm, pinnately lobed to pinnatisect or undivi-

ded and margin coarsely dentate; base cordate to truncate, apex acute. Upper stem leaves shortly petiolate, smaller; leaf blade usually undivided, margin dentate to entire, both surfaces green and glabrous. Uppermost stem leaves linear to subulate. Capitula several, in a lax corymbiform or paniculiform synflorescence, long pedunculate. Involucre obconic, (0.5–)1–1.5 cm in diam. Phyllaries in 5 or 6 rows, apical part reflexed, apex long acuminate; outer phyllaries ovate, 5–6 × 1–2 mm; middle phyllaries narrowly ovate-elliptic, ca. 10 × 2 mm; inner phyllaries narrowly elliptic to linear, ca. 15 × 2 mm. Receptacle bristles ca. 7 mm. Corolla purplish red, 1.2–1.5 cm, tube 6–9 mm, limb 5–6 mm. Achene brown, cylindric, 4–7 mm, ribbed. Pappus dirty white; outer bristles 2–3 mm, smooth or scabrid; inner bristles ca. 1 cm. Fl. and fr. Jul–Sep. $2n = 26$.

Montane forests, forest margins. Heilongjiang, Jilin, Nei Mongol [Korea, Russia (Far East)].

212. *Saussurea subtriangulata* Komarov, Bot. Mater. Gerb. Glavn. Bot. Sada S.S.S.R. 6: 18. 1926.

吉林风毛菊 ji lin feng mao ju

Saussurea eriolepis Bunge ex Candolle var. *caudata* Herder; *S. grandifolia* Maximowicz var. *caudata* (Herder) Komarov.

Herbs 40–80(–100) cm tall, perennial. Stem solitary, slender, erect, many branched, brown arachnoid. Basal and lower stem leaves petiolate; petiole to 12 cm; leaf blade 7–16 × 4–6 cm, base cordate to cuneate, margin dentate, apex acuminate. Middle stem leaves sessile, narrowly obovate to narrowly ovate-elliptic, 6–8 × 0.7–1.2 cm. Upper stem leaves narrowly ovate-elliptic to linear, smaller. Capitula numerous, in a paniculiform synflorescence, long pedunculate. Involucre campanulate, 1–1.5(–2) cm in diam. Phyllaries in 4 or 5(–8) rows, purple, apical part saber-shaped and recurved, apex long acuminate; outer phyllaries triangular-ovate, ca. 4 × 1 mm; middle phyllaries elliptic, ca. 7 × 3 mm; inner phyllaries linear-oblong, ca. 11 × 2 mm. Receptacle bristles 1–1.2 cm. Corolla purple, 1.3–1.5(–2) cm, tube 7–9 mm, limb 6–7 mm, lobes ca. 4 mm. Achene blackish brown with dark spots, cylindric, 3–4 mm, glabrous. Pappus dirty white; outer bristles 3–5 mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Jul–Sep. $2n = 26$.

Forest margins, forests. Heilongjiang, Jilin [Korea, Russia (Far East)].

213. *Saussurea cordifolia* Hemsley, J. Linn. Soc., Bot. 29: 310. 1892.

心叶风毛菊 xin ye feng mao ju

Saussurea aegiophylla Diels; *S. cavaleriei* H. Léveillé & Vaniot; *S. cordifolia* var. *ombrophila* Handel-Mazzetti; *S. dutaillyana* Franchet.

Herbs 40–150 cm tall, perennial. Stem solitary, erect, apically branched, subglabrous. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 8–20 cm; leaf blade cordate, 8–20 × 7–18 cm, both surfaces green, abaxially glabrous or sparsely strigose on veins, adaxially scabrid and sparsely strigose, base deeply cordate, margin coarsely dentate, apex acuminate. Uppermost stem leaves shortly petiolate or

sessile; leaf blade ovate, elliptic, or narrowly ovate-elliptic, base rounded to broadly truncate. Capitula usually numerous, in a lax corymbiform synflorescence but rarely solitary, long pedunculate. Involucre campanulate, (0.8–)1.5–2 cm in diam. Phyllaries in 4–6 rows, straw-colored, leathery, conspicuously veined, glabrous or white to brown arachnoid tomentose at margin, apical part green, herbaceous, and reflexed to erect, apex acuminate; outer phyllaries ovate, 2–4(–7) × 2–3 mm; middle phyllaries narrowly ovate, 4–15 × 3–5 mm; inner phyllaries linear, 13–16 × 1.5–2 mm. Receptacle bristles 6–9 mm. Corolla pink to dark purple, (1.2–)1.5–1.7 cm, tube 6–8 mm, limb 8–9 mm, lobes 3–4 mm. Achene brown, cylindric, 5–7 mm, glabrous. Pappus pale brown; outer bristles 2–6 mm, scabrid; inner bristles 1.1–1.5 cm. Fl. and fr. Aug–Oct.

• Montane forests, forest margins; 700–2200 m. Anhui, Chongqing, Guizhou, Henan, Hubei, Hunan, Shaanxi, Sichuan, Zhejiang.

Saussurea dutaillyana, characterized by dense brown indumentum of articulate hairs on stem and petioles, by basal leaves crowded in a rosette, and by ample lax paniculiform synflorescences, may deserve separate taxonomic status. It has been accepted in several provincial floras and is recorded from Chongqing, Henan, Hubei, S Shaanxi (Qin Ling), Sichuan, and Zhejiang.

The following species, *Saussurea oligantha*, also belongs to this species group and is not well separated from *S. cordifolia*.

214. *Saussurea oligantha* Franchet, J. Bot. (Morot) 10: 421. 1896.

少花风毛菊 shao hua feng mao ju

Saussurea oligantha var. *oligolepis* (Y. Ling) X. Y. Wu; *S. oligantha* var. *parvifolia* Y. Ling; *S. oligolepis* Y. Ling.

Herbs 40–70 cm tall, perennial. Stem solitary, erect, simple or apically few branched, with sparse multicellular articulate hairs or glabrescent. Leaves green, sparsely strigose to subglabrous. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 9–15 cm, covered with brown articulate hairs or glabrous; leaf blade broadly ovate-cordate, 5–11 × 5–11 cm, base cordate to hastate, margin coarsely dentate, apex acuminate. Upper stem leaves sessile, narrowly ovate to narrowly elliptic, gradually smaller upward on stem, apex long acuminate. Capitula 2–8, in a lax paniculiform or corymbiform synflorescence or sometimes solitary, long pedunculate. Involucre obconic to campanulate, 1.2–1.5 cm in diam. Phyllaries in 4–6 rows, apical part green, herbaceous, and reflexed to erect, apex acuminate; outer phyllaries ovate, ca. 6 × 2 mm; middle phyllaries oblong to elliptic, 8–10 × 3–3.5 mm; inner phyllaries linear, ca. 10 × 2 mm. Corolla purple, 1.1–1.4 cm, tube 6–7 mm, limb 5–7 mm, lobes 3–3.5 mm. Achene oblong, 3–4 mm, glabrous. Pappus dirty white; outer bristles 3–4 mm, scabrid; inner bristles ca. 9 mm. Fl. and fr. Jul–Sep.

• Mountain slopes, forest margins, forests; 1300–3800 m. Chongqing, Gansu, Henan, Hubei, Shaanxi, Sichuan, SE Xizang, NW Yunnan.

215. *Saussurea stricta* Franchet, J. Bot. (Morot) 8: 342. 1894.

喜林风毛菊 xi lin feng mao ju

Saussurea subcordata F. H. Chen.

Herbs 75–120 cm tall, perennial. Stem solitary, erect, api-

cally branched. Basal leaves usually withered at anthesis. Lower and middle stem leaves petiolate; petiole 2–13(–18) cm; leaf blade ovate-triangular, 6–12 × 4–7(–13) cm, both surfaces green and subglabrous with a few brown articulate hairs, base cordate, margin dentate, apex acuminate. Upper stem leaves subsessile; leaf blade ovate to narrowly ovate-elliptic, base cuneate, margin denticulate or entire, apex acuminate. Capitula numerous, in a panicle or corymbiform synflorescence, pedunculate. Involucre narrowly campanulate, 0.8–1.2 cm in diam. Phyllaries in 4 or 5 rows, apically purple, conspicuously 3–5-veined, glabrous or sparsely arachnoid; outer phyllaries broadly ovate, 3–4 × 2–3 mm, patent to recurved, apex rounded and very shortly acuminate; middle phyllaries oblong, 4–8 × 2–3 mm, apex acuminate; inner phyllaries linear, 10–11 × 1–2 mm, apex obtuse and mucronate. Receptacle bristles 7–9 mm. Corolla dark purple, 1–1.2 cm, tube 4–5 mm, limb 6–7 mm, lobes 2–2.5 mm. Achene straw-colored, tinged purple, cylindric, 6–6.5 mm, glabrous. Pappus pale brown; outer bristles 2.5–5 mm, scabrid or almost smooth; inner bristles 8–10 mm. Fl. and fr. Aug–Oct.

• Montane forests; 1400–2200 m. N Chongqing, SE Gansu, N Sichuan.

Saussurea stricta is very close to *S. cordifolia*. Specimens determined as *S. stricta* from W Henan match typical *S. cordifolia*, whereas those from SE Xizang and NW Yunnan must be referable to *S. hylophila*.

216. *Saussurea hylophila* Handel-Mazzetti, Symb. Sin. 7: 1148. 1936.

林地风毛菊 lin di feng mao ju

Herbs 60–100 cm tall, perennial. Stem solitary, erect, simple or apically branched, subglabrous. Basal leaves usually withered at anthesis. Lower and middle stem leaves petiolate; petiole 2–11 cm; leaf blade cordate to ovate-cordate, 5–11 × 3–7 cm, papery, abaxially pale green and strigose, adaxially green and sparsely strigose but glabrescent, base deeply cordate, margin dentate, apex acuminate. Upper stem leaves subsessile; leaf blade narrowly ovate-elliptic, base rounded to attenuate, margin entire or denticulate, apex acuminate. Capitula 2 or 3, in a corymbiform synflorescence or sometimes solitary, long pedunculate. Involucre campanulate, 1–1.5(–2) cm in diam. Phyllaries in 4 or 5 rows, straw-colored, sometimes apically tinged purple, ± villous and glabrescent; outer phyllaries ovate, 3–6 × 2–3 mm, apex acuminate; middle phyllaries narrowly ovate, 8–12 × 2–3 mm, apex long acuminate and 3–6 mm; inner phyllaries narrowly elliptic to linear, 14–16 × 1.5–2 mm, apex acute. Corolla purple, 1.2–1.4 cm, tube 5–6 mm, limb 7–8 mm, lobes 3–4 mm. Achene straw-colored with dark spots, cylindric, 5–6 mm, glabrous, apex with a short crown. Pappus dirty white; outer bristles 4–7 mm, scabrid to shortly plumose; inner bristles 1.2–1.3 cm. Fl. and fr. Aug–Oct.

• Montane forests; 3000–3200 m. S and SE Xizang (Cona, Zayü), NW Yunnan (Gongshan).

Saussurea hylophila has been treated under *S. stricta* by S. W. Liu (Fl. Yunnan. 13: 557. 2004). However, all specimens seen from Yunnan and Xizang clearly differ from that species occurring in N Sichuan.

217. *Saussurea manshurica* Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 18: 424. 1901.

东北风毛菊 dong bei feng mao ju

Saussurea manshurica var. *pinnatifida* Nakai; *S. triangulata* Trautvetter & C. A. Meyer subsp. *manshurica* (Komarov) Kitamura; *S. triangulata* var. *pinnatifida* (Nakai) Kitamura.

Herbs (25–)50–100 cm tall, perennial. Stem solitary, erect, apically branched, subglabrous. Basal leaves petiolate; petiole 4–14 cm, sparsely strigose; leaf blade triangular-hastate to rarely ovate or oblong, 6.5–16 × 2–5(–8) cm, thin, papery, both surfaces green, abaxially glabrous, adaxially subglabrous to sparsely strigose, base cordate, cuneate, or rarely truncate, margin sinuate-dentate, apex acute to acuminate. Lower and middle stem leaves ovate to narrowly ovate, smaller. Upper stem leaves sessile, narrowly ovate-elliptic, oblong, or linear, margin entire. Capitula numerous, in a paniculiform synflorescence, long pedunculate. Involucre narrowly campanulate, 5–8(–12) mm in diam. Phyllaries in 5–7 rows, straw-colored, apically flushed purple, ± arachnoid, glabrescent, apex obtuse; outer phyllaries broadly ovate, 2–2.5 × 1–1.5 mm; middle phyllaries ovate to narrowly ovate, 3–10 × 1–1.5 mm; inner phyllaries linear, 13–14 × 0.8–1.1 mm. Receptacle bristles to 7 mm. Corolla purple, 1–1.3 cm, tube 5–6 mm, limb 6–7 mm, lobes 3–4 mm. Achene brown, cylindric, 3–5 mm, glabrous. Pappus pale brown; outer bristles 2–4 mm; inner bristles 0.9–1.2 cm. Fl. and fr. Jul–Sep. $2n = 26$.

Mixed or coniferous forests, stony slopes, rock crevices; 900–1500 m. Heilongjiang, Jilin, Liaoning [Korea, Russia (Far East)].

218. *Saussurea triangulata* Trautvetter & C. A. Meyer in Middendorff, Reise Sibir. 1(2): 58. 1856.

毛苞风毛菊 mao bao feng mao ju

Saussurea lanatocephala F. H. Chen; *S. triangulata* var. *alpina* Nakai.

Herbs 30–40[–70] cm tall, perennial. Stem solitary, erect, simple or apically branched. Basal leaves often withered at anthesis. Basal and lower stem leaves petiolate; petiole to 14 cm; leaf blade ovate-triangular, triangular-hastate, or narrowly ovate-triangular, 4–10[–12] × 2.5–6 cm, abaxially pale green and pubescent or glabrous, adaxially green, base truncate, cuneate, or cordate, margin sinuate-dentate, apex acuminate. Middle and upper stem leaves sessile or subsessile, gradually smaller upward on stem; leaf blade elliptic to narrowly ovate, base truncate, cuneate, or rounded, margin dentate to entire, apex acuminate. Capitula 3–5[–20], in a ± clustered corymbiform synflorescence, shortly pedunculate. Involucre tubular-campanulate, 5–10 mm in diam. Phyllaries in 4 or 5 rows, dark or green with dark apical part and margin, to 1.5 cm, sparsely arachnoid to almost glabrous, apex subobtusely; outer and middle phyllaries ovate; inner phyllaries oblong-linear. Receptacle bristles ca. 7 mm. Corolla pale purple, 1–1.2 cm, tube 5–6 mm, limb 5–6 mm, lobes 2.5–3 mm. Achene dark brown, cylindric, 4–6 mm, glabrous. Pappus brownish; outer bristles to 3 mm; inner bristles 9–10 mm. Fl. and fr. Jul–Oct.

Alpine meadows, deciduous and coniferous forests. Jilin (Changbai Shan) [Korea, Russia (Far East)].

219. *Saussurea bullockii* Dunn, J. Linn. Soc., Bot. 35: 509. 1903.

庐山风毛菊 lu shan feng mao ju

Saussurea kwangtungensis F. H. Chen; *S. tienmoshanensis* F. H. Chen.

Herbs 30–100 cm tall, perennial. Stem solitary, 2–10 mm in diam., erect, apically branched, thinly arachnoid lanate, glabrescent. Lower stem leaves petiolate; petiole 5–17 cm; leaf blade triangular-cordate, 8–15(–25) × 4–14 cm, abaxially pale green and thinly arachnoid tomentose but glabrescent, adaxially green and sparsely strigose, base cordate, margin sharply sinuate-dentate, apex acuminate. Upper stem leaves shortly petiolate; leaf blade ovate to ovate-triangular, gradually smaller upward on stem. Capitula numerous, in a lax paniculiform to corymbiform synflorescence. Involucre campanulate to obconic, (0.8–)1–1.3(–1.5) cm in diam. Phyllaries in 5 or 6 rows, arachnoid or glabrescent, margin and apex usually slightly purple; outer phyllaries ovate, 2–3 × 1.5–2 mm, apex obtuse and mucronate; middle phyllaries oblong to narrowly elliptic, 4–10 × ca. 2 mm, apex obtuse; inner phyllaries narrowly oblong, 10–12 × 1–2 mm, apex obtuse. Corolla purple, 1.3–1.6 cm, minutely gland-dotted, tube 6–9 mm, limb ca. 8 mm, lobes ca. 4 mm. Achene pale brown, cylindric, 3–4 mm, ribbed, glabrous, apex with a short crown. Pappus apically white, basally pale brown; outer bristles 2–4 mm, scabrid; inner bristles 1.2–1.3 cm. Fl. and fr. Jul–Oct.

• Montane forests, meadows, near streams; 800–2100 m. Anhui, Fujian, Guangdong, Hubei, Hunan, Jiangxi, Shaanxi, Zhejiang.

220. *Saussurea pseudobullockii* Lipschitz, Novosti Sist. Vyssh. Rast. 1964: 321. 1964.

洮河风毛菊 tao he feng mao ju

Herbs 25–40 cm tall, perennial. Stems several, straw-colored, 3–5 mm in diam., erect, apically branched, sparsely arachnoid, glabrescent. Basal leaves almost withered at anthesis. Lower stem leaves petiolate; petiole 1–3 cm; leaf blade narrowly ovate-triangular, 7.5–9.5 × 2–4 cm, abaxially light green, gland-dotted, and tomentose but glabrescent, adaxially dark green and glabrous, base shallowly cordate, truncate, or cuneate, margin dentate, apex acute. Middle and upper stem leaves shortly petiolate, smaller, base truncate. Uppermost leaves subsessile; leaf blade narrowly ovate to linear, margin entire. Capitula numerous, in a clustered corymbiform or paniculiform synflorescence, shortly pedunculate. Involucre cylindric or obconic, 8–10 mm in diam. Phyllaries in 4 or 5 rows, arachnoid, apically purplish; outer phyllaries ovate-triangular, 3–4 × 1.5–2 mm; middle phyllaries ovate-triangular, 4–8 × 1.8–2.2 mm, apex acuminate and mucronate; inner phyllaries 8–10 × 1–1.5 mm, apex acute to obtuse. Receptacle bristles subulate, 3–5 mm. Corolla purple to pink, 1.2–1.3 cm, tube 6.5–7 mm, limb 5.5–6 mm, lobes 4–4.5 mm. Achene ca. 3 mm, glabrous, apex with a small crown. Pappus dirty white; outer bristles 2.5–4 mm, scabrid; inner bristles 8–10 mm. Fl. Jul.

• Montane meadows and grasslands; 2700–2800 m. Gansu (Jonê, Lintan).

221. *Saussurea tenerifolia* Kitagawa, Rep. Inst. Sci. Res. Manchoukuo 5: 159. 1941.

长白山风毛菊 chang bai shan feng mao ju

Herbs 50–70 cm tall, perennial. Stem solitary, erect, simple or apically branched, glabrous. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 7–17 cm; leaf blade ovate-cordate, 9–15 × 7–9 cm, abaxially pale green and pilose on veins, adaxially green and sparsely strigose but glabrescent, base cordate to hastate, margin dentate, apex acuminate. Upper stem leaves sessile or subsessile; leaf blade ovate to narrowly ovate-elliptic, gradually smaller upward on stem, base rounded to cuneate, margin denticulate or entire, apex acuminate. Capitula 5–14, in a dense corymbiform synflorescence, pedunculate. Involucre cylindric, ca. 5 mm in diam. Phyllaries in ca. 4 rows, straw-colored but purple apically, rigid, leathery, sparsely arachnoid, apex acute to rounded and mucronate; outer phyllaries broadly ovate, 2–3 × 2–3 mm; middle and inner phyllaries elliptic, ca. 5 × 3 mm. Corolla purple, ca. 8 mm, tube ca. 4 mm, limb ca. 4 mm. Achene cylindric, ca. 3 mm. Pappus dirty white; outer bristles 1–2 mm, scabrid; inner bristles 6–7 mm. Fl. Jul.

• Montane forests and forest margins; 1100–1700 m. Jilin (Changbai Shan).

222. *Saussurea grandifolia* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 169. 1859.

大叶风毛菊 da ye feng mao ju

Saussurea coarctata (Herder) Kitamura; *S. grandifolia* var. *asperifolia* Herder; *S. grandifolia* var. *coarctata* Herder; *S. grandifolia* var. *tenuior* Herder.

Herbs 35–120 cm tall, perennial. Stem solitary, erect, apically branched, sparsely strigose to subglabrous. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 3–9(–13) cm; leaf blade cordate-ovate to triangular-ovate, 7–20 × 4–13 cm, rigid, both surfaces green, scabrid, and sparsely strigose, base shallowly cordate to truncate, margin coarsely dentate, apex acuminate. Upper stem leaves shortly petiolate to subsessile; leaf blade ovate-triangular, ovate-rhombic, or narrowly ovate-elliptic, gradually smaller upward on stem, base cuneate, apex acuminate. Capitula 3–18, in a corymbiform or paniculiform synflorescence or rarely solitary, pedunculate. Involucre campanulate, 1.2–1.5 cm in diam. Phyllaries in 5 or 6(–9) rows, arachnoid, apex acute to obtuse and mucronate; outer phyllaries ovate-elliptic, 3–5 × 2–3 mm; middle phyllaries elliptic, 5–8 × 2–3 mm; inner phyllaries linear, 8–12 × 1.5–2 mm. Receptacle bristles 7–8 mm. Corolla dull red, 1.3–1.5 cm, tube 6–8 mm, limb 6–7 mm, lobes 4–5 mm. Achene straw-colored, cylindric, 4–5 mm, glabrous. Pappus dirty white; outer bristles 1–2 mm, scabrid; inner bristles 0.9–1.1 cm. Fl. and fr. Aug–Oct. $2n = 26$.

Forests, forest margins, meadows, mountain slopes; 200–1100 m. Heilongjiang, Jilin, Liaoning [Korea, Russia (Far East)].

223. *Saussurea hwangshanensis* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 6: 79. 1949.

黄山风毛菊 huang shan feng mao ju

Saussurea sinuata Komarov var. *cordata* F. H. Chen.

Herbs to 50 cm tall, perennial. Stem solitary, erect, apically branched, glabrous. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 4–16 cm; leaf blade ovate-cordate, 8–17 × 6–12 cm, both surfaces green, abaxially glabrous, adaxially sparsely strigose, base cordate, margin coarsely dentate, apex acuminate. Upper stem leaves shortly petiolate to subsessile; leaf blade ovate, gradually smaller upward on stem. Capitula 4–8, in a corymbiform synflorescence, pedunculate. Involucre campanulate to globose, 1–1.5 cm in diam. Phyllaries in 4 or 5(–7) rows, straw-colored, basally leathery, apically herbaceous, purplish and densely white arachnoid, and patent to recurved, apex long acuminate; outer phyllaries narrowly triangular-ovate, 4–6 × ca. 2(–3) mm; middle phyllaries narrowly elliptic, 6–10 × ca. 2 mm; inner phyllaries narrowly linear-elliptic, 10–14 × 1.5–2 mm. Receptacle bristles to 5 mm. Corolla purplish red, 1.2–1.5 cm, tube 6–9 mm, limb 5–6 mm, lobes 3.5–4 mm. Achene purplish brown, cylindric, 3.5–4 mm, glabrous. Pappus pale brown to dirty white; outer bristles 2–3 mm, scabrid; inner bristles 9–10 mm. Fl. and fr. Aug–Sep.

• Forests, grasslands; 1000–1700 m. Anhui (Huang Shan), Zhejiang.

224. *Saussurea ussuriensis* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 167. 1859.

乌苏里风毛菊 wu su li feng mao ju

Saussurea ussuriensis var. *incisa* Maximowicz; *S. ussuriensis* var. *laxiodontolepis* Q. Z. Han & Shu Y. Wang; *S. ussuriensis* var. *pinnatifida* Maximowicz.

Herbs 30–120 cm tall, perennial. Stem solitary, erect, apically branched. Basal and lower stem leaves petiolate; petiole 3.5–20 cm; leaf blade ovate or oblong, 6–18 × 2.5–6[–10] cm, pinnately lobed or undivided, both surfaces green, ± concolorous, usually gland-dotted, and sparsely strigose but glabrescent, base cordate to truncate, apex acuminate; lateral lobes 3–7 pairs, triangular-oblong, margin entire or coarsely dentate. Middle and upper stem leaves shortly petiolate; leaf blade oblong to linear, gradually smaller upward on stem. Capitula numerous, clustered at end of branches in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–8 mm in diam. Phyllaries in 5–7 rows, margin and apically usually purplish, arachnoid to glabrescent, apex acuminate to acute; outer phyllaries ovate, 2–3 × 0.5–1 mm; middle phyllaries oblong, 3–9 × 1.5–2 mm; inner phyllaries linear, 9–11(–14) × 1–1.5 mm. Receptacle bristles 5–6 mm. Corolla purplish red, 1–1.3 cm, tube 5–6 mm, limb 5–5.5 mm, lobes 3.5–4 mm. Achene pale brown with dark spots, 4–5 mm, glabrous, apex with a short crown. Pappus straw-colored; outer bristles 2–4 mm, scabrid; inner bristles 7–9 mm. Fl. and fr. Jul–Sep. *2n* = 26.

Montane forests, thickets, grasslands, by rivers, ravines; 1100–2900 m. Gansu, Hebei, Heilongjiang, Henan, Jiangsu, Jilin, Liaoning, Nei Mongol, ?Ningxia, Qinghai, Shaanxi, Shandong, Shanxi [Japan, Korea, Mongolia, Russia (Far East)].

A single plant of *Saussurea ussuriensis* from Liaoning has been

described as *S. ussuriensis* var. *laxiodontolepis*. The description matches the typical variety of *S. ussuriensis*, except for the dentate phyllaries, which may be the result of introgression from *S. odontolepis* or *S. pectinata*. Also, Lipschitz (Fl. URSS 27: 448. 1962) reported hybrids of *S. ussuriensis* with *S. odontolepis*.

225. *Saussurea firma* (Kitagawa) Kitamura, Acta Phytotax. Geobot. 9: 112. 1940.

硬叶风毛菊 ying ye feng mao ju

Saussurea ussuriensis Maximowicz var. *firma* Kitagawa, Rep. Exped. Manchoukuo Sect. IV, 4: 97. 1936; *S. controversa* Candolle var. *firma* (Kitagawa) Kitagawa; *S. controversa* f. *sinuata* (Kitagawa) Kitagawa; *S. discolor* (Willdenow) Candolle var. *firma* (Kitagawa) Kitagawa; *S. discolor* f. *sinuata* (Kitagawa) Kitagawa; *S. ussuriensis* f. *sinuata* Kitagawa.

Herbs 30–80 cm tall, perennial. Stem solitary, erect or ascending, simple or apically branched. Basal and lower stem leaves petiolate; petiole 3–12 cm; leaf blade ovate to elliptic, 3–12 × 2–6 cm, leathery, abaxially grayish green to grayish white and sparsely arachnoid to densely tomentose, adaxially green, gland dotted, and subglabrous, base cordate to truncate, margin denticulate, apex acute to acuminate. Middle and upper stem leaves subsessile, gradually smaller upward on stem; leaf blade narrowly ovate-elliptic to linear. Capitula numerous, in a corymbiform synflorescence, pedunculate. Involucre narrowly campanulate, 4–7(–10) mm in diam. Phyllaries in 5–7 rows, straw-colored but apically usually purple, sparsely arachnoid, glabrescent, apex acute to subacute or shortly mucronate; outer phyllaries ovate, 2–3 × 1–2 mm; middle phyllaries narrowly oblong, 3–6 × 1–1.5 mm; inner phyllaries linear, 6–8 × 1–1.5 mm. Corolla purple, 1–1.2 cm, tube 5–6 mm, limb 5–6 mm, lobes ca. 4 mm. Achene 4–9 mm, glabrous. Pappus white; outer bristles 1–2 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Jul–Sep. *2n* = 26.

Grasslands on mountain slopes, ravines; 1100–1800 m. Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol [Russia (Far East)].

For *Saussurea firma*, the name *S. discolor* was misapplied by C. Y. Li (Fl. Liaoning, 2: 593. 1992) and W. Wang and C. Y. Li (Fl. Pl. Herb. Chin. Bor.-Orient. 9: 339. 2004). *Saussurea discolor* is a distinct taxon from the mountains of C Europe and is not present in Asia.

226. *Saussurea graciliformis* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 532. 1972.

纤细风毛菊 xian xi feng mao ju

Herbs 10–40 cm tall, perennial. Stem solitary, slender, erect, apically few branched, subglabrous. Basal and lower stem leaves petiolate; petiole 1.5–8 cm; leaf blade ovate to narrowly ovate-elliptic, 1–11 × 0.7–2.5 cm, thick, abaxially grayish white and densely tomentose, adaxially green and glabrous, base shallowly cordate to truncate, margin sinuate and denticulate, apex acute. Middle stem leaves gradually smaller upward on stem. Upper stem leaves narrowly elliptic to linear. Capitula 2–5, in a clustered corymbiform synflorescence, shortly pedunculate to subsessile. Involucre narrowly cylindric, 4–6(–10) mm in diam. Phyllaries in ca. 5 rows, thin, glabrous, apex acute; outer phyllaries ovate, 3–5 × ca. 1.5 mm, apex mucronate; middle phyl-

laries elliptic, ca. 7×1.8 mm, apex mucronate; inner phyllaries narrowly elliptic, ca. 8×1.6 mm. Corolla purplish red, 0.9–1.1 cm, tube 4–6 mm, limb ca. 5 mm. Achene cylindric, 3–5 mm, ribbed, glabrous. Pappus white; outer bristles ca. 2 mm, scabrid; inner bristles ca. 8 mm. Fl. and fr. Jul–Sep.

• Montane forests, among rocks, river edges; 2200–3400 m. Gansu, Qinghai.

227. *Saussurea nivea* Turczaninow, Bull. Soc. Imp. Naturalistes Moscou 10(7): 153. 1837.

银背风毛菊 yin bei feng mao ju

Saussurea erirolepis Bunge ex Candolle.

Herbs 30–120 cm tall, perennial. Stem solitary, erect, apically branched, sparsely arachnoid or glabrescent. Basal leaves usually withered at anthesis. Lower and middle stem leaves petiolate; petiole 3–8 cm; leaf blade narrowly triangular-ovate, $9\text{--}12 \times 4\text{--}6.5$ cm, abaxially white and densely arachnoid lanate, adaxially green and glabrous, base cordate, hastate, or truncate, margin dentate, apex acuminate. Upper stem leaves petiolate to subsessile; leaf blade triangular-ovate to narrowly ovate-elliptic, gradually smaller upward on stem. Uppermost leaves linear, subtending synflorescence. Capitula in a corymbiform synflorescence, pedunculate. Involucre campanulate, (0.6–)1–1.2 cm in diam. Phyllaries in 6 or 7 rows, white lanate; outer phyllaries ovate, ca. 4×2 mm, apex acuminate and with a dark purple mucro; middle phyllaries elliptic to ovate-elliptic, ca. 7×3 mm, apex acute to subobtusate; inner phyllaries linear, ca. 10×1.5 mm, apex acute. Corolla purple, 1–1.2(–1.4) cm, tube 5–6 mm, limb 5–6 mm. Achene brown, cylindric, ca. 5 mm, glabrous. Pappus white; outer bristles ca. 4 mm, scabrid; inner bristles 9–10 mm. Fl. and fr. Jul–Sep. $2n = 26^*$.

Forests, forest margins, thickets; 400–2200 m. Gansu, Hebei, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shanxi [Korea].

Saussurea komaroviana Lipschitz was described from the Korean side of the Yalu Jiang, opposite the Chinese province of Liaoning. According to W. Wang and C. Y. Li (Fl. Pl. Herb. Chin. Bor.-Orient. 9: 339. 2004), there are no known records from China, so the species is not being treated here. The species is very close to *S. nivea*, from which it differs by the smaller capitula and the less dense indumentum on the abaxial leaf surface (which therefore looks grayish green, not white) and on the phyllaries. *Saussurea komaroviana* occurs in shady and moist cliffs and rock fissures in mountains of the Korean peninsula.

Saussurea splendida Komarov, known from the Russian part of the Heilongjiang region, has apparently not yet been found in China. It also belongs to the group of *Saussurea* with cordate leaves and white, densely tomentose abaxial leaf surface. It is a large, ca. 1 m tall plant and differs from *S. nivea* by the very large, broadly ovate lower stem leaves ($14\text{--}16 \times 8\text{--}11$ cm with up to 15 cm petiole) and the very diffuse, much-branched paniculiform-corymbiform synflorescence with 2–6 clustered, subsessile capitula at branch ends. *Saussurea splendida* may eventually be found in Heilongjiang or Jilin.

228. *Saussurea dimorphaea* Franchet, J. Bot. (Morot) 8: 340. 1894.

东川风毛菊 dong chuan feng mao ju

Herbs 25–35 cm tall, perennial. Stem solitary, erect, flexuous, apically few branched, conspicuously winged. Basal and

lower stem leaves withered at anthesis. Middle stem leaves crowded, petiolate; petiole 1–4 cm, winged, sometimes with a pair of lobes; leaf blade broadly ovate, cordate, or ovate-triangular, $5\text{--}8 \times 2\text{--}4$ cm, abaxially grayish white and densely tomentose, adaxially green and scabrid, base cordate, truncate, or cuneate, margin dentate. Upper stem leaves sessile, ovate to narrowly ovate-elliptic, gradually smaller upward on stem. Capitula to 3–5 in a clustered corymbiform synflorescence at end of stem or branches, shortly pedunculate to subsessile. Involucre narrowly campanulate, 5–7 mm in diam. Phyllaries in ca. 5 rows, sparsely arachnoid; outer phyllaries ovate-triangular, $2\text{--}3 \times 1.5\text{--}2$ mm, apex shortly acuminate; middle phyllaries narrowly ovate-elliptic, $3\text{--}6 \times 1\text{--}1.5$ mm, apex obtuse; inner phyllaries narrowly elliptic to linear, $7\text{--}8 \times 1\text{--}1.5$ mm, apex obtuse. Corolla purple, 8–9 mm, tube 3.5–4 mm, limb 4–5 mm, lobes 2.5–3 mm. Achene obconic, ca. 2 mm, glabrous. Pappus straw-colored; outer bristles 2–3 mm, scabrid; inner bristles 6–7 mm.

• N Chongqing (Chengkou).

229. *Saussurea vestitiformis* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 643. 1937.

河谷风毛菊 he gu feng mao ju

Herbs 30–70 cm tall, perennial. Stem solitary, erect, apically branched, densely leafy, apically arachnoid tomentose. Basal and lower stem leaves petiolate; petiole 10–13 cm; leaf blade ovate, $6\text{--}13 \times 3.5\text{--}8.5$ cm, thick, abaxially grayish green to grayish white and densely tomentose, adaxially green and sparsely arachnoid but glabrescent, base deeply cordate, margin sinuate-denticulate, apex acute. Middle stem leaves petiolate; leaf blade base truncate, rounded, or cuneate. Upper stem leaves sessile, narrowly elliptic to ovate-elliptic, gradually smaller upward on stem. Capitula numerous, in a paniculiform or laxly corymbiform synflorescence, pedunculate. Involucre campanulate, 8–10 mm in diam. Phyllaries in 5 or 6 rows, pale yellow sericeous, apex obtuse to rounded and with a black mucro; outer phyllaries narrowly ovate, $2\text{--}3 \times 1\text{--}1.5$ mm; middle phyllaries narrowly ovate-elliptic, $5\text{--}7 \times$ ca. 1 mm; inner phyllaries linear, $8\text{--}10 \times$ ca. 1 mm. Corolla dark purple, ca. 1.2 cm. Achene obconic, glabrous. Pappus straw-colored; outer bristles simple, ca. 1/4 as long as inner ones. Fl. and fr. Aug–Sep.

• Montane forests and grasslands; ca. 2900 m. NW Yunnan (Lijiang, Zhongdian).

230. *Saussurea baroniana* Diels, Bot. Jahrb. Syst. 29: 625. 1901.

棕脉风毛菊 zong mai feng mao ju

Saussurea broussonetifolia F. H. Chen; *S. rufotricha* Y. Ling.

Herbs 20–60 cm tall, perennial. Stem solitary, erect, apically branched, with brown multicellular articulate hairs. Lower and middle stem leaves petiolate; petiole 2–13 cm, with brown articulate hairs; leaf blade ovate to ovate-cordate, $8.5\text{--}14 \times 4.5\text{--}9$ cm, abaxially grayish white and densely arachnoid lanate, adaxially green, scabrid, and strigose, base cordate to rarely rounded, margin coarsely dentate, apex acuminate. Upper stem

leaves shortly petiolate to sessile, gradually smaller upward on stem; leaf blade ovate, base cuneate. Capitula 2 or 3 clustered at end of branches, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate to ovoid, 6–10 mm in diam. Phyllaries in 6 or 7 rows, arachnoid; outer phyllaries ovate-triangular, leathery, apically black, apex mucronate; inner phyllaries oblong to narrowly ovate-elliptic, apically purple, apex obtuse. Corolla purple, ca. 1.1 cm. Achene ca. 5 mm, glabrous. Pappus grayish white to pale brown; outer bristles scabrid. Fl. and fr. Aug–Oct.

• Montane forests, forest margins; 2200–2800 m. S Shaanxi (Qin Ling).

231. *Saussurea flaccida* Y. Ling, Contr. Inst. Bot. Natl. Acad. Peiping 3: 165. 1935.

萎软风毛菊 *wei ruan feng mao ju*

Herbs 25–50 cm tall, perennial. Stem solitary, slender, erect, simple or apically few branched, sparsely arachnoid. Basal and lower stem leaves petiolate; petiole 6–13 cm; leaf blade ovate to broadly ovate, 2.5–6 × 2–5 cm, thinly papery, abaxially grayish white and densely white tomentose, adaxially green, scabrid, and densely strigose, base cordate, margin sinuate-dentate to denticulate, apex acute to acuminate. Upper stem leaves shortly petiolate to sessile, gradually smaller upward on stem; leaf blade narrowly ovate-elliptic to oblong. Capitula 2–4, in a corymbiform synflorescence or sometimes solitary, pedunculate. Involucre obconic to oblong, 5–6 mm in diam. Phyllaries in ca. 4 rows, rigid, leathery, densely arachnoid, apex with a blackish purple mucro; outer phyllaries ovate-triangular, ca. 3 × 2 mm, apex acute; middle phyllaries elliptic, ca. 6 × 2 mm, apex obtuse; inner phyllaries broadly linear, ca. 7 × 1 mm, apex acute. Corolla pale yellowish brown, ca. 1 cm, tube ca. 5 mm, limb ca. 5 mm. Achene cylindric, ca. 5 mm, ribbed, glabrous. Pappus straw-colored; outer bristles 2–3 mm, scabrid; inner bristles ca. 8 mm. Fl. and fr. Aug–Sep.

• Montane grasslands, thickets; 2700–2800 m. S Shaanxi (Qin Ling).

232. *Saussurea acromelaena* Handel-Mazzetti, Symb. Sin. 7: 1151. 1936.

肾叶风毛菊 *shen ye feng mao ju*

?*Saussurea discolor* (Willdenow) Candolle var. *nana* F. H. Chen; ?*S. nivea* Turczaninow var. *nana* (F. H. Chen) Handel-Mazzetti; *S. reniformis* Y. Ling.

Herbs 40–50 cm tall, perennial. Stem solitary, stout, erect, apically branched, sparsely lanate. Basal and lower stem leaves petiolate; petiole 6–12 cm; leaf blade broadly ovate, cordate, or reniform, 3–11 × 7–10(–17) cm, abaxially grayish white and densely lanate, adaxially yellowish green and glabrous or sparsely pilose, base cordate, margin dentate, apex rounded to emarginate. Middle and upper stem leaves petiolate; petiole 0.5–5 cm; leaf blade ovate, triangular-ovate, or ovate-elliptic, gradually smaller upward on stem, base cordate, truncate, or cuneate, apex acute to acuminate. Capitula numerous, in a corymbiform synflorescence. Involucre campanulate, 6–10 mm in diam. Phyllaries in ca. 5 rows, leathery, densely white lanate,

apex with a blackish purple mucro; outer phyllaries ovate, ca. 4 × 3 mm; middle phyllaries oblong, ca. 7 × 3 mm; inner phyllaries oblong to narrowly elliptic-linear, 8–10 × 1–2.5 mm. Corolla pale purple, 1–1.2 cm, tube 5–6 mm, limb 4–5 mm, lobes 3–4 mm. Achene brown, cylindric, 4–5 mm, glabrous. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles 8–9 mm. Fl. and fr. Sep–Oct.

• Montane forests; 1400–2500 m. Hebei, Henan, W Hubei, Shaanxi.

233. *Saussurea pinetorum* Handel-Mazzetti, Symb. Sin. 7: 1150. 1936.

松林风毛菊 *song lin feng mao ju*

Saussurea ionodasys Handel-Mazzetti.

Herbs 30–50 cm tall, perennial. Stem solitary, erect, branched, narrowly winged, with rusty multicellular articulate hairs. Basal and lower stem leaves petiolate; petiole 1.5–3 cm, winged, wing margin sparsely dentate or entire; leaf blade oblong to ovate, 3–10 × 2.5–6 cm, abaxially grayish white and densely tomentose, adaxially green, scabrid, and with rust-colored multicellular articulate hairs, base subcordate to truncate, margin dentate, apex rounded, obtuse, or acute. Middle stem leaves shortly petiolate to sessile; petiole if present winged, wings or leaf base decurrent on stem; leaf blade oblong, narrowly ovate-elliptic, or linear, smaller upward on stem. Capitula 2–12 at end of branches, in a corymbiform or paniculiform synflorescence, pedunculate. Involucre cylindric, 7–9 mm in diam. Phyllaries in ca. 5 rows, subglabrous, apex subacute to rounded; outer phyllaries ovate, 2.8–3 × ca. 1.5 mm; middle phyllaries narrowly elliptic, 5–8 × 1.8–2 mm; inner phyllaries linear, ca. 9 × 1 mm. Corolla purple, ca. 1 cm, tube ca. 5 mm, limb ca. 5 mm. Achene pale brown, 2–3 mm, glabrous. Pappus white; outer bristles ca. 2 mm, scabrid; inner bristles ca. 9 mm. Fl. and fr. Jul–Sep.

• *Pinus* forests, grassy slopes; 1900–3800 m. NE Chongqing, W Sichuan, NW Yunnan (Lijiang).

234. *Saussurea paleata* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 168. 1859.

膜片风毛菊 *mo pian feng mao ju*

?*Saussurea corymbosa* F. H. Chen; *S. eriolepis* Bunge ex Candolle var. *paleata* (Maximowicz) Herder.

Herbs to 60 cm tall, perennial. Stem solitary, erect, apically branched, arachnoid or glabrescent. Basal and lower stem leaves petiolate; petiole 5–7 cm; leaf blade narrowly ovate-cordate to oblong-cordate, 6–8 × 4–5 cm, abaxially grayish green and thinly arachnoid tomentose, adaxially green and glabrous, base cordate, margin serrate to dentate, apex acuminate. Middle stem leaves petiolate; leaf blade ovate to narrowly ovate-elliptic, gradually smaller upward on stem. Upper stem leaves shortly petiolate to sessile; leaf blade narrowly ovate-elliptic to linear, apex acute. Capitula several, in a paniculiform or corymbiform synflorescence, pedunculate. Involucre campanulate, 7–10 mm in diam. Phyllaries in 3 or 4 rows, apically purplish red, arachnoid near margin, apex acute; outer phyllaries triangular, ca. 3 × 1 mm; middle phyllaries oblong, 3–6 ×

1–1.5 mm; inner phyllaries linear-elliptic, 6–8 × ca. 1 mm. Corolla purplish red, ca. 8 mm, tube ca. 4 mm, limb ca. 4 mm. Achene brown, ca. 2 mm, glabrous. Pappus basally brownish but apically white; outer bristles 1–2 mm, scabrid; inner bristles ca. 7 mm. Fl. and fr. Jul–Sep. $2n = 26^*$.

- Mountain slopes; 1700–2200 m. Hebei, ?Liaoning.

Saussurea paleata is a doubtful taxon, probably only a glabrescent form of *S. nivea*; it was already reduced to a variety of the latter (as *S. eriolepis*) by Herder (Bull. Soc. Imp. Naturalistes Moscou 41(3): 32. 1868). The type specimen of *S. corymbosa* has not been examined by the present authors; therefore, the identity of that taxon remains unclear.

235. *Saussurea chetchozensis* Franchet, J. Bot. (Morot) 2: 359. 1888.

大坪风毛菊 da ping feng mao ju

Herbs to 70 cm tall, perennial. Stem solitary, erect, apically few branched, usually narrowly winged in middle part, arachnoid. Basal and lower stem leaves petiolate; petiole 4–6 cm; leaf blade broadly ovate, 8–10 × 4–6 cm, abaxially grayish white or green and densely tomentose or glabrous, adaxially green and scabrid, base cordate to cuneate, margin denticulate, apex acute to obtuse. Middle stem leaves petiolate; petiole 1–2 cm, winged, base decurrent on stem; leaf blade ovate to narrowly elliptic, 5–7 × 1.5–2 cm. Upper stem leaves sessile, narrowly elliptic to linear, base decurrent, apex acute. Capitula 2–9, in a lax corymbiform synflorescence or sometimes solitary, pedunculate. Involucre campanulate-obconic, 1.2–1.5 cm in diam. Phyllaries in 5 or 6 rows, densely arachnoid tomentose; outer phyllaries triangular-ovate, 3–5 × 3–4 mm, apex acute and usually with a dark mucro; middle phyllaries ovate, 5–10 × 2–3 mm, apex acute to obtuse; inner phyllaries narrowly ovate, 12–14 × 1–1.5 mm, apex obtuse. Corolla bluish purple, 1.3–1.4 cm, tube 6–7 mm, limb 6.5–7 mm, lobes 3–3.5 mm. Achene brown, ca. 3 mm, glabrous. Pappus dirty white; outer bristles 1–2 mm, scabrid; inner bristles 1–1.2 cm. Fl. and fr. Aug–Oct.

- Montane forests and thickets, grasslands; 2000–3700 m. Guizhou, Sichuan, Yunnan.

- 1a. Leaf blade abaxially grayish white and densely tomentose 235a. var. *chetchozensis*
- 1b. Leaf blade abaxially green and glabrous 235b. var. *glabrescens*

235a. *Saussurea chetchozensis* var. *chetchozensis*

大坪风毛菊(原变种) da ping feng mao ju (yuan bian zhong)

Saussurea coeruleoviolacea H. Léveillé; *S. lanuginosa* Vaniot.

Leaf blade abaxially grayish white and densely tomentose.

- Montane forests, grasslands; 2000–3700 m. Guizhou, Sichuan, Yunnan.

235b. *Saussurea chetchozensis* var. *glabrescens* (Handel-Mazzetti) Lipschitz, Novosti Sist. Vyssh. Rast. 8: 248. 1971.

光叶风毛菊 guang ye feng mao ju

Saussurea lanuginosa var. *glabrescens* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 643. 1937.

Leaf blade abaxially green and glabrous.

- Montane thickets, grasslands; 3000–3600 m. SW Sichuan, NW Yunnan.

236. *Saussurea lyratifolia* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 95. 1981.

大头羽裂风毛菊 da tou yu lie feng mao ju

Herbs to 60 cm tall, perennial. Stem solitary, erect, simple, basally covered with dark brown remains of old leaf sheaths. Lower stem leaves ca. 2, elliptic, lyrate-pinnately parted, abaxially pale green and sparsely arachnoid lanate, adaxially green and pilose, base auriculate-amplexicaul, margin irregularly sinuate-dentate; lateral lobes oblong, 2.5–3.5 × 1.2–1.5 cm; terminal lobe ca. 10 × 8 cm. Middle and upper stem leaves ca. 2, narrowly ovate-elliptic, 7–14 × 2.5–6 cm, base auriculate, margin irregularly dentate, apex acuminate and mucronate. Capitula ca. 5, clustered in a hemispheric synflorescence, subsessile. Involucre ovoid, 9–10 mm in diam. Phyllaries in ca. 4 rows, pale yellowish green, apically and near margin dark purple, pilose, apex long acuminate; outer phyllaries broadly ovate-elliptic; inner phyllaries narrowly oblong. Receptacle bristles ca. 4 mm. Corolla purplish red, 1.1–1.2 cm, tube 4.5–5 mm, limb 3.5–4 mm, lobes ca. 2 mm. Achene cylindric, ca. 2 mm, smooth, glabrous, apex with a denticulate crown. Pappus brown; outer bristles short, scabrid; inner bristles plumose. Fl. and fr. Jul–Aug.

- Forests; ca. 3800 m. SE Xizang (Bomi).

Saussurea lyratifolia was placed in *S.* subg. *Frolovia* by C. Shih and S. Y. Jin (FRPS 78(2): 58. 1999). As all other former members of this subgenus are now accommodated in different genera, *S. lyratifolia* is now placed in *S.* subg. *Saussurea*. The typical double pappus and the capitula and synflorescence structure leave no doubt that this species belongs to *Saussurea* s.s. and not to one of the segregates. It is very similar to *S. laneana* W. W. Smith from India (Sikkim). Further studies are needed to investigate if this is indeed the same species.

237. *Saussurea neofranchetii* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 676. 1972.

耳叶风毛菊 er ye feng mao ju

Saussurea auriculata Franchet, Nouv. Arch. Mus. Hist. Nat., sér. 2, 10: 40. 1887, not (Candolle) Schultz Bipontinus (1846).

Herbs 50–100 cm tall, perennial. Stem solitary, erect, simple or apically few branched, glabrous. Basal leaves petiolate, sometimes withered at anthesis; petiole to 12 cm; leaf blade ovate to narrowly ovate-elliptic, 5.5–15 × 1.5–5 cm, abaxially pale green, often tinged purple, and glabrous, adaxially dark green and glabrous, base cuneate-attenuate, margin serrulate, apex acuminate. Lower, middle, and upper stem leaves usually sessile, gradually smaller upward on stem; leaf blade narrowly ovate-elliptic to oblong, to 15 × 3 cm, basally slightly constricted, base auriculate and amplexicaul. Capitula 1–3, long pedunculate. Involucre campanulate, 1.5–2 cm in diam. Phyllaries in 4 or 5 rows, dark purplish brown, leathery, glabrous or sparsely pilose, apex acute to acuminate and reflexed; outer phyllaries ovate, 8–10 × 4–5 mm; middle phyllaries 10–16 × 2–4 mm; inner phyllaries narrowly ovate-elliptic, 16–19 × ca. 2

mm. Corolla purplish red, 1.4–1.6 cm, tube 7–8 mm, limb 7–8 mm, lobes 4–5 mm. Achene blackish brown, cylindric, 4–5 mm, ribbed, glabrous, apex with a short crown. Pappus straw-colored to reddish; outer bristles scabrid. Fl. and fr. Jul–Aug.

• Forest margins, thickets, montane grasslands; 3000–3800 m. W Sichuan, NW Yunnan (Lijiang, Zhongdian).

Saussurea neofranchetii was described from a specimen without basal leaves. Whereas the lower stem leaves can either be sessile or petiolate, the basal leaves are always distinctly petiolate.

238. *Saussurea caudata* Franchet, Bull. Annuel Soc. Philom. Paris, sér. 8, 3: 147. 1891.

尾叶风毛菊 *wei ye feng mao ju*

Herbs 20–85 cm tall, perennial. Stem solitary, purple, erect, simple or apically few branched, glabrous. Basal leaves petiolate; petiole 7–9 cm; leaf blade narrowly ovate-elliptic to oblong, 8–15 × 1–1.5 cm, abaxially pale green, glabrous, adaxially green and glabrous or sparsely strigose on veins, base cuneate-attenuate, margin serrulate-denticulate, apex caudate-acuminate. Lower stem leaves broadly linear, base attenuate into a winged petiole, apex caudate-acuminate. Middle and upper stem leaves sessile, narrowly ovate-elliptic to oblong, basally slightly narrowed, base auriculate and amplexicaul, apex caudate-acuminate. Capitula 2–4, terminal on stem or branches in a lax corymbiform synflorescence or sometimes solitary, long pedunculate. Involucre campanulate, 1.2–2 cm in diam. Phyllaries in 4 or 5 rows, leathery; outer phyllaries ovate, 8–9 × 4–7 mm, apex acuminate and reflexed; middle phyllaries oblong, ca. 12 × 4 mm; inner phyllaries linear, ca. 15 × 2 mm, apex acute. Corolla purple, ca. 1.6 cm, tube ca. 9 mm, limb ca. 6 mm. Achene cylindric, ca. 3 mm, ribbed, glabrous. Pappus dirty white; outer bristles ca. 3 mm; inner bristles ca. 1.3 cm. Fl. and fr. Jul–Sep.

• Forest margins, meadows, open rocky pastures; 3000–4000 m. W Sichuan, NW Yunnan (Zhongdian).

239. *Saussurea leclerei* H. Lévillé, Bull. Géogr. Bot. 25: 18. 1915.

利马川风毛菊 *li ma chuan feng mao ju*

Saussurea mollis Franchet (1894), not (Cavanilles) Sprengel (1826).

Herbs to 1 m tall, perennial. Stem solitary, erect, apically branched, narrowly winged, glabrous. Basal and lower stem leaves usually withered at anthesis. Middle and upper stem leaves shortly petiolate; petiole base inconspicuously small auriculate and decurrent on stem; leaf blade ovate to elliptic, 6–11 × 2.5–4.5 cm, abaxially grayish green and arachnoid tomentose, adaxially dark green and glabrous, base cuneate-attenuate and decurrent on petiole, margin sinuate-denticulate, apex caudate-acuminate. Uppermost stem leaves subsessile, narrowly ovate-elliptic, smaller, margin subsinuate or entire. Capitula numerous, in a clustered corymbiform synflorescence at end of stem and branches, shortly pedunculate. Involucre campanulate, 5–6 mm in diam. Phyllaries in ca. 5 rows, brown, glabrous; outer phyllaries ovate, 2–3 × 1–1.5 mm, apex acute; middle phyllaries ovate, 3–6 × 1.5–2 mm, apex obtuse; inner phyllaries

linear, 6–8 × 1–1.5 mm, apex rounded. Corolla purple, 8–9(–12) mm, tube 3–5 mm, limb 4.5–5 mm, lobes ca. 3 mm. Achene cylindric, ca. 3 mm, glabrous. Pappus pale brown; inner bristles 7–8 mm. Fl. and fr. Aug–Oct.

• Montane grasslands; 2000–3300 m. Chongqing, Hubei, Sichuan, NC Yunnan.

240. *Saussurea merinoi* H. Lévillé, Bull. Géogr. Bot. 25: 19. 1915.

截叶风毛菊 *jie ye feng mao ju*

Herbs to 1 m tall, perennial. Stem solitary, erect, apically branched, not winged, glabrous. Basal and lower stem leaves usually withered at anthesis. Middle stem leaves shortly petiolate; leaf blade ovate, elliptic, or oblong, 6–10 × 2–3.5 cm, surfaces dark green and ± concolorous, abaxially puberulent on veins, adaxially glabrous, base truncate to cuneate, margin sinuate-denticulate, apex caudate-acuminate. Upper stem leaves sessile, ovate-elliptic to narrowly ovate-elliptic, smaller. Capitula numerous, in a clustered corymbiform synflorescence at end of stem and branches, shortly pedunculate. Involucre narrowly campanulate, 4–6 mm in diam. Phyllaries in ca. 5 rows, brown, glabrous; outer phyllaries ovate, 2–3 × 1–2 mm, apex acuminate; middle phyllaries ovate-elliptic, 3–6 × 1.5–2 mm, apex subacute; inner phyllaries linear, 7–10 × 1–1.5 mm, apex subacute. Corolla purple, 8–10 mm, tube 3.5–5 mm, limb 4.5–5 mm, lobes ca. 3 mm. Achene brown, cylindric, ca. 4 mm, glabrous. Pappus pale reddish brown; outer bristles 0.2–3 mm; inner bristles 7–8 mm. Fl. and fr. Aug–Oct.

• Montane grasslands; ca. 3200 m. NE Yunnan (Qiaojia).

Apparently, *Saussurea merinoi* is only known from the type specimens, which lack the basal and underground parts of the plants. This species is probably close to *S. leclerei*.

241. *Saussurea macrota* Franchet, J. Bot. (Morot) 8: 343. 1894.

大耳叶风毛菊 *da er ye feng mao ju*

Saussurea auriculata Hemsley (1892), not (Candolle) Schultz Bipontinus (1846), nor Franchet (1887); *S. hemsleyana* Handel-Mazzetti; *S. kitamurae* S. Y. Hu; *S. macrota* var. *papyracea* Lipschitz; *S. otophylla* Diels; *S. otophylla* var. *cinerea* Y. Ling.

Herbs 25–85 cm tall, perennial. Stem solitary, erect, apically branched, apically flexuous, wingless, subglabrous. Basal leaves withered at anthesis. Lower and middle stem leaves sessile, elliptic to ovate-elliptic, 8–23 × 2.5–6 cm, abaxially sparsely arachnoid or glabrous and sometimes gland-dotted, adaxially green and sparsely strigose or glabrous, base auriculate and amplexicaul, margin denticulate to coarsely serrate, apex acute to acuminate. Upper stem leaves narrowly ovate to narrowly elliptic, gradually smaller upward on stem. Capitula numerous, in a clustered corymbiform synflorescence at end of stem and branches, pedunculate. Involucre narrowly campanulate, 6–10 mm in diam. Phyllaries in 5 or 6 rows, brownish, apically and near margin purple, glabrous or sparsely arachnoid; outer phyllaries ovate, 3–4 × 2–2.5 mm, apex usually obtuse; middle phyllaries narrowly ovate, 5–11 × 1.5–3 mm, apex obtuse to acute; inner phyllaries linear, 11–13 × 1–1.5 mm, apex

subacute. Corolla dark purple, 1–1.2 cm, tube 5–6 mm, limb 5–7 mm, lobes 3–3.5 mm. Achene cylindric, 3–4.5 mm, ribbed, glabrous. Pappus pale brown; outer bristles 1.5–3 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Jul–Aug.

• Montane forests, thickets; 2200–3300 m. N Chongqing, Gansu, W Hubei, Ningxia, Shaanxi, Sichuan.

242. *Saussurea semiamplexicaulis* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 528. 1972.

半抱茎风毛菊 ban bao jing feng mao ju

Herbs 50–70 cm tall, perennial. Stem solitary, erect, apically branched, wingless, apically with brown articulate hairs. Leaves green and golden gland-dotted, margin dentate-denticulate. Lower stem leaves petiolate; petiole 3–5 cm, winged, base enlarged, auriculate, and semiamplexicaul; leaf blade narrowly ovate-elliptic, 6–9 × 2.5–4 cm, both surfaces green, abaxially gland-dotted and sparsely arachnoid, adaxially ± sparsely gland-dotted and glabrous, base subcordate to truncate, apex acute. Middle and upper stem leaves sessile, gradually smaller upward on stem, base auriculate and semiamplexicaul. Capitula numerous, to 4–10 in a clustered corymbiform synflorescence at end of branches, shortly pedunculate or sessile. Involucre cylindric to narrowly campanulate, 5–7(–10) mm in diam. Phyllaries in 5 or 6 rows, brown, leathery, glabrous, apex obtuse to acuminate; outer phyllaries ovate, 3–4 × 2–2.5 mm; middle phyllaries narrowly ovate, 4–8 × 1.5–2 mm, apex acute to obtuse; inner phyllaries linear, 8–10 × 1–1.5 mm. Receptacle bristles 5–7 mm. Corolla purple, 1.2–1.3 cm, tube 6–7 mm, limb 5.5–6.5 mm, lobes 3–3.5 mm. Achene gray with dark black spots, 3–3.5 mm, glabrous. Pappus dirty white; outer bristles scabrid, 2–4 mm; inner bristles 9–10 mm. Fl. and fr. Sep.

• Montane grasslands; ca. 2700 m. NW Yunnan (Dèqên).

243. *Saussurea peduncularis* Franchet, J. Bot. (Morot) 2: 357. 1888.

显梗风毛菊 xian geng feng mao ju

Saussurea peduncularis var. *corymbosa* Franchet; *S. peduncularis* var. *diversifolia* Franchet; *S. peduncularis* var. *lobata* Franchet.

Herbs 25–90 cm tall, perennial. Stem erect, apically branched, winged, glabrous. Lower stem leaves petiolate; petiole to 4 cm, winged with 1 or 2 pairs of teeth; leaf blade narrowly ovate, elliptic, or ovate, 8–18 × 4–8 cm, lyrate-pinnate, abaxially sparsely strigose on veins or glabrous, adaxially green and glabrous, base cuneate-attenuate into winged petiole, margin toothed, apex acute to obtuse. Middle and upper stem leaves sessile, narrowly elliptic, gradually smaller upward on stem, base decurrent on stem, margin dentate. Capitula numerous, in a corymbiform or paniculiform synflorescence, pedunculate. Involucre ovoid to campanulate, 6–12(–15) mm in diam., apically usually constricted. Phyllaries in ca. 5 rows, margin sparsely arachnoid; outer phyllaries ovate, ca. 4 × 2 mm, apex acute to obtuse; middle phyllaries elliptic, ca. 7 × 3 mm, apex acute; inner phyllaries narrowly elliptic, ca. 9 × 2 mm, apex obtuse. Corolla dark bluish purple, 1–1.3 cm, tube ca. 7 mm, limb ca. 6 mm. Achene brown, cylindric, ca. 2.5 mm, glabrous. Pappus

pale brown; outer bristles ca. 2 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Aug–Oct.

• Montane forests, forest margins, thickets, open meadows; 2800–3500 m. NW Yunnan.

244. *Saussurea frondosa* Handel-Mazzetti, Acta Horti Gothob. 12: 312. 1938.

狭翼风毛菊 xia yi feng mao ju

Herbs 50–60 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, densely pubescent. Basal leaves withered at anthesis. Lower and middle stem leaves shortly petiolate or sessile; petiole winged if present; leaf blade ovate to elliptic, 10–17 × 3–8 cm, undivided or lyrate-pinnately lobed, both surfaces green and glabrous, base cuneate-attenuate and decurrent, margin serrulate, apex acute to acuminate; lateral lobes inconspicuous, 1 pair, triangular to elliptic; terminal lobe ovate to elliptic. Upper stem leaves subsessile; leaf blade elliptic to narrowly elliptic, 7–10 × 3–3.5 cm, gradually smaller upward on stem, margin entire. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre ovoid-oblong, ca. 5 mm in diam. Phyllaries in ca. 5 rows, abaxially sparsely arachnoid; outer and middle phyllaries ovate to elliptic, 5–6 × 2–3 mm, apex with a 3–4 mm subulate awn; inner phyllaries oblong, 7–10 × 2–3 mm, apex obtuse and mucronate. Corolla purplish red or white, ca. (1–)1.6 cm, tube ca. 9.5 mm, limb ca. 6.5 mm. Achene brown, cylindric, ca. 5 mm, glabrous. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles ca. 9 mm. Fl. and fr. Jul–Sep(–Nov).

• Montane forests; 1400–2300 m. Fujian, Henan, ?Shaanxi, Shanxi, ?Sichuan, Yunnan.

245. *Saussurea eriocephala* Franchet, J. Bot. (Morot) 8: 339. 1894.

棉头风毛菊 mian tou feng mao ju

Saussurea pallidiceps Handel-Mazzetti.

Herbs 45–75 cm tall, perennial. Stem solitary, erect, apically branched, winged, arachnoid; wing entire. Lower stem leaves shortly petiolate; petiole to 3 cm, base widened, semi-amplexicaul, and decurrent; leaf blade ovate, 5–10 × 3–7 cm, lyrate-pinnatisect or pinnately lobed, abaxially grayish white and thinly arachnoid, adaxially green and glabrous; lateral segments 1–3 pairs, elliptic, broadly ovate, or suborbicular, 0.3–2 cm; terminal segment broadly ovate, 3.5–8 cm, base shallowly cordate, margin denticulate or subentire, apex acute to obtuse. Middle and upper stem leaves petiolate or sessile, gradually smaller upward on stem; leaf blade lyrate-pinnate or undivided; lateral segments 1 pair and elliptic or absent; terminal segment ovate-cordate, 2.5–7 × 2–4.5 cm. Capitula numerous, in a corymbiform or paniculiform synflorescence, pedunculate. Involucre campanulate, 1–1.7 cm in diam. Phyllaries in ca. 5 rows, apically densely yellowish brown villous, apex acuminate and mucronate; outer phyllaries ca. 5 × 2–3 mm; middle and inner phyllaries narrowly elliptic to linear, 10–14 × 2–2.5 mm. Corolla purple, ca. 1 cm. Achene glabrous. Pappus brown; outer bristles ca. 4 mm, scabrid; inner bristles ca. 1 cm. Fl. Aug–Sep.

• Montane grasslands; 1900–2900 m. SW Sichuan (Muli), NW Yunnan (Lijiang).

246. *Saussurea dzeurensis* Franchet, J. Bot. (Morot) 8: 339. 1894.

川西风毛菊 chuan xi feng mao ju

Herbs 20–90 cm tall, perennial. Stem solitary, erect, apically branched, winged, sparsely lanate or glabrescent; wing sinuate-dentate. Basal and lower stem leaves long petiolate; petiole to 7 cm; leaf blade narrowly ovate-elliptic, 3–12 × 0.4–3 cm, runcinate-pinnately lobed or dentate, abaxially grayish white and arachnoid, adaxially green and sparsely strigose, base decurrent, apex acuminate; lateral lobes 3–6 pairs, triangular-ovate, margin dentate. Middle and upper stem leaves sessile, narrowly ovate-elliptic, gradually smaller upward on stem, base decurrent, margin coarsely dentate. Capitula numerous, in corymbiform synflorescence, pedunculate. Involucre ovoid, 5–8 mm in diam. Phyllaries in 5 or 6 rows, brown but black near margin, leathery, sericeous, apex acute to obtuse; outer phyllaries ovate, ca. 3 mm; middle phyllaries narrowly ovate-elliptic; inner phyllaries linear. Corolla purple, 8–10 mm. Achene ca. 3 mm, glabrous. Pappus pale yellowish brown; outer bristles scabrid. Fl. and fr. Jul–Oct.

• Alpine steppes and grasslands; 2600–4000 m. Gansu, Qinghai, W Sichuan.

247. *Saussurea carduiformis* Franchet, J. Bot. (Morot) 8: 343. 1894.

菊状风毛菊 ji zhuang feng mao ju

Herbs 50–60 cm tall, perennial. Stem solitary, erect, apically branched, basally strigose. Basal and lower stem leaves sessile, obovate to elliptic, 8–15 × 4–6 cm, abaxially pale green and sparsely arachnoid or glabrous but sparsely strigose on veins, adaxially green and scabrid but glabrescent, base semiamplexicaul and decurrent, margin basally pinnately lobed and apically coarsely dentate, apex acuminate. Middle and upper stem leaves sessile, elliptic to narrowly elliptic, gradually smaller upward on stem, base cuneate and semiamplexicaul, margin coarsely sinuate-dentate to subentire, apex acuminate. Capitula 2–7, in a racemiform to corymbiform synflorescence or solitary, long pedunculate. Involucre hemispheric, 1.5–2.5 cm in diam. Phyllaries in 4–6 rows, brownish, leathery, sparsely arachnoid, apically usually patent or reflexed; outer phyllaries triangular-ovate, 4–5 × 2–2.5 mm, apex long acuminate; middle phyllaries narrowly triangular-ovate, 5–10 × 2–3 mm, apex long acuminate; inner phyllaries narrowly elliptic, 10–11 × 1.5–2 mm, apex shortly acuminate. Corolla bluish purple, 1.2–1.4 cm, tube 6–7 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene cylindric, ca. 3 mm, glabrous. Pappus dirty white; outer bristles ca. 2 mm; inner bristles 8–10 mm. Fl. and fr. Sep–Oct.

• Open montane forests, mountain trails; 2600–2800 m. Chongqing, Gansu, Shaanxi, Sichuan.

248. *Saussurea mutabilis* Diels, Bot. Jahrb. Syst. 36(Beibl. 82): 109. 1905.

变叶风毛菊 bian ye feng mao ju

Saussurea mutabilis var. *diplochaeta* Y. Ling.

Herbs 40–70(–100) cm tall, perennial. Stem solitary, erect,

apically much branched, sparsely pubescent. Lower stem leaves withered at anthesis. Middle stem leaves petiolate; petiole 5–11 cm; leaf blade ovate to elliptic, 7–15 × 5–9 cm, thin, lyrate pinnately parted or undivided, both surfaces green and glabrous or subglabrous; lateral lobes 1 or 2 pairs, elliptic to triangular; terminal lobe ovate, margin sinuate-dentate, apex acute. Upper stem leaves shortly petiolate or sessile, gradually smaller upward on stem; leaf blade lyrate pinnately parted or undivided; lateral lobes if present 1 pair, ovate-elliptic. Capitula numerous, in a paniculiform or corymbiform synflorescence. Involucre narrowly campanulate, 4–9 mm in diam. Phyllaries in 5 or 6 rows, arachnoid; outer phyllaries ovate, apex recurved; inner phyllaries narrowly ovate-elliptic, apex acute to subobtusate. Corolla white, 8–11 mm. Achene pale brown, ca. 5 mm, glabrous. Pappus white; outer bristles ca. 3 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Aug–Sep.

• Montane forests; 1300–1800 m. Gansu, S Shaanxi (Qin Ling).

249. *Saussurea morifolia* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 8: 123. 1938.

桑叶风毛菊 sang ye feng mao ju

Herbs 20–60 cm tall, perennial. Stem solitary, erect, simple or few branched, glabrous. Basal and lower stem leaves petiolate; petiole 8–11 cm; leaf blade obovate to elliptic, 7–11 × 3.5–6 cm, lyrate pinnatisect, both surfaces green and glabrous; lateral segments 2–4 pairs, elliptic to narrowly triangular, margin denticulate or subentire, apex obtuse to acute; terminal segment ovate to triangular-ovate, margin sparsely denticulate, apex acute to acuminate. Middle stem leaves shortly petiolate; leaf blade elliptic; lateral segments 1 or 2 pairs, elliptic; terminal segment triangular-hastate. Upper stem leaves small, with 1 pair of lobes or undivided; terminal lobe or leaf blade narrowly elliptic to broadly linear. Capitula solitary and terminal on stem or 2–4 in a corymbiform synflorescence, pedunculate. Involucre campanulate, 7–12 mm in diam. Phyllaries in 4–6 rows, subglabrous, apically reflexed; outer phyllaries ovate, ca. 5 × 3 mm; middle phyllaries elliptic, 6–8 × 1.5–2 mm, apex long acuminate; inner phyllaries linear, 9–10 × ca. 1 mm, apex acute. Corolla purple, ca. 1.5 cm, tube ca. 9 mm, limb ca. 6 mm, lobes ca. 4 mm. Achene brown, 4–5 mm, glabrous. Pappus dirty white; outer bristles ca. 2 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Jul–Sep.

• Montane forests, trailsides; 1800–2700 m. SE Gansu, S Shaanxi (Qin Ling).

250. *Saussurea lampsanifolia* Franchet, J. Bot. (Morot) 2: 357. 1888.

鹤庆风毛菊 he qing feng mao ju

Herbs 25–40 cm tall, perennial. Stems erect, simple or apically branched, narrowly winged, many leaved. Basal and lower stem leaves petiolate; petiole broadly winged, margin dentate; leaf blade ovate to elliptic, 7–10 × 3–4 cm, lyrate pinnatisect, abaxially whitish and densely tomentose, adaxially green and scabrid; lateral lobes 2 or 3 pairs, ovate to triangular, base truncate or shallowly cordate, margin entire or dentate; terminal lobe ovate-triangular, apex acute to shortly acuminate. Upper stem leaves gradually smaller upward on stem. Capitula

numerous, in 3–5 corymbiform synflorescences at end of axillary branches, subsessile. Involucre narrowly campanulate, 5–7 mm in diam. Phyllaries in 5 or 6 rows, straw-colored, subglabrous, apex long acuminate and patent or reflexed; outer phyllaries ovate, 2–3 × 1–1.5 mm; middle phyllaries narrowly ovate-elliptic, 3–6 × ca. 1.5 mm; inner phyllaries linear, 6–8 × ca. 1 mm. Corolla and achene unknown. Pappus pale white; outer bristles scabrid; inner bristles ca. 7 mm. Fl. and fr. Sep–Oct.

- Forests, thickets. Yunnan (Heqing).

Saussurea lampsanifolia is apparently only known from the single type specimen with not yet developed florets.

251. *Saussurea hieracioides* J. D. Hooker, Fl. Brit. India 3: 371. 1881.

长毛风毛菊 chang mao feng mao ju

Saussurea leveilleana Maire; *S. villosa* Franchet.

Herbs 5–20(–35) cm tall, perennial. Stem solitary, well developed, erect, simple, densely white villous. Basal leaves distinctly petiolate; petiole to 8 cm; leaf blade elliptic to narrowly elliptic-oblongate, 2–16 × 0.8–4 cm, abaxially pale green and sparsely villous, adaxially dark green and sparsely villous, base oblique and rounded to cuneate, margin entire and ciliate, apex acute to obtuse. Stem leaves few, sessile, narrowly ovate-elliptic to linear, gradually smaller upward on stem. Capitulum solitary, terminal on stem. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 4 or 5 rows, blackish purple, densely villous, apex long acuminate; outer phyllaries narrowly ovate-triangular, ca. 10 × 3 mm; middle phyllaries narrowly ovate-elliptic, ca. 13 × 2.5 mm; inner phyllaries narrowly lanceolate to linear, ca. 2 × 0.2 cm. Corolla purple, 1.8–2.4 cm, tube 1–1.6 cm, limb ca. 8 mm, lobes 5–6 mm. Achene brown, cylindric, 2–4 mm, glabrous. Pappus pale brown; outer bristles 2–7 mm, scabrid; inner bristles ca. 1.4 cm. Fl. and fr. Jun–Sep. $2n = 64$.

Alpine scree slopes, grasslands, rocky slopes; 4400–5200 m. W Sichuan, Xizang, NW Yunnan [Bhutan, India (Sikkim), Nepal].

252. *Saussurea superba* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 212. 1934.

横断山风毛菊 heng duan shan feng mao ju

Saussurea superba f. *pygmaea* J. Anthony; *S. tatsienensis* Franchet var. *monocephala* Diels.

Herbs 3–25(–35) cm tall, perennial, stemless or cauliferous. Stem solitary, erect, simple, densely villous. Rosette leaves sessile or shortly petiolate; petiole winged if present; leaf blade elliptic to narrowly obovate-elliptic, 3–10 × 1–3.5 cm, both surfaces green and subglabrous, base attenuate, margin entire or inconspicuously denticulate, apex obtuse to subacute. Stem leaves sessile, narrowly elliptic to linear, smaller. Capitulum solitary, sessile in center of leaf rosette or terminal on stem. Involucre broadly campanulate, 1.5–4 cm in diam. Phyllaries in 4 or 5 rows, blackish purple, subglabrous, apex long acuminate; outer phyllaries narrowly ovate-triangular, 10–15 × 3–5 mm; middle phyllaries narrowly ovate-elliptic, 12–18 × 2–3 mm; inner phyllaries narrowly ovate-elliptic to linear, 15–25 × 1–2 mm. Corolla bluish purple, 1.8–2.6 cm, tube 1–1.8 cm, limb 8–

11 mm, lobes 5–6 mm. Achene brown, cylindric, 3–4 mm, glabrous. Pappus pale brown; outer bristles 2–5 mm, scabrid; inner bristles 1.3–2 cm. Fl. and fr. Jun–Sep.

- Alpine grasslands, rocky slopes; 2800–5200 m. Gansu, Qinghai, W Sichuan, Xizang, NW Yunnan (Dêqên, Zhongdian).

253. *Saussurea tatsienensis* Franchet, Bull. Annuel Soc. Philom. Paris, sér. 8, 3: 146. 1891.

打箭风毛菊 da jian feng mao ju

Herbs 10–60 cm tall, perennial. Stem solitary, erect, simple or apically few branched, villous. Lower stem leaves petiolate; petiole to 7 cm; leaf blade narrowly ovate-elliptic to narrowly elliptic, 4–15(–20) × 1–3(–5) cm, both surfaces green and pubescent, base attenuate, margin entire or denticulate and ciliate, apex acute to acuminate. Middle stem leaves sessile, gradually smaller upward on stem, base semiamplexicaul. Uppermost stem leaves linear-subulate, subtending synflorescence. Capitula 2–8, in a corymbiform synflorescence or sometimes solitary, pedunculate. Involucre campanulate to obconic, 1–2 cm in diam. Phyllaries in 4 or 5 rows, blackish purple, glabrous or sparsely villous, apex acuminate; outer phyllaries narrowly triangular-ovate, 8–10 × 2–3 mm; middle phyllaries narrowly ovate-elliptic, 10–12 × 1.5–2 mm; inner phyllaries linear, 12–15 × 1–1.5 mm. Corolla bluish purple, 1.2–1.4 cm, tube 6–8 mm, limb 5–6 mm, lobes 3–3.5 mm. Achene glabrous. Pappus dirty white; outer bristles 2–3.5 mm, scabrid; inner bristles 9–10 mm. Fl. Jul–Sep.

- Alpine meadows, montane grasslands; 3000–4600 m. Qinghai, W Sichuan, NW Yunnan.

In Qinghai, several specimens have been found that are morphologically intermediate between *Saussurea nigrescens* and *S. tatsienensis*. Both species are very common in the high montane grasslands in the NE part of the Qinghai-Xizang Plateau and probably hybridize where they occur together.

254. *Saussurea acutisquama* Raab-Straube, Willdenowia 41: 83. 2011.

尖苞风毛菊 jian bao feng mao ju

Herbs 5–45 cm tall, perennial. Stems solitary or several, erect, simple or apically few branched, sparsely villous. Basal and lower stem leaves petiolate; petiole to 12 cm; leaf blade narrowly elliptic, 2–13 × 0.5–1.5(–2) cm, both surfaces green and sparsely villous, base attenuate, margin denticulate and ciliate, apex acute to acuminate. Middle stem leaves sessile, narrowly elliptic to linear, smaller, base semiamplexicaul. Upper stem leaves linear. Capitula 2 or 3(–6), in corymbiform synflorescence or sometimes solitary, pedunculate. Involucre obconic, 1–1.5 cm in diam. Phyllaries in 4 or 5 rows, blackish purple, glabrous or subglabrous, apex acute to acuminate; outer phyllaries narrowly ovate-elliptic, 10–13 × 2–3 mm; middle phyllaries narrowly triangular, 13–17 × 2–2.5 mm; inner phyllaries narrowly elliptic to linear, 17–20 × 1–2 mm. Receptacle bristles 5–7 mm. Corolla blackish to bluish purple, 1.4–1.5 cm, tube 6–7 mm, limb 7–8 mm, lobes 3.5–4 mm. Achene brown or gray with black spots, ellipsoid, 3–3.5 mm, glabrous. Pappus apically white, basally straw-colored to pale brown; outer bris-

tlens 3–5 mm, scabrid; inner bristles 13–15 mm. Fl. and fr. Jul–Oct.

• Alpine meadows, montane grasslands; 3400–4900 m. Gansu, Qinghai, W Sichuan, Xizang, NW Yunnan.

Saussurea acutisquama is a taxon that has been recognized as *S. polycolea* var. *acutisquama* (e.g., Lipschitz, *Rod Saussurea*, 64. 1979; S. W. Liu, Fl. Qinghai. 3: 451. 1996) or as *S. nigrescens* var. *acutisquama* (e.g., S. Y. Liang, Fl. Xizang. 4: 871. 1985). Both names are based on a type that represents an entirely different taxon, *S. erubescens*. *Saussurea acutisquama* is widespread in the grasslands of the NE part of the Qinghai-Xizang Plateau and is a good species, quite different from both *S. polycolea* and *S. nigrescens*.

255. *Saussurea euodonta* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 198. 1912.

锐齿风毛菊 *rui chi feng mao ju*

Herbs 30–150 cm tall, perennial. Stem solitary, erect, 5–6 mm in diam., apically few branched, apically flexuous, basally glabrous, apically strigose with brown articulate hairs. Lower and middle stem leaves petiolate; petiole 1–3 cm; leaf blade ovate, elliptic, or narrowly ovate-elliptic, 6–20 × (2–)3.5–7 cm, both surfaces green, abaxially sparsely pubescent on veins or glabrous, adaxially scabrid and sparsely strigose, base slightly cordate, truncate, or cuneate-attenuate, margin coarsely dentate-serrate, apex acuminate. Upper stem leaves shortly petiolate to subsessile, smaller; leaf blade narrowly ovate-elliptic. Capitula 2 or 3(–6), in a lax corymbiform synflorescence or sometimes solitary, long pedunculate. Involucre campanulate, (0.8–)1.3–2 cm in diam. Phyllaries in 4–6 rows, brown but dark purple apically, sparsely pilose, apex acute to acuminate and patent to reflexed; outer phyllaries narrowly ovate-triangular, 8–11 × 3–3.5 mm; middle phyllaries narrowly ovate-elliptic, 8–16 × 2–3 mm; inner phyllaries narrowly elliptic to linear, 16–20 × 1.5–2 mm. Receptacle bristles 0.8–1.2 cm. Corolla purple, 1.2–1.4 cm, tube 6–7 mm, limb 6–7 mm, lobes 4–5 mm. Achene brown, cylindric, ca. 4 mm, glabrous. Pappus dirty white; outer bristles few or sometimes lacking, 1.5–5 mm, scabrid; inner bristles 1–1.1 cm. Fl. and fr. Aug–Oct.

• Montane grasslands, *Pinus* forest margins; 2300–3700 m. Sichuan, NW Yunnan.

256. *Saussurea hultenii* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 57: 528. 1972.

雅龙风毛菊 *ya long feng mao ju*

Herbs 65–70 cm tall, perennial. Stem solitary, 5–6 mm in diam., erect, apically few branched, apically flexuous, sparsely arachnoid and with brown articulate hairs. Lower and middle stem leaves petiolate; petiole 1.5–2.5 cm; leaf blade ovate-elliptic to narrowly ovate-elliptic, 11–16 × 3–6 cm, abaxially light green and sparsely pubescent or glabrous, adaxially dark green and glabrous, base cuneate, margin coarsely dentate-serrate, apex acuminate. Upper stem leaves shortly petiolate to subsessile; leaf blade narrowly ovate to narrowly elliptic, 9–13 × 2.5–4 cm. Capitula 3–6, in a lax corymbiform synflorescence, long pedunculate. Involucre campanulate, 1.5–2 cm in diam. Phyllaries in 4–6 rows, straw-colored, apically and near margin dark brown or purplish, sparsely pilose, apex acute to acuminate and usually patent to reflexed; outer phyllaries triangular-

ovate, 7–9 × 2–4 mm; middle phyllaries narrowly ovate-elliptic, 8–13 × 2.5–3 mm; inner phyllaries narrowly ovate-elliptic, 13–14 × 2–3 mm. Receptacle bristles straw-colored, 5–7 mm. Corolla purple, 1.2–1.4 cm, tube 6–7 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene brown, cylindric, ca. 4 mm. Pappus dirty white; outer bristles usually lacking; inner bristles 1–1.1 cm. Fl. and fr. Aug.

• Mountain slopes, thickets; ca. 2300 m. Yunnan (Gongshan).

257. *Saussurea micradenia* Handel-Mazzetti, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 62: 16. 1925.

滇风毛菊 *dian feng mao ju*

Herbs to 60 cm tall, perennial. Stem solitary, erect, simple, sparsely arachnoid. Basal and lower stem leaves petiolate; petiole 3–10 cm; leaf blade narrowly oblong, elliptic, or linear, 8–30 × 1–1.5 cm, abaxially pale green, gland-dotted, and glabrescent, adaxially dark green, base attenuate, margin subentire to sparsely denticulate, apex acute to acuminate. Middle and upper stem leaves few, sessile, linear, gradually smaller upward on stem, base semiamplexicaul. Capitula 1 or 2, long pedunculate. Involucre campanulate, ca. 2 cm in diam. Phyllaries in 5 or 6 rows, sparsely villous, apex long acuminate; outer phyllaries narrowly ovate-triangular, 5–6 × 1–1.5 mm, apically herbaceous and reflexed; inner phyllaries narrowly ovate-elliptic to linear, 10–12 × ca. 1 mm. Receptacle bristles 5–6 mm. Corolla blackish purple, ca. 1.5 cm, tube ca. 7 mm. Achene gland-dotted. Pappus in 1 row, pale yellowish brown, 1–1.1 cm. Fl. and fr. Aug.

• Montane forests; 2300–3100 m. NW Yunnan (Gongshan).

258. *Saussurea retroserrata* Y. L. Chen & S. Yun Liang, Acta Phytotax. Sin. 19: 97. 1981.

倒齿风毛菊 *dao chi feng mao ju*

Herbs 30–40 cm tall, perennial. Stem solitary, erect, apically few branched, with reddish brown hairs. Basal and lower stem leaves petiolate; petiole 2–3 cm; leaf blade narrowly elliptic, 12–16 × 1–1.6 cm, both surfaces green, adaxially with reddish brown hairs, base attenuate, margin retrorsely serrate, apex acuminate. Middle and upper stem leaves few, shortly petiolate or sessile, gradually smaller upward on stem. Capitula 3 or 4, in a lax racemiform or corymbiform synflorescence, long pedunculate. Involucre ovoid to narrowly campanulate, 1.2–1.5 cm in diam. Phyllaries in 5 or 6 rows, straw-colored to brown but purplish apically and near margin, sparsely villous or glabrescent, apex acuminate; outer phyllaries narrowly triangular-ovate, 8–10 × ca. 3 mm, apically reflexed; inner phyllaries narrowly ovate-elliptic, 10–12 × 2–3 mm. Receptacle bristles linear, 2–3 mm. Corolla purplish red, 1.8–1.9 cm, tube 6–7 mm, limb 6–7 mm, lobes 3.5–4 mm. Achene cylindric, 2.5–3 mm, glabrous. Pappus brownish; outer bristles scabrid. Fl. and fr. Aug–Oct.

• *Picea* forest margins; ca. 3500 m. SE Xizang (Zayü).

259. *Saussurea acuminata* Turczaninow ex Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 1: 37. 1835.

渐尖风毛菊 *jian jian feng mao ju*

Herbs 30–60 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, subglabrous. Basal leaves petiolate; leaf blade narrowly ovate-elliptic to oblong, both surfaces green and glabrous, usually withered at anthesis. Lower and middle stem leaves petiolate; petiole winged; leaf blade narrowly elliptic to linear, $10\text{--}18 \times 2\text{--}2.5$ cm, base attenuate, margin revolute and entire or denticulate, apex long acuminate. Upper stem leaves sessile, smaller ones linear. Capitula numerous, in a clustered hemispheric-corymbiform synflorescence at end of stem and branches, shortly pedunculate or sessile. Involucre narrowly campanulate, 5–6 mm in diam. Phyllaries in ca. 4 rows, sparsely pubescent; outer phyllaries ovate, apex long acuminate to caudate and usually reflexed; middle phyllaries oblong, apex acute; inner phyllaries linear, apex subacute. Corolla pale purplish red, 1.2–1.5 cm, tube ca. 8 mm, limb ca. 7 mm. Achene cylindric, 1.5–2 mm. Pappus white; outer bristles 2–3 mm, scabrid; inner bristles ca. 1.4 cm. Fl. and fr. Jul–Sep.

Moist meadows, forests, steppes. Heilongjiang, Nei Mongol [Mongolia, Russia (Siberia)].

260. *Saussurea glandulosa* Kitamura, Acta Phytotax. Geobot. 3: 137. 1934.

腺点风毛菊 xian dian feng mao ju

Saussurea yatagaiana Mori.

Herbs 10–75 cm tall, perennial. Stem solitary, erect, apically branched, flexuous, distinctly winged. Basal leaves usually withered at anthesis. Lower and middle stem leaves petiolate; petiole winged; leaf blade ovate, elliptic, or narrowly ovate-elliptic, $(3\text{--})6\text{--}20 \times (1\text{--})2\text{--}4.5$ cm, abaxially pale green, gland-dotted, and sparsely pubescent, adaxially green and scabrid, base cuneate and decurrent, margin sinuate-dentate, apex acute. Upper stem leaves sessile, narrowly ovate-elliptic, gradually smaller upward on stem, base cuneate and decurrent, apex acuminate. Capitula several, in a clustered corymbiform synflorescence at end of branches, shortly pedunculate. Involucre cylindric, ca. 3 mm in diam. Phyllaries in 3 or 4 rows, purplish, apically tomentose, apex acuminate; outer phyllaries narrowly triangular-ovate; middle phyllaries narrowly ovate-elliptic; inner phyllaries narrowly elliptic to linear. Receptacle with bristles. Corolla purple, 1–1.1 cm, tube 4–6 mm, limb 4–5 mm. Pappus outer bristles scabrid; inner bristles 7–8 mm. Fl. and fr. Aug.

• Montane forests; 2000–3700 m. Taiwan.

261. *Saussurea kiraisiensis* Masamune, J. Soc. Trop. Agric. 2: 241. 1930.

台岛风毛菊 tai dao feng mao ju

Herbs 5–15 cm tall, perennial. Stem solitary, slender, erect, simple, puberulent. Lower stem leaves petiolate; petiole 1.5–4 cm, sometimes winged; leaf blade oblong, ovate, or broadly ovate, 2–5 cm, pinnately lobed, abaxially whitish and lanate, adaxially green and puberulent, base truncate to cuneate and decurrent into petiole, margin denticulate, apex acuminate, acute, or obtuse; lateral lobes oblong, small. Upper stem leaves petiolate or sessile, gradually smaller upward on stem; leaf blade oblong, ovate, or narrowly ovate-elliptic, base cuneate to

truncate, apex acute to acuminate. Capitula 2–4, clustered in a corymbiform synflorescence or sometimes solitary, shortly pedunculate. Involucre campanulate, 4–6 mm in diam. Phyllaries in ca. 4 rows; outer phyllaries narrowly ovate-elliptic, apex acuminate; middle phyllaries oblong, apex acute; inner phyllaries linear, apex acute. Corolla pink, 7–9 mm. Achene unknown by authors. Pappus dirty white; inner bristles ca. 8 mm.

• Alpine rocky areas or scree slopes; 2900–3500 m. Taiwan.

The misspelling “*Saussurea kiraisanensis*,” established by Kitamura, has been widely used in the literature, including in Fl. Taiwan, ed. 2 (4: 1051. 1998).

262. *Saussurea epilobioides* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 495. 1882.

柳叶菜风毛菊 liu ye cai feng mao ju

Saussurea epilobioides var. *cana* Handel-Mazzetti; *S. karlongensis* Handel-Mazzetti.

Herbs 25–60 cm tall, perennial. Stems solitary or few, erect, simple, subglabrous. Basal leaves withered at anthesis. Lower and middle stem leaves sessile, narrowly elliptic to linear, $7\text{--}12 \times 0.9\text{--}2$ cm, abaxially grayish green, usually gland-dotted, densely to sparsely tomentose or glabrescent, adaxially green and subglabrous, base auriculate and semiamplexicaul, margin denticulate, apex long acuminate. Upper stem leaves gradually smaller upward on stem, base cuneate. Capitula numerous, in a clustered corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 6–8 mm in diam. Phyllaries in 4 or 5 rows, apically usually arachnoid; outer phyllaries ovate-triangular, $9\text{--}13 \times 1.5\text{--}3$ mm, apical part blackish green, saber-shaped, 5–9 mm, and reflexed, apex acuminate; middle phyllaries narrowly ovate-elliptic, $7\text{--}9 \times 2\text{--}3$ mm, apical part blackish purple and 1–4 mm; inner phyllaries linear, $8\text{--}10 \times 1\text{--}1.5$ mm, apex acute to subobtusate. Corolla purple, 8–10 mm, tube 4–5 mm, limb 4–5 mm, lobes 3–3.5 mm. Achene cylindric, 3–4 mm, glabrous. Pappus dirty white; outer bristles 1.5–3.5 mm, scabrid; inner bristles 7–8 mm. Fl. and fr. Jul–Sep.

• Mountain slopes, alpine meadows; 2600–4200 m. Gansu, Ningxia, Qinghai, W Sichuan.

263. *Saussurea umbrosa* Komarov, Trudy Imp. S.-Peterburgsk. Bot. Sada 18: 423. 1901.

湿地风毛菊 shi di feng mao ju

Herbs 50–100 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, pubescent. Basal leaves petiolate; petiole narrowly winged; leaf blade elliptic to narrowly ovate-elliptic, $10\text{--}25 \times 2\text{--}4(6)$ cm, abaxially grayish green, gland-dotted, and sparsely arachnoid, adaxially green and sparsely brown pubescent, base truncate to rounded, margin dentate, apex acute. Lower and middle stem leaves sessile, narrowly elliptic to narrowly oblong, $9\text{--}18 \times 1\text{--}3$ cm, base cuneate, margin dentate, apex acute to acuminate. Upper stem leaves narrowly elliptic to linear, margin entire. Capitula several, in a paniculiform or corymbiform synflorescence. Involucre campanulate, ca. 1 cm in diam. Phyllaries in ca. 5 rows, gland-dotted and puberulent; outer and middle phyllaries ovate, apical

part saber-shaped and reflexed, apex acuminate-caudate; inner phyllaries narrowly elliptic to linear, apex acuminate. Corolla pale purple, 1.2–1.5 cm, tube 6–8 mm, limb 6–7 mm. Achene cylindric, 3–4 mm. Pappus pale brown; outer bristles 2–3 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Jul–Aug.

Forests, forest meadows. Heilongjiang, Jilin, Nei Mongol [Korea, Russia (Far East, E Siberia)].

264. *Saussurea hemsleyi* Lipschitz, Bot. Zhurn. (Moscow & Leningrad) 51: 1947. 1966.

湖北风毛菊 hu bei feng mao ju

Saussurea decurrens Hemsley, J. Linn. Soc., Bot. 29: 310. 1892, not Hemsley (1888).

Herbs 30–60(–75) cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, sparsely arachnoid and glandular hairy. Lower and middle stem leaves petiolate; petiole 0.5–5.5 cm, winged, base decurrent; leaf blade ovate, oblong, or narrowly ovate-elliptic, 5–10(–15) × 2–3.5 cm, abaxially green, gland-dotted, and sparsely tomentose, adaxially dark green and glabrescent, base cuneate and abruptly narrowed into petiole, margin crenate to dentate, apex acuminate to caudate. Upper stem leaves shortly petiolate or sessile, gradually smaller upward on stem; leaf blade narrowly ovate-elliptic, base decurrent. Capitula numerous, to 3–5 in a clustered corymbiform synflorescence at end of branches, shortly pedunculate. Involucre narrowly campanulate, 5–7(–10) mm in diam. Phyllaries in 5 or 6 rows, basally yellowish green, apically sometimes purplish, glabrous or arachnoid, apex obtuse; outer phyllaries ovate, 1.5–2 × 1–1.5 mm; middle phyllaries narrowly ovate, 2–6 × 1.5–2 mm; inner phyllaries linear, 7–8(–10) × 0.8–1.5 mm. Receptacle bristles subulate, 4–5 mm. Corolla purple, 8–9(–12) mm, tube 4–5 mm, limb 4–4.5 mm, lobes 2.5–3 mm. Achene cylindric, 3–4 mm, glabrous. Pappus dirty white; outer bristles 1–3 mm, scabrid; inner bristles 6–9 mm. Fl. and fr. Jul–Sep.

• Montane forests, moist places; 2200–3800 m. ?Guizhou, Hubei, ?Sichuan, NW Yunnan.

Saussurea hemsleyi was mistakenly treated by Handel-Mazzetti as *S. parviflora* var. *atriplicifolia* (Acta Horti Gothob. 12: 317. 1938).

265. *Saussurea parviflora* (Poiret) Candolle, Ann. Mus. Natl. Hist. Nat. 16: 200. 1810.

小花风毛菊 xiao hua feng mao ju

Serratula parviflora Poiret in Lamarck, Encycl. 6: 554. 1805; *Saussurea atriplicifolia* Fischer ex Herder; *S. chowana* F. H. Chen; *S. parviflora* var. *atriplicifolia* (Fischer ex Herder) Handel-Mazzetti; *S. parviflora* var. *cinerascens* Handel-Mazzetti; *S. parviflora* var. *cuspidata* Handel-Mazzetti.

Herbs 30–110 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, sparsely pubescent or glabrous. Basal leaves withered at anthesis. Lower stem leaves petiolate to subsessile; petiole 5–10(–20) mm, narrowly winged, base decurrent; leaf blade elliptic or narrowly ovate, 7–18(–30) × 1.5–4.5 cm, abaxially grayish green or glaucous, usually gland-dotted, and glabrous or puberulent, adaxially green and scabrid but glabrescent, base attenuate, margin dentate to den-

tulate, apex acuminate. Middle and upper stem leaves sessile, narrowly ovate-elliptic to narrowly elliptic, 4–15 × 1–3.5 cm, gradually smaller upward on stem. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–8 mm in diam. Phyllaries in 4 or 5 rows, yellowish green, apically or entirely dark purple, glabrous or sparsely pubescent, apex subacute to obtuse; outer phyllaries ovate, 2–3 × 1.5–2 mm; middle phyllaries narrowly ovate-elliptic, 3–7 × 2–2.5 mm; inner phyllaries narrowly elliptic, 9–10 × 0.8–1.5 mm. Receptacle bristles subulate, 5–6 mm. Corolla purple, 1.1–1.3 cm, tube 5–7 mm, limb 5–6 mm, lobes 2.5–4 mm. Achene cylindric, 3–4 mm. Pappus dirty white; outer bristles 2–4 mm, scabrid; inner bristles (6–)8–9 mm. Fl. and fr. Jul–Sep. $2n = 26$.

Forest margins, thickets, montane meadows and grasslands; 1600–3800 m. Gansu, Hebei, ?Nei Mongol, Ningxia, Qinghai, ?Shanxi, Sichuan, Xinjiang, ?Yunnan [Kazakhstan, Mongolia, Russia].

266. *Saussurea candolleana* (Candolle) Wallich ex Schultz Bipontinus, Linnaea 19: 331. 1846.

宽翅风毛菊 kuan chi feng mao ju

Aptotaxis candolleana Candolle, Prodr. 6: 541. 1838; *Saussurea candolleana* var. *glabrata* Lipschitz; *S. candolleana* subsp. *platyptera* Lipschitz; *S. pterocaulon* Decaisne.

Herbs 50–100 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged. Lower stem leaves sessile, ovate-elliptic, obovate, or narrowly elliptic-oblong, 12–18 × 4–6 cm, abaxially pale green, gland-dotted, and sparsely arachnoid, adaxially dark green, scabrid, and sparsely pubescent to subglabrous, base attenuate, semiamplexicaul, and decurrent, margin denticulate, apex acuminate. Middle and upper stem leaves 6–16 × 0.8–4 cm, gradually smaller upward on stem. Capitula 10–20, in a clustered corymbiform synflorescence. Involucre narrowly campanulate, 5–8 mm in diam. Phyllaries in 5 or 6 rows, yellowish green but dark purple apically; outer phyllaries ovate, 3–6 × 1–2.5 mm, apex acuminate; middle phyllaries narrowly ovate-elliptic, 5–8 × 1.5–2 mm, apex acuminate to subacute; inner phyllaries narrowly elliptic to linear, 8–10 × 1–1.5 mm, apex obtuse. Receptacle bristles light brown, 5–8 mm. Corolla 1–1.2 cm, tube 5–6 mm, limb 5–6 mm, lobes 3.5–4 mm. Achene obconic to cylindric, ca. 5 mm, glabrous. Pappus light brown; outer bristles 2–4 mm; inner bristles 8–9 mm. Fl. and fr. Aug–Sep. $2n = 26$.

Tall forb communities on scree slopes, *Juniperus* woodlands; 2800–3900 m. S Xizang (Tingri, Yadong) [Bhutan, NE and NW India, Kashmir, Nepal].

The report of *Saussurea parviflora* from S Xizang (S. Y. Liang, Fl. Xizang. 4: 893. 1985) is in fact referable to *S. candolleana*, which has recently also been found in a second locality in S Xizang, in Tingri Xian.

267. *Saussurea latifolia* Ledebour, Icon. Pl. 1: 17. 1829.

宽叶风毛菊 kuan ye feng mao ju

Herbs 35–100 cm tall, perennial. Stem solitary, erect, apically few branched, winged, densely leafy. Basal and lower stem leaves petiolate; leaf blade ovate to elliptic, 6–15 × 4–9

cm, both surfaces green, abaxially pubescent or glabrous, adaxially scabrid, base \pm cordate, margin serrate and ciliate, apex acuminate. Middle and upper stem leaves shortly petiolate or sessile, gradually smaller upward on stem, base decurrent. Uppermost stem leaves narrowly ovate-elliptic to narrowly elliptic. Capitula numerous, in a clustered corymbiform synflorescence. Involucre campanulate, 5–6(–8) mm in diam. Phyllaries in 4 or 5 rows, often dark violet, pubescent; outer phyllaries ovate, apex obtuse to subacute; middle and inner phyllaries oblong to narrowly ovate-elliptic, apex subobtusate to acuminate. Receptacle sparsely bristly. Corolla purplish violet, 1–1.1 cm, tube 5–6 mm, limb 5–6 mm, lobes ca. 3.5 mm. Achene pale brown, cylindric, ca. 3.5 mm. Pappus dirty white; outer bristles 3–4 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Jul–Sep. $2n = 24, 26$.

Forests, subalpine and alpine meadows; below 2500 m. N Xinjiang (Altay Shan) [SE Kazakhstan, Mongolia, Russia (Siberia)].

268. *Saussurea dielsiana* Koidzumi, Fl. Symb. Orient.-Asiat. 50. 1930.

狭头风毛菊 xia tou feng mao ju

Saussurea microcephala Diels, Bot. Jahrb. Syst. 29: 624. 1901, not Franchet (1888); *S. stenocephala* Y. Ling.

Herbs 50–80 cm tall, perennial. Stems solitary or several, erect, simple or apically branched, wingless. Lower stem leaves petiolate; petiole 3–6 cm; leaf blade oblong-triangular to ovate, 8–10 \times 4–5(–8) cm, undivided or pinnately lobed, both surfaces green, scabridulous, and subglabrous, base truncate to rarely cordate, margin sinuate-dentate, apex acuminate; lateral lobes 2 or 3 pairs. Upper stem leaves petiolate; petiole 0.5–4 cm; leaf blade narrowly ovate-elliptic to narrowly triangular, gradually smaller upward on stem, usually undivided, base cuneate, truncate, or slightly rounded, apex long acuminate. Capitula numerous, in a corymbiform synflorescence or solitary at leaf axils, pedunculate. Involucre narrowly campanulate to cylindric, 4–6 mm in diam. Phyllaries in 5 or 6 rows, leathery, apically purple, arachnoid at margin; outer phyllaries ovate, small, apex acute and patent to recurved; inner phyllaries linear, apex acute to slightly obtuse. Corolla purplish red, ca. 1.1 cm. Achene brown, cylindric, ca. 5 mm. Pappus white; outer bristles ca. 2 mm, scabrid; inner bristles ca. 9 mm. Fl. and fr. Oct. $2n = 26^*$.

• Montane grasslands; 800–1800 m. Nei Mongol, Shaanxi, Shanxi, Sichuan.

齿叶风毛菊 chi ye feng mao ju

Saussurea serrata Candolle var. *amurensis* Herder; *S. parviflora* (Poirot) Candolle var. *amurensis* (Herder) S. Y. Hu.

Herbs 30–100 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, glabrescent. Basal leaves withered at anthesis. Lower and middle stem leaves petiolate; petiole 3–10 cm, winged; leaf blade ovate-elliptic to elliptic, 10–21 \times 3–6[–8.5] cm, abaxially glaucous and subglabrous, adaxially green and glabrous, base attenuate, margin dentate to serrate, apex long acuminate. Upper stem leaves narrowly ellip-

tic to linear, gradually smaller upward on stem. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate-obconic, 3–6 mm in diam. Phyllaries in 4–6 rows, yellowish green but blackish purple apically and near margin, conspicuously 3-veined, subglabrous, apex obtuse; outer phyllaries ovate, 1.5–2.5 \times 1–1.5 mm; middle phyllaries narrowly ovate, 2–8 \times 1.5–1.8 mm; inner phyllaries linear, 8–10 \times 1–1.5 mm. Receptacle bristles subulate, 3–4 mm. Corolla purple, 9–10 mm, tube 5–6 mm, limb 4–5 mm, lobes 3–4 mm. Achene brown, cylindric, 3–4(–6) mm. Pappus dirty white; outer bristles 1.5–3 mm, scabrid; inner bristles 6–8 mm. Fl. and fr. Jul–Aug. $2n = 26, 52$.

Larix forest margins, forest meadows. Heilongjiang, Jilin, Nei Mongol [Korea, Mongolia, Russia (Far East, E Siberia)].

270. *Saussurea iodoleuca* Handel-Mazzetti, Symb. Sin. 7: 1151. 1936.

浅堇色风毛菊 qian jin se feng mao ju

Herbs 40–65 cm tall, perennial. Stem solitary, erect, simple, unwinged, arachnoid. Basal leaves petiolate; petiole 1–3 cm; leaf blade ovate to elliptic, 3–10 \times 1.5–5 cm, abaxially grayish white or grayish green and densely tomentose, adaxially green and strigose, base rounded to cuneate, margin denticulate, apex obtuse to acute and mucronate. Lower stem leaves petiolate; leaf blade narrowly elliptic to elliptic, base cuneate-attenuate. Middle and upper stem leaves shortly petiolate or sessile, gradually smaller upward on stem; leaf blade narrowly elliptic to linear. Capitula 3–6, clustered in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 5–7 mm in diam. Phyllaries in 4–6 rows, straw-colored or pale green, tomentose, apex subobtusate and mucronate; outer phyllaries ovate, ca. 3 \times 2–3 mm; middle phyllaries narrowly elliptic, ca. 7 \times 3 mm; inner phyllaries linear, ca. 10 \times 1 mm. Corolla white, ca. 1 cm. Pappus pale brown; outer bristles ca. 2 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Oct.

• Montane forests, thickets; 2000–2300 m. NW Yunnan (Dali, Yongsheng).

271. *Saussurea smithiana* Handel-Mazzetti, Acta Horti Gothob. 12: 310. 1938.

西康风毛菊 xi kang feng mao ju

Herbs 30–40 cm tall, perennial. Stem solitary, erect, simple or apically few branched, narrowly winged. Basal leaves petiolate; petiole 4–6 cm, narrowly winged; leaf blade ovate to elliptic, 6–10 \times 3–5 cm, abaxially white, densely tomentose, and with brown hairs on veins, adaxially green, scabridulous, and densely strigose, base cuneate-attenuate and decurrent, margin shallowly crenate, denticulate, or subentire, apex obtuse and mucronate. Lower stem leaves petiolate; petiole 1–1.5 cm, winged, base widened, semiamplexicaul, and decurrent on stem; leaf blade ovate, 4.5–6 \times 1.8–2.5 cm. Middle and upper stem leaves petiolate or sessile, gradually smaller upward on stem; leaf blade narrowly elliptic to linear. Capitula 2–4, in a racemiform or corymbiform synflorescence or sometimes solitary, long pedunculate. Involucre ovoid, (5–)8–10 mm in diam. Phyllaries in 5 or 6 rows, straw-colored but apically purple, sparsely arachnoid, apex obtuse and mucronate; outer phyllaries

ovate, 3–4 × 1–2 mm; middle phyllaries narrowly ovate-elliptic, 4–10 × 2–2.5 mm; inner phyllaries linear, 12–13 × 1–1.5 mm. Receptacle bristles subulate-filiform, 7–9 mm. Corolla purple, 1.4–1.5 cm, tube 7–8 mm, limb 7–7.5 mm, lobes 3.5–4 mm. Pappus dirty white; outer bristles 1.5–2 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Aug–Oct.

• Montane thickets, meadows; 3000–3500 m. W Sichuan (Kangding).

272. *Saussurea woodiana* Hemsley, J. Linn. Soc., Bot. 29: 312. 1892.

牛耳风毛菊 niu er feng mao ju

Saussurea nobilis Franchet; *S. woodiana* f. *caulescens* Lipschitz; *S. woodiana* f. *subacaulis* Lipschitz.

Herbs 3–8(–25) cm tall, perennial, stemless or cauliferous. Stem solitary, erect, simple. Rosette leaves subsessile or petiolate; petiole winged; leaf blade elliptic to obovate, 5–20 × 1.5–7 cm, abaxially grayish green or brownish and densely tomentose, adaxially green and glandular hairy, base attenuate, margin subentire, apex obtuse to subacute. Stem leaves 1–3, similar to basal leaves. Capitulum solitary, in center of leaf rosette or terminal on stem. Involucre campanulate, 2–2.5(–3) cm in diam. Phyllaries in 5 or 6 rows, straw-colored but purplish apically and near margin, densely yellowish villous, apex long acuminate; outer phyllaries narrowly triangular-ovate, 8–20 × 3–5 mm; middle phyllaries narrowly ovate-elliptic, 1.9–2.3 × 0.4–0.6 cm; inner phyllaries narrowly elliptic, 2.8–3 × 0.2–0.3 cm. Corolla purple, 2.8–3.2 cm, tube (1.4–)1.8–2.2 cm, limb 1–1.2 cm, lobes 6–8 mm. Achene cylindric, ca. 4 mm, glabrous. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 2.2 cm. Fl. and fr. Jul–Sep.

• Montane grasslands; 3000–4200 m. Qinghai, Sichuan.

273. *Saussurea komarnitzkii* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 59(6): 81. 1954.

脑头风毛菊 ye tou feng mao ju

Herbs 20–35 cm tall, perennial. Stem solitary, erect, simple, ± flexuous, narrowly winged, apically densely leafy, glabrous. Basal and lower stem leaves withered at anthesis. Middle stem leaves shortly petiolate to subsessile; petiole winged, base semiamplexicaul and decurrent; leaf blade broadly ovate, suborbicular, or orbicular, 3–6 × 2.5–5 cm, leathery, abaxially white, densely tomentose, and with conspicuous veins, adaxially dark green and subglabrous to sparsely strigose, base semiamplexicaul and decurrent on stem, margin crenate-dentate, apex shortly acuminate. Upper stem leaves sessile, somewhat smaller. Capitula 2–6, in a corymbiform synflorescence or sometimes solitary, shortly pedunculate. Involucre cylindric to narrowly campanulate, 5–7(–10) mm in diam. Phyllaries in ca. 4 rows, straw-colored, densely arachnoid tomentose; outer phyllaries ovate, 2–3 × 1.5–2.5 mm, apex acuminate and with a purplish mucro; middle phyllaries narrowly ovate-elliptic, 3–6 × 1.5–2.5 mm, apex acuminate to obtuse; inner phyllaries linear, 6–7 × 1–1.5 mm, apex obtuse. Corolla purplish red, 8–9 mm, tube 4–4.5 mm, limb 4–4.5 mm, lobes 3–3.5 mm. Achene brown, ca. 4 mm, glabrous. Pappus dirty white to light brown;

outer bristles 1–4 mm, scabrid; inner bristles 6–7 mm. Fl. and fr. Aug–Oct.

• Montane grasslands, rocky slopes; 2000–2300 m. Guizhou (Fanjing Shan, Jiangkou, Qingshan).

274. *Saussurea rotundifolia* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 6: 98. 1935.

圆叶风毛菊 yuan ye feng mao ju

Saussurea tenella Y. Ling.

Herbs 10–30 cm tall, perennial. Stem solitary, erect, simple, apically very narrowly winged or wingless, sparsely arachnoid. Basal leaves withered at anthesis. Middle stem leaves petiolate; petiole 1–1.5 cm, narrowly winged, base enlarged and amplexicaul; leaf blade broadly ovate to orbicular or triangular, 0.5–5.5 × 0.5–4 cm, abaxially arachnoid tomentose, adaxially green and scabrid or glabrous, base truncate to cuneate and decurrent, margin serrulate, apex acute. Upper stem leaves subsessile, slightly smaller. Capitula 1–3, pedunculate. Involucre ovoid-campanulate, ca. 1.3 cm in diam. Phyllaries in ca. 4 rows, pubescent; outer phyllaries narrowly ovate to triangular, apex acuminate; middle phyllaries narrowly ovate-elliptic, apex acute to obtuse; inner phyllaries narrowly elliptic to linear, apex acuminate. Corolla purple, 9–10 mm. Achene cylindric, ca. 4 mm. Pappus dirty white; outer bristles scabrid. Fl. and fr. Aug–Sep.

• Trailsides on mountain slopes; 3100–3300 m. S Shaanxi (Qin Ling), Sichuan.

275. *Saussurea alaschanica* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 27: 492. 1882.

阿拉善风毛菊 a la shan feng mao ju

Herbs 10–30 cm tall, perennial. Stem solitary, erect, simple, sparsely arachnoid. Basal and lower stem leaves petiolate; petiole 1–5 cm; leaf blade elliptic to ovate-elliptic, 2.5–13 × 1.5–5 cm, abaxially grayish green and densely tomentose, adaxially green and glabrous, base cuneate to rounded, margin denticulate to sinuate-dentate, apex acuminate. Middle stem leaves few, shortly petiolate, gradually smaller upward on stem. Upper stem leaves sessile, narrowly ovate-elliptic to narrowly elliptic. Capitula 2 or 3, in a clustered corymbiform synflorescence or sometimes solitary, shortly pedunculate to subsessile. Involucre campanulate, 1–1.2 cm in diam. Phyllaries in 4 or 5 rows, straw-colored but purple apically and near margin, villous, apex acuminate; outer phyllaries triangular-ovate; inner phyllaries linear. Corolla purplish red, 1.2–1.5 cm, tube ca. 6 mm, limb 6–9 mm. Achene blackish brown, cylindric, ca. 4 mm. Pappus dirty white; outer bristles 2–3 mm, scabrid; inner bristles ca. 1.2 cm. Fl. and fr. Jul–Sep.

Thickets, mountain slopes, rock fissures. Nei Mongol, Ningxia [Mongolia].

276. *Saussurea polygonifolia* F. H. Chen, Bull. Fan Mem. Inst. Biol., Bot. 8: 125. 1938.

蓼叶风毛菊 liao ye feng mao ju

Herbs ca. 70 cm tall, perennial. Stem solitary, erect, api-

cally few branched, narrowly winged, sparsely arachnoid or glabrous. Basal and lower stem leaves withered at anthesis, long petiolate. Middle stem leaves sessile, narrowly ovate-elliptic to narrowly elliptic, $5-8 \times 1-2$ cm, abaxially grayish green or white and densely tomentose, adaxially light green and scabrid, base decurrent, margin subentire to denticulate, apex acuminate. Upper stem leaves sessile, narrowly elliptic to linear, gradually smaller upward on stem. Capitula 4–10, in a lax racemiform synflorescence, long pedunculate. Involucre narrowly campanulate, (5–)7–9 mm in diam. Phyllaries in 4 or 5 rows, straw-colored to reddish brown, glabrous or sparsely villous, apex acuminate; outer phyllaries triangular-ovate, ca. 3×2 mm; middle phyllaries narrowly ovate-elliptic, $3-5 \times 1-2$ mm; inner phyllaries narrowly elliptic, ca. 5×1 mm. Corolla white, ca. 1.2 cm. Achene ca. 2 mm. Pappus straw-colored; outer bristles scabrid. Fl. Sep.

- Forests. NW Yunnan.

277. *Saussurea vestita* Franchet, J. Bot. (Morot) 2: 358. 1888.

绒背风毛菊 *rong bei feng mao ju*

Herbs 20–60 cm tall, perennial. Stem erect, simple or apically few branched, winged, arachnoid and brown floccose. Basal and lower stem leaves petiolate; petiole 3–6 cm; leaf blade ovate-elliptic to elliptic, (3–)6–12 \times 3–7.5 cm, thick, abaxially grayish white and densely tomentose, adaxially green to yellowish green and sparsely white or pale brown floccose, base attenuate and decurrent, margin dentate, apex obtuse. Middle and upper stem leaves elliptic to narrowly elliptic, gradually smaller upward on stem. Capitula several, in a paniculiform or corymbiform synflorescence. Involucre narrowly campanulate to obconic, 6–10 mm in diam. Phyllaries in 5 or 6 rows, yellowish green but usually purple apically, arachnoid, apex long acuminate; outer phyllaries triangular-ovate, ca. 6×1 mm; middle phyllaries narrowly elliptic, $8-9 \times$ ca. 3 mm; inner phyllaries linear, ca. 10×1.5 mm. Corolla blackish purple, ca. 1.5 cm, tube ca. 5 mm, limb ca. 1 cm. Achene cylindric, ca. 4 mm, glabrous. Pappus pale brown; outer bristles ca. 3 mm, scabrid; inner bristles ca. 1.1 cm. Fl. and fr. Aug–Oct.

- Montane meadows, trailsides; 3000–3900 m. NW Yunnan (Binchuan, Eryuan, Lijiang).

278. *Saussurea platypoda* Handel-Mazzetti, Symb. Sin. 7: 1152. 1936.

川南风毛菊 *chuan nan feng mao ju*

Herbs to 1.1 m tall, perennial. Stem solitary, stout, erect, much branched, winged, densely leafy, with articulate hairs. Basal and lower stem leaves withered at anthesis. Middle and upper stem leaves sessile, narrowly oblong to narrowly elliptic, $3-9 \times 1-2$ cm, abaxially grayish green and densely tomentose, adaxially green and scabrid, base attenuate and decurrent, margin crenate, apex acute. Capitula numerous, in a clustered corymbiform synflorescence at end of branches, shortly pedunculate. Involucre campanulate, 8–10 mm in diam. Phyllaries in ca. 5 rows, arachnoid; outer phyllaries ovate, $3-4 \times$ ca. 2 mm, apex acuminate; middle phyllaries narrowly ovate, $5-8 \times 1-2$ mm; inner phyllaries linear, ca. 10×1 mm, apex obtuse. Receptacle bristles subulate, 4–6 mm. Corolla bluish purple, tube ca.

4 mm. Pappus brown; outer bristles 2–4 mm, scabrid; inner bristles ca. 8 mm. Fl. and fr. Sep–Oct.

- Montane thickets; 2900–3300 m. SW Sichuan (Yanyuan).

279. *Saussurea cauloptera* Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 645. 1937.

翅茎风毛菊 *chi jing feng mao ju*

Saussurea rosthornii Diels var. *sessilifolia* Diels.

Herbs 50–60 cm tall, perennial. Stem solitary, erect, simple, narrowly winged or wingless. Basal and lower stem leaves withered at anthesis. Middle stem leaves petiolate; petiole winged; leaf blade ovate to elliptic, $7-11 \times 3.5-6$ cm, abaxially grayish white and densely tomentose, adaxially green and slightly scabrid, base cuneate-attenuate to truncate, margin denticulate, apex acute. Capitula 4–10, in a clustered corymbiform synflorescence, shortly pedunculate or sessile. Involucre ovoid, ca. 6 mm in diam. Phyllaries in 4 or 5 rows, brownish, pubescent or arachnoid; outer phyllaries ovate, apex with black mucro; middle phyllaries narrowly ovate-elliptic; inner phyllaries linear. Corolla red, 9–10 mm. Achene ca. 3 mm, glabrous. Pappus pale brown; outer bristles scabrid. Fl. and fr. Sep–Oct.

- Open forests; 1700–3000 m. Chongqing (Nanchuan), Henan, Shaanxi (Qin Ling).

280. *Saussurea amurensis* Turczaninow ex Candolle, Prodr. 6: 534. 1838.

龙江风毛菊 *long jiang feng mao ju*

Saussurea amurensis subsp. *stenophylla* (Freyn) Kitamura; *S. stenophylla* Freyn.

Herbs 40–100 cm tall, perennial. Stem solitary, erect, apically branched, narrowly winged, arachnoid or glabrous. Basal leaves long petiolate; leaf blade ovate-elliptic to narrowly ovate-elliptic, $10-30 \times 2-5$ cm, abaxially grayish white or grayish green and densely arachnoid tomentose, adaxially green and glabrous, base cuneate-attenuate, margin denticulate, apex acuminate. Lower and middle stem leaves shortly petiolate or sessile; leaf blade narrowly elliptic to linear, base cuneate-attenuate and decurrent, margin denticulate, apex acuminate. Upper stem leaves sessile, linear, gradually smaller upward on stem, margin entire. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 6–8 mm in diam. Phyllaries in 4 or 5 rows, villous; outer phyllaries purple, ovate, ca. 3×2 mm, apex acuminate to acute; middle phyllaries narrowly elliptic, ca. 7×2 mm, apex acute to subobtusate; inner phyllaries lanceolate to oblong-lanceolate, ca. 10×1.5 mm, apex subobtusate. Corolla pale purple, 1–1.2 cm, tube 5–6 mm, limb 5–7 mm. Achene brown, cylindric, 3–4 mm, glabrous. Pappus dirty white; outer bristles ca. 1 mm, scabrid; inner bristles 8–10 mm. Fl. and fr. Jul–Sep. $2n = 26, 48, 52, 54$.

- Marshy meadows, meadows, forest margins; 900–1300 m. Heilongjiang, Jilin, Liaoning, Nei Mongol [Korea, Russia (Far East, E Siberia)].

281. *Saussurea bullata* W. W. Smith, Notes Roy. Bot. Gard. Edinburgh 8: 206. 1914.

泡叶风毛菊 *pao ye feng mao ju*

Herbs 5–16 cm tall, perennial, stemless or shortly stemmed. Stem solitary, purple, erect, apically few branched, densely covered with brown articulate hairs. Leaves usually in basal rosette. Rosette and lower stem leaves petiolate; petiole 1–3 cm, densely covered with brown articulate hairs; leaf blade broadly ovate or elliptic to suborbicular, 4–7 × 2–5 cm, abaxially white, densely tomentose, and with brown hairs on veins, adaxially green and with hairs on veins, base rounded, truncate, or slightly cordate, margin dentate, apex rounded. Middle stem leaves sessile, smaller. Capitula 2–8, clustered in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, (5–)8–10 mm in diam. Phyllaries in 4–7 rows, blackish purple, villous, apex acuminate; outer phyllaries ovate, 3–5 × 2–3 mm; middle phyllaries narrowly ovate-elliptic, ca. 6 × 3 mm; inner phyllaries narrowly elliptic, ca. 9 × 1.5 mm. Corolla purplish red, 1.2–1.5 cm, glabrous, tube 6–9 mm, limb 5–6 mm, lobes 3–4 mm. Achene grayish, cylindric, transversely rugose, ca. 2 mm, apex with a short crown. Pappus basally brown, apically dirty white; outer bristles scabrid, 1–2 mm, inner bristles 9–10 mm. Fl. and fr. Sep.

• Alpine grasslands, consolidated scree slopes; 3600–4300 m. NW Yunnan (Dêqên, Lijiang, Zhongdian).

282. *Saussurea alpina* (Linnaeus) Candolle, Ann. Mus. Natl. Hist. Nat. 16: 198. 1810.

高山风毛菊 gao shan feng mao ju

Serratula alpina Linnaeus, Sp. Pl. 2: 816. 1753.

Herbs 20–70 cm tall, perennial. Stem solitary, straw-colored to purplish red, erect, apically branched, wingless, sparsely pubescent or subglabrous. Lower and middle stem leaves petiolate; petiole 1–4 cm; leaf blade narrowly elliptic to ovate-elliptic, 8–12(–20) × 0.7–3 cm, abaxially grayish white or grayish green and densely arachnoid tomentose, adaxially green and glabrous, base cuneate-attenuate, margin denticulate, apex acuminate. Upper stem leaves sessile, narrowly elliptic to linear, 1–5 × 0.1–0.5 cm, gradually smaller upward on stem, base slightly amplexicaul, margin entire, apex acuminate. Capitula numerous, in a corymbiform synflorescence, shortly pedunculate. Involucre narrowly campanulate, 6–12 mm in diam. Phyllaries in 4 or 5 rows, greenish but purple apically, glabrous to sparsely villous, apex acute to subobtusate; outer phyllaries ovate-elliptic, ca. 3 × 2 mm; middle phyllaries oblong, ca. 6 × 2 mm; inner phyllaries narrowly ovate-elliptic, ca. 9 × 1.5 mm. Corolla purplish red, 1–1.2 cm, tube ca. 5 mm, limb ca. 7 mm. Achene pale brown, cylindric, 2–3 mm. Pappus basally pale brown, apically white; outer bristles 1–3 mm, scabrid; inner bristles 7–9 mm. Fl. and fr. Aug–Sep. *2n* = 26, 52, 54.

Alpine steppes, rocky slopes, scree slopes; ca. 3000 m. N and W Xinjiang (Altay Shan, Tian Shan) [Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan; C and N Europe].

283. *Saussurea elliptica* C. B. Clarke ex J. D. Hooker, Fl. Brit. India 3: 372. 1881.

藏新风毛菊 zang xin feng mao ju

Saussurea kuschakewiczii C. Winkler.

Herbs 2–8[–20] cm tall, perennial, almost stemless or

shortly stemmed. Caudex 2–4(–6) mm in diam., long creeping, few branched. Stem solitary, simple, erect to ascending, 1.5–3 mm in diam. Lower and middle stem leaves petiolate; petiole 0.8–4.5 cm; leaf blade ovate to elliptic, 1.5–7 × 0.5–3 cm, both surfaces grayish green, gland-dotted, and arachnoid, base cuneate, attenuate, or subtruncate, margin denticulate, apex acute to acuminate. Uppermost stem leaves linear, subtending synflorescence. Capitula 2–10[–20], in a dense to lax clustered corymbiform synflorescence, subsessile to shortly pedunculate. Involucre obconical to narrowly campanulate, 5–13 mm in diam. Phyllaries in 3 or 4 rows, straw-colored and sometimes tinged with purple, arachnoid tomentose to glabrescent, apex acuminate to subacute; outer phyllaries triangular-ovate, ca. 3 mm wide; middle phyllaries narrowly ovate-elliptic; inner phyllaries narrowly elliptic-linear. Receptacle naked or with few subulate bristles. Corolla pale reddish purple, 1.1–1.6 cm, glandular, tube 5–8 mm, limb 5–8 mm, lobes to 5 mm. Achene brown, 3–5 mm, usually gland-dotted. Pappus white to brownish; outer bristles 1–3 mm; inner bristles 1.1–1.4 cm. Fl. and fr. Aug–Sep.

Alpine grasslands and meadows, moraines, rocky slopes, scree slopes, among rocks; 2500–3700[–4600] m. W Xinjiang (Wuqia) [Kashmir, Kazakhstan, Kyrgyzstan, Pakistan, Tajikistan].

284. *Saussurea pseudoalpina* N. D. Simpson, J. Linn. Soc., Bot. 41: 427. 1913.

假高山风毛菊 jia gao shan feng mao ju

Saussurea ambigua Krylov ex Sergievskaya.

Herbs (4–)10–20 cm tall, perennial. Stems solitary or few, erect, simple. Basal and lower stem leaves shortly petiolate; leaf blade ovate-elliptic, 5–20 × 1–3 cm, abaxially grayish green, gland-dotted, and arachnoid, adaxially pale green and subglabrous, base attenuate, margin sparsely denticulate, apex acuminate. Middle and upper stem leaves sessile, elliptic to linear, base not decurrent, margin entire. Capitula 4–12, in a clustered corymbiform synflorescence, shortly pedunculate. Involucre campanulate, (3–)5–8 mm in diam. Phyllaries in 3 or 4 rows, pale or violet-blackish; outer phyllaries ovate to ovate-oblong, pubescent, apex acuminate; inner phyllaries oblong, villous, apex subobtusate. Receptacle bristles ca. 4 mm. Corolla purple, 1.1–1.2 cm, tube 5–6 mm, limb 5–6 mm, lobes ca. 3.5 mm. Achene pale brown with dark brown spots, cylindric, 2–4 mm, glabrous. Pappus dirty white; outer bristles 1.5–4 mm; inner bristles 8–9 mm. Fl. and fr. Jul–Sep.

Stony and saline steppes, saline meadows; below 2900 m. N Xinjiang (Altay Shan) [SE Kazakhstan, Mongolia, Russia (Siberia)].

285. *Saussurea undulata* Handel-Mazzetti, Symb. Sin. 7: 1147. 1936.

波缘风毛菊 bo yuan feng mao ju

Herbs to 1.2 m tall, perennial. Stem solitary, erect, apically branched, wingless, arachnoid and with yellowish brown hairs. Lower stem leaves sessile, oblong to narrowly elliptic, 7–12 × 1.5–4 cm, pinnately lobed, lyrate, or undivided, abaxially grayish green and arachnoid tomentose, adaxially dark green and sparsely strigose, base auriculate and amplexicaul, apex acute; lobes 1–4 pairs, margin denticulate. Middle and upper

stem leaves narrowly elliptic, 5–8 × 1–2 cm, gradually smaller upward on stem, undivided, base rounded, margin subentire, apex acute. Capitula numerous, in a paniculiform or lax corymbiform synflorescence, pedunculate. Involucre narrowly ovoid, 8–10 mm in diam. Phyllaries in 4 or 5 rows, straw-colored but blackish brown apically and near margin, sparsely arachnoid; outer phyllaries ovate, ca. 2 × 1 mm, apex dark mucronate; inner phyllaries narrowly elliptic, to 10 × 1 mm, apex acute to obtuse. Corolla bluish purple, ca. 1 cm, tube 4–5 mm, limb ca. 5 mm, lobes ca. 2 mm. Achene glabrous. Pappus brown; outer bristles ca. 3 mm, scabridulous; inner bristles 9–10 mm. Fl. and fr. Oct.

• Montane thickets and grasslands; 2800–3300 m. SW Sichuan (Yanyuan), NW Yunnan (Lijiang).

286. *Saussurea grosseserrata* Franchet, J. Bot. (Morot) 2: 354. 1888.

粗裂风毛菊 cu lie feng mao ju

Herbs 12–35 cm tall, perennial, sometimes laxly caespitose. Stems solitary or several, erect, simple, arachnoid. Basal and lower stem leaves petiolate; petiole 2–10 cm; leaf blade obovate, narrowly obovate, or narrowly elliptic, (1.5–)4.5–11 × 0.9–5 cm, both surfaces pale green and sparsely arachnoid, base cuneate to attenuate, margin coarsely dentate to pinnately lobed, apex rounded, obtuse, or subacute and mucronate. Middle and upper stem leaves few, petiolate; leaf blade narrowly elliptic to linear, gradually smaller upward on stem, margin triangular-dentate to entire. Capitulum solitary, terminal on stem. Involucre campanulate, 1–1.5(–2) cm in diam. Phyllaries in 4–6 rows, blackish purple, arachnoid; outer phyllaries elliptic, ca. 12 × 4–6 mm, apex long acuminate; middle phyllaries narrowly elliptic, ca. 1.8 × 0.4–0.5 cm, apex obtuse; inner phyllaries narrowly elliptic to linear, ca. 1.8 × 0.2 cm, apex caudate-acuminate. Corolla blackish purple to bluish purple, 1.2–1.5 cm, tube 3–6 mm, limb ca. 9 mm. Achene brown, cylindric, ca. 5 mm, glabrous. Pappus pale brown; outer bristles ca. 1 mm, scabrid; inner bristles ca. 1.2 cm. Fl. and fr. Aug–Oct.

• *Rhododendron* thickets, alpine grasslands, consolidated scree slopes; 2300–4000 m. NW Yunnan (Dali, Lijiang, Zhongdian).

287. *Saussurea pratensis* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 210. 1934.

草原雪莲 cao yuan xue lian

Herbs to 30 cm tall, perennial. Stem solitary, erect, simple, densely yellowish white villous, covered at base with brown residue of petioles. Lower stem leaves petiolate; petiole 3–6 cm; leaf blade oblong, broadly linear, or narrowly elliptic, 15–18 × 1–1.2 cm, sparsely yellowish white villous, base attenuate, margin sinuate and sparsely denticulate, apex obtuse. Middle stem leaves sessile, narrowly ovate-elliptic, to 11 × 0.5 cm, margin entire. Upper stem leaves sessile, narrowly ovate-elliptic to linear, 1.3–6 × ca. 0.2 cm, base amplexicaul, apex acuminate. Capitulum solitary, terminal on stem. Involucre hemispheric, ca. 1.3 cm in diam. Phyllaries in 4 rows, purplish red, densely yellowish white villous, apex acuminate; outer phyllaries narrowly oblong-elliptic, ca. 14 × 4 mm; middle phyllaries narrowly ovate-elliptic, ca. 1.7 × 0.3 cm; inner phyllaries

narrowly triangular-linear, ca. 18 × 1–2 mm. Corolla purplish red, ca. 1.7 cm, tube ca. 1 cm, limb ca. 7 mm. Achene pale brown, oblong, ca. 3.5 mm. Pappus pale brown; outer bristles ca. 3 mm; inner bristles ca. 1 cm. Fl. and fr. Jul–Sep.

• Forest margins, montane meadows; 2000–3100 m. NW Yunnan (Dali, Lijiang).

Saussurea pratensis was erroneously placed in *S.* subg. *Amphilaena* by Lipschitz (Rod *Saussurea*, 64. 1979) and by C. Shih and S. Y. Jin (FRPS 78(2): 30. 1999), but it does not show the colored bracts typical for that subgenus.

288. *Saussurea tunglingensis* F. H. Chen, Bull. Fan Mem. Inst. Bot., Bot. 5: 85. 1934.

卷苞风毛菊 juan bao feng mao ju

Saussurea sclerolepis Nakai & Kitagawa; *S. sclerolepis* f. *pinnatipartita* Nakai & Kitagawa.

Herbs 10–60 cm tall, perennial. Stems solitary or few, erect, simple or few branched, sparsely strigose or glabrous. Basal and lower stem leaves petiolate; petiole 5–14 cm, winged; leaf blade ovate to narrowly ovate-elliptic, 5–15 × 2–5 cm, both surfaces green and glabrous, base cuneate, subtruncate, or cordate, margin sinuate-dentate, apex acuminate. Middle and upper stem leaves sessile or with a narrowly winged short petiole; leaf blade narrowly elliptic, base truncate to cordate-sagittate, apex acuminate. Capitulum solitary, terminal on stem or few in a lax corymbiform synflorescence, pedunculate. Involucre broadly campanulate, (1–)1.5–2(–2.5) cm in diam. Phyllaries in 6 or 7 rows, apically purple, apex acuminate and reflexed; outer phyllaries ovate to ovate-triangular, ca. 4 × 4 mm; middle phyllaries narrowly ovate-elliptic, ca. 1.7 × 0.4 cm; inner phyllaries narrowly elliptic to linear, ca. 1.8 × 0.3 cm, apex obtuse. Corolla purplish red, 1.5–1.8 cm, tube ca. 8 mm, limb ca. 1 cm. Achene pale brown, obconic, 5–5.5 mm, ribbed, glabrous. Pappus dirty white; outer bristles to 6 mm, scabrid; inner bristles ca. 1.5 cm. Fl. and fr. Jul–Sep.

• Montane grasslands, forest margins, ravines; 1700–1900 m. Hebei, Liaoning, Nei Mongol.

Saussurea sclerolepis was published in November 1934, whereas *S. tunglingensis* was published in May of the same year.

289. *Saussurea recurvata* (Maximowicz) Lipschitz, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 21: 374. 1961.

折苞风毛菊 zhe bao feng mao ju

Saussurea elongata Candolle var. *recurvata* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 167. 1859; *S. parasclerolepis* A. I. Baranov & Skvortsov; *S. recurvata* var. *angustata* H. C. Fu; *S. sclerolepis* Nakai & Kitagawa var. *parasclerolepis* (A. I. Baranov & Skvortsov) C. Y. Li.

Herbs 40–100 cm tall, perennial. Stems solitary or several, erect, simple, glabrous. Basal and lower stem leaves petiolate; petiole 3–7 cm; leaf blade narrowly triangular-ovate to narrowly triangular-hastate, (3–)10–15 × (2–)2.5–6 cm, thick, pinnately lobed, both surfaces green to grayish green, thick, abaxially sparsely pubescent, adaxially sparsely strigose, base hastate to truncate, apex acute to acuminate; lateral lobes unequally

incised, dentate, or denticulate, rarely entire. Middle stem leaves shortly petiolate, smaller; leaf blade pinnately divided or dentate. Upper stem leaves sessile, narrowly elliptic to linear, smaller, undivided. Capitula 3–5, in a clustered corymbiform synflorescence, shortly pedunculate. Involucre campanulate, 1–1.5 cm in diam. Phyllaries in 5–7 rows; outer phyllaries ovate, apex long acuminate and usually reflexed; middle phyllaries narrowly ovate-elliptic, apex acute and mucronate; inner phyl-

laries usually purple, linear, apex acute to obtuse. Corolla purple, 1.2–1.5 cm, tube 6–8 mm, limb 6–7 mm. Achene cylindric, 4–5 mm, glabrous. Pappus dirty white; outer bristles 2–3 mm, scabrid; inner bristles ca. 1 cm. Fl. and fr. Jul–Sep. $2n = 26$.

Forest margins, thickets, grasslands; 1000–2900 m. Gansu, Heilongjiang, Jilin, ?Liaoning, Nei Mongol, Ningxia, ?Qinghai, Shaanxi [Korea, Mongolia, Russia (Far East)].

2. ARCTIUM group

牛蒡群 niu bang qun

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, biennial or perennial. Capitula homogamous, bisexual. Phyllaries ending in a straight, recurved, or hooked spine. Receptacle densely covered with long bristles. Florets bisexual. Corolla \pm actinomorphic. Stamen filaments distinct, glabrous or papillose. Style branches distinct and divergent. Achene glabrous; apical rim \pm inconspicuous, sometimes denticulate, not forming a crown; apical plate flat. Pappus of scabrid bristles not basally connate into a ring, falling off singly, or sometimes lacking.

About four genera and ca. 700 species: NW Africa, Asia, Europe; three genera and 14 species (two endemic) in China.

- 1a. Outer and middle phyllaries ending in a hooked spine 25. *Arctium*
- 1b. Outer and middle phyllaries ending in a straight or recurved spine.
 - 2a. Capitula glabrous to cobwebby, when in clusters not surrounded by leaflike lanate bracts 23. *Cousinia*
 - 2b. Capitula densely lanate, in clusters surrounded by leaflike lanate bracts 24. *Schmalhausenia*

23. COUSINIA Cassini in F. Cuvier, Dict. Sci. Nat. 47: 503. 1827.

刺头菊属 ci tou ju shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, biennial or perennial. Leaves divided or undivided, margin spiny or spinulose. Capitula 1 to many, forming a racemose, panicle, or corymbose synflorescence, or solitary, glabrous to cobwebby. Involucre spherical to cylindric. Phyllaries imbricate, leathery, ending in a spine. Stamen filaments glabrous; anther with \pm lacerate basal appendages. Style branches short to long, apex acute. Achene obovoid to obconic, laterally compressed, with (2–)4 or 5 raised ribs, rugose, apex \pm rimmed; rim sometimes denticulate. Pappus rarely absent, when present bristles in ca. 3 rows, outer ones much shorter than inner.

About 600 species: C, S, and SW Asia; 11 species (two endemic) in China.

- 1a. Stems winged.
 - 2a. Corolla yellow.
 - 3a. Involucre 1.2–1.5 cm in diam.; leaves \pm leathery 1. *C. dissecta*
 - 3b. Involucre 0.6–0.9 cm in diam.; leaves thinly papery 2. *C. alata*
 - 2b. Corolla red to purple.
 - 4a. Involucre 1.2–1.5 cm in diam., glabrous; phyllaries green; leaves undivided 3. *C. leioccephala*
 - 4b. Involucre 1.5–2 cm in diam., densely cobwebby; phyllaries grayish white; basal and lower cauline leaves pinnately lobed 4. *C. platylepis*
- 1b. Stems unwinged.
 - 5a. Corolla white or yellow.
 - 6a. Involucre spherical to ovoid, 1.5–2 cm in diam.; corolla white 5. *C. affinis*
 - 6b. Involucre narrowly ellipsoid to cylindric, 0.6–0.8 cm in diam.; corolla yellow 6. *C. polyccephala*
 - 5b. Corolla purplish red.
 - 7a. Stems unbranched; capitulum solitary.
 - 8a. Involucre 4–4.5 cm in diam.; leaf segments broadly ovate 8. *C. sclerolepis*
 - 8b. Involucre 1.5–2 cm in diam.; leaf segments triangular to triangular-lanceolate 9. *C. caespitosa*
 - 7b. Stems branched; capitula several.
 - 9a. Leaves undivided 7. *C. lasiophylla*
 - 9b. Basal and lower cauline leaves pectinately divided into needle-shaped segments.
 - 10a. Capitula 4 or 5; terminal spine of leaf segments 5–10 mm 10. *C. falconeri*
 - 10b. Capitula numerous; terminal spine of leaf segments ca. 4 mm 11. *C. thomsonii*

1. Cousinia dissecta Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 391. 1842.

深裂刺头菊 shen lie ci tou ju

Arctium dissectum (Karelin & Kirilov) Kuntze.

Herbs 25–35 cm tall, biennial. Stems erect, apically branched, densely cobwebby; wings 2–4(–10) mm wide, with spiny teeth. Leaves ± leathery, abaxially grayish white and densely cobwebby-felted, adaxially grayish green and densely cobwebby. Basal and lower cauline leaves shortly petiolate, bipinnatisect. Middle cauline leaves sessile, bipinnatisect or pinnatisect; uppermost cauline leaves narrowly lanceolate, less divided. Capitula broadly ovoid. Involucre 1.2–1.5 cm in diam. Outer and middle phyllaries falcately recurved in distal half, apex narrowed into a spine to 3 mm; inner phyllaries narrowly lanceolate, margin ciliate, apex long acuminate. Corolla yellow. Achene ca. 5 × 1.5–2 mm, 4-ribbed, ribs apically prolonged into a tooth. Fl. and fr. May–Aug.

Sandy areas adjacent to sand dunes. NW Xinjiang [Kazakhstan].

No material of *Cousinia dissecta* was seen by the present authors. The description here is based on the original publication and the treatments by Tscherneva (Fl. URSS 27: 160. 1962) and G. M. Shen (Fl. Xinjiang. 5: 300. 1999).

2. Cousinia alata Schrenk ex Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 40. 1841.

翼茎刺头菊 yi jing ci tou ju

Herbs 50–90 cm tall, perennial. Stems erect, freely branched, glabrous; wings with spiny teeth. Leaves thinly papery, sparsely cobwebby. Basal and lower cauline leaves sessile, lanceolate to elliptic, ca. 12 × 4 cm, bipinnatipartite; ultimate lobes triangular to narrowly ovate, margin entire, apex with a 1–1.5 mm spine. Middle cauline leaves similar or pinnatipartite; upper cauline leaves gradually smaller upward, pinnately lobed or toothed. Capitula many, corymbose to paniculate. Involucre ovoid, 6–9 mm in diam., sparsely cobwebby. Phyllaries in ca. 9 rows; outer and middle phyllaries ± narrowly lanceolate, 4–7 × ca. 1 mm, apex narrowed into a patent or ± recurved 1.5–3 mm spine; inner phyllaries lanceolate-elliptic, 8–10 × 1–1.5 mm, apex narrowed into a spine ca. 3 mm. Corolla yellow, ca. 8 mm. Mature achene unknown. Pappus short. Fl. Jul.

Slopes, sandy places; 500–700 m. Xinjiang (Tian Shan part of Junggar Pendi) [Kazakhstan, Uzbekistan].

3. Cousinia leioccephala (Regel) Juzepczuk, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 3: 314. 1937.

光苞刺头菊 guang bao ci tou ju

Cousinia sewertzowii Regel var. *leioccephala* Regel, Trudy Imp. S.-Peterburgsk. Bot. Sada 6: 314. 1880.

Herbs 30–60 cm tall, biennial. Stems solitary, grayish white, erect, apically or sometimes basally branched, densely cobwebby; wings 4–6 mm wide, teeth with 0.5–1.5 mm terminal spines. Leaves thinly papery, concolorous, green to grayish green, sparsely cobwebby. Basal leaves sessile, undivided, lan-

ceolate to broadly lanceolate, margin with spiny teeth. Middle and upper cauline leaves sessile, lanceolate, 2.5–3.5 × 0.7–1.5 cm, margin spinulose and toothed, teeth with apical spines. Capitula 9–12. Involucre campanulate, 1.2–1.5 cm in diam., glabrous. Phyllaries in ca. 12 rows, green; outer and middle phyllaries triangular-subulate to linear-subulate, 5–10 × ca. 1 mm, apex narrowed into a recurved spine 0.5–2 cm; inner phyllaries linear, ca. 12 × 1 mm, abaxially strigose, margin with short cilia, apex expanded and scarious. Corolla purplish red, ca. 1.2 cm, tube 4–4.5 mm. Achene pale grayish brown variegated with dark brown, obovoid, ca. 3 mm, multistriate. Fl. and fr. Jun–Aug.

Slopes; 1100–1800 m. Xinjiang (Tian Shan) [Uzbekistan].

4. Cousinia platylepis Fischer, C. A. Meyer & Avé-Lallemant, Index Sem. Hort. Petrop. 9(Suppl.): 10. 1844.

宽苞刺头菊 kuan bao ci tou ju

Arctium platylepis (Fischer, C. A. Meyer & Avé-Lallemant) Kuntze.

Herbs 30–80 cm tall, biennial. Stems erect, grayish white cobwebby-felted; wings 3–4 mm wide, with spiny teeth. Leaves concolorous, grayish white, densely cobwebby-felted. Basal and lower cauline leaves sessile, lanceolate, pinnately lobed. Upper cauline leaves sessile, lanceolate, 2–2.5 × 1–1.5 cm, margin spiny or toothed, teeth spiny laterally and narrowed into a 0.5–3 mm spine; uppermost cauline leaves elliptic to ovate, ca. 10 × 4–5 mm, margin entire. Capitula several. Involucre broadly campanulate, 1.5–2 cm in diam., densely cobwebby. Phyllaries in ca. 7 rows, grayish white; outer and middle phyllaries triangular, triangular-lanceolate, or elliptic, 3–10 × 1–3 mm, apex narrowed into a ca. 2 mm spine; inner phyllaries elliptic, ca. 11 × 3 mm, apex rigid, expanded, scarious, and mucronulate; innermost phyllaries broadly linear, ca. 14 × 2 mm, apex obtuse to rounded. Corolla red, ca. 1.2 cm, tube ca. 5 mm. Achene yellowish, ellipsoid, ca. 1.8 mm, multistriate. Fl. and fr. May–Aug.

Slopes; 1200–2000 m. NW Xinjiang [Kazakhstan, Uzbekistan].

5. Cousinia affinis Schrenk ex Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 41. 1841.

刺头菊 ci tou ju

Arctium affine (Schrenk ex Fischer & C. A. Meyer) Kuntze; *Cousinia wolgensis* (M. Bieberstein ex Willdenow) C. A. Meyer ex Candolle var. *affinis* (Schrenk ex Fischer & C. A. Meyer) Regel.

Herbs 15–40 cm tall, perennial. Rootstock thick, densely cottony and covered with petiole remains. Stems erect, unbranched or apically branched, unwinged, thickly grayish white felted to glabrescent or glabrous. Leaves abaxially grayish white and thickly felted, adaxially green and sparsely cobwebby. Basal leaves with a brown winged petiole; leaf blade elliptic to oblanceolate, 8–12 × 2–4 cm, margin toothed or lobed; teeth or lobes ± broadly ovate to semiorbicular, margin with 0.5–1 mm spinules, apex with 2.5–5 mm spine. Lower and middle cauline leaves sessile, gradually smaller, base auriculate

and semiamplexicaul, otherwise similar to basal leaves or \pm narrowly ovate, smallest uppermost ones ovate. Capitula several. Involucre globose to ovoid, 1.5–2 cm in diam., glabrous or sparsely cobwebby. Phyllaries in ca. 9 rows; outer and middle phyllaries subulate, ovate-elliptic or ovate, 8–12 \times 2–3 mm, margin ciliate, apex abruptly constricted into a recurved 4–5 mm spine; inner phyllaries elliptic to broadly linear, ca. 15 \times 2–2.5 mm, apex narrowed into a short spine; innermost phyllaries oblanceolate, ca. 18 \times 2 mm, abaxially strigose, margin with short cilia, apex with a short spine. Corolla white, ca. 2.3 cm, tube ca. 5 mm. Achene narrowly obovoid, ca. 4 mm, 4-ribbed, ribs apically prolonged into a tooth. Fl. and fr. Jun–Sep.

Deserts, dunes; 400–800 m. Xinjiang (Junggar Pendi) [Kazakhstan, Mongolia].

6. Cousinia polycephala Ruprecht, Mém. Acad. Imp. Sci. Saint Pétersbourg, Sér. 7, 14(4): 54. 1869.

多花刺头菊 duo hua ci tou ju

Arctium polycephalum (Ruprecht) Kuntze.

Herbs to 1 m tall, perennial. Stems erect, branched from middle or apically, unwinged, cobwebby. Leaves leathery, abaxially grayish white and sparsely to thickly felted, adaxially green and sparsely cobwebby. Basal leaves petiolate; leaf blade elliptic-lanceolate, 15–50 \times 5–11 cm, pinnatisect; segments triangular, margin with spiny teeth. Lower cauline leaves similar to basal leaves but sessile and smaller. Capitula many, corymbose. Involucre narrowly ellipsoid to cylindric, 6–8 mm in diam., cobwebby. Phyllaries in 3 or 4 rows; outer phyllaries 4–5 mm, apex narrowed into a short spine; middle phyllaries narrowly ovate to narrowly lanceolate, ca. 3 \times as long as outer ones, apex narrowed into a long spine; inner phyllaries linear. Corolla yellow. Achene obconic, 4–5 mm, 3- or 4-ribbed, ribs apically prolonged into a tooth. Fl. and fr. Jul–Aug. $2n = 24$.

Rocky slopes in mountains. Xinjiang (W Tian Shan) [Tajikistan].

No material of *Cousinia polycephala* from China was seen by the present authors, and the description here is based on the treatment by Tscherneva (Fl. URSS 27: 206. 1962).

7. Cousinia lasiophylla C. Shih, Bull. Bot. Res., Harbin 4(2): 59. 1984.

丝毛刺头菊 si mao ci tou ju

Herbs to 40 cm tall, biennial. Stems erect, unwinged; branches purplish red, long, striate, sparsely felted to glabrescent. Leaves abaxially grayish green and sparsely cobwebby-felted, adaxially green and sparsely cobwebby. Middle cauline leaves sessile, oblong-elliptic, 9.5–14.5 cm, undivided, margin with 0.5–1.5 mm spines or teeth with curved 2.5–5 mm spines, apex narrowed into a rigid spine. Upper cauline leaves ovate, ovate-lanceolate, or elliptic, 4.5–6 \times 3.5–4 cm, margin spiny or with laterally and apically spiny teeth; uppermost leaves oblanceolate, ca. 4 \times 1 cm, margin entire and unarmed. Capitula several. Involucre broadly campanulate, 4.5–5 cm in diam., fluffily cobwebby. Phyllaries in ca. 7 rows; outer and middle phyllaries triangular-lanceolate, 2.6–3.2 \times 0.5–0.6 cm, leathery, with a medial abaxial ridge, apex with a triquetrous rigid 3–5 mm spine; inner and innermost phyllaries elliptic-lanceolate, linear,

or narrowly linear, 2.5–2.8 \times 0.1–0.3 cm, rigid, apex scarious and acuminate to acute. Corolla purplish red, ca. 2.2 cm, tube ca. 1 cm. Achene variegated with brown, obovoid, ca. 5 mm. Fl. and fr. Jul.

• Grasslands on mountain slopes; 3000–3200 m. W Xinjiang (Wuqia).

8. Cousinia sclerolepis C. Shih, Bull. Bot. Res., Harbin 4(2): 60. 1984.

硬苞刺头菊 ying bao ci tou ju

Herbs to 30 cm tall, biennial. Stems purplish red, tufted, erect, unbranched, unwinged, densely fluffily cobwebby. Leaves papery, \pm concolorous, grayish green, sparsely cobwebby. Basal leaves with petiole ca. 6 cm; leaf blade elliptic, ca. 12 \times 6 cm, pinnatifid or pinnatipartite; segments 5 or 6 pairs, broadly ovate, margin with 3–7 unequal teeth with 3–6 mm lateral spines, apical spine to 1 cm. Cauline leaves similar to basal leaves but sessile; upper cauline leaves lanceolate, smaller. Capitulum 1. Involucre broadly campanulate, 4–4.5 cm in diam., fluffily cobwebby. Phyllaries in 6 or 7 rows; outer and middle phyllaries elliptic-subulate to lanceolate-subulate, 1.8–3.3 \times 0.3–0.4 cm, rigid, leathery, with a medial abaxial ridge, apex narrowed into a rigid triquetrous spine; inner and innermost phyllaries oblanceolate to broadly linear, ca. 2.3 \times 0.2–0.3 cm, rigid, apex scarious, yellowish, and slightly expanded. Corolla purplish red, ca. 2 cm, tube ca. 1.2 cm. Achene pale, obliquely obovoid, ca. 5 mm, darkly striate. Pappus absent. Fl. and fr. Jul.

• Mountain slopes; ca. 3200 m. W Xinjiang (Wuqia).

9. Cousinia caespitosa C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 10: 93. 1887.

丛生刺头菊 cong sheng ci tou ju

Herbs 8–14 cm tall, perennial. Rootstock well developed. Stems many, tufted, unbranched, unwinged, cobwebby. Leaves \pm concolorous, grayish white, sparsely cobwebby. Basal leaves with winged petiole 1–2 cm; leaf blade elliptic, 1–2 \times 0.8–1.3 cm, pinnatisect; segments 4–6 \pm opposite pairs, triangular to triangular-lanceolate, patent at right angle, margin revolute, apical spine 1–2 mm. Cauline leaves few, similar to basal leaves but smaller, sessile. Capitulum 1. Involucre bowl-shaped, 1.5–2 cm in diam., sparsely cobwebby. Phyllaries in ca. 5 rows, abaxially purplish red; outer and middle phyllaries triangular, 5–12 \times 1.5–2 mm, apex narrowed into a 1.5–2 mm spine; inner phyllaries broadly linear, ca. 15 \times 1 mm, apex acuminate. Corolla purplish red, ca. 1.2 cm, tube ca. 9 mm. Achene brown, ca. 5.5 mm, ribs apically prolonged into a tooth. Fl. and fr. Jul–Sep.

Rocky mountain slopes; ca. 3200 m. W Xinjiang (Wuqia) [Kazakhstan].

10. Cousinia falconeri J. D. Hooker, Fl. Brit. India 3: 360. 1881.

穗花刺头菊 sui hua ci tou ju

Herbs 30–100 cm tall, biennial. Stems grayish white, erect, apically branched, unwinged, felted. Leaves leathery, abaxially grayish white and densely felted, adaxially green to yellowish

green and glabrous. Basal leaves with petiole ca. 3 cm; leaf blade ca. 10×5 cm, \pm pinnatisect; segments needle-shaped, patent at right angle, margin entire and revolute, midvein thick and abaxially raised, apex narrowed into a yellow rigid 5–10 mm spine. Cauline leaves similar to basal leaves but sessile; upper cauline leaves lanceolate, smaller, semiamplexicaul. Capitula spicate by 4 or 5 near apex of stem and branches. Involucre subglobose, 3–5 cm in diam., densely and fluffily cobwebby. Phyllaries in ca. 9 rows, rigid, leathery; outer and middle phyllaries lanceolate, $1.9\text{--}2.2$ cm \times ca. 0.4 mm, apex narrowed into a straight 2–4 mm spine; inner phyllaries narrowly lanceolate, $1.8\text{--}2 \times$ ca. 0.3 cm, apex narrowed into a ca. 2.5 mm spine. Corolla purplish red. Mature achene unknown. Fl. Jun.

Slopes, gravelly places in flooded lands; 4100–4400 m. W Xizang [India, Pakistan].

11. Cousinia thomsonii C. B. Clarke, Compos. Ind. 213. 1876.

毛苞刺头菊 mao bao ci tou ju

Herbs 30–80 cm tall, biennial. Rootstock covered with

petiole remains. Stems grayish white, erect, apically branched, unwinged, thickly cobwebby-felted. Leaves leathery, abaxially grayish white and thickly felted, adaxially green and glabrous. Basal and lower cauline leaves with a brown winged petiole; leaf blade elliptic to oblanceolate, $12\text{--}13 \times 3\text{--}3.5$ cm, pinnatisect; segments 6–11 pairs, needle-shaped to triangular-subulate, patent at right angle, margin entire and revolute, midvein thick and abaxially raised, apex narrowed into a rigid ca. 4 mm spine. Middle cauline leaves sessile, similar to lower ones or lanceolate to elliptic-lanceolate, semiamplexicaul. Capitula many. Involucre subspherical, 3–4 cm in diam., densely and fluffily cobwebby. Phyllaries in ca. 9 rows, rigid, leathery, abaxially purplish red; outer phyllaries triangular, $1.8\text{--}2.3 \times 0.4\text{--}0.5$ cm, apex narrowed into a rigid 3–4 mm spine; middle and inner phyllaries lanceolate, ca. $2.3 \times 0.2\text{--}0.4$ cm, apex narrowed into a 1.5–2.5 mm spine. Corolla purple to pink, ca. 1.4 cm, tube ca. 7 mm. Achene brown, obovoid, ca. 5 mm, 1-ribbed on each side. Fl. and fr. Jul–Sep.

Grasslands, gravelly places in flooded lands; 3700–4300 m. S Xizang [India, Nepal, Pakistan].

24. SCHMALHAUSENIA C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 12: 281. 1892.

虎头蓟属 hu tou ji shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, perennial. Leaves bipinnatisect, with spiny lobes. Capitula many, clustered at apex of stem, surrounded by leaflike densely lanate bracts. Involucre campanulate, densely and fluffily lanate. Phyllaries imbricate, apex a long spine. Stamen filaments minutely papillose; anther with short, lacerate basal appendages. Achene obovoid, laterally compressed, with 4–6 ribs each ending in a small tooth, rugose, apex with a denticulate rim. Pappus of ca. 3 rows of bristles, outer ones much shorter than inner.

One species: China, Kazakhstan.

1. Schmalhausenia nidulans (Regel) Petrak, Allg. Bot. Z. Syst. 20: 117. 1914.

虎头蓟 hu tou ji

Cirsium nidulans Regel, Bull. Soc. Imp. Naturalistes Moscou 40(3–4): 160. 1867; *Arctium eriophorum* (Regel & Schmalhausen) Kuntze; *Carduus horridus* (Ruprecht) B. Fedtschenko (1912), not Adams (1805); *Cousinia eriophora* Regel & Schmalhausen; *Jurinea horrida* Ruprecht; *Schmalhausenia eriophora* (Regel & Schmalhausen) C. Winkler.

Herbs to 25 cm tall. Stem solitary, erect, thick, hollow, unbranched, densely and fluffily cobwebby-felted, base covered

with petiole remains. Leaves concolorous, grayish white or grayish green, densely and fluffily villous. Basal leaves petiolate; leaf blade elliptic-oblanceolate, $35\text{--}40 \times 10\text{--}14$ cm; ultimate lobes lanceolate, apex narrowed into a long spine. Cauline leaves similar but sessile, smaller, sometimes narrowly elliptic. Capitula 5–10. Involucre 2.2–4 cm in diam. Phyllaries in 3 or 4 rows, narrowly lanceolate, apex narrowed into a long subulate spine; outer and middle phyllaries abaxially brown villous. Corolla purple. Achene ca. 5 mm, wrinkled, ribs prolonged into a small tooth. Pappus bristles brown, to 1.3 cm, unequal. Fl. and fr. Jul–Sep.

Meadows; ca. 3600 m. NW Xinjiang [Kazakhstan].

25. ARCTIUM Linnaeus, Sp. Pl. 2: 816. 1753.

牛蒡属 niu bang shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Bardana Hill; *Lappa* Scopoli.

Herbs, biennial [or perennial]. Leaves simple, margin sparsely denticulate to subentire. Capitula many, glabrous or cobwebby, forming a corymbose [or racemose] synflorescence. Phyllaries (except sometimes innermost) narrowed into a slender hooked spine. Stamen filaments papillose; anther with subentire to lacerate basal appendages. Style branches linear. Achene obovoid to narrowly ellipsoid, laterally compressed, rugose, striate or ribbed, apex inconspicuously rimmed. Pappus of ca. 3 rows of bristles, outer ones very short.

Eleven species: N Africa, Asia, Europe; two species in China.

- 1a. All phyllaries narrowed into a slender hooked spine; involucre minutely glandular pubescent but not cobwebby 1. *A. lappa*
 1b. Inner phyllaries apically expanded into a dark purple \pm truncate appendage; involucre \pm densely cobwebby 2. *A. tomentosum*

1. *Arctium lappa* Linnaeus, Sp. Pl. 2: 816. 1753.

牛蒡 niu bang

Arctium leiospermum Juzepczuk & Ye. V. Sergievskaja; *A. majus* Bernhardt, nom. illeg. superfl.; *Lappa major* Gaertner, nom. illeg. superfl.; *L. vulgaris* Hill.

Herbs to 2 m tall, biennial. Stem purplish, erect, stout, apically branched, sparsely cobwebby; branches ascending. Leaves abaxially grayish white or pale green and thinly felted, adaxially green, sparsely strigose, and yellow gland-dotted. Basal leaves with petiole ca. 32 cm; leaf blade broadly heart-shaped, ca. 30 \times 21 cm, margin entire and repand to mucronulate denticulate. Cauline leaves similar to basal leaves or ovate; uppermost cauline leaves ovate to shallowly cordate, smaller. Capitula few to many, \pm corymbose. Involucre ovoid, 1.5–2 cm in diam., glabrous except for minute glandular hairs. Phyllaries all with a hooked apex; outer phyllaries triangular to lanceolate-subulate, ca. 15 \times 1 mm; middle and inner phyllaries lanceolate to linear-subulate, ca. 15 \times 1.5–3 mm. Corolla purplish red, ca. 1.4 cm, tube ca. 8 mm. Achene pale brown variegated with dark brown or concolorous, narrowly sometimes obliquely obovoid, 5–7 mm, multistriate. Pappus bristles to 3.5 mm. Fl. and fr. Jun–Sep. $2n = 18, 34, 36$.

Near villages, roadsides, near rivers, wet and waste places, forest margins, thickets, valleys, slopes; 700–3500 m. Throughout China except for Hainan, Taiwan, and Xizang [Afghanistan, Bhutan, India, Japan, Nepal, Pakistan; SW Asia, Europe].

Arctium lappa is cultivated almost throughout China. The achenes and roots are used medicinally.

2. *Arctium tomentosum* Miller, Gard. Dict., ed. 8, *Arctium* no. 3. 1768.

毛头牛蒡 mao tou niu bang

Lappa tomentosa (Miller) Lamarck.

Herbs to 2 m tall, biennial. Stem erect, branched, sparsely cobwebby; branches ascending. Leaves abaxially grayish white and densely felted, adaxially green and glabrous. Basal leaves petiolate; leaf blade heart-shaped, 25–50 \times 10–30 cm, margin sparsely denticulate, teeth spinulose or mucronulate, apex acute to obtuse and mucronulate. Cauline leaves similar to basal leaves; uppermost cauline leaves sessile, ovate to ovate-elliptic. Capitula few to many, \pm corymbose. Involucre ovoid, 1.5–2 cm in diam., \pm densely cobwebby. Outer phyllaries subulate, triangular-subulate, or lanceolate, ca. 6 \times 1 mm; middle phyllaries linear-subulate, 10–14 \times ca. 2 mm, all with a hooked apex; inner phyllaries lanceolate to linear-lanceolate, apex acuminate. Corolla purplish red, 0.9–1.2 cm, tube 4.5–6 mm. Achene pale brown variegated with dark brown, narrowly obovoid, ca. 5.6 mm, multistriate. Pappus bristles pale brown, ca. 3 mm. Fl. and fr. Jul–Sep.

Grasslands; 1200–2100 m. Xinjiang (Tian Shan) [Kazakhstan, Kyrgyzstan, Russia, Tajikistan, Uzbekistan; Europe].

The above description of Chinese plants does not match typical *Arctium tomentosum*, which, as mentioned in the key, is characterized by inner phyllaries with a dark purple, expanded, truncate apical portion. The identity of the plant in Xinjiang requires confirmation.

3. ONOPORDUM group

大翅蓟群 da chi ji qun

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, biennial or perennial. Capitula homogamous, bisexual. Phyllaries pointed, often ending in a straight or recurved spine. Receptacle densely covered with bristles or naked and alveolate. Florets bisexual. Corolla \pm actinomorphic. Stamen filaments distinct, glabrous or papillose. Style branches coherent for most of their length. Achene glabrous; apical rim sometimes inconspicuous but usually forming a low to prominent \pm denticulate (rarely entire) crown; apical plate flat or with a conic to rarely cylindric sclerenchymatous non-oleaginous body. Pappus of scabrid, barbellate, or plumose bristles basally connate into a ring, falling off together, rarely with an inner row of narrow scales.

Nine genera and ca. 90 species: N Africa, Asia, Europe; seven genera (one endemic) and 17 species (five endemic) in China.

- 1a. Receptacle naked and alveolate 31. *Onopordum*
 1b. Receptacle covered with bristles.
 2a. Outer pappus of filiform bristles and inner pappus of narrow scales ending in a barbellate subulate tip 30. *Syreitschikovia*
 2b. Pappus (when present) of bristles only.
 3a. Pappus bristles plumose 32. *Ancathia*
 3b. Pappus bristles scabrid or barbellate.
 4a. Corolla yellow.
 5a. Plants stemless; capitula basal, shortly pedunculate, in center of leaf rosette 29. *Xanthopappus*
 5b. Plants caulescent; capitula terminal on stem and branches 27. *Alfredia*
 4b. Corolla purple, red, blue, or rarely white.
 6a. Basal and lower cauline leaves heart-shaped to triangular-sagittate, undivided 26. *Synurus*
 6b. Basal and lower cauline leaves linear to elliptic, \pm deeply pinnately divided 28. *Olgaea*

26. SYNURUS Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada S.S.S.R. 6: 35. 1926.

山牛蒡属 shan niu bang shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, perennial. Leaves heart-shaped to triangular-sagittate, undivided or sometimes pinnately divided, margin toothed or merely spinulose denticulate. Capitula large, nodding. Involucre globose. Phyllaries imbricate, lanceolate to linear-lanceolate, rigid, apex long acuminate. Receptacle with long bristles. Corolla purple. Stamen filaments glabrous; anther with long, strongly lacerate basal appendages laterally fused into a tubular sheath enclosing distal part of filament. Style branches short. Achene obovoid, laterally compressed, longitudinally striate but otherwise smooth; apical rim forming a crenulate crown; apical plate with a low central pyramidal non-oleaginous body crowned by a cupular disk. Pappus of 3 or 4 rows of scabrid bristles, outer ones less than 1/2 as long as inner ones.

One species: China, Japan, Korea, Mongolia, Russia.

1. *Synurus deltoides* (Aiton) Nakai in Tozawa & Nakai, Kôryô Sikenrin Ippan, 64. 1932.

山牛蒡 shan niu bang

Onopordum deltoides Aiton, Hort. Kew. 3: 146. 1789; *Carduus atriplicifolius* Fischer ex Hornemann; *Centaurea atriplicifolia* (Fischer ex Hornemann) Matsumura; *Cirsium ficifolium* Fischer; *Rhaponticum atriplicifolium* (Fischer ex Hornemann) Candolle; *Serratula atriplicifolia* (Fischer ex Hornemann) Schultz Bipontinus; *S. atriplicifolia* var. *excelsa* Makino; *S. deltoides* (Aiton) Makino; *S. deltoides* var. *palmatopinnatifida* Makino; *S. pungens* Franchet & Savatier (1878), not Poirlet (1805); *Synurus atriplicifolius* (Fischer ex Hornemann) Iljin; *S. excelsus* (Makino) Kitamura; *S. hondae* Kitagawa; *S. palmatopinnatifidus* (Makino) Kitamura; *S. pungens* Kitamura; *S. pungens* var. *giganteus* Kitamura.

Herbs 0.7–1.5 m tall. Rootstock stout. Stem solitary, stout, erect, ribbed, branched or unbranched, basally densely felted to

glabrescent or glabrous. Leaves abaxially grayish white and densely felted, adaxially green, asperous, and setulose. Basal and lower cauline leaves with narrowly winged petiole to 34 cm; leaf blade cordate, ovate, broadly ovate, ovate-triangular, or hastate, 10–26 × 12–20 cm, base cordate, sagittate, or truncate. Upper cauline leaves gradually smaller upward, sessile or shortly petiolate, ovate, elliptic, or elliptic-lanceolate, margin toothed to spiny. Capitula several. Involucre 3–6 cm in diam., densely and fluffily cobwebby to glabrous. Phyllaries in 13–15 rows; outer and middle phyllaries lanceolate, 7–23 × 3–4 mm, patent to reflexed; inner phyllaries longest, linear-lanceolate, 2.3–2.5 × ca. 0.2 cm, sometimes purple. Corolla ca. 2.5 cm, tube ca. 9 mm. Achene brown, narrowly ellipsoid, ca. 7 mm, apex truncate. Pappus bristles brown, 1.5–2 cm. Fl. and fr. Jun–Oct. $2n = 26$.

Forest margins, forests, meadows; 500–2200 m. Anhui, Chongqing, S Gansu, Hebei, Heilongjiang, Henan, Hubei, N Hunan, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, E Shandong, S Shanxi, NE Yunnan, Zhejiang [Japan, Korea, Mongolia, Russia].

27. ALFREDIA Cassini in F. Cuvier, Dict. Sci. Nat. 1(Suppl.): 115. 1816.

翅膜菊属 chi mo ju shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, perennial, caulescent. Stem solitary, erect, sulcate, unwinged. Leaves subentire to pinnatipartite, with spiny or spinulose teeth or segments. Capitula large, few (sometimes only 1), terminal on stem and branches. Involucre campanulate. Phyllaries numerous, abaxially with appressed tortuous blackish hairs and often white cobwebby, with membranous wings or appendage. Receptacle flat, with dense long bristles. Corolla yellow [or purple]. Stamen filaments glabrous or papillose; anther tails long, subentire to lacerate. Style branches short, apex rounded. Achene narrowly obovoid to narrowly ellipsoid, laterally compressed, often with 12–20 thin inconspicuous ribs, otherwise smooth; apical rim forming a low crown; apical plate with a central pyramidal body of sclerenchyma crowned by a stout disk. Pappus of 3–5 rows of barbellate bristles, outer ones ca. 1/2 as long as inner ones, inner ones gradually wider and flattened.

Six species: C Asia; five species (two endemic) in China.

- 1a. Outer and middle phyllaries distally with a scarious denticulate to lacerate appendage, apically narrowed into a 1–4 mm spine.
 - 2a. Leaves papery, undivided 4. *A. cernua*
 - 2b. Leaves leathery, pinnately divided 5. *A. fetissowii*
- 1b. Outer and middle phyllaries laterally expanded into membranous fimbriate-lacerate wings, apically narrowed into a ca. 10 mm spine.
 - 3a. Leaves leathery, with slender 5–10 mm spines 1. *A. nivea*
 - 3b. Leaves papery, with 1–4 mm spinules.
 - 4a. Basal and lower cauline leaves pinnately divided, terminal lobe cuneate at base; capitula nodding 2. *A. aspera*
 - 4b. Basal and lower cauline leaves with lobed petiole and large undivided blade truncate to cordate at base; capitula erect 3. *A. acantholepis*

1. *Alfredia nivea* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 395. 1842.

厚叶翅膜菊 *hou ye chi mo ju*

Alfredia suaveolens Ruprecht; *Arctium niveum* (Karelin & Kirilov) Kuntze; *Carduus karelinii* B. Fedtschenko; *Cousinia trautvetteri* Regel.

Herbs 35–60 cm tall. Stem purplish red, unbranched or with 1 branch, stout, many ribbed, sparsely cobwebby-felted. Leaves leathery, abaxially grayish white and densely thickly felted, adaxially green and \pm glabrous, margin with teeth ending in straw-colored needle-shaped 5–10 mm spines. Basal and lower cauline leaves with winged petiole; leaf blade elliptic to elliptic-lanceolate, 15–30 \times 4–7 cm, pinnately lobed or sub-pinnatifid; segments 6–8 pairs, elliptic to semiorbicular, margin toothed, terminal segment triangular. Middle cauline leaves similar but sessile or with a short winged petiole; uppermost cauline leaves lanceolate to linear-lanceolate, to 8 \times 1 cm, margin with sparse spinulose teeth. Capitula 1 or 2, nodding. Involucre 5–6 cm in diam. Outer and middle phyllaries 2.5–3 cm, middle portion laterally expanded into scarious fimbriate-lacerate wings, apex narrowed into a ca. 1 cm spine; innermost phyllaries linear to linear-lanceolate, to 3 cm, rigid, scarious, margin entire, apex acuminate. Corolla yellow, ca. 2.2 cm, tube ca. 7 mm. Achene pale yellowish white variegated with brown, narrowly ellipsoid, ca. 6 mm, inconspicuously multistriate. Pappus bristles to 2 cm, fragile. Fl. and fr. Jul–Sep.

Grasslands in river valleys, trailsides, *Picea* forests; 1400–2400 m. Xinjiang (Borohoro Shan, Tarbagatay Shan, Tian Shan) [Kazakhstan].

2. *Alfredia aspera* C. Shih, Acta Phytotax. Sin. 22: 454. 1984.

糙毛翅膜菊 *cao mao chi mo ju*

Herbs to 72 cm tall. Stem purplish red, apically once branched, ribbed, sparsely floccose. Leaves papery, abaxially grayish white and densely thickly felted, adaxially green, asperulous, and strigose, margin ciliate with yellowish 1–4 mm spinules. Basal and lower cauline leaves with winged petiole 7–15 cm; leaf blade elliptic, 18–24 \times 8–10 cm, pinnatifid; segments 5 or 6 pairs, elliptic or obliquely triangular to obovate, terminal segment largest, base cuneate. Middle cauline leaves similar but sessile; uppermost cauline leaves undivided, narrowly elliptic to lanceolate, semiamplexicaul. Capitula 2, nodding. Involucre ca. 5 cm in diam. Outer and middle phyllaries ovate-lanceolate to needle-shaped, 1.5–1.8 \times 0.5–0.7 cm, middle portion laterally expanded into scarious fimbriate-lacerate wings, apex narrowed into a ca. 1 cm spine; inner phyllaries lanceolate, ca. 2.5 \times 0.5 cm, rigid, distally with a small scarious lacerate appendage narrowed into a short spine. Corolla yellow, ca. 2.2 cm, tube ca. 7 mm. Mature achene unknown. Pappus bristles brown, to 1.8 cm. Fl. Jul–Sep.

• Open places in forests; 1700–3100 m. Xinjiang (Tian Shan).

3. *Alfredia acantholepis* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 394. 1842.

薄叶翅膜菊 *bao ye chi mo ju*

Alfredia karelinii Ledebour, nom. illeg. superfl.; *A. tianschanica* Ruprecht; *Carduus tianschanicus* (Ruprecht) B. Fedtschenko.

Herbs 40–120 cm tall. Stem purplish red, stout, unbranched or rarely with 1 branch, with sparse appressed long white hairs. Leaves papery, abaxially grayish white and thickly felted, adaxially green, asperulous, and strigose, margin densely ciliate with 1–2 mm spinules. Basal and lower cauline leaves petiolate; petiole 8–10 cm, winged, distally lobed, lobes in 2 or 3 pairs, elliptic to ovate, and small; leaf blade otherwise undivided, ovate, 11–13 \times 5–8 cm, base cordate to truncate. Middle cauline leaves similar but sessile; upper cauline leaves narrowly ovate, small, semiamplexicaul. Capitula 1 or 2, erect. Involucre broadly campanulate, 4–6 cm in diam. Outer and middle phyllaries lanceolate to needle-shaped, 1.2–2.4 \times 0.3–0.5 cm, middle portion laterally expanded into scarious fimbriate-lacerate wings, apex narrowed into a ca. 1 cm spine; inner phyllaries linear-lanceolate, ca. 3 \times 0.3 cm, rigid, scarious, margin sometimes expanded into small fimbriate-lacerate scarious wings. Corolla yellow, ca. 2.2 cm, tube ca. 8 mm. Achene cream-colored variegated with brown, obliquely narrowly obovoid, ca. 7 mm, compressed, inconspicuously multistriate. Pappus bristles to 2 cm, fragile. Fl. and fr. Jul–Oct.

Meadows, steppes, open forests, moist places; 1600–3300 m. Xinjiang (Tian Shan) [Kazakhstan].

4. *Alfredia cernua* (Linnaeus) Cassini in F. Cuvier, Dict. Sci. Nat. 1(Suppl.): 115. 1816.

翅膜菊 *chi mo ju*

Cnicus cernuus Linnaeus, Sp. Pl. 2: 826. 1753; *Alfredia stenolepis* Karelin & Kirilov; *Carduus cernuus* (Linnaeus) Steudel; *Silybum cernuum* (Linnaeus) Gaertner; *S. squarrosus* Tausch.

Herbs 1–3 m tall. Stem purplish red, apically long branched, sparsely cobwebby. Leaves papery, abaxially grayish white and densely felted, adaxially green and sparsely strigillose, margin spinulose denticulate. Basal and lower cauline leaves petiolate; petiole long, spinulose, winged, base auriculate and semiamplexicaul; leaf blade undivided, ovate to heart-shaped, 25–50 \times 15–30 cm. Middle cauline leaves similar but shortly petiolate or sessile, cordate amplexicaul; upper cauline leaves sessile, smaller. Capitula several, nodding. Involucre 4–5 cm in diam. Outer and middle phyllaries lanceolate to oblanceolate, 8–20 \times 3–4 mm, distally with a roundish scarious denticulate appendage apically narrowed into a 1–5 mm spine; inner phyllaries oblanceolate, ca. 3 \times 0.3 cm, with a small scarious entire to \pm lacerate usually blunt apical appendage. Corolla yellow, ca. 1.6 cm, tube ca. 6 mm. Achene brown, narrowly ovoid to obovoid, ca. 5.5 mm, multistriate. Pappus bristles to 1.5 cm, fragile. Fl. and fr. Jul–Sep. $2n = 26$.

Sunny slopes in forests, wet grasslands, rocky crevices; 1400–2000 m. Xinjiang (Altay Shan) [Kazakhstan, Russia].

5. *Alfredia fetissowii* Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 4: 38. 1923.

长叶翅膜菊 *chang ye chi mo ju*

Herbs to 1 m tall. Stem purplish red, sparsely cobwebby.

Leaves leathery, abaxially grayish white and densely felted, adaxially green and glabrous, margin with acicular spines to 5 mm. Lower cauline leaves with petiole 7–14 cm; leaf blade elliptic, 17–30 × 4–8 cm, pinnately divided; segments 4–6 pairs, elliptic to ovate. Middle and upper leaves similar but sessile, sometimes lanceolate to oblanceolate. Capitula 1 or 2, nodding. Involucre 5–7 cm in diam. Outer and middle phyllaries lanceolate to broadly linear, 0.8–3 × 0.2–0.4 cm, distally

expanded into a scarious lacerate appendage apically narrowed into a 1–1.5 mm spine; inner phyllaries linear, ca. 3 × 0.3 cm, lacking an appendage. Corolla yellow, ca. 2.7 cm, tube ca. 9 mm. Achene brown, narrowly obovoid, ca. 5 mm, multistriate and with numerous ribs. Pappus bristles to 2.8 cm, serrulate. Fl. and fr. Jul–Aug.

• Mountain slopes, ravines; 2100–2800 m. Xinjiang (Tian Shan).

28. *OLGAEA* Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 3: 141. 1922.

蜆菊属 wei ju shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Takeikadzuchia Kitagawa & Kitamura.

Herbs, perennial. Leaves linear to elliptic, pinnately divided, with spiny teeth or segments. Capitula few to many, solitary or glomerate. Involucre campanulate, semiglobose, or ovoid. Phyllaries rigid, leathery, straight or apically recurved. Receptacle flat, with dense long bristles. Corolla purple to blue. Stamen filaments glabrous or subglabrous; anther with long ± entire basal appendages. Style branches slender, apex obtuse to rounded. Achene narrowly ellipsoid to obovoid, laterally compressed, often with 12–15 ribs but otherwise smooth; apical rim forming a crenulate crown; apical plate with central pyramidal body of sclerenchyma crowned by a stout disk. Pappus bristles 3–5 rows, barbellate, outer ones somewhat shorter than inner.

About 16 species: mostly in C Asia; six species (two endemic) in China.

1a. Stem winged.

2a. Basal leaves papery and soft in texture, with elliptic to ovate segments; involucre sparsely cobwebby 1. *O. lomonossowii*

2b. Basal leaves ± leathery, with triangular segments or teeth; involucre glabrous or subglabrous.

3a. Leaves subconcolorous, adaxially ± densely cobwebby; basal leaves ± narrowly elliptic, 3–5 cm wide; leaves and stem wings parchmentlike; phyllaries 2–3 mm wide 2. *O. leucophylla*

3b. Leaves strongly discolorous, adaxially green and glabrous; basal leaves ± broadly linear, ca. 3 cm wide; leaves and stem wings leathery; phyllaries 1–1.5 mm wide 3. *O. tangutica*

1b. Stem unwinged.

4a. Capitula solitary at end of stem and branches; involucre sparsely cobwebby 4. *O. pectinata*

4b. Capitula clustered at end of unbranched stem; involucre densely lanate.

5a. Involucre 2.5–3.5 cm in diam.; outer and middle phyllaries with a 1–1.5 cm pungent apical spine; small capitula usually present in leaf axils below main capitula cluster 5. *O. roborowskyi*

5b. Involucre ca. 4.5 cm in diam.; outer and middle phyllaries apically with a short weak spine; small capitula not present in leaf axils below main capitula cluster 6. *O. laniceps*

1. *Olgaea lomonossowii* (Trautvetter) Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 3: 144. 1922.

蜆菊 wei ju

Carduus lomonossowii Trautvetter, Trudy Imp. S.-Peterburgsk. Bot. Sada 1: 183. 1872; *C. hsiaowutaishanensis* F. H. Chen; *C. sinensis* S. Moore; *Olgaea hsiaowutaishanensis* (F. H. Chen) Y. Ling; *O. sinensis* (S. Moore) Iljin; *Serratula diabolica* Kitamura; *Synurus diabolicus* (Kitamura) Kitamura; *Takeikadzuchia lomonossowii* (Trautvetter) Kitagawa & Kitamura.

Herbs 15–60 cm tall. Stem solitary, grayish white, erect, usually branched from near base, rarely unbranched, densely and thickly felted, eventually glabrescent, base covered with petiole remains; wings 1–2 mm wide, margin entire and spinulose. Leaves papery, strongly discolorous, abaxially grayish white and thickly felted, adaxially green and glabrous. Basal leaves with brown petiole; leaf blade elliptic, 8–20 × 4–7 cm, pinnately lobed or pinnatifid; segments 4–7 pairs, elliptic, ± narrowly ovate, or ovate-lanceolate, margin and apex with 0.5–2 mm spines; terminal segment ± narrowly ovate or lanceolate.

Lower cauline leaves similar but sessile; upper cauline leaves gradually smaller upward, ± narrowly elliptic, lanceolate, or narrowly triangular, less divided to entire. Capitula (1 or) few to many. Involucre campanulate to hemispheric, 5–7 cm in diam., sparsely cobwebby. Phyllaries narrowed into long spines; outer and middle phyllaries linear-triangular, 8–24 × 1–2 mm; inner phyllaries similar but longer, ca. 3.5 × 0.2 cm. Corolla purple, ca. 3 cm, tube ca. 1.2 cm. Achene cuneate-obovoid, ca. 6 mm, with a repand apical rim. Pappus bristles brown, to 2 cm, slender. Fl. and fr. Jul–Oct.

Valleys, slopes, sandy areas, riverbeds; 800–2300 m. C Gansu, Hebei, N Jilin, Nei Mongol, N Ningxia, Shaanxi, Shanxi [Mongolia].

2. *Olgaea leucophylla* (Turczaninow) Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 3: 145. 1922.

火媒草 huo mei cao

Carduus leucophyllus Turczaninow, Bull. Soc. Imp. Naturalistes Moscou 5: 194. 1832; *Olgaea leucophylla* var. *aggregata* Y. Ling; *O. leucophylla* var. *albiflora* Y. B. Chang; *O. leucophylla* var. *jucunda* Iljin.

Herbs 15–80 cm tall. Stems grayish white, erect, branched from base or unbranched, stout, densely cobwebby-felted; wings wide, parchmentlike, spiny, toothed, or lobed. Leaves grayish white, subconcolorous, abaxially cobwebby-felted, adaxially \pm densely cobwebby. Basal leaves with thick densely felted petiole; leaf blade \pm narrowly elliptic, 12–20 \times 3–5 cm, parchmentlike, shallowly pinnately lobed or toothed; segments or teeth 7–10 pairs, triangular to semiorbicular, with lateral spines and a brown to yellowish 5–6(–10) mm apical spine. Middle cauline leaves similar or elliptic to elliptic-lanceolate, sometimes undivided; upper cauline leaves elliptic, lanceolate, or narrowly triangular, smaller. Capitula few to many. Involucre campanulate, 3–4 cm in diam., glabrous or subglabrous. Phyllaries distally narrowed into a spine; outer phyllaries triangular, 10–15 \times 2.5–3 mm, recurved; middle phyllaries lanceolate to elliptic-lanceolate, 1.8–2.5 \times ca. 0.3 cm; inner phyllaries linear-elliptic to broadly linear, 3.2–3.6 \times ca. 0.2 cm. Corolla purple or white, ca. 3.3 cm, tube ca. 8 mm. Achene yellowish variegated with brown, narrowly ellipsoid, ca. 1 cm, 10-ribbed. Pappus bristles pale brown, to 2.5 cm. Fl. and fr. May–Oct.

Grasslands, farmlands, by ditches; 700–1800 m. Gansu, Hebei, Heilongjiang, Henan, Jilin, Nei Mongol, Ningxia, N Shaanxi, Shanxi [Mongolia].

3. *Olgaea tangutica* Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 3: 144. 1922.

刺疙瘩 ci ge da

Olgaea echinantha Y. Ling.

Herbs 20–100 cm tall. Stems solitary or up to 3, erect, usually long branched, sparsely cobwebby, base covered with petiole remains; wings wide, leathery, unequally spiny toothed. Leaves leathery, discolorous, abaxially grayish white and densely thickly felted, adaxially green and glabrous. Basal leaves with a brown fibrous basally thickened petiole; leaf blade \pm broadly linear, ca. 33 \times 3 cm, pinnately lobed or pinnatifid; segments ca. 10 pairs, triangular, with 2 or 3 unequal teeth each with 2 or 3 lateral spines and a brown to yellowish 3–4 mm apical spine. Cauline leaves similar but sometimes undivided, narrowly triangular, smaller, with spiny teeth. Capitula several, in a lax corymb. Involucre campanulate, 3–4 cm in diam., glabrous. Outer phyllaries triangular, 5–10 \times 1–1.5 mm, apex recurved to patent and spiniform; middle phyllaries lanceolate to linear-lanceolate, 10–17 \times 1–1.5 mm, apex similar to outer ones; inner phyllaries linear, ca. 2.3 \times 0.1 cm, apex narrowed into a long spine. Corolla purple to bluish purple, ca. 2.7 cm, tube ca. 1.7 cm. Achene pale yellowish variegated with brown, long cuneate-ellipsoid, ca. 6 mm. Pappus bristles brown to pale brick colored, to 1.5 cm. Fl. and fr. Jun–Sep.

• Slopes, thickets in valleys, farmlands, flooded lands, wastelands; 1200–2000 m. Gansu, Hebei, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shanxi.

4. *Olgaea pectinata* Iljin, Izv. Glavn. Bot. Sada R.S.F.S.R. 23: 146. 1924.

新疆蜡菊 xin jiang wei ju

Herbs 30–70 cm tall. Stem solitary, grayish white, erect,

apically branched, unwinged, densely lanate. Leaves leathery, discolorous, abaxially grayish white and densely felted, adaxially green and glabrous. Basal and lower cauline leaves with a spinose or unarmed petiole; leaf blade elliptic, 10–15 \times 3–3.5 cm, pinnately lobed or pinnatifid; segments numerous pairs, ovate-triangular, 3–5-toothed, each tooth with basal ca. 1.5 mm spines and a 3–3.5 mm apical spine. Middle and upper cauline leaves similar but shortly petiolate or sessile and smaller; uppermost cauline leaves smallest, elliptic to lanceolate, pectinately spiny. Capitula several, solitary at end of stem and branches. Involucre broadly campanulate, ca. 5 cm in diam., sparsely cobwebby. Outer phyllaries elliptic to lanceolate, 2–2.5 \times 0.5–1 cm, middle portion of margin spinulose to spiny toothed, apex with a 2–5 mm spine; middle phyllaries lanceolate-subulate to elliptic-subulate, 2–3 \times ca. 0.3 cm, apex acuminate-subulate; inner phyllaries linear-lanceolate, 2–3 \times ca. 0.2 cm, apex acuminate. Corolla pale purple, ca. 2.6 cm, tube ca. 9 mm. Achene (immature) ca. 6 mm. Pappus bristles yellowish to dirty white, to 2.5 cm. Fl. Jul–Sep.

Rocky mountain slopes; ca. 2900 m. W Xinjiang (Wuqia) [Kazakhstan].

5. *Olgaea roborowskyi* Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 3: 142. 1922.

假九眼菊 jia jiu yan ju

Herbs 20–25 cm tall. Stem solitary, grayish white, erect, unbranched, unwinged, lanate. Leaves leathery, discolorous, abaxially grayish white and thickly lanate, adaxially green, glabrous, and shiny. Middle cauline leaves sessile, elliptic, 10–20 \times 2.5–4 cm, pinnatifid or pinnatifid; segments 7–10 pairs, broadly ovate to broadly triangular, with 3–5 teeth tipped with 3–10 mm spines; upper cauline leaves toothed, with unequal triangular spine-tipped and pectinately spiny teeth. Capitula 3–8, clustered at end of stem; small capitula usually present in leaf axils below main cluster. Involucre ovoid to campanulate, 2.5–3.5 cm in diam., densely lanate. Outer phyllaries lanceolate-subulate, ca. 2 \times 0.3 cm, apex narrowed into a pungent ca. 1.1 cm spine; middle phyllaries \pm narrowly elliptic to linear-subulate, 2.5–3 \times 0.2–0.3 cm, with a 1.2–1.5 cm apical spine; inner phyllaries lanceolate to linear-lanceolate, 2.5–3 \times 0.1–0.3 cm, apex acuminate and softly spiny. Corolla purple, ca. 2.2 cm, tube ca. 1.4 cm. Achene gray and dark variegated, long cuneate-ellipsoid, ca. 7 mm. Pappus bristles brownish, to 2 cm. Fl. and fr. Jul.

• Rocky mountain slopes; 2700–2800 m. W Xinjiang (Wuqia).

6. *Olgaea laniceps* (C. Winkler) Iljin, Bot. Mater. Gerb. Glavn. Bot. Sada R.S.F.S.R. 3: 143. 1922.

九眼菊 jiu yan ju

Carduus laniceps C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 9: 519. 1886.

Herbs to 40 cm tall. Stem solitary, erect, unbranched, unwinged, densely lanate. Leaves leathery, discolorous, abaxially grayish white and densely cobwebby-felted, adaxially green, glabrous, and shiny. Basal leaves with spiny petiole ca. 5

cm; leaf blade linear-elliptic to lanceolate-elliptic, 10–20 × 3.5–5.5 cm, pinnately lobed or pinnatipartite; segments 9–11 pairs, semiobicular to broadly triangular, with marginal spinules of to 1 mm and 3–5 teeth with a yellowish 4–6 mm apical spine. Middle and upper cauline leaves similar but shortly petiolate or sessile. Capitula 5–9, clustered at end of stem, without small capitula present in leaf axils below main cluster. Involucre broadly campanulate, ca. 4.5 cm in diam., densely lanate; outer

and middle phyllaries lanceolate-subulate, ca. 2 cm × 3.5 mm, apex narrowed into a short weak spine; inner phyllaries ± broadly linear, 2.5–3 × ca. 0.2 cm, apex acuminate. Corolla purplish red, ca. 2.9 cm, tube ca. 1.2 cm. Achene obconic, 6–7 mm. Pappus bristles yellowish, to 2.5 cm. Fl. and fr. Jul–Aug.

River valleys, gravelly places along rivers; 1800–2100 m. Xinjiang (Tian Shan) [Kazakhstan].

29. XANTHOPAPPUS C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 10. 1893.

黄缨菊属 huang ying ju shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, perennial, stemless. Leaves all basal, rosulate, pinnatipartite, with spiny lobes. Capitula basal, large, shortly pedunculate, clustered in center of leaf rosette. Phyllaries ending in a straight or ± falcate keeled spine. Receptacle concave, covered with bristles. Corolla yellow. Stamen filaments glabrous; anther with long, subentire basal appendages. Style branches short, apex truncate. Achene (immature) narrowly obovoid, inconspicuously striate but otherwise smooth; apical rim forming an entire conspicuous crown; apical plate with shortly cylindric cup-shaped disk surmounted by a cylindric hardened style base. Pappus of ca. 5 rows of scabrid bristles of almost equal length.

• One species: China.

1. Xanthopappus subacaulis C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 13: 11. 1893.

黄缨菊 huang ying ju

Carduus euosmus Forrest; *Xanthopappus multicephalus* Y. Ling.

Rootstock very short, with dense fibrous remains of old petioles. Leaves with a spiny rigid 2–10 cm petiole; leaf blade ± narrowly elliptic, 20–30 × 5–8 cm, abaxially grayish white and thickly cobwebby-felted, adaxially green and glabrous, midvein abaxially raised; segments 8–12 pairs, narrowly elliptic to ovate-

triangular, with triangular teeth or toothed lobes, margin with patent spinules, apex of segments, lobes, and teeth with a rigid yellow spine. Capitula to 20. Involucre broadly campanulate, ca. 6 cm in diam. Phyllaries in 8 or 9 rows, rigid, abaxially scabrid; outer phyllaries lanceolate, 2–2.5 × 0.3–0.4 cm, leathery; middle phyllaries ± narrowly lanceolate, 3–3.5 × 0.4–0.5 cm, leathery; inner phyllaries ± broadly linear, 3.5–4 × 0.3–0.4 cm, scarious. Corolla yellow, ca. 3.5 cm. Achene (immature) ca. 7 mm. Pappus bristles yellowish, 2.5–3.5 cm, brittle. Fl. and fr. Jul–Sep.

• Meadows, steppes, dry slopes; 2400–4000 m. Gansu, W Nei Mongol, Ningxia, Qinghai, Sichuan, NW Yunnan.

30. SYREITSCHIKOVIA Pavlov, Repert. Spec. Nov. Regni Veg. 31: 192. 1933.

疆菊属 jiang ju shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, perennial, caespitose. Leaves linear to linear-lanceolate, margin ± spinulose near base. Capitulum small, solitary, upright, pedunculate. Involucre cylindric to campanulate. Phyllaries imbricate, ending in a patent to reflexed but not hooked spine. Receptacle covered with bristles. Stamen filaments glabrous; anther with setaceous bifid basal appendages. Style branches short. Achene narrowly oblong, laterally compressed, longitudinally striate but otherwise smooth; apical rim forming a membranous toothed crown; apical plate with central cylindric body crowned by a disk. Pappus elements in 2 dissimilar series, outer of thin scabrid bristles, inner of narrowly lanceolate scales ending in a barbellate subulate tip.

Two species: C Asia; one species in China.

1. Syreitschikovia tenuifolia (Bongard) Pavlov, Repert. Spec. Nov. Regni Veg. 31: 192. 1933.

疆菊 jiang ju

Serratula tenuifolia Bongard, Bull. Sci. Acad. Imp. Sci. Saint-Petersbourg 8: 340. 1841; *Jurinea tenuis* Bunge.

Herbs 15–50 cm tall. Rootstock branched, densely covered with dark scales. Stems erect, unbranched, slender, unwinged, cobwebby to glabrescent. Leaves sessile, linear to linear-lanceolate, 3–20 × 0.4–0.7 cm, soft, abaxially grayish white and

densely thickly felted, adaxially green and glabrous, base narrowed, apex acuminate to acute. Involucre 0.8–1.2 cm in diam., glabrous or subglabrous. Phyllaries in 6 or 7 rows; outer phyllaries broadly triangular to ovate, 3–3.5 × ca. 2 mm, apical spine ca. 0.5 mm; middle and inner phyllaries ovate, elliptic, or broadly linear, 6–11 × 1–1.5 mm, apical spine 1–2 mm. Corolla blue to purplish red, ca. 1.3 cm, tube ca. 6 mm. Achene ellipsoid, 6–7 mm, with toothed apical rim. Pappus scales of inner row 0.8–1.2 cm, longer than outer row. Fl. and fr. Jun–Jul.

Grasslands on rocky mountain slopes; 1200–1700 m. Xinjiang (Tian Shan) [Kazakhstan].

31. ONOPORDUM Linnaeus, Sp. Pl. 2: 827. 1753.

大翅蓟属 *da chi ji shu*

Shi Zhu (石铸 Shih Chu); Werner Greuter

Acanos Adanson.

Herbs, biennial. Stems erect, with spiny wings. Leaves toothed or pinnately lobed, spiny. Capitula single or few. Phyllaries numerous, imbricate, apex erect to reflexed but not hooked. Receptacle naked, alveolate. Stamen filaments papillose; anther with short entire to lacerate basal appendages. Style branches long. Achene obovoid, laterally compressed, with 3–5 ribs ending in inconspicuous apical rim; apical plate flat, disk not protruding. Pappus of 1 or several rows of scabrid or plumose bristles of unequal length.

About 40 species: C and SW Asia, Europe; two species in China.

- 1a. Pappus bristles scabrid; outer and middle phyllaries with divaricate to reflexed apex 1. *O. acanthium*
 1b. Pappus bristles plumose; phyllaries straight 2. *O. leptolepis*

1. *Onopordum acanthium* Linnaeus, Sp. Pl. 2: 827. 1753.

大翅蓟 *da chi ji*

Acanos spina Scopoli, nom. illeg. superfl.

Herbs to 2 m tall. Stem erect, usually branched above, stout, glabrous or cobwebby; wings 2–5 cm wide, with triangular spiny lobes or teeth; spines yellowish brown, to 5 mm. Leaves glabrous or sparsely cobwebby to densely lanate. Basal leaves elliptic to broadly ovate, 10–30 × 4–15 cm, pinnately lobed or with unequal triangular teeth, teeth and lobes ending in yellowish brown spines. Middle and upper cauline leaves sessile, narrowly elliptic to oblanceolate, gradually smaller upward. Capitula solitary. Involucre globose to ovoid, ca. 5 cm in diam., cobwebby, glabrescent. Phyllaries abaxially gland-dotted, margin ciliate; outer and middle phyllaries ovate-subulate to lanceolate-subulate, 1.7–1.8 × 0.4–0.5 cm, leathery, apex narrowed into a pungent divaricate to reflexed spine; inner phyllaries lanceolate to linear, 2–3 × ca. 0.3 cm, straight, apex acuminate-subulate. Corolla purplish red to pink, ca. 2.4 cm, tube ca. 1.2 cm. Achene grayish black to gray, obovoid to narrowly ellipsoid, ca. 6 mm, 3-ribbed, transversely wrinkled, apical rim not prominent. Pappus bristles reddish, to 1.2 cm, scabrid. Fl. and fr. Jun–Sep. $2n = 34$.

Mountain slopes, wastelands, by ditches; 400–1200 m. N Xinjiang

[Afghanistan, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia, Europe].

2. *Onopordum leptolepis* Candolle, Prodr. 6: 619. 1838.

羽冠大翅蓟 *yu guan da chi ji*

Herbs 30–40 cm tall. Stem erect, unbranched or with few branches, densely lanate; wings broad, undulate, densely lanate, with yellow spines. Leaves densely lanate. Lower cauline leaves sessile, ± narrowly elliptic, 30–40 cm, pinnately lobed; lobes ovate, margin undulate, with spiny teeth. Upper cauline leaves gradually smaller upward, lobed or toothed; teeth and lobes apically with yellow spines. Capitula solitary. Involucre globose to subglobose, 4–6 cm in diam., lanate pubescent. Outer and middle phyllaries lanceolate, straight, apex accumbent to involucre and narrowed into a slender spine; innermost phyllaries 3–3.5 × ca. 0.2 cm, narrowed into a scarious 1.2–1.5 cm acumen. Achene brown to grayish brown, tetragonous, ca. 6 mm, 4-ribbed, wrinkled along edges, apical rim scarious. Pappus bristles to 2.5 cm, plumose, a single inner one more robust than others and ca. 3 cm. Fl. and fr. May–Jun. $2n = 34$.

Mountainous regions. Xinjiang [Kazakhstan].

No material of *Onopordum leptolepis* from China was seen by the present authors. The above description is taken from the treatment by Pavlov (Fl. Kazakhst. 9: 348–350. 1966).

32. ANCATHIA Candolle, Arch. Bot. (Paris) 2: 331. 1833.

肋果蓟属 *lei guo ji shu*

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, perennial. Stems usually unbranched, unwinged. Cauline leaves undivided, linear-lanceolate or linear, margin entire and revolute between spaced, paired, or digitate spines. Capitula 1 or 2, erect. Involucre campanulate. Phyllaries numerous, imbricate, with reflexed to patent but not with an uncinate apical spine. Receptacle with dense long bristles. Stamen filaments glabrous; anther with long lacerate basal appendages. Style branches coherent, short, apex obtuse. Achene narrowly ellipsoid, laterally compressed, with ca. 15 raised contiguous wavy interlocking ribs, glabrous; apical rim forming a high crenulate crown; center of apical plate broadly conic, crowned by a cup-shaped disk. Pappus of 4 or 5 rows of plumose bristles; bristles basally connate into a ring, falling off together, outer not much shorter than inner.

One species: China, Kazakhstan, Mongolia, Russia.

1. *Ancathia igniaria* (Sprengel) Candolle, Arch. Bot. (Paris) 2: 331. 1833.

肋果蓟 *lei guo ji*

Cirsium igniarium Sprengel, Syst. Veg., ed. 16, 3: 375. 1826; *Cnicus igniarius* (Sprengel) Benth.

Herbs 15–20 cm tall, rhizomatous. Rootstock stout,

branched. Stems densely felted. Basal leaves absent at anthesis. Cauline leaves numerous, sessile, 10–20 × 0.5–1 cm, leathery, abaxially grayish white and densely felted, adaxially glabrous and shiny, marginal and apical spines 5–6 mm. Involucre 3–5 cm, cobwebby. Outer phyllaries triangular, 7–8 × 1.6–2 mm, apex tipped with a reflexed 2–3 mm spine; middle phyllaries oblanceolate, 1.5–2.5 cm × 3–4 mm, apically abruptly con-

stricted and tipped with a reflexed to patent 5–6 mm spine; inner phyllaries red, lanceolate, oblanceolate, or linear, 3–3.2 × ca. 0.4 cm, scarious, apex long acuminate. Corolla purple to red, ca. 2.8 cm, tube ca. 1.2 cm. Achene dark brown, ca. 6.5 mm. Pappus bristles whitish. Fl. and fr. Jun–Sep.

Mountain slopes, rocky areas; 1100–1500 m. N Xinjiang [Kazakhstan, Mongolia, Russia].

4. Subtribe CARDUINAE

飞廉亚族 *fei lian ya zu*

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, annual to perennial. Capitula homogamous. Phyllaries pointed, ending in a straight or recurved spine; inner phyllaries sometimes with a scarious appendage. Receptacle with dense long bristles. Florets bisexual, rarely unisexual and then plants dioecious. Corolla ± actinomorphic. Stamen filaments distinct, ± pubescent. Style branches coherent for most of their length. Achene glabrous; apical rim forming a smooth-margined upright crown; apical plate with a prominent oleaginous central umbo (elaiosome). Pappus of scabrid or plumose bristles basally connate into a ring and falling off together.

Eleven genera and ca. 380 species: E and N Africa, Asia, Europe; two genera and 49 species (23 endemic) in China.

Cynara scolymus Linnaeus and *C. cardunculus* Linnaeus, of Mediterranean origin, are cultivated in China for their edible receptacle and phyllaries. Another Mediterranean species, *Silybum marianum* (Linnaeus) Gaertner, is grown as an ornamental and for its achenes, which are used medicinally.

- 1a. Pappus of plumose bristles 33. *Cirsium*
1b. Pappus of scabrid bristles 34. *Carduus*

33. CIRSIUM Miller, Gard. Dict. Abr., ed. 4, [334]. 1754.

蓟属 *ji shu*

Shi Zhu (石铸 Shih Chu); Werner Greuter

Cirsium sect. *Epitrachys* Candolle ex Duby; *C.* subg. *Lophiolepis* Cassini; *C.* subg. *Orthocentron* Cassini; *Echenais* Cassini; *Epitrachys* (Candolle ex Duby) K. Koch; *Eriolepis* Cassini; *Lophiolepis* (Cassini) Cassini; *Onotrophe* Cassini; *Orthocentron* (Cassini) Cassini.

Herbs, annual to perennial, bisexual or dioecious. Stems (when developed) unwinged or sometimes with spiny wings. Leaves subentire to bipinnately divided, lanceolate or wider, margin spinulose or spiny. Capitula solitary to clustered. Phyllaries numerous, regularly imbricate or of subequal length, abaxially often with a dark glandular resinous medial swelling below apex, apex ending in a straight or gradually recurved spine, spinule, or acumen. Florets normally all bisexual, or if unisexual then plants dioecious. Stamen filaments pubescent; anther with short subentire to lacerate basal appendages. Achene narrowly obovoid, laterally compressed, often with 4 or more slender spaced longitudinal ribs or striae, otherwise smooth; apical rim forming a smooth-margined upright crown; elaiosome crowned by an inconspicuous disk. Pappus of 3 or 4 rows of plumose bristles, outer ones not much shorter than inner.

About 250–300 species: N Africa, Asia, Central and North America, Europe; 46 species (23 endemic) in China.

In addition, the following four species have been reported to occur in Taiwan: *Cirsium ferum* Kitamura (Acta Phytotax. Geobot. 1: 149. 1932), *C. hosokawae* Kitamura (loc. cit.: 57), *C. kawakamii* Hayata (J. Coll. Sci. Imp. Univ. Tokyo 30(1): 159. 1911), and *C. suzukii* Kitamura (loc. cit.: 58). As no material has been seen by the present authors, these taxa have not been included in the following treatment and key.

- 1a. Plants dioecious.
2a. Stems glabrous or cobwebby-felted; leaves divided or undivided but if undivided then base cuneate 45. *C. arvense*
2b. Stems hairy; leaves undivided with base auriculate and semiamplexicaul 46. *C. shihianum*
1b. Florets bisexual.
3a. Some of phyllaries expanded laterally into membranous wings or distally into a scarious appendage.
4a. Leaves adaxially rough and spinulose.
5a. Leaves abaxially densely felted; outer and middle phyllaries unwinged but inner phyllaries expanded into a scarious white or pink appendage 37. *C. leducii*
5b. Leaves abaxially sparsely cobwebby; outer and middle phyllaries with a margin expanded into yellowish scarious wings 44. *C. chrysolepis*
4b. Leaves adaxially smooth or covered with hair-tipped papillae and slightly rough but not spinulose.
6a. Bracts surrounding capitula with pectinately arranged long pungent spines.
7a. Margin of middle phyllaries not laterally expanded into wings but inner phyllaries apically expanded 41. *C. argyracanthum*

- 7b. Margin of middle phyllaries expanded above base into denticulate to lacerate scarious wings.
 - 8a. Outer phyllaries unwinged but usually with pectinately spinulose margin, middle phyllaries with irregularly lacerate scarious wings 42. *C. glabrifolium*
 - 8b. Outer and middle phyllaries with regularly denticulate-lacerate wings 43. *C. sieversii*
- 6b. Bracts surrounding capitula (if present) without pectinately arranged long pungent spines.
 - 9a. Leaves green, concolorous, and glabrous or with sparse hairs along veins.
 - 10a. Stems below capitulum felted 33. *C. tianmushanicum*
 - 10b. Stems with crispate hairs, below capitulum also \pm cobwebby 34. *C. chinense*
 - 9b. Leaves abaxially grayish white and cobwebby or felted, adaxially green, glabrous, papillose, or with scattered crispate hairs.
 - 11a. Leaves undivided or rarely slightly lobed in proximal third 35. *C. lineare*
 - 11b. Leaves pinnately lobed to pinnatipartite at least in proximal half 36. *C. shansiense*
- 3b. Phyllaries lacking wings and scarious appendage.
 - 12a. Outer and middle phyllaries villous or hirsute with multicellular hairs or bristles.
 - 13a. Leaves concolorous, greenish, with sparse to dense bristles 15. *C. fuscotrichum*
 - 13b. Leaves discolorous, abaxially grayish white and densely felted, adaxially green and glabrous 16. *C. muliense*
 - 12b. Involucre glabrous, sparsely cobwebby, or lanate, phyllaries never hirsute or villous.
 - 14a. Involucre densely lanate.
 - 15a. Leaves adaxially with scattered spinules or smooth, pinnately divided, segments elliptic, semiorbicular, or ovate 7. *C. eriophoroides*
 - 15b. Leaves adaxially rough with sparse to dense spinules, bipinnatipartite, segments triangular to triangular-lanceolate 12. *C. lidjiangense*
 - 14b. Involucre glabrous or cobwebby.
 - 16a. Leaves adaxially rough and spinulose.
 - 17a. Stems winged 14. *C. vulgare*
 - 17b. Stems unwinged.
 - 18a. Leaf segments elliptic, semiorbicular, or ovate.
 - 19a. Leaves discolorous, abaxially grayish white, adaxially green 8. *C. subulariforme*
 - 19b. Leaves concolorous, green 9. *C. verutum*
 - 18b. Leaf segments lanceolate to narrowly triangular.
 - 20a. Leaves concolorous, green to yellowish green 10. *C. chlorolepis*
 - 20b. Leaves discolorous, abaxially grayish white, adaxially greenish.
 - 21a. Outer and middle phyllaries ending in a subulate spine 8–13 mm, outer phyllaries not much shorter than inner 11. *C. botryodes*
 - 21b. Outer phyllaries ending in a spinule or acumen to 2 mm, outer phyllaries much shorter than inner 13. *C. interpositum*
 - 16b. Leaves adaxially smooth and not spinulose.
 - 22a. Corolla yellow or white.
 - 23a. Plants 80–150 cm tall; involucre 4–4.5 cm in diam.; leaves concolorous 6. *C. monocephalum*
 - 23b. Plants 45–50 cm tall; involucre ca. 2 cm in diam.; leaves discolorous 40. *C. alberti*
 - 22b. Corolla red to purple.
 - 24a. Plants stemless with all leaves basal.
 - 25a. Petiole unwinged or with discontinuous wing; outer and middle phyllaries narrowly triangular, pectinately fringed with spinules 4. *C. souliei*
 - 25b. Petiole with continuous wing; outer and middle phyllaries ovate to lanceolate, margin not spinulose 23. *C. esculentum*
 - 24b. Plants with leafy stems at least 20 cm tall.
 - 26a. Stems winged 29. *C. alatum*
 - 26b. Stems unwinged.
 - 27a. Outer phyllaries bractlike, dissimilar from and almost twice as long as middle and inner phyllaries 1. *C. bracteiferum*
 - 27b. Outer phyllaries not bractlike, similar to and not longer than middle ones.
 - 28a. Outer and middle phyllaries pectinately fringed with spinules.
 - 29a. Leaves abaxially cobwebby or glabrous, adaxially glabrous 5. *C. fargesii*
 - 29b. Leaves not cobwebby but with crispate multicellular hairs.
 - 30a. Involucre ca. 4 cm in diam., sparsely cobwebby 2. *C. leo*
 - 30b. Involucre ca. 2 cm in diam., glabrous 3. *C. henryi*
 - 28b. Outer and middle phyllaries not fringed with spinules.
 - 31a. Bracts surrounding capitula reduced to pectinately arranged long pungent spines.

- 32a. Leaves concolorous, green, glabrous 38. *C. semenowii*
 32b. Leaves discolorous, abaxially grayish green to whitish and cobwebby or felted, adaxially greenish and hairy.
 33a. Outer and middle phyllaries narrowed into a 0.1–0.5 cm spine 24. *C. periacanthaceum*
 33b. Outer and middle phyllaries tipped with a ca. 3 cm spine 39. *C. sairamense*
 31b. Bracts surrounding capitula (if present) not reduced to pectinately arranged long pungent spines.
 34a. Phyllaries in ca. 10 rows; corolla tube more than twice as long as limb 32. *C. pendulum*
 34b. Phyllaries in 5–8 rows; corolla tube shorter or at most slightly longer than limb.
 35a. Leaves undivided, margins entire or toothed with spinules of at most 2 mm.
 36a. Outer and middle phyllaries with an apical spine 3–7 mm 30. *C. vernonioides*
 36b. Phyllaries with an apical spinule of at most 1 mm.
 37a. Leaves discolorous, abaxially grayish to white and felted.
 38a. Lower cauline leaves petiolate, to 3 cm wide, narrowed at base 19. *C. vlassovianum*
 38b. All cauline leaves sessile, at least 4 cm wide, semiamplexicaul 21. *C. helenioides*
 37b. Leaves concolorous, abaxially green and glabrous or with multicellular hairs but not felted.
 39a. Involucre ovoid 18. *C. serratuloides*
 39b. Involucre campanulate.
 40a. Outer and middle phyllaries abaxially with a dark resinous gland 17. *C. viridifolium*
 40b. Phyllaries lacking a resinous gland 20. *C. fanjingshanense*
 35b. Leaves pinnately divided (or at least lobed), margin usually distinctly spiny.
 41a. At least upper cauline leaves discolorous, abaxially gray to white and felted, adaxially \pm green.
 42a. Lower cauline leaves petiolate, often concolorous; capitula corymbose 25. *C. maackii*
 42b. All cauline leaves sessile, discolorous; capitula racemose 26. *C. racemiforme*
 41b. Leaves concolorous, abaxially green and glabrous or with sparse to dense multicellular hairs but not felted.
 43a. Involucre 2–3 cm in diam.
 44a. Cauline leaves sessile; basal leaves present at anthesis 22. *C. japonicum*
 44b. Lower and middle cauline leaves petiolate; basal leaves withered at anthesis 28. *C. schantarense*
 43b. Involucre 3–4.5 cm in diam.
 45a. Corolla tube less than 1/2 as long as limb; outer and middle phyllaries abaxially with a dark resinous gland 27. *C. fangii*
 45b. Corolla tube slightly longer than limb; phyllaries lacking a resinous gland 31. *C. handellii*

1. *Cirsium bracteiferum* C. Shih, Acta Phytotax. Sin. 22: 388. 1984.

刺盖草 ci gai cao

Herbs to 40 cm tall, perennial. Stems erect, branched above, unwinged, with long multicellular hairs and apically also cobwebby. Leaves concolorous, surface smooth but with sparse multicellular hairs. Upper cauline leaves sessile, elliptic, ca. 13×4 cm, pinnatipartite, semiamplexicaul; segments 6 or 7 pairs, obliquely triangular, margin sparsely spinose or with teeth tipped with a 3–6 mm spine. Bracts similar to leaves but smaller. Peduncles stout, with dense multicellular hairs. Capitula several, racemose. Involucre broadly campanulate, 3–4.5 cm in diam., glabrous. Phyllaries in ca. 6 rows, lacking wings and scarious appendage; outer phyllaries bractlike, $3.5\text{--}4 \times 0.3\text{--}0.5$ cm, margin minutely toothed and spiny, basal portion elliptic to lanceolate, apical portion subulate and narrowed into a long spine; middle and inner phyllaries markedly different, elliptic to broadly linear, ca. $2.1 \times 0.2\text{--}0.4$ cm, apex acute. Florets bisexual. Corolla purplish red, ca. 2.1 cm, tube ca. 1 cm. Mature achene unknown. Fl. Jul.

• Slopes; ca. 1500 m. Chongqing (Nanchuan).

2. *Cirsium leo* Nakai & Kitagawa, Rep. Exped. Manchoukuo Sect. IV, 1: 60. 1934.

魁薊 kui ji

Cirsium chienii C. C. Chang; *C. pinnatibracteatum* Y. Ling.

Herbs 40–100 cm, perennial. Stems simple or tufted, erect, branched above or rarely unbranched, ribbed, unwinged, with long crispate multicellular hairs. Leaves concolorous, green, surface smooth and not cobwebby but with crispate multicellular hairs dense abaxially along veins but scattered elsewhere. Basal and lower cauline leaves with petiole to 5 cm; leaf blade elliptic to oblanceolate-elliptic, $10\text{--}25 \times 4\text{--}7$ cm, pinnatipartite; segments 8–12 pairs, semiobicular, \pm narrowly elliptic, or obliquely triangular, with unequal triangular teeth laterally spiny and with an apical (3–)5–6(–12) mm spine. Middle and upper cauline leaves similar but sessile and gradually smaller upward. Capitula corymbose. Involucre campanulate, ca. 4 cm in diam., sparsely cobwebby. Phyllaries in ca. 8 rows, lacking wings and scarious appendage, all of similar length; outer and middle phyllaries $2\text{--}3 \times 0.2\text{--}0.3$ cm, pectinately fringed with spinules

to 2.5 mm, basal portion triangular to lanceolate, apical portion subulate tipped with a ca. 3 mm spinule; inner phyllaries lanceolate to linear, ca. $2 \times 0.1\text{--}0.2$ cm, apex long acuminate. Florets bisexual. Corolla purplish red, ca. 2.4 cm, tube ca. 1 cm. Achene dark gray, ca. 5 mm. Pappus bristles dirty white, ca. 2.2 cm. Fl. and fr. May–Sep.

• Mountain valleys, slopes, forest margins, flooded lands, rock crevices, along streams, wet places; 700–3400 m. Gansu, Hebei, Henan, Ningxia, Shaanxi, Shanxi, Sichuan.

3. *Cirsium henryi* (Franchet) Diels, Bot. Jahrb. Syst. 29: 627. 1901.

刺苞蓟 ci bao ji

Cnicus henryi Franchet, J. Bot. (Morot) 11: 21. 1897; *Cirsium forrestii* (Diels) H. Léveillé; *C. melanolepis* Petrak; *C. taliense* (Jeffrey) H. Léveillé; *Cnicus forrestii* Diels; *C. taliensis* Jeffrey.

Herbs 30–50 cm tall, perennial. Stems erect, branched above, rarely unbranched, unwinged, with brown multicellular hairs. Leaves concolorous, surface green to pale green, smooth, and not cobwebby but with \pm dense crispate multicellular hairs. Basal and lower cauline leaves petiolate; leaf blade lanceolate, oblanceolate, or \pm narrowly elliptic, $10\text{--}18 \times 4\text{--}8$ cm, pinnately divided; segments 5–8 pairs, elliptic, lanceolate, or triangular, with unequal triangular teeth laterally spiny and with an apical (2–)6–7 mm spine; terminal segment largest. Middle and upper cauline leaves similar but sessile and gradually smaller upward. Bracts entire, \pm broadly linear, margin spiny. Capitula corymbose or paniculate, \pm nodding. Involucre campanulate, ca. 2 cm in diam., glabrous. Phyllaries in ca. 6 rows, lacking wings and scarious appendage, all of similar length; outer and middle phyllaries narrowly triangular, $11\text{--}14 \times 1.5\text{--}2$ mm, pectinately fringed with geminate 2.5–3 mm spinules, apex narrowed into a spinule; inner phyllaries triangular to lanceolate, $13\text{--}14 \times$ ca. 2 mm, not spinulose. Florets bisexual. Corolla purple, ca. 1.6 cm, tube ca. 1 cm. Achene brownish, ca. 4 mm. Pappus bristles brownish, to 1.5 cm. Fl. and fr. Jun–Oct.

• Meadows; 2700–3500 m. W Hubei, Sichuan, Yunnan.

4. *Cirsium souliei* (Franchet) Mattfeld, J. Arnold Arbor. 14: 42. 1933.

葵花大蓟 kui hua da ji

Cnicus souliei Franchet, J. Bot. (Morot) 11: 21. 1897.

Herbs, stemless, perennial. All leaves basal, rosulate, petiolate, concolorous, green, smooth, with long multicellular hairs particularly along veins; petiole 1.5–4 cm, unwinged or with discontinuous wing; leaf blade \pm narrowly elliptic, elliptic-lanceolate, or oblanceolate, $8\text{--}21 \times 2\text{--}6$ cm, pinnately lobed to pinnatipartite; segments 7–11 pairs, ovate-lanceolate, elliptic, or broadly triangular, toothed; teeth with a 2–5 mm apical spinule or spine; terminal segment largest. Peduncles short. Capitula few to many, clustered in center of rosette. Involucre campanulate, 3–5 cm in diam., glabrous. Phyllaries in 3–5 rows, lacking wings and scarious appendage, all of similar length; outer and middle phyllaries narrowly triangular, $1.8\text{--}2.3 \times 0.1\text{--}0.2$ cm, pectinately fringed with 2–3 mm spinules, tipped with a slender

ca. 5 mm spine; inner phyllaries ca. 2.5×0.2 cm, not spinulose. Florets bisexual. Corolla purplish red, ca. 2.3 cm, tube ca. 1.8 cm. Achene dark, ca. 5 mm. Pappus bristles dirty white to brownish, to 2 cm. Fl. and fr. Jul–Sep.

Forest margins, roadsides, fallow fields, flooded lands, fields, moist places by water; 1900–4800 m. Gansu, S Ningxia, Qinghai, Sichuan, Xizang [India (Sikkim)].

5. *Cirsium fargesii* (Franchet) Diels, Bot. Jahrb. Syst. 29: 627. 1901.

等苞蓟 deng bao ji

Cnicus fargesii Franchet, J. Bot. (Morot) 11: 22. 1897.

Herbs to 1 m tall, perennial. Stems erect, sparingly branched above, ribbed, unwinged, sparsely cobwebby and with long multicellular hairs. Leaves smooth on both faces, abaxially green or grayish white and glabrous or sparsely cobwebby-felted, adaxially green and glabrous. Lower to middle cauline leaves petiolate; leaf blade broadly lanceolate to lanceolate, $20\text{--}30 \times 7\text{--}8$ cm, pinnatifid; segments ca. 6 pairs, elliptic to \pm broadly triangular, teeth laterally shortly spiny and with an apical spine to 1 cm; terminal segment narrowly lanceolate, margin spiny. Middle and upper cauline leaves similar but sessile, semiamplexicaul. Capitula few, corymbose. Involucre broadly campanulate, ca. 4 cm in diam., \pm cobwebby. Phyllaries in ca. 4 rows, lacking wings and scarious appendage, all of similar length; outer and middle phyllaries $2.1\text{--}2.4 \times$ ca. 0.3 cm, pectinately fringed with ca. 2 mm spinules, basal portion linear to triangular, apical portion subulate, patent to slightly recurved, and tipped with a brown spine; inner phyllaries linear, ca. 2.1×0.2 cm, with an apical spine. Florets bisexual. Corolla purplish, ca. 2.2 cm, tube ca. 1 cm. Mature achene unknown. Pappus bristles to 2 cm. Fl. Jul.

• Slopes; 2400–2500 m. Hubei, Shaanxi, Sichuan.

6. *Cirsium monocephalum* (Vaniot) H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 189. 1913.

马刺蓟 ma ci ji

Cnicus monocephalus Vaniot, Bull. Acad. Int. Géogr. Bot. 12: 122. 1903; *Cirsium cavaleriei* (H. Léveillé) H. Léveillé; *C. provostii* (Franchet) Petrak var. *monocephalum* (Vaniot) Petrak; *C. provostii* var. *oleracioides* Petrak; *C. provostii* var. *racemosum* Petrak; *C. provostii* var. *spinosum* Petrak; *Cnicus cavaleriei* H. Léveillé.

Herbs 0.8–1.5 m tall, perennial. Stems erect, branched above, ribbed, unwinged, sparsely cobwebby and with long multicellular hairs. Leaves concolorous, green, surface smooth and glabrous or with sparse long multicellular hairs. Middle cauline leaves sessile, \pm narrowly elliptic to lanceolate, $15\text{--}25 \times 5\text{--}9$ cm, pinnatipartite; segments 5–10 pairs, \pm narrowly lanceolate to triangular, margin spiny or with teeth tipped with a 3–10 mm spine. Upper cauline leaves similar but smaller. Capitula few, corymbose to paniculate. Involucre broadly campanulate to hemispheric, 4–4.5 cm in diam., sparsely cobwebby. Phyllaries in ca. 8 rows, $2.2\text{--}3.5 \times 0.3\text{--}0.4$ cm, all of similar length, lacking wings and scarious appendage, basal portion linear, apical portion subulate, patent to reflexed, and narrowed into a

long spine. Florets bisexual. Corolla white or yellowish, ca. 1.4 cm, tube ca. 7 mm. Achene brown, ca. 3.5 mm. Pappus bristles to 1.7 cm. Fl. and fr. Jul–Oct.

• Mountain valleys, forest margins, forests, thickets, wastelands; 700–2000 m. Chongqing, S Gansu, Guizhou, SW Hubei, S Shaanxi (Qin Ling), S Shanxi, Sichuan.

7. *Cirsium eriophoroides* (J. D. Hooker) Petrak, Biblioth. Bot. 18(Heft 78): 9. 1912.

贡山薊 gong shan ji

Cnicus eriophoroides J. D. Hooker, Fl. Brit. India 3: 363. 1881; *Cirsium bolocephalum* Petrak; *C. bolocephalum* var. *racemosum* Petrak; *C. bolocephalum* subsp. *setschwanicum* Petrak.

Herbs 1–3 m tall, perennial. Stems erect, branched above, unwinged, sparsely cobwebby and with long multicellular hairs. Leaves papery, concolorous, green, abaxially glabrous or sparsely cobwebby and with multicellular hairs, adaxially with sparse 3–8 mm spinules and spines but sometimes almost completely smooth. Lower and middle cauline leaves petiolate; leaf blade elliptic, 20–35 × 8–15 cm, toothed or pinnately divided; segments when present 4–8 pairs, elliptic, semiorbicular, or ovate, with 2–5 spines or teeth laterally shortly spiny and with a 0.5–1.5 cm apical spine. Upper cauline leaves similar but sessile. Capitula few, corymbose, nodding to erect. Involucre globose, ca. 5 cm in diam., densely and fluffily lanate. Phyllaries in ca. 6 rows, all of similar length or inner somewhat longer, lacking wings and scarious appendage; outer and middle phyllaries 2–3 × 0.2–0.4 cm, basal portion lanceolate to triangular, apical portion subulate and 1.5–2 cm; inner phyllaries ca. 3.5 × 0.2–0.3 cm, basal portion linear-lanceolate to linear, apical portion subulate and ca. 1.5 cm. Florets bisexual. Corolla purple, ca. 3.5 cm, tube ca. 2.2 cm. Achene dark brown, ca. 5 mm. Pappus bristles ca. 2.5 cm. Fl. and fr. Jul–Oct.

Slopes, thickets, thicket margins, grasslands, meadows, flooded lands, by water; 2000–4100 m. SW Sichuan, SE Xizang, Yunnan [Bhutan, India (Sikkim)].

8. *Cirsium subulariforme* C. Shih, Fl. Reipubl. Popularis Sin. 78(1): 90. 1987.

钻苞薊 zuan bao ji

Cirsium subuliforme C. Shih, Acta Phytotax. Sin. 22: 391. 1984, not G. B. Ownbey (1982).

Herbs 1.5–2 m tall, perennial. Stems erect, ribbed, unwinged, sparsely cobwebby, often densely cobwebby below capitula. Leaves papery, discolorous, abaxially grayish white and densely felted, adaxially green to yellowish green, very rough, and covered with dense 1–3 mm spinules and scattered 4–11 mm spines. Lower cauline leaves with winged petiole to 14 cm, wing undulate to dissected into semiorbicular segments and with 1–1.5 cm spines or spine-tipped teeth; leaf blade elliptic, ca. 33 × 18 cm, pinnatifid; segments 7 or 8 pairs, elliptic, with 3–5 unequal triangular teeth fringed with ca. 1 mm spinules and with a ca. 1 cm apical spine. Middle and upper cauline leaves sessile, narrowly elliptic to lanceolate, gradually smaller upward, semiamplexicaul, margin entire or toothed and with 5–

10 mm spines. Bracts reduced to spines. Capitula corymbose to racemose. Involucre campanulate, 3–4 cm in diam., glabrous. Phyllaries in ca. 7 rows, ca. 18 × 1.5–2 mm, all of similar length or somewhat longer inwardly, lacking wings and scarious appendage, basal portion linear, lanceolate, or elliptic, apical portion subulate and 3–10 mm. Florets bisexual. Corolla purple, ca. 3 cm, tube ca. 1.9 cm. Achene ca. 5 mm. Pappus bristles brownish to dirty white, ca. 1.8 cm. Fl. and fr. Jul–Aug.

• Grasslands on mountain slopes, thickets in river valleys, forests; 1500–2500 m. SE Xizang, NW Yunnan.

9. *Cirsium verutum* (D. Don) Sprengel, Syst. Veg., ed. 16, 3: 370. 1826.

苞叶薊 bao ye ji

Cnicus verutus D. Don, Prodr. Fl. Nepal. 167. 1825; *Cirsium involucreatum* Candolle, nom. illeg. superfl.

Herbs 1–1.5 m tall, perennial. Stems erect, branched, unwinged, with long multicellular hairs. Leaves concolorous, green, abaxially glabrous or sparsely cobwebby and with long multicellular hairs, adaxially rough and sparsely to densely spinulose. Middle cauline leaves sessile, oblanceolate, 15–20 × 3–9 cm, pinnatifid, semiamplexicaul; segments ca. 10 pairs, ovate to elliptic, with unequal triangular teeth with 1–2 mm lateral spinules and a 3–5 mm apical spine, basal teeth sometimes spiniform. Upper cauline leaves similar but ovate to narrowly elliptic, segments or teeth with a 5–10 mm apical spine. Bracts ovate, margin spiny or with spiny teeth. Capitula corymbose. Involucre campanulate, 3–3.5 cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 7 rows, lacking wings and scarious appendage; outer and middle phyllaries 1.2–2.5 × 0.2–0.3 cm, basal portion triangular to lanceolate, apical portion subulate, 1–1.2 cm, and patent to reflexed; inner phyllaries linear-lanceolate, ca. 2.5 × 0.2 cm, apex long acuminate. Florets bisexual. Corolla reddish purple, ca. 2.8 cm, tube ca. 1.5 cm. Achene dark, ca. 3.5 mm. Pappus bristles brownish, to 2 cm. Fl. and fr. Jul–Sep.

Slopes, forests, forest margins; 2900–3900 m. Xizang [Afghanistan, Bhutan, India, Nepal, Pakistan, Vietnam].

10. *Cirsium chlorolepis* Petrak, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 63: 109. 1926.

两面薊 liang mian ji

Herbs 30–100 cm tall, perennial. Stems erect, branched above, unwinged, with dense long multicellular hairs and sparsely cobwebby, densely cobwebby-felted above. Leaves concolorous, green to yellowish green, abaxially sparsely covered with spinules less than 1 mm, adaxially rough and densely covered with 1–2 mm spinules. Lower and middle leaves sessile, lanceolate, oblanceolate, or elliptic, 16–20 × 6–8 cm, pinnately divided, amplexicaul; segments 5–8 pairs, triangular-lanceolate to ± narrowly triangular, fringed with spinules, with a 5–7 mm apical spine; terminal segment largest. Upper cauline leaves similar but smaller. Capitula racemose or corymbose, ± nodding. Involucre broadly campanulate, 3.5–4 cm in diam., glabrous or sparsely cobwebby. Phyllaries in 7 or 8 rows, 1.3–2.3 × 0.3–0.5 cm, all of similar length, lacking wings and

scarious appendage, basal portion lanceolate, apical portion subulate, 6–10 mm, and patent to recurved. Florets bisexual. Corolla purplish red, ca. 2 cm, tube ca. 1 cm. Achene yellowish, cuneate-ob lanceolate, ca. 4 mm. Pappus bristles brownish. Fl. and fr. Jul–Oct.

• Forests, grasslands on mountain slopes; 1300–1800 m. SW Guizhou, Yunnan.

11. *Cirsium botryodes* Petrak, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 63: 109. 1926.

Cirsium griseum H. Léveillé (1913), not (Rydberg) Cockrell (1911); *C. heleophilum* Petrak; *C. mairei* (H. Léveillé) H. Léveillé (1913), not Halácsy (1908); *C. yunnanense* Petrak; *Cnicus mairei* H. Léveillé.

Herbs 50–100 cm tall, perennial. Stems grayish white, erect, usually branched, unwinged, with dense long multicellular hairs and cobwebby, densely felted below capitula. Leaves rigid, discolorous, abaxially grayish white and densely felted, adaxially greenish, rough, and densely spinulose. Lower to upper cauline leaves sessile, lanceolate to ovate-lanceolate, 12–16 × 6.5–8 cm, pinnately divided, semiamplexicaul; segments ca. 4 pairs, narrowly triangular to lanceolate, basally on one or both sides with a triangular tooth with 1–1.5 mm lateral spinules and a 3–7 mm apical spine, apex narrowed into a 5–7 mm spine. Bracts reduced to spines. Capitula racemose to racemose-corymbose. Involucre broadly campanulate, ca. 3.5 cm in diam., sparsely cobwebby. Phyllaries in ca. 7 rows, lacking wings and scarious appendage; outer phyllaries not much shorter than inner ones; outer and middle phyllaries 10–20 × 3–4 mm, basal portion ovate to elliptic, apical portion subulate and ending in a 0.8–1.3 cm spine; inner phyllaries lanceolate-subulate to linear, ca. 2.5 × 0.1–0.2 cm. Florets bisexual. Corolla white, ca. 2 cm, tube ca. 9 mm. Achene ca. 5 mm. Pappus bristles brownish, to 2 cm. Fl. and fr. May–Sep.

• Mountain valleys, grasslands on mountain slopes; 2800–3000 m. W Guizhou, W Hunan, S Sichuan, Yunnan.

12. *Cirsium lidjiangense* Petrak & Handel-Mazzetti in Handel-Mazzetti, Symb. Sin. 7: 1170. 1936.

丽江蓟 li jiang ji

Herbs 70–120 cm tall, perennial. Stems erect, ribbed, branched above, unwinged, cobwebby to hirsute below, densely cobwebby above. Leaves discolorous, abaxially grayish white and densely felted, adaxially green and rough with sparse to dense 0.3–1 mm spinules. Lower cauline leaves sessile, elliptic, 50–60 × 18–24 cm, bipinnatifid, semiamplexicaul; primary segments 10 or 11 pairs; secondary segments 1 or 2 pairs, triangular to triangular-lanceolate, basally with 1 triangular, spine-tipped tooth; terminal lobe narrowly lanceolate, with 1 or 2 marginal spines and a 4–12 mm apical spine. Middle and upper cauline leaves similar but gradually smaller upward, with ± equally forked primary segments; secondary segments lanceolate. Capitula racemose to racemose-paniculate, nodding. Involucre globose, 4–5 cm in diam., densely lanate. Phyllaries in ca. 7 rows, lacking wings and scarious appendage; outer phyllaries

not much shorter than inner ones; outer and middle phyllaries 2.2–2.5 × 0.4–0.5 cm, apical portion triangular, lanceolate, or elliptic, apical portion subulate and with a 1–1.2 cm terminal spine; inner phyllaries linear-subulate, ca. 3.8 × 0.3 cm. Florets bisexual. Corolla reddish purple, ca. 2.2 cm, tube ca. 1.9 cm. Achene brown, ca. 5 mm. Pappus bristles brownish, ca. 2 cm. Fl. and fr. Jun–Aug.

• Meadows; 1800–3200 m. SW Sichuan, NW Yunnan.

13. *Cirsium interpositum* Petrak, Repert. Spec. Nov. Regni Veg. 43: 283. 1938.

披裂蓟 pi lie ji

Cnicus griffithii J. D. Hooker (1881), not *Cirsium griffithii* Boissier (1875).

Herbs 2–2.5 m tall, perennial. Stems erect, stout, branched in upper half, ribbed, unwinged, sparsely cobwebby. Leaves discolorous, abaxially grayish white and densely felted, adaxially green, rough, and sparsely to densely spinulose. Middle cauline leaves sessile, ± narrowly elliptic, ca. 60 × 25 cm, pinnately divided, semiamplexicaul with auricles bearing 2–4 cm spines; segments 9–11 pairs, ± narrowly lanceolate, basally on both sides with 1 or 2 spiny teeth, fringed with 1–3 mm spinules, apex narrowed into a 1.5–2.5 cm spine. Upper cauline leaves similar but gradually smaller upward. Bracts lanceolate to linear, smaller than upper leaves, fringed with 2–2.5 cm spines. Capitula corymbose, ± nodding. Involucre broadly campanulate, 4–4.5 cm in diam., sparsely cobwebby, glabrescent. Phyllaries in ca. 10 rows, lacking wings and scarious appendage, outer phyllaries much shorter than inner ones; outer phyllaries triangular to lanceolate, 8–10 × 2.5–3 mm, apex narrowed into a 0.5–2 mm acumen or spinule; middle and inner phyllaries lanceolate to linear, 1.5–3 × 0.2–0.3 cm, apex acuminate and scarious. Florets bisexual. Corolla purple, ca. 3.5 cm, tube ca. 2.5 cm. Achene dark, ca. 5 mm. Pappus bristles brownish, ca. 2.5 cm. Fl. and fr. Sep–Nov.

• Forests, open forests, grasslands on mountain slopes; 2000–2500 m. SE Xizang, W Yunnan.

14. *Cirsium vulgare* (Savi) Tenore, Fl. Napol. 5: 209. 1835–1838.

翼蓟 yi ji

Carduus vulgaris Savi, Fl. Pis. 2: 241. 1798; *C. lanceolatus* Linnaeus; *Cirsium lanceolatum* (Linnaeus) Scopoli (1772), not Hill (1769); *Eriolepis lanceolata* (Linnaeus) Cassini.

Herbs 25–150 cm tall, biennial. Stems grayish white, erect, branched above, winged, with sparse long multicellular hairs and cobwebby, densely felted above; wings toothed, teeth ending in a long spine. Leaves herbaceous, discolorous, abaxially grayish white and densely felted, adaxially green to yellowish green, rough and densely covered with ca. 1.5 mm spinules. Middle cauline leaves sessile, linear-lanceolate, lanceolate, or oblanceolate, 10–15 × 4–5 cm, bipinnatifid; primary segments 3 or 4 pairs, equally or unequally forked; secondary segments triangular to lanceolate, fringed with spinules, apex with a 5–10 mm spine; terminal lobe lanceolate, fringed

with spinules and a few spines 5–10 mm. Upper cauline leaves similar but gradually smaller upward. Bracts linear, margin with long spines. Capitula few to many, paniculate-corymbose to racemose, erect. Involucre ovoid, 3–5 cm in diam., glabrous. Phyllaries imbricate, in ca. 10 rows, lacking wings and scarious appendage; outer and middle phyllaries $0.8\text{--}3 \times 0.2\text{--}0.4$ cm, basal portion triangular, lanceolate, or linear, apical portion subulate, 5–9 mm, and narrowed into a spine; inner phyllaries linear, ca. 3.4×0.3 cm, apex acuminate. Florets bisexual. Corolla red, ca. 3 cm, tube filiform, ca. 2 cm. Achene brown, ca. 4 mm. Pappus bristles white, to 3 cm. Fl. and fr. Jul–Aug. $2n = 34, 68$.

Farmlands, wet grasslands; 400–1800 m. N Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Turkmenistan; N Africa, SW Asia, Europe].

Cirsium vulgare is a noxious weed that is naturalized in many parts of the world.

15. *Cirsium fuscotrichum* C. C. Chang, Bull. Fan Mem. Inst. Biol., Bot. 7: 161. 1936 [*“fusco-trichum”*].

褐毛蓟 he mao ji

Herbs ca. 90 cm tall, perennial. Stems ribbed, unwinged, \pm densely brownish hirsute. Leaves concolorous, greenish, abaxially with short brown bristles along veins but otherwise glabrous, adaxially sparsely to densely bristly and rough. Lower cauline leaves sessile, oblanceolate, ca. 22×9 cm, pinnatifid; segments ca. 7 pairs, subtriangular, often 1- or 2-lobulate near base, fringed with spinules, apex with a long spine. Middle and upper cauline leaves similar but smaller, base amplexicaul. Capitula few, corymbose. Involucre hemispheric, ca. 6 cm in diam., hirsute. Phyllaries in ca. 6 rows, $3\text{--}4 \times 0.1\text{--}0.2$ cm, lacking wings and scarious appendage, abaxially brownish hirsute with dense long rigid bristles, basal portion lanceolate to linear, apical portion subulate. Corolla not seen. Achene brownish, ca. 4 mm, with 1 stria on each side. Pappus bristles brownish, ca. 1.4 cm. Fl. and fr. Aug.

• Slopes; ca. 2500 m. Sichuan (Pingwu).

16. *Cirsium muliense* C. Shih, Acta Phytotax. Sin. 22: 393. 1984.

木里蓟 mu li ji

Herbs 25–100 cm tall, perennial. Stems grayish white, erect, unbranched, ribbed, unwinged, long villous; synflorescence axes densely felted. Leaves discolorous, surface smooth, abaxially grayish white and densely felted, adaxially green and glabrous. Cauline leaves sessile, elliptic, $6\text{--}7 \times 1.5\text{--}2$ cm, pinnatifid, auriculate amplexicaul; segments 3 or 4 pairs, broadly triangular to semiorbicular, fringed with 1–2 mm spinules and with 3–5 unequal triangular teeth ending in a 4–6 mm spine. Upper cauline leaves usually undivided, margin spiny or with spine-tipped teeth, spines to 1.4 cm. Capitula few, racemose, erect. Involucre campanulate, ca. 5 cm in diam., villous. Phyllaries in ca. 6 rows, lacking wings and scarious appendage, abaxially villous with dense long multicellular hairs; outer phyllaries $15\text{--}16 \times 1\text{--}2$ mm, basal portion triangular, apical portion subulate, $0.9\text{--}1.1$ cm, and spine-tipped; middle phyllaries 1.6--

$1.9 \times 0.2\text{--}0.3$ cm, basal portion lanceolate, apical portion subulate and 4–11 mm; inner phyllaries linear, ca. 17×1 mm, apex acuminate and scarious. Florets bisexual. Corolla red, ca. 1.4 cm, tube ca. 6 mm. Mature achene unknown. Pappus bristles white, ca. 1.2 cm. Fl. Nov.

• Dry mountain slopes; ca. 3200 m. SW Sichuan (Muli).

17. *Cirsium viridifolium* (Handel-Mazzetti) C. Shih, Acta Phytotax. Sin. 22: 394. 1984.

块蓟 kuai ji

Cirsium vlassovianum Fischer ex Candolle var. *viridifolium* Handel-Mazzetti, Oesterr. Bot. Z. 85: 223. 1936; *C. salicifolium* (Kitagawa) C. Shih; *C. vlassovianum* var. *salicifolium* Kitagawa.

Herbs 30–40 cm tall, perennial. Stems erect, unbranched or little branched, ribbed, unwinged, with sparse long bristles, also cobwebby above. Leaves undivided, concolorous, green, surface smooth, glabrous or with multicellular hairs. Lower cauline leaves sessile and semiamplexicaul or narrowed into a petiole to 2.5 cm; leaf blade elliptic to lanceolate, $7\text{--}8 \times 1.5\text{--}2$ cm, margin fringed with 1–2 mm spinules, apex acute and spine-tipped. Middle and upper cauline leaves similar but gradually smaller upward. Capitula 1 to few. Involucre campanulate, $1.5\text{--}2$ cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 7 rows, lacking marginal spinules, wings, and scarious appendage, all or only inner phyllaries abaxially with a resinous gland; outer and middle phyllaries triangular to lanceolate, $3\text{--}10 \times 1\text{--}2$ mm, apex acute and tipped with an acumen less than 0.5 mm; inner phyllaries elliptic to linear-lanceolate, $12\text{--}15 \times 1.5\text{--}2$ mm, apex acuminate and scarious. Florets bisexual. Corolla purple, ca. 1.9 cm, tube ca. 9 mm. Achene brown, $3.5\text{--}4$ mm, ribbed. Pappus bristles brownish, ca. 1.5 cm. Fl. and fr. Aug–Sep.

• Moist places, streamsides, roadsides, slopes; 200–2000 m. Hebei, Jilin, Nei Mongol.

18. *Cirsium serratuloides* (Linnaeus) Hill, Hort. Kew. 64. 1768.

麻花头蓟 ma hua tou ji

Carduus serratuloides Linnaeus, Sp. Pl. 2: 825. 1753; *Cirsium asiaticum* Schischkin; *Cnicus serratuloides* (Linnaeus) Roth.

Herbs to 1.2 m tall, perennial. Stem solitary, erect, branched above, ribbed, unwinged, with sparse long multicellular hairs; synflorescence branches usually sparsely cobwebby. Leaves undivided, concolorous, green, surface smooth but with long multicellular hairs. Middle cauline leaves sessile, lanceolate, $10\text{--}15 \times 1.5\text{--}3$ cm, auriculate semiamplexicaul, fringed with spinules less than 0.5 mm, apex acute. Upper cauline leaves similar but narrower and gradually smaller upward. Capitula erect, laxly corymbose. Involucre ovoid, $1.5\text{--}2$ cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 7 rows, lacking marginal spinules, wings, and scarious appendage, abaxially glabrous; outer phyllaries triangular, ca. 6×1.2 mm, apex acuminate and tipped with a ca. 1 mm spinu-

lose acumen; middle phyllaries ovate-lanceolate to lanceolate, ca. $7 \times 2\text{--}2.2$ mm, tipped with an acumen less than 0.5 mm; inner phyllaries lanceolate to linear-lanceolate, $8\text{--}15 \times 1.5\text{--}2$ mm, apex acuminate and scarious. Florets bisexual. Corolla purplish red, ca. 2 cm, tube ca. 1 cm. Achene brownish, ca. 4 mm. Pappus bristles white, ca. 1.5 cm. Fl. and fr. Jul–Oct. $2n = 34$.

Forests on mountain slopes, by rivers, by water; 1200–2600 m. Xinjiang (Altay Shan) [Mongolia, Russia].

19. *Cirsium vlassovianum* Fischer ex Candolle, Prodr. 6: 653. 1838.

绒背蓟 rong bei ji

Cirsium vlassovianum var. *bracteatum* Ledebour; *Cnicus vlassovianus* (Fischer ex Candolle) Maximowicz.

Herbs 25–90 cm tall, perennial. Roots tuberous. Stems erect, unbranched or branched above, ribbed, unwinged, with sparse long multicellular hairs apically mixed with sparse felt. Leaves discolorous, surface smooth, abaxially white and densely felted, adaxially green and with sparse multicellular hairs. Lower cauline leaves petiolate; leaf blade lanceolate to elliptic-lanceolate, $6\text{--}20 \times 2\text{--}3$ cm, undivided, fringed with ca. 1 mm spinules, apex obtuse to acuminate. Middle and upper cauline leaves similar but auriculate semiamplexicaul. Capitula 1 to few, corymbose, erect. Involucre narrowly ovoid, ca. 2 cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 7 rows, lacking marginal spinules, wings, and scarious appendage, abaxially with a dark resinous gland; outer and middle phyllaries triangular to lanceolate, $5\text{--}11 \times$ ca. 2 mm, apex acute and tipped with a spinule less than 1 mm; inner phyllaries broadly linear, ca. 2×0.2 cm, apex acuminate and scarious. Florets bisexual. Corolla purple, ca. 1.7 cm, tube ca. 7 mm. Achene brownish striate with brown, ca. 4 mm. Pappus bristles ca. 1.5 cm. Fl. and fr. May–Sep. $2n = 28, 34$.

Forests, forest margins, by rivers, moist places; 300–1500 m. Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Shanxi [Korea, Mongolia, Russia].

20. *Cirsium fanjingshanense* C. Shih, Acta Phytotax. Sin. 22: 394. 1984.

梵净蓟 fan jing ji

Herbs to 1 m tall, ?perennial. Stems erect, sparingly branched above, unwinged, subglabrous. Leaves concolorous, green, surface smooth and glabrous. Upper cauline leaves sessile, ovate-elliptic, broadly elliptic, or obovate, $8\text{--}16 \times 5\text{--}9$ cm, undivided, auriculate semiamplexicaul, fringed with $0.5\text{--}2$ mm spinules and with simple or double teeth, apex acute to obtuse and spinule-tipped. Bracts sessile, narrowly elliptic to lanceolate, base auriculate semiamplexicaul. Capitula few, terminal on long branches. Involucre broadly campanulate, $2\text{--}2.5$ cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 6 rows, lacking an abaxial resinous gland, marginal spinules, wings, and scarious appendage; outer and middle phyllaries ovate-lanceolate, elliptic, or lanceolate, $12\text{--}17 \times 2\text{--}3.5$ mm, apex acuminate and tipped with a short spinule; inner phyllaries broadly linear, ca. 15×1.8 mm, apex acuminate and scarious. Florets bisexual. Corolla purplish, ca. 1.8 cm, tube ca.

8 mm. Mature achene unknown. Pappus bristles dirty white, ca. 1.3 cm. Fl. Jul.

• Grasslands, mountain slopes. Guizhou (Fanjing Shan).

21. *Cirsium helenioides* (Linnaeus) Hill, Hort. Kew. 64. 1768.

堆心蓟 dui xin ji

Carduus helenioides Linnaeus, Sp. Pl. 2: 825. 1753; *Cirsium heterophylloides* Pavlov (1938), not Treuinfels (1875); *Cnicus helenioides* (Linnaeus) Retzius.

Herbs 0.4–2 m tall, perennial. Stems erect, branched above, ribbed, unwinged, sparsely cobwebby. Leaves discolorous, surface smooth, abaxially grayish white and densely felted, adaxially green and with multicellular hairs. Basal leaves present at anthesis, long petiolate. Lower and middle cauline leaves sessile, \pm narrowly elliptic or lanceolate, $10\text{--}30 \times 4\text{--}6$ cm, undivided, semiamplexicaul, margin with numerous obliquely triangular teeth tipped by a $0.5\text{--}1$ mm spinule and smaller regular spinules in sinuses. Upper cauline leaves similar but gradually smaller upward. Capitula 1 to few, corymbose, erect. Involucre campanulate, ca. 2.5 cm in diam., glabrous or subglabrous. Phyllaries imbricate, in ca. 6 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries triangular to lanceolate-elliptic, $6\text{--}10 \times 1.5\text{--}2$ mm, apex acute and tipped with a spinule less than 0.2 mm; inner phyllaries elliptic to linear-elliptic, $13\text{--}15 \times 2\text{--}2.5$ mm, apex acuminate and scarious. Florets bisexual. Corolla red, ca. 2 cm, tube ca. 8 mm. Achene yellowish, ca. 4.5 mm. Pappus bristles white or dirty white, ca. 2 cm. Fl. and fr. Sep. $2n = 34$.

Moist grasslands in mountain valleys, forests, forest margins; 1700–2300 m. N Xinjiang (Burqin) [Kazakhstan, Russia].

Herbs 30–80(–150) cm tall, perennial. Roots tuberous, fusiform. Stems grayish white, erect, unbranched or branched above, ribbed, unwinged, with sparse to dense long multicellular hairs mixed with dense felt under capitula. Leaves concolorous, green, with sparse multicellular hairs along veins or glabrous, surface smooth. Basal leaves present at anthesis, with winged petiole, wing spiny or with spiny teeth; leaf blade ovate, obovate, or \pm narrowly elliptic, $8\text{--}20 \times 2.5\text{--}8$ cm, pinnately divided; segments 6–12 pairs, ovate-lanceolate, elliptic, \pm narrowly triangular, or triangular-lanceolate, toothed, teeth with marginal and 2–6 mm apical spines; terminal segment largest, lanceolate to narrowly triangular. Lower and middle cauline

leaves similar but sessile, gradually smaller upward, semiamplexicaul. Capitula solitary or few, clustered at end of stem, erect or rarely nodding. Involucre campanulate, ca. 3 cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 6 rows, lacking marginal spinules, wings, and scarious appendage, abaxially with a dark resinous gland; outer and middle phyllaries triangular to narrowly triangular, 8–13 × 3–3.5 mm, narrowed into a 1–2 mm spine; inner phyllaries lanceolate to linear-lanceolate, 1.5–2 × 0.2–0.3 cm, apex acuminate and softly spiny. Florets bisexual. Corolla red to purple, ca. 2.1 cm, tube ca. 9 mm. Achene ca. 4 mm. Pappus bristles pale brown, ca. 2 cm. Fl. and fr. Apr–Nov.

Forests, forest margins, thickets, grasslands, wastelands, farmlands, roadsides, streambanks; 400–2100 m. Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hebei, Hubei, Hunan, S Jiangsu, Jiangxi, Nei Mongol, NE Qinghai, Shaanxi, Shandong, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, Korea, Russia (Far East), Vietnam].

23. *Cirsium esculentum* (Sievers) C. A. Meyer, Beitr. Pflanz. Russ. Reiches 5: 43. 1848.

莲座蓟 *lian zuo ji*

Cnicus esculentus Sievers, Neueste Nord. Beytr. Phys. Geogr. Erd- Volkerbeschreib. 3: 362. 1796; *Cirsium acaule* Ledebour var. *gmelinii* (Sprengel) C. A. Meyer; *C. acaule* var. *sibiricum* Ledebour; *C. esculentum* var. *acaule* C. A. Meyer; *C. gmelinii* (Sprengel) Tausch; *Cnicus gmelinii* Sprengel.

Herbs, stemless, perennial. All leaves basal, rosulate, concolorous, green, surface smooth with dense to sparse long multicellular hairs; petiole with entire, continuous wings; leaf blade oblanceolate or ± narrowly elliptic, 6–21 × 2.5–7 cm, pinnately divided; segments 4–7 pairs, basal ones usually reduced to spines, others obliquely ovate, elliptic, or semiobovate, margin with 2–4 mm spinules and teeth tipped with spines to 1 cm; terminal segment largest. Capitula 5–9, in basal cluster. Involucre campanulate, 2.5–3 cm in diam., glabrous. Phyllaries imbricate, in ca. 6 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries ovate to lanceolate, 10–20 × 2–4 mm, apex acute and tipped with a spinule to 0.5 mm; inner phyllaries linear-lanceolate to linear, 2.5–3 × 0.2–0.3 cm, apex acuminate and scarious. Florets bisexual. Corolla purple, ca. 2.7 cm, tube ca. 1.5 cm. Achene yellowish, ca. 5 mm. Pappus bristles white or dirty white, ca. 2.7 cm. Fl. and fr. Aug–Sep. $2n = 34$.

Moist places, by water in plains or on hilly areas; 500–3200 m. Hebei, Jilin, Liaoning, Nei Mongol, N and NW Xinjiang [Kazakhstan, Mongolia, Russia, Uzbekistan].

24. *Cirsium periacanthaceum* C. Shih, Acta Phytotax. Sin. 22: 396. 1984.

川蓟 *chuan ji*

Herbs 40–70 cm tall, perennial. Stems erect, branched above, ribbed, unwinged, densely felted with multicellular hairs. Leaves discolorous, surface smooth, abaxially grayish white and densely felted, adaxially greenish and with multicellular hairs. Basal leaves persistent at anthesis. Cauline leaves sessile, elliptic, 12–22 × 5–7 cm, pinnately divided, auriculate semiamplexicaul; segments 4–8 pairs, ± obliquely elliptic, with 3–7

unequal triangular teeth; teeth with 4–14 mm lateral spines and apical spine. Capitula many, corymbose, surrounded by pectinately spiny bracts with pungent 2–3 cm spines. Involucre campanulate, ca. 2 cm in diam., glabrous. Phyllaries imbricate, in ca. 5 rows, lanceolate to elliptic-lanceolate, 8–12 × ca. 3 mm, lacking marginal spinules, wings, and scarious appendage, apex narrowed into a 1–5 mm spine. Florets bisexual. Corolla red, ca. 1.5 cm, tube ca. 6 mm. Achene brown, ca. 4 mm. Pappus bristles brownish, ca. 1.5 cm. Fl. and fr. Jul–Sep.

• River valleys, grasslands on mountain slopes, roadsides; 2400–2600 m. Sichuan.

25. *Cirsium maackii* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 172. 1859.

野蓟 *ye ji*

Cirsium asperum Nakai; *C. japonicum* Candolle var. *amurense* Kitamura; *C. japonicum* subsp. *maackii* (Maximowicz) Nakai; *C. japonicum* var. *maackii* (Maximowicz) Matsumura; *C. japonicum* var. *ussuriense* (Regel) Kitamura; *C. littorale* Maximowicz var. *ussuriense* Regel; *C. maackii* var. *koreiense* (Nakai) Nakai; *Cnicus japonicus* Maximowicz var. *maackii* (Maximowicz) Maximowicz; *C. maackii* (Maximowicz) Nakai; *C. maackii* var. *koreiensis* Nakai.

Herbs 40–150 cm tall, perennial. Roots tuberous, fusiform. Stems grayish white, erect, branched or unbranched, unwinged, with multicellular hairs and densely felted above. Leaves with smooth surface, concolorous with crispate hairs along veins or ± discolorous, abaxially grayish green and cobwebby. Basal and lower cauline leaves often concolorous, with winged petiole, wing spiny or with triangular spine-tipped teeth; leaf blade elliptic to lanceolate, 15–30 × 7–9 cm, pinnately divided; segments 4–8 pairs, elliptic, fringed with spinules and with unequal triangular teeth with lateral spinules less than 1 mm and a ca. 5 mm apical spine; terminal segment largest. Middle and upper cauline leaves similar but sessile, smaller, sometimes undivided, discolorous, auriculate semiamplexicaul. Capitula 1 or several, corymbose, erect or nodding. Involucre campanulate, ca. 2 cm in diam., glabrous or sparsely cobwebby. Phyllaries in ca. 5 rows, lacking marginal spinules, wings, and scarious appendage, abaxially with a dark resinous gland; outer and middle phyllaries triangular-lanceolate to lanceolate, 6–13 × 2–2.5 mm, margin ciliate, apex acute and tipped with a spinule less than 0.5 mm; inner phyllaries lanceolate to linear-lanceolate, 1.3–2.3 × 0.2–0.3 cm. Florets bisexual. Corolla purplish red, ca. 2.4 cm, tube ca. 1.2 cm. Achene yellowish, ca. 4 mm. Pappus bristles white, ca. 2 cm. Fl. and fr. Jun–Sep. $2n = 34, 36$.

Grasslands on mountain slopes, forest margins, meadows, near villages; 100–1100 m. S Anhui, Hebei, Heilongjiang, Jiangsu, Jilin, Liaoning, SE Nei Mongol, E Shandong, Sichuan, N Zhejiang [Korea, Russia].

26. *Cirsium racemiforme* Y. Ling & C. Shih, Acta Phytotax. Sin. 22: 445. 1984.

总序蓟 *zong xu ji*

Herbs to 1.5 m tall, perennial. Stems erect, branched above, ribbed, unwinged, with long multicellular hairs and cobwebby; synflorescence branches densely felted. Leaves dis-

colorous, surface smooth, abaxially grayish white and densely felted, adaxially green and with multicellular hairs. Basal leaves withered at anthesis. Cauline leaves sessile, \pm narrowly elliptic, $9-21 \times 4-7$ cm, pinnately lobed or pinnatifid, auriculate semiamplexicaul; segments 3–8 pairs, elliptic to broadly triangular, toothed; teeth fringed with ca. 2 mm spinules and with a ca. 4 mm apical spine; terminal segment largest. Bracts similar to leaves or with spiny teeth. Peduncles ca. 2 cm. Capitula 4–8, racemose. Involucre campanulate, 2.5–3 cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in ca. 6 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries triangular to triangular-lanceolate, $6-9 \times 1-1.5$ mm, abaxially with a dark resinous gland, apex acute and tipped with a 0.8–1.2 mm spinule; inner phyllaries linear-lanceolate to linear, $14-22 \times 0.5-1.5$ mm, apex acuminate and scarious. Florets bisexual. Corolla purplish red, ca. 2.3 cm, tube ca. 1.2 cm. Achene yellowish, ca. 5 mm, striate. Pappus bristles dirty brown, ca. 2.2 cm. Fl. and fr. Apr–Jun.

• Mountain valleys, mountain slopes, forests, forest margins; 1000–1300 m. W Fujian, NE Guangxi, SW Guizhou, SW Hunan, NE Jiangxi, SE Yunnan.

27. *Cirsium fangii* Petrak, Repert. Spec. Nov. Regni Veg. 44: 48. 1938.

峨眉薊 e mei ji

Herbs to 1.2 m tall, ?perennial. Stems branched above, ribbed, unwinged, with long sparse multicellular hairs. Leaves concolorous, green, surface smooth, glabrous or abaxially with sparse long multicellular hairs. Basal leaves present at anthesis. Lower cauline leaves petiolate; petiole 2.5–4 cm, with expanded semiamplexicaul base and spiny wings; leaf blade lanceolate to linear-lanceolate, ca. $16 \times 7-10$ cm, subpinnatisect; segments 6 or 7 pairs, elliptic, fringed with spinules, ca. 0.5 mm cilia, and a few triangular teeth with a ca. 2 mm apical spinule. Middle and upper cauline leaves similar but sessile, gradually smaller upward, semiamplexicaul. Bracts linear to linear-lanceolate, toothed, teeth with an apical spine to 6 mm. Capitula few, terminal on long branches, nodding. Involucre broadly campanulate, ca. 4.5 cm in diam., glabrous or sparsely cobwebby. Phyllaries in ca. 7 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries triangular-lanceolate to lanceolate, $6-15 \times 1.5-3$ mm, abaxially with a dark resinous gland, margin sparsely ciliate, apex acute and tipped with a 0.5–1 mm spinule; inner and innermost phyllaries linear to broadly linear, ca. $2.4 \times 0.2-0.3$ cm, apex acuminate. Florets bisexual. Corolla red, ca. 2.1 cm, tube ca. 6 mm. Achene ca. 3.5 mm, many ribbed. Pappus bristles brown, ca. 2 cm. Fl. and fr. Jul.

• Grasslands on mountain slopes; 2300–2400 m. Sichuan.

Herbs 30–100 cm tall, perennial. Roots tuberous, fusiform. Stem solitary, usually branched above; wings undulate, with ca. 5 mm stout rigid spines. Leaves concolorous, green, surface smooth, glabrous. Basal leaves with winged petiole; leaf blade elliptic, to 30×4 cm, margin with teeth ending in a 4–9 mm spine. Lower and middle cauline leaves similar but sessile, decurrent, gradually smaller upward. Upper cauline leaves lanceolate to elliptic. Capitula 1 to several, terminal, corymbose to corymbose-paniculate. Involucre ovoid, ca. 1.5 cm in diam., glabrous. Phyllaries in ca. 6 rows, lacking marginal spinules, wings, and scarious appendage; outer phyllaries ovate, ca. 3×1.2 mm, apex acute and tipped with a ca. 1.5 mm spinule; middle phyllaries linear-lanceolate, $5-8 \times 1.7-2$ mm, apex acute and tipped with a ca. 2 mm spinule; inner phyllaries linear, $8-9 \times$ ca. 1.5 mm, apex acuminate and scarious. Florets bisexual. Corolla reddish purple, 1.8–1.9 cm, tube 7–8 mm. Achene yel-

lowish, ca. 3 mm. Pappus bristles white, 1.2–1.3 cm. Fl. and fr. Jul–Aug. $2n = 34$.

Flooded lands, grasslands by lakes, farmlands; 400–1500 m. Xinjiang (Junggar Pendi, Tian Shan) [Kazakhstan, Russia, Uzbekistan; E Europe].

30. *Cirsium vernonioides* C. Shih, Acta Phytotax. Sin. 22: 447. 1984.

斑鸠菊 ban jiu ji

Herbs, perennial. Rhizome tuberous. Stem solitary, erect, ribbed, unwinged, with long multicellular hairs and cobwebby, densely felted below capitula. Leaves discolorous, surface smooth, abaxially grayish white and densely felted, adaxially green and with multicellular hairs. Lower cauline leaves withered at anthesis. Middle and upper cauline leaves with petiole to 1.5 cm; leaf blade elliptic to lanceolate-elliptic, 8–11 × 2.5–4.5 cm, undivided, base cuneate, fringed with ca. 1 mm incurved spinules and sometimes alternating with ca. 2 mm patent spinules, apex acuminate. Capitula several, corymbose, erect. Involucre 2–2.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 8 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries 3–10 × 1.5–3 mm, basal portion triangular, lanceolate, or elliptic, apical portion subulate and narrowed into a 3–7 mm spine; inner phyllaries elliptic to linear, 1.5–2 × 0.2–0.3 cm, apex acuminate and scarious. Florets bisexual. Corolla purple, ca. 2.1 cm, tube ca. 1 cm. Achene ca. 6 mm. Pappus bristles dark brown, ca. 1.8 cm. Fl. and fr. Oct.

• Guangxi (Yangshuo).

31. *Cirsium handelii* Petrak, Anz. Akad. Wiss. Wien, Math.-Naturwiss. Kl. 63: 110. 1926.

骆骑 luo qi

Herbs to 1.7 m tall, perennial. Stems erect, branched above, ribbed, unwinged, with sparse multicellular hairs and cobwebby. Leaves concolorous, green, surface smooth, glabrous or with sparse multicellular hairs. Basal leaves present at anthesis. Lower and middle cauline leaves with winged petiole, base auriculate and semiamplexicaul, wing spiny or with spiny teeth; leaf blade elliptic, to 27 × 7 cm, pinnately divided; segments ca. 6 pairs, semiobicular, ovate-lanceolate, or broadly triangular, margin spiny or with triangular teeth tipped with a 1–4 cm spine. Upper cauline leaves similar but sessile, lanceolate, gradually smaller upward, auriculate semiamplexicaul, margin with teeth ending in a 1–4 cm spine. Capitula few to many, laxly corymbose to corymbose-paniculate or rarely solitary, ± nodding. Involucre campanulate, 3–4.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 7 rows, lacking an abaxial resinous gland, marginal spinules, wings, and scarious appendage; outer and middle phyllaries 0.7–1.5 cm × 1.5–2 mm, basal portion lanceolate, apical portion subulate, patent to reflexed, and narrowed into a short and soft spinule; inner phyllaries linear-subulate, ca. 18 × 1.5 mm, apex narrowed into a short soft spinule. Florets bisexual. Corolla purple, ca. 2.1 cm, tube ca. 1.2 cm. Achene brown, ca. 3.2 mm. Pappus bristles brownish, ca. 2 cm. Fl. and fr. May–Sep.

• Forests, forest margins, thickets, grasslands, wastelands; 1700–3400 m. Sichuan, NW and SW Yunnan.

32. *Cirsium pendulum* Fischer ex Candolle, Prodr. 6: 650. 1838.

烟管菊 yan guan ji

Cirsium hilgendorffii (Franchet & Savatier) Makino; *C. provostii* (Franchet) Petrak; *Cnicus hilgendorffii* Franchet & Savatier; *C. pendulus* (Fischer ex Candolle) Maximowicz; *C. provostii* Franchet.

Herbs 1–3 m tall, perennial. Stems erect, branched above, stout, unwinged, sparsely cobwebby and with long multicellular hairs. Leaves concolorous, surface smooth, green, glabrous. Basal and lower cauline leaves sessile or with winged petiole; leaf blade ± narrowly elliptic to oblanceolate, 40–50 × ca. 20 cm, bipinnatifid; primary segments 5–7 pairs; ultimate lobes obliquely triangular, fringed and tipped with ca. 3 mm spines; terminal lobe of segments narrowly lanceolate to broadly linear. Middle and upper cauline leaves sessile, gradually smaller upward, semiamplexicaul. Capitula several, terminal, racemose-paniculate, nodding. Involucre campanulate, 3.5–5 cm in diam., glabrous. Phyllaries imbricate, in ca. 10 rows, lacking an abaxial resinous gland, marginal spinules, wings, and scarious appendage; outer and middle phyllaries 1–4 × 0.1–0.3 cm, basal portion triangular to lanceolate, apical portion subulate and reflexed; inner and innermost phyllaries lanceolate to linear-lanceolate, 1.2–2.5 × ca. 0.2 cm, apex acuminate-subulate. Florets bisexual. Corolla purple to red, ca. 2.2 cm, tube filiform, ca. 1.6 cm. Achene ca. 4 mm. Pappus bristles dirty white, ca. 2.2 cm. Fl. and fr. Jun–Sep. $2n = 34$.

Grasslands in mountain valleys and on mountain slopes, forests, forest margins, streamsides, near villages, rock crevices; 300–2300 m. SE Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Shaanxi, Shanxi, WC Yunnan [Japan, Korea, Mongolia, Russia].

33. *Cirsium tianmushanicum* C. Shih, Bull. Bot. Res., Harbin 4(2): 64. 1984.

杭菊 hang ji

Herbs to 1 m tall, perennial. Stems erect, branched above, unwinged, felted below capitula. Leaves concolorous, green, surface smooth, with sparse crispate hairs along veins or glabrous. Upper cauline leaves with winged petiole 2–2.5 cm; leaf blade elliptic to rarely ovate, 10–15 × 6–7 cm, undivided, margin serrulate, teeth with lateral spinules less than 1 mm, apex acute and with a 1–1.5 mm spinule. Uppermost leaves and bracts similar but narrower. Capitula few to many, corymbose, erect, not surrounded with pectinately spiny pungent bracts. Involucre ovoid, 2–2.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 8 rows; outer and middle phyllaries triangular-lanceolate, ovate-lanceolate, or linear-elliptic, 5–16 × 2–3 mm, apex tipped with a 0.5–1 mm spinule; inner phyllaries linear to broadly linear, ca. 18 × 1–2 mm, apically expanded into a scarious red appendage. Florets bisexual. Corolla white, ca. 2.3 cm, tube ca. 1.1 cm. Achene ca. 4.5 mm. Pappus bristles white, ca. 2 cm. Fl. and fr. Oct.

• Forests; ca. 1300 m. Zhejiang (Tianmu Shan).

34. *Cirsium chinense* Gardner & Champion, Hooker's J. Bot. Kew Gard. Misc. 1: 323. 1849.

绿蓟 lǜ jī

Cirsium chinense var. *laushanense* (Y. Yabe) Kitamura; *C. laushanense* Y. Yabe; *C. lineare* (Thunberg) Schultz Bipontinus var. *glabrescens* Petrak; *C. lineare* var. *laushanense* (Y. Yabe) Kitamura; *C. lineare* var. *tchefouense* (Debeaux) Y. Ling; *C. manshuricum* Kitagawa; *C. tchefouense* Debeaux; *C. uninervium* (H. Léveillé & Vaniot) Nakai var. *laushanense* (Y. Yabe) Kitagawa; *Cnicus chinensis* (Gardner & Champion) Benth. ex Maximowicz; *C. tchefouensis* (Debeaux) Franchet.

Herbs 40–100 cm tall, perennial. Stems erect, branched in upper half, rarely unbranched, unwinged, with crispate hairs, below capitula also ± cobwebby. Leaves concolorous, green, surface smooth, glabrous or with long crispate hairs along veins. Basal and lower cauline leaves petiolate; leaf blade elliptic to lanceolate and pinnately divided or narrower to sometimes linear and undivided, 5–7 × 1–4 cm; segments (when present) 3 or 4 pairs, margin with 3 or 4 unequal teeth with 1–2 mm lateral spinules and a to 4 mm apical spine. Middle and upper cauline leaves usually undivided, margin with spines to 3 mm. Capitula (1 or) few, irregularly corymbose, not surrounded with pectinately spiny pungent bracts. Involucre ovoid, ca. 2 cm in diam., glabrous or subglabrous. Phyllaries imbricate, in ca. 7 rows, abaxially often with a dark resinous gland; outer phyllaries triangular, 5–8 × 1.2–2 mm, apex acute to acuminate and tipped with a ca. 0.5 mm spinule; middle and inner phyllaries lanceolate to linear-lanceolate, 1–1.4 cm × 2–3 mm; inner phyllaries apically expanded into a scarious purplish pink denticulate appendage. Florets bisexual. Corolla purplish red, ca. 2.4 cm, tube ca. 1.2 cm. Achene ca. 4 mm. Pappus bristles dirty white, ca. 1.5 cm. Fl. and fr. Jun–Oct.

• Grasslands on mountain slopes; 100–1600 m. Fujian, Guangdong, Guangxi, Hebei, Jiangsu, Jiangxi, Liaoning, Nei Mongol, Shandong, Sichuan, Zhejiang.

35. *Cirsium lineare* (Thunberg) Schultz Bipontinus, Linnaea 19: 335. 1846.

线叶蓟 xian ye jī

Carduus linearis Thunberg in Murray, Syst. Veg., ed. 14, 726. 1784; ?*Cirsium hupehense* Pampanini; *C. lineare* var. *franchetii* Kitamura; *C. lineare* var. *latifolium* H. C. Fu; *C. lineare* f. *oreithales* (Hance) Koyama; *C. lineare* f. *pallidum* Kitamura; *C. lineare* var. *pallidum* (Kitamura) Y. Ling; *C. lineare* var. *salicifolium* Y. Ling; *C. lineare* var. *tsoongianum* (Y. Ling) Y. Ling; *C. oreithales* Hance; *C. tsoongianum* Y. Ling; *Cnicus linearis* (Thunberg) Benth. & J. D. Hooker ex Franchet & Savatier; *Spanioptilon lineare* (Thunberg) Lessing.

Herbs (0.3–)0.6–1.5 m tall, perennial. Stems erect, branched from base or above, ribbed, unwinged, cobwebby and with long crispate hairs to glabrous. Leaves discolorous, abaxially grayish white and cobwebby, adaxially green, glabrous, with some crispate hairs, or ± densely covered with hair-tipped papillae and surface slightly rough but not spinulose. Lower and middle cauline leaves sessile or shortly petiolate; leaf

blade ovate, lanceolate, elliptic, or oblanceolate, 6–18(–23) × 1.5–3(–5) cm, undivided or rarely with a few lobules or teeth in proximal third, base cuneate, margin ± regularly spinulose, apex obtuse to caudate-acuminate. Upper cauline leaves similar but always sessile, often narrower, gradually smaller upward. Capitula terminal, laxly corymbose, not surrounded with pectinately spiny pungent bracts. Involucre ± narrowly ovoid, 1–2.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 6 rows, abaxially with a dark resinous gland; outer and middle phyllaries triangular-lanceolate, 5–8 × ca. 1 mm, tipped with a spinule to 2 mm; inner phyllaries triangular-lanceolate to linear, 10–15 × 1–3.5 mm, apically expanded into a scarious, acuminate, pale or purplish pink, and irregularly denticulate appendage. Florets bisexual. Corolla purplish red to pink, 2–2.2 cm, tube equaling limb. Achene ca. 2.5 mm. Pappus brownish to dirty white, ca. 1.5 cm. Fl. and fr. Aug–Oct.

Mountain slopes, thickets, forest margins, grasslands, roadsides, wastelands, farmlands; 500–2500 m. S Anhui, Chongqing, Fujian, S Gansu, Guangdong, Guizhou, Hebei, Henan, Hubei, Hunan, NE Jiangxi, Shaanxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, NE Thailand, Vietnam].

Cirsium lineare is variable in leaf shape and papillosity as well as features of the involucre, but any attempt at subdividing it is premature. *Cirsium hupehense* is sometimes regarded as distinct; it was described with phyllaries ending in long, patent to recurved spines, a feature we have not observed in any of our material.

36. *Cirsium shansiense* Petrak, Mitth. Thüring. Bot. Vereins 50: 176. 1943.

牛口蓟 niu kou jī

Cirsium chinense Gardner & Champion var. *australe* Diels; *C. lineare* (Thunberg) Schultz Bipontinus var. *intermedium* (Pampanini) Petrak; *C. lineare* var. *rigidum* Petrak; *C. lineare* var. *spatulatum* Petrak; *C. lineare* var. *tenii* Petrak; *C. lineare* var. *yunnanense* Petrak; *C. wallichii* Candolle var. *intermedium* Pampanini.

Herbs 30–150 cm tall, perennial. Stems erect, branched or unbranched, ribbed, unwinged, with long multicellular hairs and felted. Leaves discolorous, surface smooth, abaxially grayish white and densely felted, adaxially green and glabrous or with long crispate hairs. Middle cauline leaves sessile or petiolate; leaf blade ovate, lanceolate, or ± narrowly elliptic, 5–14 × 1–6 cm, pinnately lobed to pinnatipartite at least in proximal half; segments 3–6 pairs, obliquely triangular to obliquely elliptic, with a 3–6 mm apical spine; terminal segment narrowly triangular to linear. Upper cauline leaves similar but gradually smaller upward. Capitula (1 or) few to many, terminal, paniculate-corymbose, not surrounded with pectinately spiny pungent bracts. Involucre ovoid, 2–2.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 7 rows, abaxially with a dark resinous gland; outer phyllaries triangular-lanceolate to ovate-lanceolate, 8–10 mm, tipped with a ca. 1 mm spinule; middle and inner phyllaries lanceolate to broadly linear, 12–17 × 1.2–3 mm; inner phyllaries apically expanded into a scarious, pale to pink, and often denticulate appendage. Florets bisexual. Corolla pink to purple, ca. 1.8 cm, tube ca. 8 mm. Achene ca. 4 mm. Pappus bristles brownish, ca. 1.5 cm. Fl. and fr. May–Nov.

Forests, thickets, wastelands by rivers, streamsides, roadsides; 1300–3400 m. Anhui, Chongqing, SE Fujian, S Gansu, NE Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, S Hunan, NW Jiangxi, Nei Mongol, E Qinghai, S Shaanxi, Shanxi, Sichuan, NE Xizang, Yunnan [Bhutan, India, Myanmar, Vietnam].

The occurrence of *Cirsium chinense* reported from Vietnam by K. B. Lê (Fl. Vietnam 7: 454. 2007) is actually *C. shansiense*.

37. *Cirsium leducii* (Franchet) H. Léveillé, Cat. Pl. Yun-Nan, 42. 1916.

覆瓦蓟 fu wa ji

Cnicus leducii Franchet, J. Bot. (Morot) 11: 23. 1897.

Herbs 30–150 cm tall, perennial. Stems grayish white, erect, much branched above or rarely unbranched, unwinged, densely felted below capitula. Leaves discolorous, abaxially grayish white and densely felted, adaxially green, rough, and sparsely to densely spinulose. Middle cauline leaves sessile, lanceolate to ± narrowly elliptic, 4–10 × 1–3 cm, undivided or pinnately divided; segments (when present) 3–5 pairs, triangular, margin entire or with 1 spine-tipped tooth, apical spine ca. 3.5 mm; terminal segment narrowly lanceolate to broadly linear. Upper cauline leaves similar, usually undivided. Bracts smaller than leaves, lanceolate to linear-lanceolate, fringed with spinules or spinulose teeth. Capitula (1 or) few to many, corymbose. Involucre campanulate, 2–2.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 6 rows, abaxially with a dark resinous gland; outer and middle phyllaries lanceolate, 5–11 × 1–2 mm, apex narrowed into a ca. 1.5 mm spinule; inner phyllaries elliptic-lanceolate to broadly lanceolate, 12–16 × 1.2–2 mm, apically expanded into a scarious white or pink appendage. Florets bisexual. Corolla purplish red, ca. 1.9 cm, tube ca. 9 mm. Achene dark brown, ca. 3 mm, striate. Pappus bristles brownish, ca. 1.5 cm.

Forests, forest margins, grasslands on mountain slopes; 500–1500 m. Guangdong, Guangxi, Guizhou, Sichuan, Yunnan [Vietnam].

38. *Cirsium semenowii* Regel, Bull. Soc. Imp. Naturalistes Moscou 40(3–4): 161. 1867 [*“Semenowi”*].

新疆蓟 xin jiang ji

Chamaepeuce macrantha Schrank var. *bracteata* Ruprecht; *Cnicus semenowii* (Regel) C. Winkler.

Herbs 50–60(–80) cm tall, perennial. Stems erect, branched above, unwinged, with sparse long multicellular hairs and cobwebby. Leaves concolorous, green, surface smooth, glabrous. Lower and middle cauline leaves with long, winged petiole; wing margin with spinules and spine-tipped teeth; leaf blade lanceolate, linear-lanceolate, or elliptic, to 15 × 3.5 cm, pinnatifid; segments 4–6 pairs, elliptic to ovate, with unequal triangular teeth, teeth with a 0.3–2 cm apical spine. Upper cauline leaves similar but sessile, gradually smaller upward, semiamplexicaul. Capitula few to many, racemose to glomerate, erect, surrounded by pectinately spiny bracts with long pungent spines. Involucre ovoid, ca. 2(–3) cm in diam., glabrous or very sparsely cobwebby. Phyllaries in ca. 7 rows, lacking an abaxial resinous gland, marginal spinules, wings, and scarious appendage; outer phyllaries 10–14 × 2–2.5 mm, basal portion trian-

gular, apical portion subulate and narrowed into a 6–9 mm spine; middle phyllaries 12–13 × ca. 2.5 mm, basal portion ovate, apical portion subulate and narrowed into a 5–6 mm spine; inner phyllaries linear to linear-lanceolate, 12–15 × 1.5–2 mm, apex acuminate and scarious. Florets bisexual. Corolla red, ca. 1.9 cm, tube ca. 8 mm. Achene brown, ca. 5 mm. Pappus bristles brownish, ca. 1.5 cm. Fl. and fr. Jul–Oct.

Alpine meadows, forests, by water, wastelands; 1700–3000 m. Xinjiang (Tian Shan) [Kazakhstan, Uzbekistan].

39. *Cirsium sairamense* (C. Winkler) O. Fedtschenko & B. Fedtschenko, Consp. Fl. Turkestan. 4: 286. 1911.

赛里木蓟 sai li mu ji

Cnicus sairamensis C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 9: 522. 1886; *Cirsium semenowii* Regel subsp. *sairamense* (C. Winkler) Petrak.

Herbs 20–60 cm tall, perennial. Stems erect, branched from base or middle, unwinged, sparsely cobwebby and with long multicellular hairs. Leaves discolorous, surface smooth, abaxially grayish green and sparsely cobwebby, adaxially green and with long multicellular hairs. Lower and middle cauline leaves sessile, elliptic or ± narrowly lanceolate, 13–20 × 4–6 cm, pinnately divided, semiamplexicaul; segments 4–7 pairs, elliptic to triangular-ovate, with 3–5 unequal, triangular teeth fringed with 2–3 mm spinules and with a 1–2 cm apical spine. Upper cauline leaves similar but gradually smaller upward. Capitula many, terminal, corymbose-paniculate, erect or nodding, surrounded by pectinately spiny bracts with long pungent spines. Involucre campanulate to ovoid, ca. 2.5 cm in diam., glabrous or sparsely cobwebby. Phyllaries imbricate, in 7 or 8 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries ca. 4 × 0.2–0.3 cm, basal portion triangular, apical portion subulate, rigid, patent to reflexed, and tipped with a ca. 3 cm spine; inner phyllaries lanceolate, elliptic, or linear, 10–20 × 1–2 mm, apex acuminate and scarious. Florets bisexual. Corolla purple, ca. 2.2 cm, tube ca. 9 mm. Achene brownish, ca. 5 mm. Pappus bristles dirty white, ca. 1.5 cm. Fl. and fr. Jul–Sep.

Mountain slopes, mountain valleys, by water, moist places; 1700–2300 m. Xinjiang (Tian Shan) [Kazakhstan, Uzbekistan].

40. *Cirsium alberti* Regel & Schmalhaus, Trudy Imp. S.-Peterburgsk. Bot. Sada 6: 318. 1880.

天山蓟 tian shan ji

Herbs 45–50 cm tall, perennial. Stems branched from base, ribbed, unwinged, densely cobwebby and with sparse long multicellular hairs. Leaves discolorous, surface smooth, abaxially grayish white and densely felted, adaxially green and with sparse long hairs. Lower cauline leaves with spiny winged petiole; leaf blade elliptic-lanceolate to lanceolate, 22–27 × ca. 7 cm, pinnatifid; segments 4–8 pairs, triangular-ovate to elliptic, fringed with 0.5–2 mm spinules and with 3–5 teeth tipped with a 5–11 mm spine. Middle and upper cauline leaves sessile, lanceolate to narrowly lanceolate, gradually smaller upward, auriculate semiamplexicaul. Capitula several to many, terminal, corymbose to corymbose-paniculate, erect or nodding,

surrounded by pectinately spiny bracts with long pungent spines. Involucre subovoid to campanulate, ca. 2 cm in diam., glabrous. Phyllaries imbricate, in 7 or 8 rows, lacking marginal spinules, wings, and scarious appendage; outer and middle phyllaries 8–16 × 2–3 mm, basal portion triangular, ovate, or lanceolate, apical portion subulate, patent to reflexed, and tipped with a 4–8 mm spine; inner and innermost phyllaries lanceolate to linear, 12–20 × 1–2 mm, apex acuminate and scarious. Florets bisexual. Corolla yellow or white, ca. 1.9 cm, tube ca. 8 mm. Achene brown with darker striae, ca. 4 mm. Pappus bristles white, ca. 1.5 cm. Fl. and fr. Jul–Sep.

Forest margins in mountain valleys, mountain slopes, flooded lands, by streams; 1000–2400 m. Xinjiang (Tian Shan) [Kazakhstan].

41. *Cirsium argyranthum* Candolle, Prodr. 6: 640. 1838.

南蓟 nan ji

Cirsium tibeticum Kitamura; *Cnicus argyranthus* (Candolle) C. B. Clarke.

Herbs 30–100 cm tall, perennial. Stems erect, branched above, unwinged, with sparse long multicellular hairs, also cobwebby above. Leaves concolorous, green, surface smooth, with long multicellular hairs along veins. Middle cauline leaves sessile, elliptic-lanceolate to elliptic, 8–14 × 2–4 cm, pinnately divided, auriculate semiamplexicaul; segments 4–9 pairs, each with 3–5 unequal teeth with 1–2 mm lateral spinules and a 4–7 mm apical spine. Upper cauline leaves with sparse teeth tipped with a 0.7–1.4 cm spine. Capitula few to many, spicate, racemose, or racemose-paniculate, erect, surrounded by pectinately spiny bracts with pungent spines to 1.5 cm. Involucre ovoid, 1.5–2 cm in diam., glabrous. Phyllaries imbricate, in ca. 6 rows; outer phyllaries triangular, 7–8 × 1.5–2 mm, narrowed into a 3–4 mm spine; middle phyllaries lanceolate to ovate-lanceolate, ca. 10 × 2 mm, lacking membranous wings, narrowed into a 2–3 mm apical spinule; inner phyllaries linear-elliptic to broadly linear, ca. 13 × 2–3 mm, apically expanded into a scarious appendage. Florets bisexual. Corolla purple or white, ca. 1.6 cm, tube ca. 8 mm. Achene yellowish, ca. 3 mm. Pappus bristles brownish, ca. 1.4 cm. Fl. and fr. Jun–Oct. $2n = 34$.

Forests, forest margins, grasslands, thickets by rivers, by farmlands; 2100–3700 m. Xizang, NW Yunnan [Bhutan, India, Nepal, Pakistan].

42. *Cirsium glabrifolium* (C. Winkler) Petrak, Oesterr. Bot. Z. 61: 324. 1911.

无毛蓟 wu mao ji

Cnicus glabrifolius C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 9: 523. 1885.

Herbs 70–100 cm tall, perennial. Stems erect, ribbed, unwinged, with sparse multicellular hairs. Leaves concolorous, green, surface smooth, abaxially with scattered multicellular hairs, adaxially glabrous. Middle cauline leaves sessile, elliptic to elliptic-lanceolate, to 20 × 8 cm, pinnately divided, semiamplexicaul; segments 5 or 6 pairs, elliptic, ovate, or triangular-ovate, with 3–5 unequal teeth tipped with a 5–12 mm spine. Upper cauline leaves similar but narrower, gradually smaller upward, undivided but with spiny teeth and apex. Capitula

many, paniculate, surrounded by pectinately spiny bracts with long pungent spines. Involucre ovoid, 1.5–2 cm in diam., glabrous or very sparsely cobwebby. Phyllaries imbricate, in ca. 6 rows; outer phyllaries lanceolate, 6–7 × 1–2 mm, basal portion usually with pectinately spinulose margin, narrowed into a ca. 3 mm apical spinule; middle phyllaries triangular-lanceolate to lanceolate, 12–15 × 2–3 mm, above base with loosely and irregularly lacerate scarious wings, apically spine-tipped; inner phyllaries linear-lanceolate, ca. 15 × 2 mm, apically with a spiny-tipped appendage. Florets bisexual. Corolla purplish red, ca. 1.8 cm, tube ca. 9 mm. Achene yellowish with darker striae, ca. 4 mm. Pappus bristles brownish, ca. 1.5 cm. Fl. and fr. Aug–Sep.

Mountain slopes, thickets; 2500–2700 m. Xinjiang (Tian Shan), S Xizang [India, Kashmir, Kazakhstan, Uzbekistan].

43. *Cirsium sieversii* (Fischer & C. A. Meyer) Petrak, Oesterr. Bot. Z. 61: 324. 1911.

附片蓟 fu pian ji

Echenais sieversii Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 44. 1841.

Herbs 1–2 m tall, perennial. Stems erect, long branched, unwinged, with sparse long multicellular hairs. Leaves concolorous, green, surface smooth, glabrous or ± hairy. Upper cauline leaves sessile, elliptic to lanceolate, 10–18 × 3–6 cm, pinnately lobed or pinnatifid; segments 3–5 pairs, obliquely ovate to semiorbicular, with 3–5 unequal triangular teeth each with few to many lateral spinules and a 4–6 mm apical spine. Capitula 3–6 in terminal cluster or many, terminal, and paniculate, surrounded by pectinately spiny bracts with long pungent spines. Involucre narrowly ovoid, 1.5–2 cm in diam., glabrous. Phyllaries imbricate, in ca. 7 rows; outer and middle phyllaries 3–10 × 1–2 mm, above base with densely and regularly denticulate-lacerate wings, apex narrowed into a 1–3 mm spinule; inner phyllaries 10–12 × ca. 1 mm, apex acuminate and scarious. Florets bisexual. Corolla purplish red, ca. 2 cm, tube as long as limb. Mature achene not seen. Pappus bristles brownish, ca. 1.5 cm. Fl. and fr. Jul–Oct.

Forests on mountain slopes, by water; 1600–2900 m. N Xinjiang [Kazakhstan, Russia, Uzbekistan].

44. *Cirsium chrysolepis* C. Shih, Acta Phytotax. Sin. 22: 451. 1984.

黄苞蓟 huang bao ji

Herbs to 1 m tall, perennial. Stems erect, branched above, unwinged. Leaves discolorous, abaxially grayish white and sparsely cobwebby, adaxially green, rough, and densely covered with ca. 0.5 mm spinules. Lower and middle cauline leaves not seen. Upper leaves of branches sessile, elliptic to lanceolate, 4–8 × ca. 2 cm, pinnately lobed; segments ca. 3 pairs, lanceolate to obliquely triangular-ovate, with 2–4 unequal triangular teeth fringed with spinules less than 0.5 mm and with a 5–10 mm apical spine. Bracts numerous, lanceolate, with spiny teeth and marginal spines to 2 cm. Capitula corymbose, erect. Involucre campanulate, 3–3.5 cm in diam., glabrous. Phyllaries imbricate, in ca. 8 rows, straight, appressed;

outer and middle phyllaries elliptic to lanceolate, 8–25 × 2–3 mm, margin above base expanded into yellowish, scarious lacerate wings, apex narrowed into a spine; inner phyllaries lanceolate to linear, apically expanded into a short and narrow, acuminate, and spine-tipped appendage. Florets bisexual. Corolla purplish red. Mature achene unknown. Pappus bristles yellowish, ca. 1.5 mm. Fl. Aug.

- Mountain slopes; ca. 3500 m. S Xizang (Nyalam).

Cirsium chrysolepis is allied to *C. flavisquamatum* Kitamura from Nepal but differs in having cobwebby leaves.

45. *Cirsium arvense* (Linnaeus) Scopoli, Fl. Carniol., ed. 2, 2: 126. 1772.

丝路蓟 si lu ji

Herbs 30–160 cm tall, perennial, dioecious. Roots far creeping, bearing adventitious shoots. Stems erect, branched above, unwinged. Leaf surface smooth. Capitula often numerous, terminal, corymbose. Involucre ± narrowly ovoid, 1.5–2 cm in diam. Phyllaries imbricate, in 5–7 rows, lacking wings and scarious appendage; outer and middle phyllaries triangular to ovate, 3–8 × 1.2–2.5 mm, apex acute; inner phyllaries elliptic-lanceolate to broadly linear, 9–20 × 1–3 mm, apex acute to acuminate and scarious. Corolla reddish purple or rarely white; female florets 1.6–2.4 cm, tube 1.3–1.8 cm; male florets 1.5–1.8 cm, tube 0.9–1.2 cm. Achene yellowish, 3–4.5 mm. Pappus bristles dirty white, 2.5–3.5 cm.

Moist places, ditches, farmlands, lakesides, grasslands, mountain slopes, roadsides, near villages, by rivers, wet or flooded lands; 100–4300 m. Anhui, Chongqing, Fujian, Gansu, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Xinjiang, Xizang, Zhejiang [Afghanistan, India, Japan, Kazakhstan, Korea, Mongolia, Nepal, Russia; SW Asia, Europe].

Cirsium arvense is one of the world's most noxious weeds of cultivated land. Its strong potential for vegetative multiplication from long trailing roots or root fragments results in morphologically uniform clonal stands, which at times have led to the recognition of some of the variants as distinct species.

- 1a. Lower cauline leaves pinnately divided, segments with 2–5 triangular spiny teeth.
 - 2a. Leaves ± concolorous, green, glabrous or abaxially sparsely cobwebby 45a. var. *arvense*
 - 2b. Leaves discolorous, abaxially grayish white and densely felted, adaxially green and glabrous 45b. var. *alpestre*
- 1b. Lower cauline leaves simple, or if lobed then with entire spinulose lobes.
 - 3a. Leaves ± concolorous, green, glabrous or abaxially sparsely cobwebby 45c. var. *integrifolium*
 - 3b. Leaves discolorous, abaxially grayish white and densely and thickly felted, adaxially green and glabrous or sparsely cobwebby 45d. var. *vestitum*

45a. *Cirsium arvense* var. *arvense*

丝路蓟(原变种) si lu ji (yuan bian zhong)

Serratula arvensis Linnaeus, Sp. Pl. 2: 820. 1753; *Breia arvensis* (Linnaeus) Lessing; *Carduus arvensis* (Linnaeus) Robson; *Cephalonoplos arvensis* (Linnaeus) Fourreau; *Cirsium ochrolepideum* Juzepczuk; *Cnicus arvensis* (Linnaeus) Roth.

Stems glabrous but sparsely cobwebby below capitula. Leaves ± concolorous, green, glabrous or abaxially very sparsely cobwebby. Lower cauline leaves ± shortly petiolate; leaf blade elliptic to elliptic-lanceolate, 7–17 × 1.5–4.5 cm, pinnately lobed or pinnatifid; segments 3–5 pairs, obliquely triangular to obliquely elliptic, with 2 or 3 teeth each with lateral spinules and a ca. 5 mm apical spine. Middle and upper cauline leaves similar but sessile, base semiamplexicaul. Involucre very sparsely cobwebby. Outer and middle phyllaries with a ca. 0.5 mm patent to reflexed apical spinule. Fl. and fr. Jun–Sep. 2n = 34, 34+0–1B, 51, 68.

Moist places by ditches, farmlands, lakesides; 700–4300 m. Gansu, Xinjiang, Xizang [Afghanistan, India, Kazakhstan, Nepal; SW Asia, Europe].

45b. *Cirsium arvense* var. *alpestre* Nägeli, Neue Denkschr. Allg. Schweiz. Ges. Gesamten Naturwiss. 5(1): 104. 1840.

藏蓟 zang ji

Aplotaxis cirsiioides Candolle; *Cephalonoplos arvensis* var. *alpestris* (Nägeli) Kitamura; *Cirsium lanatum* (Willdenow) Sprengel; *Cnicus lanatus* Willdenow.

Stems densely cobwebby-felted or glabrous. Leaves discolorous, abaxially grayish white and densely felted, adaxially green and glabrous. Lower cauline leaves sessile or shortly petiolate; leaf blade elliptic to oblanceolate, 7–12 × 2.5–3 cm, pinnately lobed or pinnatifid or lower ones undivided, base cuneate; segments (0–)3–5 pairs, semiorbicular, broadly ovate, or elliptic, with (2 or)3–5 triangular teeth each with lateral spinules and a 3.5–10 mm apical spine. Upper cauline leaves similar but smaller. Involucre glabrous. Outer and middle phyllaries tipped with a 2.5–4 mm spinule. Fl. and fr. Jun–Sep.

Grasslands on mountain slopes, moist places, roadsides, near villages; 500–4300 m. Gansu, Qinghai, Xinjiang, Xizang [Europe].

45c. *Cirsium arvense* var. *integrifolium* Wimmer & Grabowski, Fl. Siles. 2(2): 92 [“82”]. 1829.

Stems glabrous or sparsely felted. Leaves \pm concolorous, surface smooth, abaxially green to grayish green and glabrous or sparsely cobwebby, adaxially green and glabrous. Lower and middle cauline leaves usually sessile, \pm narrowly elliptic to elliptic-lanceolate, $7-15 \times 1.5-10$ cm, undivided or sometimes pinnately divided into entire lobes, base usually cuneate, margin entire and densely fringed with tender spinules, apex obtuse to rounded. Upper cauline leaves elliptic, lanceolate, or linear-lanceolate, gradually smaller upward. Involucre glabrous. Outer and middle phyllaries with an apical spinule less than 0.5 mm. Fl. and fr. May–Sep.

Mountain slopes, by rivers, wet lands, farmlands; 100–2700 m. Anhui, Chongqing, Fujian, Gansu, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Xinjiang, Zhejiang [Japan, Korea, Mongolia, Russia; SW Asia, Europe].

Cirsium arvense var. *integrifolium* is the most common variant in China. The whole plant is used medicinally.

45d. *Cirsium arvense* var. *vestitum* Wimmer & Grabowski, Fl. Siles. 2(2): 92 [“82”]. 1829.

阿尔泰蓟 a er tai ji

Stems grayish white, cobwebby-felted in upper half. Leaves discolorous, abaxially grayish white and densely felted, adaxially green and glabrous or sparsely cobwebby. Lower and middle cauline leaves sessile with cuneate base, elliptic to ovate, $7-8 \times$ ca. 3.4 cm, undivided or sometimes pinnately divided into entire lobes, base cuneate, densely fringed with tender 0.2–0.5 mm spinules. Upper cauline leaves similar but smaller.

Involucre glabrous. Outer and middle phyllaries tipped with a ca. 1 mm spinule. Fl. and fr. Aug–Sep. $2n = 34, 68$.

Grasslands on flooded lands; 500–1700 m. Xinjiang (Altay Shan) [Kazakhstan; SW Asia, Europe].

46. *Cirsium shihianum* Greuter, **nom. nov.**

薄叶蓟 bao ye ji

Replaced synonym: *Cirsium tenuifolium* C. Shih, Acta Phytotax. Sin. 22: 452. 1984, not *Cirsium tenuifolium* (Gaudin) Hagenbach, Verh. Schweiz. Naturf. Ges. 23: 235. 1838.

Herbs to 40 cm tall, ?annual, dioecious. Stems erect, unbranched or rarely with up to 10 branches above, unwinged, with sparse long multicellular hairs. Leaves subconcolorous, abaxially pale green and glabrous or very sparsely cobwebby, adaxially green and with sparse long multicellular hairs. Lower cauline leaves withered at anthesis. Middle cauline leaves sessile, elliptic to elliptic-lanceolate, $6-18 \times 1.3-2$ cm, undivided, auriculate semiamplexicaul, fringed with ca. 3 mm spinules alternating with ca. 5 mm spines, apex acute to acuminate. Upper cauline leaves linear-lanceolate to narrowly linear, gradually smaller upward. Capitula 1 to few. Involucre narrowly ovoid to narrowly ellipsoid, 1.5–2 cm, glabrous. Phyllaries imbricate, in ca. 7 rows, lacking wings and scarious appendage; outer phyllaries triangular, ca. $5 \times 1-1.5$ mm, tipped with a 1–2 mm recurved to reflexed spinule; middle phyllaries ovate-lanceolate to lanceolate, $7-10 \times 2-3$ mm, apex acuminate; inner phyllaries linear to linear-lanceolate, ca. 15×2 mm, apex acuminate. Corolla red, ca. 1.7 cm; tube in male florets ca. 8 mm and in female florets ca. 7.5 mm. Achene yellowish, ca. 4 mm. Pappus bristles white, to 1.5 cm. Fl. and fr. Jul–Aug.

• Forests in mountain valleys, grasslands; 1400–1600 m. Xinjiang (Altay Shan).

34. **CARDUUS** Linnaeus, Sp. Pl. 2: 820. 1753.

飞廉属 fei lian shu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, biennial or perennial. Stems with spiny wings. Leaves subentire or pinnately divided, spiny. Capitula solitary to clustered. Involucre cylindric to depressed-globose. Phyllaries imbricate. Florets bisexual. Corolla purple to red or rarely white. Stamen filaments densely pubescent; anther with short, basal appendages entire to somewhat lacerate. Style branches short. Achene narrowly obovoid, laterally compressed, often with 10–15 slender longitudinal striae but otherwise smooth; elaiosome crowned by an inconspicuous disk. Pappus 4 or 5 rows of scabrid bristles, outer ones shorter than inner.

About 95 species: tropical Africa, Asia, Europe; three species in China.

- 1a. Capitula solitary, \pm nodding; involucre 4–7 cm in diam.; outer and middle phyllaries 4–5 mm wide, distal portion narrowed at base 1. *C. nutans*
- 1b. Capitula clustered by 3–5 or sometimes solitary, erect; involucre 1.5–2(–2.5) cm in diam.; phyllaries to 2 mm wide, distal portion not narrowed at base.
 - 2a. Plants dark green; leaves abaxially sometimes gray and thinly cobwebby; leaf and wing spines weak, to 3 mm 2. *C. crispus*
 - 2b. Plants light green or bluish green; leaves concolorous and hardly cobwebby; major leaf and wing spines pungent, 3–6 mm 3. *C. acanthoides*

1. *Carduus nutans* Linnaeus, Sp. Pl. 2: 821. 1753.

飞廉 fei lian

Carduus armenus Boissier; *C. coloratus* Tamamschjan; *C.*

leiophyllus Petrovič; *C. nutans* subsp. *leiophyllus* (Petrovič) Stojanov & Stefanov; *C. schischkinii* Tamamschjan; *C. songoricus* Tamamschjan; *C. thoermeri* Weinmann.

Herbs 30–100 cm tall, biennial or perennial. Stems grayish

white, usually branched, sparsely cobwebby and hirsute below, densely cobwebby-felted above; wings continuous, unequally toothed; teeth triangular, margin and apex with spines. Leaves green, concolorous, hirsute along veins or sparsely cobwebby. Lower and middle cauline leaves sessile, ovate to lanceolate, (5–)10–40 × (1.5–)3–10 cm, pinnatifid or pinnatipartite; segments 5–7 pairs, obliquely triangular to triangular-ovate, margin spinulose, apex with a 4–6 mm spine. Upper cauline leaves similar but gradually smaller upward, pinnately lobed or entire. Capitula 4–6, solitary at end of stem and branches, ± nodding. Involucre ± broadly campanulate, 4–7 cm in diam. Phyllaries slightly constricted at or beyond middle then expanded into a lanceolate, spiny-tipped, and patent to recurved distal portion; outer phyllaries 14–15 × 4–5 mm; middle and inner phyllaries 1.5–2 × ca. 0.5 cm; innermost phyllaries broadly linear to linear-lanceolate, 2–2.2 × 0.2–0.3 cm, not constricted. Corolla purplish red, ca. 2.5 cm, tube ca. 1.3 cm. Achene grayish yellow with pale brown striae, ca. 3.5 mm. Pappus bristles white, unequal, to 2 cm. Fl. and fr. Jun–Sep. $2n = 16, 40$.

By croplands, grasslands, valleys; 500–2300 m. N Xinjiang [Kazakhstan, Mongolia, Russia; N Africa, SW Asia, Europe].

Carduus nutans is a variable species. At least fifteen subspecies have been recognized in the western, European part of its range. *Carduus nutans* subsp. *nutans* does not extend to Asia. The Chinese plants probably belong to *C. nutans* subsp. *leiophyllus*, as the synonymy indicates, but more research is needed.

2. *Carduus crispus* Linnaeus, Sp. Pl. 2: 821. 1753.

丝毛飞廉 si mao fei lian

Herbs 40–150 cm tall, biennial or perennial. Stems erect, apically usually branched, sparsely hirsute, usually cobwebby above; wings toothed, teeth with slender spines 1–3 mm at margin and apex. Leaves dark green, abaxially sometimes gray and thinly cobwebby, sparsely hirsute along veins. Lower cauline leaves sessile, ± narrowly elliptic or oblanceolate, 5–18 × 1–7 cm, pinnatifid or lowermost undivided; segments 7–12 pairs, elliptic, triangular, or ovate-triangular, margin spinulose and unequally toothed, teeth triangular, laterally with short spinules, and apically with a spine to ca. 3 mm. Middle cauline leaves similar but smaller. Uppermost cauline leaves oblanceolate to broadly linear. Capitula mostly 3–5 clustered at end of stem or branches, rarely solitary. Involucre subglobose, 1.5–2(–2.5) cm in diam., glabrous or sparsely cobwebby. Outer phyllaries triangular, ca. 3 × 0.7 mm, apex mucronulate to spiniform; middle phyllaries 4–13 × 0.9–2 mm, narrowed into a triangular-subulate erect-patent or spreading spiny-tipped distal portion; inner

phyllaries linear, straight, distally membranous and acuminate. Corolla purplish red or rarely white, ca. 1.5 cm, tube ca. 7 mm. Achene ca. 4 mm. Pappus bristles white, to 1.3 cm. Fl. and fr. Feb–Oct. $2n = 16, 16+2B, 18$.

Grasslands on mountain slopes, farmlands, wastelands, by rivers, forests; 400–3600 m. Widely distributed in China (but see discussion for *Carduus acanthoides*) [Kazakhstan, Korea, Mongolia, Russia; SW Asia, Europe].

Carduus crispus is weedy but a good nectariferous plant. It is widely naturalized in North America.

3. *Carduus acanthoides* Linnaeus, Sp. Pl. 2: 821. 1753.

节毛飞廉 jie mao fei lian

Herbs (10–)20–100 cm tall, biennial or perennial. Stem solitary, long branched, ± hirsute; wings toothed, teeth with major spines pungent, 3–5 mm. Leaves concolorous, light or bluish green, not or scarcely cobwebby, sparsely hirsute along veins. Basal and lower cauline leaves sessile, elliptic to oblanceolate, 6–29 × 2–7 cm, pinnately lobed to pinnatipartite; segments 6–12 pairs, elliptic to triangular, margin toothed, teeth laterally and apically with 3–5 mm spines. Middle and upper cauline leaves similar but gradually smaller upward; uppermost cauline leaves ± broadly linear, sometimes undivided. Capitula mostly solitary or clustered at end of stem and branches. Involucre subglobose, 1.5–2(–2.5) cm in diam., glabrous or sparsely cobwebby. Outer phyllaries linear to triangular-subulate, ca. 7 × 1 mm, apical spinule 1–2 mm; middle phyllaries 8–14 × 1.5–1.6 mm, narrowed into a triangular-subulate erect-patent or spreading distal portion with apical 1–2 mm spinule; inner phyllaries linear, straight, ca. 16 × 1 mm, apex thin and acuminate. Corolla purplish red or rarely white, ca. 1.7 cm, tube ca. 8 mm. Achene brownish, ca. 4 mm. Pappus bristles white, ca. 1.5 cm. Fl. and fr. May–Oct. $2n = 16, 22$.

Mountain slopes, mountain valleys, ravines, grasslands, forest margins, thickets, farmlands, by water; 200–3500 m. Gansu, Guizhou, Hebei, Henan, SW Hunan, W Jiangsu, N Jiangxi, S Nei Mongol, Ningxia, E and S Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, N Xinjiang, E Xizang, Yunnan [Russia; SW Asia, Europe].

The distinction between *Carduus crispus* and *C. acanthoides* breaks down in Chinese material, which for the most part shows intermediate features. Perhaps only a single species (best assigned to *C. acanthoides*) exists in China.

Carduus acanthoides is naturalized in North and South America and the Pacific islands (New Zealand).

5. Subtribe CENTAUREINAE

矢车菊亚族 shi che ju ya zu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs or subshrubs, annual, biennial, or perennial. Stems and leaves usually unarmed. Capitula homogamous or heterogamous; if capitula heterogamous then outer florets in 1 row, tubular, often enlarged and radiant, sterile or rarely female; inner florets in many rows, bisexual. Receptacle with dense whitish linear smooth setae. Corolla tube slender. Achene with or without an apical rim, glabrous or rarely hairy; attachment scar usually lateral. Pappus usually double (i.e., differentiated into 2 types of pappus elements); outer pappus elements bristlelike, usually in many rows and increasing in length from outermost to inner; inner pappus elements scalelike or bristlelike but wider than outer ones; or pappus simple and all pappus elements bristlelike or scalelike, rarely absent.

About 29 genera and ca. 750 species: mainly in N Africa, C and SW Asia, and Europe, with a few in tropical Africa, tropical and E Asia, Australia, and North and South America; 16 genera (one endemic, two introduced) and 37 species (two endemic, four introduced) in China.

- 1a. Capitula homogamous; all florets bisexual.
 - 2a. Middle phyllaries apically rounded, with a narrow hyaline margin or with a scarious appendage.
 - 3a. Involucre 3–6 cm in diam., or if involucre smaller then pappus elements pinnate at apex and persistent 35. *Rhaponticum*
 - 3b. Involucre 1–2.5 cm in diam. and pappus elements serrulate and easily falling off 41. *Plagiobasis*
 - 2b. Middle phyllaries apically acute or acuminate, without an appendage or with a simple spine, spinule, or subulate tip.
 - 4a. Outer phyllaries leaflike or with a leaflike appendage 48. *Carthamus*
 - 4b. All phyllaries \pm leathery and without a leaflike appendage but often apicalmost leaves approximate to capitulum.
 - 5a. Annuals; pappus elements of two types (i.e., innermost bristle or bristles wider and longer than others).
 - 6a. Middle phyllaries with an apical spinule; stems mostly branched from base and branches procumbent or ascending 36. *Oligochaeta*
 - 6b. Middle phyllaries without apical spinule; stems erect and branched only in apical part 42. *Russowia*
 - 5b. Perennials; pappus elements all \pm of one type.
 - 7a. Middle phyllaries 0.5–1 mm wide, subulate or narrowly ovate, apex attenuate into long subulate tip 39. *Tricholepis*
 - 7b. Middle phyllaries 1–6 mm wide, narrowly triangular or narrowly ovate, apex with or without a short apical spinule.
 - 8a. Stem virgately branched, terminal branches densely foliate up to capitulum 38. *Archiserratula*
 - 8b. Stem simple or branched, terminal branches sparsely foliate or leafless 37. *Klasea*
 - 1b. Capitula heterogamous; outer florets female or sterile, inner florets bisexual.
 - 9a. Outer and middle phyllaries with a fimbriate, spiny, scarious, or hyaline appendage.
 - 10a. Appendage of middle phyllaries fimbriate, long decurrent almost to base; bisexual florets violet-blue 49. *Cyanus*
 - 10b. Appendage of middle phyllaries fimbriate, lacerate, or entire, not or only shortly decurrent; bisexual florets purple, pink, white, or yellow.
 - 11a. Leaves densely tomentose especially on abaxial side 46. *Psephellus*
 - 11b. Leaves glabrous or with various pubescence types but not densely tomentose.
 - 12a. Leaf blade margin argutely toothed; longitudinal striae of middle phyllaries conspicuous 45. *Rhaponticoides*
 - 12b. Leaf blade margin entire, coarsely dentate, or spinose; longitudinal striae of middle phyllaries inconspicuous or lacking 50. *Centaurea*
 - 9b. Outer and middle phyllaries without an appendage but sometimes with a spinule and/or hyaline margin.
 - 13a. Apex of middle phyllaries broadly rounded.
 - 14a. Pappus elements scalelike; plants annual or biennial 40. *Amberboa*
 - 14b. Pappus elements bristlelike; plants perennial.
 - 15a. Corolla pink to purplish; leaf blade undivided but margin serrate 41. *Plagiobasis*
 - 15b. Corolla yellow to yellowish; leaf blade pinnatisect, pinnate, or bipinnatisect 45. *Rhaponticoides*
 - 13b. Apex of middle phyllaries acute or acuminate.
 - 16a. Perennials; phyllaries lanate or velvety 44. *Serratula*
 - 16b. Annuals; phyllaries glabrous or subglabrous.
 - 17a. Leaf blade margin spiny; dwarf plants less than 20 cm tall 43. *Schischkinia*
 - 17b. Leaf blade margin serrate-dentate, not spiny; erect plants 20–60 cm tall 47. *Crupina*

35. RHAPONTICUM Vaillant, Königl. Akad. Wiss. Paris 5: 177. 1754.

漏芦属 *lou lu shu*

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Acroptilon Cassini; *Klaseopsis* L. Martins; *Leuzea* Candolle; *Stemmacantha* Cassini.

Herbs, perennial. Stems erect, simple or branched. Capitulum homogamous, solitary, at end of stem or branches. Phyllaries imbricate, with narrow membranous margin or apical scarious or membranous appendage. Florets bisexual. Corolla pink to purple. Achene tetragonal or inconspicuously striate. Pappus elements in several rows, brittle, scabrid to shortly plumose; pappus elements of innermost row basally wider than and as long as or slightly longer than others.

About 26 species: Africa, Asia, Australia, Europe; four species (one endemic) in China.

- 1a. Stem simple; capitulum 1; middle phyllaries with a conspicuous scarious appendage; involucre 3.5–6 cm in diam.
 2a. Pappus elements scabrid; appendage of phyllaries glabrous or puberulent 1. *R. uniflorum*
 2b. Pappus elements plumose; appendage of phyllaries villous 2. *R. carthamoides*
 1b. Stem branched; capitula few to many, or if rarely 1 then middle phyllaries with a very narrow membranous margin but without an appendage; involucre 0.5–3 cm in diam.
 3a. Involucre 0.5–1.3 cm in diam.; phyllaries with membranous appendage; corolla ca. 1.4 cm; achene 3.5–4 mm ... 3. *R. repens*
 3b. Involucre 1.5–3 cm in diam.; phyllaries with very narrow membranous margin; corolla 1.8–3 cm; achene 5–8 mm 4. *R. chinense*

1. *Rhaponticum uniflorum* (Linnaeus) Candolle, Ann. Mus. Natl. Hist. Nat. 16: 189. 1810.

漏芦 lou lu

Cnicus uniflorus Linnaeus, Mant. Pl. 2: 572. 1771; *Centaurea monantha* Georgi; *Leuzea uniflora* (Linnaeus) Holub; *Rhaponticum monanthum* (Georgi) Voroschilov; *R. satzyperovii* Soskov; *R. uniflorum* subsp. *satzyperovii* (Soskov) Voroschilov; *Serratula uniflora* (Linnaeus) Poirét; *Stemmacantha uniflora* (Linnaeus) Dittrich.

Herbs (10–)20–100 cm tall. Stems single or few, grayish white, ca. 5 mm in diam., lanate, basally clothed with remains of petioles. Leaves grayish white, soft, arachnoid lanate. Basal and lower stem leaves petiolate; petiole 6–20(–40) cm; leaf blade elliptic, narrowly elliptic, or oblanceolate, 10–25 × 3–9 cm, pinnatipartite or subpinnatisect; lateral lobes or segments 5–12 pairs, elliptic to oblanceolate, margin toothed, coarsely toothed, or entire. Middle and upper stem leaves sessile or shortly petiolate, similar in form and same in division to basal and lower stem leaves. Peduncle stout, leafless or with a few diminished leaves. Capitulum 1. Involucre 3.5–6 cm in diam. Phyllaries in (4 or) 5–8 rows, appendaged; appendages brown, broadly ovate to suborbicular, 0.9–1.5 × 0.8–1.5 cm, margin lacerate; outer phyllaries ovate, ca. 5 × 3 mm excluding apical appendage; middle phyllaries elliptic to lanceolate, ca. 10 × 4 mm excluding apical appendage; inner and innermost phyllaries lanceolate, ca. 2 × 0.3 cm excluding apical appendage. Corolla 2.5–3.5 cm. Achene cuneate, ca. 4 mm, with denticulate rim at apex. Pappus elements in many rows, longest ca. 2 cm, scabrid. Fl. Apr–Jul, fr. May–Aug. $2n = 26^*$.

Hills, forests, rocky slopes; 100–2700 m. Gansu, Hebei, SW Heilongjiang, Henan, Hubei, E Jilin, Liaoning, Nei Mongol, Ningxia, E Qinghai, Shaanxi, Shandong, Shanxi, Sichuan [Korea, Mongolia, Russia].

The occurrence of *Rhaponticum satzyperovii* in NE China was indicated by Soskov (Fl. URSS 28: 317. 1963). It is said to differ from *R. uniflorum* by its more robust habit and its stem leaves with 4–6 pairs of ovate lobes (not 8–12 pairs of lanceolate lobes). This taxon should probably be treated as *R. uniflorum* subsp. *satzyperovii*, but the material seen is too scarce to make a decision about its taxonomic status.

2. *Rhaponticum carthamoides* (Willdenow) Iljin, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 1: 204. 1933.

漏草 lou cao

moides (Willdenow) Poirét; *Stemmacantha carthamoides* (Willdenow) Dittrich.

Herbs 60–90 cm tall. Stems simple, ca. 1 cm in diam., sparsely arachnoid. Leaves green, sparsely arachnoid along veins and margin. Lower and middle stem leaves shortly petiolate to subsessile; leaf blade elliptic, oblanceolate, or lanceolate, 13–25 × ca. 7 cm, pinnatipartite or subpinnatisect; lateral lobes or segments 5–8 pairs, lanceolate to narrowly lanceolate, margin serrate, apex attenuate-apiculate. Upper stem leaves sessile, lanceolate, decreasing in size upward, basally pinnatisect or pinnatipartite with 3 or 4 pairs of lateral segments or undivided, margin toothed. Capitulum 1. Involucre 4.5–6 cm in diam. Phyllaries in 10–12 rows; outer and middle phyllaries ovate to narrowly ovate, 5–10 × 4–5 cm excluding apical appendage, apically purplish red; appendage of middle phyllaries brown, ovate, broadly triangular, or subrhombic, to 7 × 7 mm, spreading to reflexed, villous; inner and innermost phyllaries lanceolate to linear-lanceolate, 15–18 × 2–3 mm excluding apical appendage; appendage of inner phyllaries brown, ovate, 6–8 × 2–5 mm, villous. Corolla ca. 2.5 cm. Achene brown, narrowly ellipsoid, ca. 7 mm, with denticulate rim at apex. Pappus elements yellowish to pale brown, longest ca. 1.8 cm, shortly plumose. Fl. and fr. Jul. $2n = 24$.

Grasslands, meadows; 2000–2700 m. NW Xinjiang [Kazakhstan, Mongolia, Russia].

The rhizomes are used medicinally.

3. *Rhaponticum repens* (Linnaeus) Hidalgo, Ann. Bot. (Oxford) 97: 714. 2006.

顶羽菊 ding yu ju

Centaurea repens Linnaeus, Sp. Pl., ed. 2, 2: 1293. 1763; *Acroptilon australe* Iljin; *A. picris* (Pallas ex Willdenow) C. A. Meyer; *A. repens* (Linnaeus) Candolle; *C. picris* Pallas ex Willdenow; *Serratula picris* (Pallas ex Willdenow) M. Bieberstein.

Herbs 25–70 cm tall. Stems 1 or few, erect, branched from base, densely foliate, arachnoid. Leaves sessile, elliptic, spatulate, or linear, 2–7 × 0.4–1.3 cm, pinnatifid, slightly rigid, grayish green, sparsely arachnoid to glabrescent, margin dentate or entire. Upper leaves often smaller. Capitula many, corymbose to corymbose-paniculate. Involucre ovoid to ellipsoid-ovoid, 5–13 mm in diam. Phyllaries in ca. 6 rows; outer and middle phyllaries ovate to broadly ovate, 3–11 × 2–6 mm, appendaged, basal part green and to a large extent concealed by appendages; appendage of outer phyllaries white, membranous, glabrous, apically ciliate or villous, apex obtuse to acuminate; inner phyllaries lanceolate to linear-lanceolate, ca. 13 × 2–3 mm; appendage of inner phyllaries small, apically densely vil-

lous. Corolla ca. 1.4 cm. Achene yellowish to pale brown, narrowly obovoid, 3.5–4 mm, apex rounded. Pappus elements 8–10 mm, shortly plumose at apex, easily falling off at maturity. Fl. and fr. May–Sep. $2n = 26^*$.

Mountain slopes, hills, waste places, farmlands, plains; 600–2600 m. Gansu, Hebei, Nei Mongol, Ningxia, Qinghai, N Shaanxi, N Shanxi, Xinjiang [Afghanistan, Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, Pakistan, Russia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia, Europe].

4. *Rhaponticum chinense* (S. Moore) L. Martins & Hidalgo, Bot. J. Linn. Soc. 152: 461. 2006.

华漏芦 hua lou lu

Herbs 60–120 cm tall. Stems erect, branched or rarely unbranched, sparsely arachnoid, glabrescent, or glabrous. Leaf blade of middle stem leaves ovate, lanceolate, or narrowly lanceolate, 6–15 × 0.9–7.5 cm, scabrid, setiferous and minutely brownish yellow gland-dotted, margin dentate, denticulate, or serrate, apex acute to attenuate-acuminate. Middle stem leaves petiolate; petiole 0.5–2.5(–4.5) cm. Upper leaves sessile or subsessile, similar to middle stem leaves, decreasing in size upward. Peduncle inflated below capitula. Involucre bowl-shaped, 1.5–3 cm in diam. Phyllaries in 6 or 7 rows, tinged purple, margin narrow and scarious, apex rounded to obtuse; outer phyllaries ovate to elliptic, 5–13 × 3–5 mm; inner and innermost phyllaries elliptic to linear-elliptic, 2–2.6 × 0.2–0.5 cm. Corolla 1.8–3 cm. Achene dark brown, narrowly ellipsoid, 5–8 mm, without an apical rim. Pappus elements brown, longest 1–1.6 cm, scabrid. Fl. and fr. Jul–Oct.

• Grasslands on slopes, forest margins, forests, thickets, thicket margins; 300–1400 m. W Anhui, Fujian, SE Gansu, N and NE Guangdong, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, S Shaanxi, Sichuan, Yunnan, S Zhejiang.

36. *OLIGOCHAETA* (Candolle) K. Koch, *Linnaea* 17: 42. 1843.

寡毛菊属 gua mao ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Serratula sect. *Oligochaeta* Candolle, Prodr. 6: 671. 1838.

Herbs, annual. Stem usually branched from base. Leaves undivided or lyrate pinnatifid. Capitula homogamous, sessile, axillary or terminal at end of stem and branches, solitary or in clusters of 2 or 3. Phyllaries imbricate, attenuate into a short spinule or acuminate. Florets bisexual. Corolla pink. Stigmatic branches patent. Achene with an entire or minutely denticulate apical rim. Pappus elements of two types; outer pappus of scabrid bristles; inner pappus of 1–5 bristles, slightly longer and distinctly wider than outer ones.

Four species: Asia; one species in China.

滇黔漏芦 dian qian lou lu

Basionym: *Centaurea missionis* H. Léveillé, Repert. Spec. Nov. Regni Veg. 8: 451. 1910.

Leaf blade of middle stem leaves narrowly lanceolate, 6–11 × 0.9–2.5 cm, margin serrate, apex attenuate-acuminate; teeth herbaceous, directed toward apex at an acute angle. Anther appendages narrowly triangular, acuminate.

• Guizhou, Yunnan.

adaxially glabrous, base cuneate, margin serrate and sometimes lobed near base, apex acute. Capitula few. Involucre ellipsoid to ellipsoid-ovoid, 10–13 × 4–7 mm. Phyllaries in ca. 5 rows; outer and middle phyllaries ovate to elliptic, 4–10 × 1.5–2 mm, abaxially white pubescent, apex attenuate into a 2–3 mm spinule; inner phyllaries linear, ca. 12 × 1 mm, apex acuminate and spiniform. Corolla ca. 7.5 mm. Achene yellowish, oblanceolate, ca. 2.5 mm, apex truncate. Pappus elements white, scabrid; outer pappus elements ca. 4 mm; inner pappus elements 1(or 2), ca. 6 mm. Fl. and fr. Jul.

Mountain slopes. N Xinjiang [Afghanistan, Pakistan, Turkmenistan, Uzbekistan; SW Asia].

37. **KLASEA** Cassini in F. Cuvier, Dict. Sci. Nat. 35: 173. 1825.

麻花头属 *ma hua tou shu*

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Nikitinia Iljin; *Schumeria* Iljin.

Herbs, perennial. Leaves pinnatilobed, pinnatipartite, or pinnatisect, rarely undivided, rigid or soft, margin entire or toothed. Capitula homogamous, 1 or to many in a panicle, rarely compactly corymbose, solitary at end of stem and branches. Involucre globose, ovoid, hemispheric, or bowl-shaped. Phyllaries imbricate, rigid; middle phyllaries with apex acute to acuminate and often with apical spinule; inner phyllaries longest, papillose-puberulent at apex. Florets bisexual. Corolla purple to pink, rarely almost white; tube 1/3–1/2 as long as corolla. Stigmatic branches to 1(–3) mm. Achene glabrous, with a subentire apical rim. Pappus elements of one type, in several rows, whitish to yellowish brown, all ± same length or outer ones shorter, scabrid or finely barbellate.

About 45 species: N Africa, Asia, Europe; eight species in China.

All Chinese species belong to *Klasea* sect. *Klasea*.

- 1a. Leaf blade adaxially scabrous with multicellular hairs but sometimes sparsely so.
 - 2a. Stems always simple, to 10 cm; margin of phyllaries black 6. *K. lyratifolia*
 - 2b. Stems simple or branched, (10–)15–150 cm; margin of phyllaries purplish or pale-colored.
 - 3a. Middle phyllaries acuminate, with apical spinule 2.5–5 mm; leaf blade glandular with minute sessile glands 3. *K. dissecta*
 - 3b. Middle phyllaries acute, with apical spinule 0.2–2 mm or without spinule; leaf blade not glandular 8. *K. centauroides*
- 1b. Leaf blade adaxially glabrous but margin sometimes pubescent.
 - 4a. Leaf blade glaucous, margin entire.
 - 5a. Involucre 1.5–3 cm in diam.; middle phyllaries with conspicuous black to dark brown area at apex 1. *K. marginata*
 - 5b. Involucre 0.8–1.5 cm in diam.; middle phyllaries with inconspicuous brownish spot at apex 2. *K. cardunculus*
 - 4b. Leaf blade green, margin dentate.
 - 6a. Stem to 15 cm, usually decumbent; involucre 1.8–2.5 cm in diam. 5. *K. procumbens*
 - 6b. Stem 15–80 cm, erect; involucre 1.1–1.7 cm in diam.
 - 7a. Spinule of middle phyllaries to 1 mm; leaf blade leathery with paler venation and margin white cartilaginous 4. *K. suffruticulosa*
 - 7b. Spinule of middle phyllaries (1–)3–5 mm; leaf blade herbaceous, concolorous 7. *K. sogdiana*

1. *Klasea marginata* (Tausch) Kitagawa, J. Jap. Bot. 40: 137. 1965.

薄叶麻花头 *bao ye ma hua tou*

Serratula marginata Tausch, Flora 11: 484. 1828; *Klasea algida* (Iljin) Hidalgo; *S. algida* Iljin; *S. dshungarica* Iljin; *S. glauca* Ledebour (1812), not Linnaeus (1753); *S. nitida* Fischer ex Sprengel var. *glauca* Trautvetter.

Herbs 15–80 cm tall. Rhizomes ascending to procumbent. Stem solitary, erect, simple or rarely with 1 branch, base clothed with fibrous remains of petioles. Leaves glabrous or with sparse hairs, glaucous, margin often minutely ciliate. Basal leaves petiolate; leaf blade elliptic, narrowly elliptic, or ovate, tapering into petiole, 3–15 × 1.5–4 cm, margin entire, repand-crenate, or rarely pinnatilobed. Stem leaves few, sessile, lanceolate to linear, pinnatilobed or undivided, margin entire or toothed. Capitulum 1(or 2). Involucre campanulate to bowl-shaped, 1.5–2.5(–3) cm in diam. Phyllaries in 5–7 rows, apically dark brown to black; outer and middle phyllaries ovate-triangular, elliptic, or ovate-elliptic, 5–14 × 2–3 mm, apex acuminate and with a 1–3 mm spinule; inner and innermost phyllaries lanceolate to linear-lanceolate 10–20 × 1.5–3 mm. Corolla purple, (1.3–)1.6–2.3 cm. Achene brown, oblong, 4–6 mm. Pappus whitish, ca. 1.2 cm. Fl. and fr. Jun–Aug. *2n* = 30.

Mountain steppes, hilly areas; 1500–2300 m. Gansu, Heilongjiang, Nei Mongol, N Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan, Uzbekistan].

2. *Klasea cardunculus* (Pallas) Holub, Folia Geobot. Phytotax. 12: 305. 1977.

分枝麻花头 *fen zhi ma hua tou*

Centaurea cardunculus Pallas, Reise Russ. Reich. 1: 500. 1771; *Serratula cardunculus* (Pallas) Schischkin; *S. nitida* Fischer ex Sprengel.

Herbs 20–70 cm tall. Rhizomes short. Stems erect, unbranched or apically branched, glabrous or subglabrous, base clothed with remains of petioles. Leaves glabrous or with sparse hairs, glaucous. Basal leaves shortly to long petiolate; leaf blade oblong-elliptic, elliptic, or lanceolate, 5–10 × 0.8–2 cm, base cuneate-attenuate, margin entire or toothed, apex obtuse to acute. Stem leaves several, sessile, lanceolate to narrowly elliptic, smaller than basal ones, margin entire, toothed, or pinnatilobed. Upper stem leaves linear, smaller than others, margin entire. Capitula (1 or) 2–7(–9). Involucre campanulate, 0.8–1.5 cm in diam., glabrous. Phyllaries imbricate, in 5 or 6 rows; outer and middle phyllaries ovate to ovate-lanceolate, 1.7–2.5 mm wide. Corolla purple or rarely white, 1.5–1.7 cm. Achene dark brown to black, oblong, 3.5–5 mm. Pappus whitish, 7–9 mm. Fl. and fr. Jun–Jul.

Meadows; 500–1500 m. Nei Mongol (Xilin Gol Meng), Xinjiang [Kazakhstan, Mongolia, Russia; Europe].

3. *Klasea dissecta* (Ledebour) L. Martins, Bot. J. Linn. Soc. 152: 455. 2006.

羽裂麻花头 yu lie ma hua tou

Serratula dissecta Ledebour, Fl. Altaic. 4: 40. 1833; *S. angulata* Karelin & Kirilov; *S. dissecta* var. *angulata* (Karelin & Kirilov) Trautvetter.

Herbs 20–40 cm tall. Rhizomes short and thick. Stems solitary or few, erect, branched in upper part, sparsely setiferous, with fibrous remains of petioles at base. Leaves pubescent with multicellular hairs and minute sessile yellow glands. Basal and lower stem leaves long petiolate; petiole fibrous; leaf blade elliptic, 10–15 × 1.5–3.5 cm, pinnatipartite; lateral lobes 5–8 pairs, lanceolate, narrowly elliptic, or broadly linear, margin toothed. Middle stem leaves sessile, similar in form and same in division to basal and lower stem leaves. Upper stem leaves lanceolate, margin toothed. Capitula few to many, corymbose-paniculate. Involucre ovoid-cylindric to narrowly obconic, 5–12 mm in diam., sparsely tomentose. Phyllaries in 6 or 7 rows; outer phyllaries ovate, 3.5–6 × 1.5–2 mm, apex with a 0.5–2 mm straight to patent spinule; middle phyllaries lanceolate, ca. 10 × 2 mm, apex attenuate into a straight or spreading 2.5–5 mm spinule; inner and innermost phyllaries elliptic to broadly linear, ca. 17 × 1.5–2 mm, apex acuminate. Corolla purple to pink, ca. 1.3 cm. Achene pale to dark brown, narrowly ellipsoid, 4–6 mm, many striate. Pappus whitish to straw-colored, ca. 8 mm. Fl. and fr. Jun–Jul.

Deserts; 1000–1500 m. NW Xinjiang [Kazakhstan].

4. *Klasea suffruticulosa* (Schrenk) L. Martins, Taxon 54: 636. 2005.

木根麻花头 mu gen ma hua tou

Serratula suffruticulosa Schrenk, Bull. Cl. Phys.-Math. Acad. Imp. Sci. Saint-Petersbourg 3: 110. 1845; *S. ajdarovae* Sultanova.

Herbs (10–)15–50 cm tall. Rhizomes brown, robust, woody. Stems erect, woody at base, apically with few branches or rarely simple. Leaves rigid, leathery, glabrous or subglabrous, venation paler than rest of blade, margin toothed and white cartilaginous. Basal leaves petiolate; petiole 2.5–5 cm; leaf blade elliptic to spatulate, 4.5–9 × 1.5–5 cm, base cuneate, apex obtuse to acute. Middle cauline leaves similar to basal ones or lanceolate to oblanceolate and smaller. Upper cauline leaves smallest, linear. Capitula few or rarely 1. Involucre green to yellowish green, cylindric to ovoid-cylindric, 1.1–1.5 cm in diam., glabrous. Phyllaries imbricate, in 6–8 rows; outer phyllaries triangular-ovate to ovate, 2.5–5 × 2–3 mm; middle phyllaries elliptic, narrowly elliptic, or elliptic-lanceolate, 7–15 × 2.5–4 mm, apex acute and with a less than 1 mm spinule; inner and innermost phyllaries broadly linear to linear, 14–20 × 1.3–2 mm, apex acute and mucronate. Corolla purple, 1.5–1.9 cm. Achene brown, cuneate-ellipsoid, ca. 6 mm, striate. Pappus 6–11 mm. Fl. and fr. Jul–Aug.

Mountain slopes; ca. 1500 m. Xinjiang (Tian Shan) [Kazakhstan, Kyrgyzstan].

5. *Klasea procumbens* (Regel) Holub, Folia Geobot. Phytotax. 12: 427. 1977.

歪斜麻花头 wai xie ma hua tou

Serratula procumbens Regel, Bull. Soc. Imp. Naturalistes Moscou 40(3–4): 165. 1867.

Herbs 7–15 cm tall. Rhizomes long, procumbent. Stems single or few, decumbent or ascending, simple or sparingly branched, glabrous. Leaves narrowly elliptic, lanceolate-elliptic, or lanceolate, leathery, inconspicuously puberulent especially on margin or glabrous. Basal and lower stem leaves shortly petiolate; leaf blade 3–7 × 0.7–2 cm, base attenuate, margin toothed; teeth with cartilaginous tip. Middle stem leaves sessile, base semiamplexicaul, margin toothed below middle. Uppermost stem leaves broadly linear, margin entire. Capitula 1–3. Involucre ovoid-cylindric, 1.8–2.5 cm in diam., glabrous or subglabrous. Phyllaries in 7–9 rows; outer phyllaries triangular to ovate-lanceolate, 5–7 × ca. 3 mm, apex acute and with a straight or patent 1–2 mm spinule; middle phyllaries elliptic-lanceolate to elliptic, 9–12 × ca. 3 mm, with an apical straight or patent 1.5–2 mm spinule; inner phyllaries lanceolate, linear-lanceolate, or broadly linear, 1.6–2.2 × ca. 0.2 cm. Corolla purple to pink, ca. 2.5 cm. Achene brown, ellipsoid, ca. 6 mm. Pappus pale, ca. 1.3 cm. Fl. and fr. Jul–Sep.

Mountain slopes, ruderal areas; 2600–3600 m. SW Xinjiang [Afghanistan, Kashmir, Pakistan, Tajikistan].

6. *Klasea lyratifolia* (Schrenk ex Fischer & C. A. Meyer) L. Martins, Taxon 54: 636. 2005.

无茎麻花头 wu jing ma hua tou

Serratula lyratifolia Schrenk ex Fischer & C. A. Meyer, Enum. Pl. Nov. 1: 45. 1841; *Klasea rugosa* (Iljin) Kitagawa; *S. modestii* Borissova; *S. rugosa* Iljin; *S. tianschanica* Saposhnikov & Nikitina.

Herbs, stemless or stem to 10 cm tall. Rhizome stout, oblique. Leaves petiolate; petiole 1–5 cm; leaf blade 2.5–10 × 1.5–4 cm, lyrate or pinnatipartite, subleathery, with scattered rather large multicellular hairs on adaxial surface, margin denticulate; lateral lobes 1–3(–5) pairs, broadly triangular, elliptic, or narrowly elliptic; terminal lobe ovate to orbicular, larger than others. Capitulum 1. Involucre bowl-shaped, 1.5–3 cm in diam., glabrous or subglabrous. Phyllaries in 6–8 rows, green with narrow black margin; outer phyllaries triangular, 5–10 × 2–6 mm, apex acute; middle phyllaries ovate to ovate-elliptic, 6–15 × 4–6 mm, apex acute and with a less than 2 mm spinule; inner phyllaries lanceolate, elliptic-lanceolate, or broadly linear, 1.4–2.2 × 0.2–0.5 cm, apex with a scarious appendage. Corolla purple, 2–2.6 cm. Achene grayish brown or dark brown, narrowly cuneate-ellipsoid, 5–6 mm. Pappus 1.5–2.2 cm. Fl. and fr. Jul–Sep. $2n = 30$.

Mountain slopes; 2000–3400 m. NW Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

The taxonomic status of *Klasea rugosa* needs clarification. It should possibly be assigned subspecific rank. It differs from typical *K. lyratifolia* by the terminal leaf segment not enlarged and by long (ca. 3 mm) stigmatic branches.

7. *Klasea sogdiana* (Bunge) L. Martins, Bot. J. Linn. Soc. 152: 455. 2006.

阿拉套麻花头 a la tao ma hua tou

Serratula sogdiana Bunge, Beitr. Fl. Russl. 191. 1852; *S. alata* C. A. Meyer; *S. dissecta* Ledebour var. *asperula* Regel & Herder; *S. trautvetterana* Regel & Schmalhaus.

Herbs 30–80 cm tall. Rhizomes long, woody. Stems erect, apically long virgately branched, glabrous or basally with scattered hairs. Leaves glabrous except at margin, adaxially shiny. Basal leaves petiolate; leaf blade elliptic, undivided, margin toothed. Lower and middle stem leaves lyrate pinnatifid; lobes toothed, lateral lobes sublinear to linear, terminal lobe ovate to narrowly elliptic. Upper stem leaves pinnatifid or undivided. Capitula several, solitary at end of a branch. Involucre campanulate, 1.2–1.7 cm in diam. Phyllaries tightly imbricate, in 8 or 9 rows; outer phyllaries triangular, ovate, or ovate-elliptic, 4–7.5 × 1.5–2.5 mm, apex acute and with a (1–)3–5 mm apical spinule; middle phyllaries elliptic-lanceolate or narrowly lanceolate, 11–13 × 1.8–2.5 mm, apex acute and with a (1–)3–5 mm spinule; inner and innermost phyllaries oblanceolate, 20–23 × 1.5–2 mm, apex acuminate. Corolla purple, 1.6–2 cm. Achene brown, ovoid-ellipsoid, ca. 5 mm. Pappus ca. 1 cm. Fl. and fr. Jul–Sep. $2n = 30, 60$.

Mountain slopes; ca. 1400 m. NW Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

8. *Klasea centauroides* (Linnaeus) Cassini ex Kitagawa, J. Jap. Bot. 21: 138. 1947.

麻花头 ma hua tou

Herbs (10–)25–150 cm tall. Stem erect, simple or branched, sparsely to densely crispate-pubescent near base, subglabrous in upper part, base with lacerate remains of old petioles. Leaves subglabrous to scabrid; pubescence often sparse, somewhat denser toward margin and along veins, composed of small appressed (ca. 0.2 × 0.03 mm) and larger patent (ca. 1 × 0.1 mm) multicellular hairs. Basal and lower stem leaves petiolate. Upper leaves sessile. Capitula 1 to many. Involucre 0.6–3 cm in diam. Phyllaries imbricate, in 4–10 rows; outer and middle phyllaries 2–11 × 1.5–5(–6) mm, without an apical spine or with a 0.2–2 mm spinule. Corolla purple to pink, rarely almost white, 2–3 cm. Achene brown to pale brown, cuneate-ellipsoid to obliquely cuneate, 4.5–6 mm, faintly ribbed. Pappus 7–11 mm. Fl. and fr. May–Oct.

Mountain slopes, steppes, meadows, sandy hills, open forests, forests, grasslands, wastelands, roadsides, riversides, watersides, farmlands; 200–3500 m. Anhui, Gansu, Hebei, Heilongjiang, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, N Sichuan [Korea, Mongolia, Russia].

Klasea centauroides is a very polymorphic species with respect to number of capitula, leaf shape, shape of involucre, and coloration of phyllaries. Several distinctive forms have been described as species, but all of them are connected by intermediate forms. Delimitation of subspecies is problematic especially in regions where their ranges overlap. Herbarium specimens are often misidentified; therefore, distribution data from literature have to be taken with care and may be incomplete for some subspecies treated here.

- 1a. Stem much branched; capitula (3–)10–60; involucre 0.6–1.2 cm in diam. 8b. subsp. *polycephala*
- 1b. Stem simple or sparingly branched; capitula 1–6(–12); involucre 1.1–3 cm in diam.
 - 2a. All leaves undivided 8e. subsp. *cupuliformis*
 - 2b. At least middle stem leaves pinnatisect or pinnatifid.
 - 3a. Involucre obconic to bowl-shaped; inner phyllaries straight, without clear distinction between basal part and scarious appendage; middle phyllaries yellowish green with pale margin 8f. subsp. *chanetii*
 - 3b. Involucre semiglobose, ovoid, or campanulate; inner phyllaries mostly geniculate between basal part and appendage; middle phyllaries with dark tip and/or purple scarious margins.
 - 4a. Involucre base shortly attenuate; middle phyllaries 1.8–3 mm wide; lateral segments of middle stem leaves usually antrorse at an acute angle 8c. subsp. *komarovii*
 - 4b. Involucre base rounded or slightly umbilicate; middle phyllaries 2.5–6 mm wide; lateral segments of middle stem leaves usually at right angle or nearly so.
 - 5a. Stem ± foliate throughout; peduncles 1–12(–18) cm; involucre not or slightly constricted, 1.1–2.2 cm in diam. 8a. subsp. *centauroides*
 - 5b. Stem ± leafless in upper part; peduncles (10–)15–40 cm; involucre conspicuously constricted, (1.5–)2–3 cm in diam. 8d. subsp. *strangulata*

8a. *Klasea centauroides* subsp. *centauroides*

麻花头(原亚种) ma hua tou (yuan ya zhong)

Serratula centauroides Linnaeus, Sp. Pl. 2: 820. 1753; *Klasea centauroides* var. *albiflora* Y. B. Chang; *K. centauroides* var. *yamatsutana* (Kitagawa) Kitagawa; *K. mongolicola* (Kitagawa) Kitagawa; *K. ortholepis* (Kitagawa) Kitagawa; *S. mongolicola* Kitagawa; *S. ortholepis* Kitagawa; *S. polycephala* Iljin var. *ortholepis* (Kitagawa) Y. Ling ex H. C. Fu; *S. yamatsutana* Kitagawa; *S. yamatsutana* var. *mongolicola* (Kitagawa) Kitagawa.

Herbs (10–)25–80 cm tall. Rhizomes prostrate. Stem unbranched or sparingly branched in upper part. Petiole of basal

and lower stem leaves 2–10 cm; leaf blade elliptic to narrowly elliptic in outline, 5–12(–16) × 2–5(–8) cm, pinnatipartite; lateral lobes 5–8 pairs, narrowly elliptic to broadly linear, margin entire or few toothed, apex acute. Middle stem leaves sessile or very shortly petiolate, similar in form and same in division to basal and lower stem leaves; lateral segments usually at right angle or nearly so. Upper stem leaves smaller than others. Peduncles 1–12(–18) cm. Capitula 1–4(–12). Involucre ovoid to narrowly ovoid, 1.1–2.2 cm in diam., base rounded or slightly umbilicate, apically ± constricted. Phyllaries loosely imbricate, in 6–8 rows; outer and middle phyllaries triangular, triangular-ovate, or ovate-lanceolate, 4–15 × 2.5–4 mm, leathery, greenish, darker toward apex and purple at margin, apex acute and with a 0.5–2 mm spinule; inner and innermost phyllaries narrowly elliptic or linear, 10–20 × 1–2 mm, transitioning into appendage; appendage straw-colored or purple-tinged, linear to linear-lanceolate, slightly bent outward or almost straight, margin slightly revolute or plane. Fl. and fr. Jun–Sep. *2n* = 30, 60.

Mountain slopes, steppes, meadows, sandy hills; 800–1700 m. Hebei, Heilongjiang, Liaoning, Nei Mongol, Shandong [Mongolia, Russia].

8b. *Klasea centauroides* subsp. *polycephala* (Iljin) L. Martins, Bot. J. Linn. Soc. 152: 457. 2006.

多花麻花头 duo hua ma hua tou

Serratula polycephala Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 90. 1928; *Klasea polycephala* (Iljin) Kitagawa.

Herbs 30–80 cm tall. Rhizomes stout. Stem branched in upper part. Petiole of basal and lower stem leaves 1.5–4 cm; leaf blade oblanceolate, elliptic-lanceolate, or elliptic in outline, 5–15 × 2.5–5 cm, pinnatipartite or pinnatilobate; lateral lobes 5–9 pairs, broadly elliptic, triangular, or narrowly elliptic, margin entire or toothed, apex acute to acuminate. Middle and upper stem leaves sessile, pinnatipartite; lateral lobes usually at right angle or nearly so, narrowly elliptic to broadly linear, margin entire or few toothed, apex acute. Uppermost leaves linear to subulate or with 1–3 pairs of lateral segments. Capitula (3–)10–60, corymbose. Involucre narrowly ovoid, 6–12 mm in diam. Phyllaries imbricate, in 6–8 rows; outer and middle phyllaries greenish with darker tip, ovate, ovate-triangular, or elliptic-lanceolate, 3–11 × 2–3 mm, acute and with 0.2–0.8 mm apical spinule; inner phyllaries linear, ca. 16 × 1–2 mm, transitioning into appendage; appendage straw-colored or purple-tinged, slightly bent outward or almost straight, linear to linear-lanceolate, with slightly revolute or plane margins. Fl. and fr. Jul–Sep.

• Mountain slopes, roadsides, farmlands; 600–2000 m. Hebei, Liaoning, Nei Mongol, Shanxi.

8c. *Klasea centauroides* subsp. *komarovii* (Iljin) L. Martins, Bot. J. Linn. Soc. 152: 457. 2006.

北麻花头 bei ma hua tou

Serratula komarovii Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 89. 1928; *Klasea hayatae* (Nakai) Kitagawa; *K. nishimurana* (Kitagawa) Kitagawa; *S. charbinensis* A. I. Baranov

& Skvortsov; *S. hayatae* Nakai; *S. hsinganensis* Kitagawa; *S. nishimurana* Kitagawa.

Herbs 0.5–1.5 m tall. Rhizomes prostrate. Stems unbranched or sparingly branched in upper part. Petiole of basal and lower stem leaves 3–9 cm; leaf blade elliptic in outline, 8–20 × 3–10 cm, pinnatipartite or rarely undivided; lateral lobes 4–8 pairs, narrowly elliptic to broadly linear, margin entire or few toothed, apex acute. Middle stem leaves sessile or very shortly petiolate, similar in form and same in division to basal and lower stem leaves; lateral segments usually falcate or antrorse at an acute angle. Upper stem leaves smaller than others, linear or with 1–3 pairs of lateral segments. Peduncles (8–)12–30 cm, leafless or with 1 or few linear diminished leaves. Capitula 1–6(–9). Involucre campanulate or ovoid-campanulate, 1.1–1.5(–1.7) cm in diam., constricted, base shortly attenuate. Phyllaries tightly imbricate, in 7–10 rows; outer and middle phyllaries triangular, triangular-ovate, or ovate-lanceolate, 3–10 × 1.8–3 mm, leathery, greenish, often darker toward apex and purple at margin, apex acute and with a 0.5–1.5 mm apical spinule; inner and innermost phyllaries narrowly elliptic to linear, 10–20 × 1–2.5 mm, transitioning into appendage; appendage straw-colored or purple-tinged, linear to linear-lanceolate, bent outward, margin slightly revolute. Fl. and fr. Jul–Oct.

Mountain slopes, steppes, meadows; 200–1800 m. Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol, Shaanxi, Shanxi [Korea, Russia].

8d. *Klasea centauroides* subsp. *strangulata* (Iljin) L. Martins, Bot. J. Linn. Soc. 152: 457. 2006.

缢苞麻花头 yi bao ma hua tou

Serratula strangulata Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 89. 1928; *Klasea strangulata* (Iljin) Kitagawa.

Herbs 40–100 cm tall. Rhizomes procumbent. Stem unbranched or sparingly branched from middle and branches erect. Petiole of basal and lower stem leaves 4–10 cm; leaf blade elliptic, oblanceolate-elliptic, or oblanceolate in outline, 10–20 × 3–7 cm, lyrate pinnatipartite or pinnatipartite, rarely undivided; lateral lobes 3–7 pairs, elliptic to triangular, margin toothed, few toothed, or entire. Middle stem leaves sessile, similar in form and same in division as basal and lower stem leaves; lateral segments usually at right angle or nearly so, narrowly triangular, linear-triangular, or lanceolate, 0.5–1.5 cm wide, margin entire or distantly toothed. Upper stem leaves linear, margin entire. Peduncles (10–)15–40 cm. Capitula 1 or few. Involucre hemispheric, (1.5–)2–3 cm in diam., conspicuously constricted, base rounded. Phyllaries imbricate, in 7 or 8 rows; outer and middle phyllaries yellowish, blackish green striate toward apex, dark purple at margin, ovate, ovate-lanceolate, or elliptic, 6–13 × 3–5(–6) mm, leathery, apex acute and with a ca. 1 mm apical spinule; inner and innermost phyllaries elliptic to linear, 14–22 × 2–5 mm, transitioning into appendage; appendage straw-colored, linear to linear-lanceolate, bent outward, margin slightly revolute. Fl. and fr. Jun–Sep.

• Mountain slopes, grasslands, riversides, farmlands; 1300–3500 m. S Gansu, W Henan, Nei Mongol, Ningxia, Qinghai, S Shaanxi, Shanxi, N Sichuan.

8e. *Klasea centauroides* subsp. *cupuliformis* (Nakai & Kitagawa) L. Martins, Bot. J. Linn. Soc. 152: 457. 2006.

钟苞麻花头 zhong bao ma hua tou

Serratula cupuliformis Nakai & Kitagawa, Rep. Exped. Manchoukuo Sect. IV, 1: 66. 1934; *Klasea cupuliformis* (Nakai & Kitagawa) Kitagawa.

Herbs 40–100 cm tall. Rhizome robust. Stem unbranched or sparingly branched in upper part. Petiole of basal and lower stem leaves 1–6 cm; leaf blade narrowly elliptic, oblanceolate, or elliptic, 8–20 × 2–7 cm, base attenuate, margin coarsely toothed to biserrate, apex acuminate. Middle stem leaves lyrate-pinnatifid or undivided. Upper stem leaves similar to lower and middle stem leaves, oblanceolate, or linear, smaller than other leaves. Peduncles 2–24 cm. Capitula usually 1, rarely to 4 in robust individuals. Involucre hemispheric to ovoid, (1.3–)1.8–2.5 cm in diam., constricted. Phyllaries in 7 or 8 rows; outer and middle phyllaries yellowish, blackish green striate toward apex, dark purple at margin, ovate to lanceolate, 2.5–9 × 2–3.5 mm, leathery, apex acute and with a 0.3–1 mm apical spinule; inner phyllaries lanceolate, linear-lanceolate, or narrowly linear, 9–11 × 1.5–3 mm, transitioning into appendage; appendage straw-colored, linear to linear-lanceolate, bent outward, margin slightly revolute. Fl. and fr. Jul–Oct.

● Grasslands on mountain slopes, open forests; 900–2400 m. Hebei, Henan, Liaoning, Shanxi.

8f. *Klasea centauroides* subsp. *chanetii* (H. Léveillé) L. Martins, Bot. J. Linn. Soc. 152: 457. 2006.

碗苞麻花头 wan bao ma hua tou

Serratula chanetii H. Léveillé, Repert. Spec. Nov. Regni Veg. 10: 351. 1912; *Klasea potaninii* (Iljin) Kitagawa; *S. potaninii* Iljin.

Herbs (15–)30–90 cm tall. Rhizome short. Stems solitary or few, branched in upper part, rarely unbranched. Petiole of basal and lower stem leaves 2–9 cm; leaf blade elliptic, oblanceolate, or oblanceolate-elliptic in outline, pinnatifid, pinnatifid-partite, lyrate-pinnatifid, or lyrate-pinnatifid-partite, 6–20 × 3–7 cm; lateral lobes 6–10 pairs, margin few toothed or entire. Middle leaves sessile, similar in form and same in division as basal and lower stem leaves. Upper stem leaves broadly linear to linear or with 3–5 pairs of lateral segments, margin entire. Peduncles 1–22 cm. Capitula (1–)3–6(–12), inconspicuously corymbose. Involucre obconic to bowl-shaped, 1.8–2.5 cm in diam. Phyllaries loosely imbricate, in 4–6 rows; outer and middle phyllaries yellowish green, paler at margin, triangular, narrowly triangular, linear-lanceolate, or elliptic-lanceolate, 2–10 × 1.5–3.5 mm, apex acute and without an apical spinule or with a ca. 0.5 mm spinule; inner phyllaries linear-lanceolate to linear, 10–18 × 1–2.5 mm, straight, plane, without distinction between basal part and appendage. Fl. and fr. May–Sep.

● Grasslands on mountain slopes, forests, wastelands, farmlands, watersides; 200–2100 m. Anhui, Hebei, Henan, Shandong, Shanxi.

38. *ARCHISERRATULA* L. Martins, Taxon 55: 973. 2006.

滇麻花头属 dian ma hua tou shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Serratula sect. *Suffruticosae* Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 92. 1928.

Subshrubs or perennial herbs. Stems virgately branched, foliate throughout. Leaves undivided, with reticulate resin ducts. Capitula solitary at end of branches, homogamous. Phyllaries imbricate, apex acute or apiculate. Receptacle cylindric to obconic. Florets bisexual. Stigmatic branches divergent, canaliculate. Achene ellipsoid-cylindric, smooth, glabrous, apex with a denticulate rim. Pappus elements in many rows, bristlelike, not connate into a ring, pinnate at least in their distal part.

● One species: China.

1. *Archiserratula forrestii* (Iljin) L. Martins, Taxon 55: 973. 2006.

滇麻花头 dian ma hua tou

Serratula forrestii Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 91. 1928.

Herbs or subshrubs, 0.7–1.5 m tall. Stems sometimes purplish red, erect, long virgately branched, woody at base, leafy, glabrous or subglabrous. Leaves subsessile, lanceolate to linear-lanceolate, glabrous, with resin ducts along veins visible on abaxial side, base cuneate, margin denticulate, apex acute. Lower and middle stem leaves 2.5–10 × 0.3–2 cm. Upper stem

leaves similar to lower and middle stem leaves, decreasing in size upward. Capitula several to many. Involucre cylindric to narrowly obconic, 6–10 mm in diam. Phyllaries imbricate, in 7 or 8 rows, green to yellowish green, sometimes slightly purple tinged; outer and middle phyllaries triangular, ovate-triangular, ovate, or lanceolate, 2–14 × 1–3 mm, apex acute or acuminate; inner phyllaries linear-lanceolate, ca. 18 × 1.5–2 mm, densely puberulent near apex. Corolla pale purple, 1.9–2.2 cm. Achene ellipsoid-cylindric, 7–9.5 mm. Pappus elements light brown, ca. 1.2 cm, finely serrulate, pinnate toward apex. Fl. and fr. Aug–Nov.

● Grasslands on mountain slopes, rock crevices; 1300–2000 m. NW Yunnan.

39. *TRICHOLEPIS* Candolle, Arch. Bot. (Paris) 2: 515. 1833.

镇苞菊属 zhen bao ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Stictophyllum Edgeworth.

Herbs or subshrubs, annual or perennial. Stem erect, branched from base or middle. Lower stem leaves pinnately divided or entire. Capitula homogamous, several, solitary at end of stem and branches. Involucre campanulate to hemispheric. Phyllaries subulate to subulate-lanceolate, very narrow, unappendaged or with an awnlike appendage. Florets bisexual. Corolla purple, pink, yellow, or whitish. Stigmatic branches divergent. Achene with a denticulate rim at apex. Pappus elements in many rows or absent; outer pappus elements shortly plumose, scabrid, or serrulate, distinct or basally connate into a ring; inner pappus elements scarcely longer and basally wider, flattened.

About 17 species: Asia; three species in China.

There is one specimen of *Tricholepis roylei* J. D. Hooker from "Tibet." However, this is probably erroneous or is from a locality outside of China but referred to as "Tibet" in a historical sense. This species is only known from Himachal Pradesh, India, and it is very unlikely to occur in China.

1a. Involucre 0.9–1.5 cm in diam.; middle and upper leaves linear or nearly so, to 0.2 cm wide 3. *T. tibetica*

1b. Involucre 1.5–6 cm in diam.; middle and upper leaves lanceolate or narrowly lanceolate, 0.3–3 cm wide.

2a. Capitula not subtended by leaves; peduncles slender, ca. 1 mm in diam.; phyllaries flexuous or bent outward 1. *T. furcata*

2b. Capitula subtended by uppermost leaf or leaves; peduncles stout, ca. 2 mm in diam.; phyllaries straight 2. *T. karenium*

1. *Tricholepis furcata* Candolle, Prodr. 6: 563. 1838.

镇苞菊 zhen bao ju

Herbs 0.6–1.4 m tall, perennial. Stem branched from base or middle; stem and branches purplish red, glabrous or sparsely pubescent. Lower stem leaves shortly petiolate; leaf blade elliptic to lanceolate, 5–12 × 3–5 cm, scabrid, yellowish gland-dotted, base cuneate, margin serrate, apex acute to acuminate. Upper stem leaves sessile, similar to lower stem leaves, 2–4 × 0.3–1.3 cm. Peduncles slender, ca. 1 mm in diam. Capitula nodding. Involucre hemispheric, 1.5–4 cm in diam. Phyllaries in many rows; appendage usually blackish, awnlike, 4–24 × 0.5–0.7 mm, somewhat recurved; outer phyllaries sparsely ciliate toward apex; inner phyllaries densely ciliate to plumose toward apex. Corolla yellow, ca. 2 cm; lobes glabrous. Achene cuneate-ellipsoid, 4–5 mm, glabrous. Pappus elements scabrid to serrulate, deciduous, decreasing in length outward, basally connate into a ring; innermost pappus elements ca. 15 × 0.1 mm, flattened. Fl. and fr. Oct.

Forest margins in mountain valleys; ca. 2600 m. SE Xizang [Bhutan, India (Sikkim), Nepal].

Tricholepis furcata has been indicated to also occur in NW India, Kashmir, and Pakistan (Nasir & Ali, Fl. W. Pakistan, 797. 1972; Hajra, Fl. India 12: 222. 1995). Those specimens, however, are distinct from typical *T. furcata* by their erect capitula and wider (ca. 1 mm wide), apically glabrous phyllaries and should instead be referred to *T. elongata* Candolle.

2. *Tricholepis karenium* Kurz, J. Asiat. Soc. Bengal, Pt. 2, Nat. Hist. 41: 318. 1872.

云南镇苞菊 yun nan zhen bao ju

Herbs or subshrubs, 0.5–1 m tall, perennial. Stem erect, basally woody, branched, puberulent. Leaves sessile or shortly petiolate, linear-lanceolate to linear-oblong, 3.5–18 × 0.5–2 cm, undivided, both surfaces puberulent, abaxially with minute dark dots, base narrowly cuneate, apex acute to acuminate. Lower

leaves distantly denticulate. Upper leaves entire. Peduncles stout, ca. 2 mm in diam. Capitula erect, subtended by 1 or few leaves. Involucre ovoid to broadly obconic, 4–6 cm in diam., base truncate. Phyllaries in many rows, subulate and slightly broader at base, 10–50 × 0.5–1 mm, straight, sparsely ciliate or glabrous near base, densely ciliate at apex. Corolla white or nearly so, ca. 2.1 cm; lobes appressed puberulent toward apex. Achene oblong, base oblique, apex slightly curved. Pappus elements multiseriate, filiform, 1–1.5 cm, shortly ciliate. Fl. Jun–Oct.

Rocky slopes, open dry places; ca. 1400 m. Yunnan [India, Kashmir, Myanmar, N Thailand].

3. *Tricholepis tibetica* J. D. Hooker & Thomson ex C. B. Clarke, Compos. Ind. 241. 1876.

红花镇苞菊 hong hua zhen bao ju

Herbs or subshrubs, 25–60 cm tall, perennial. Stems virgately branched, sparsely pubescent or glabrous, floccose lanate at base; branches slender. Leaves glabrous, glabrescent, or sparsely tomentose, somewhat fleshy. Lower leaves oblong, 2–6 × 0.2–0.5 cm, margin dentate to pinnatifid; lobes few, distant. Upper leaves oblong to linear, 5–15 × ca. 1 mm, margin entire. Peduncles ca. 1 mm in diam. Capitula erect or almost so. Involucre ovoid, 0.9–1.5 cm in diam., base truncate to obtuse. Phyllaries imbricately appressed, in many rows, lanceolate-subulate, 2–12 × 0.5–1 mm, apex acuminate with tip somewhat deflexed; outer and middle phyllaries glabrous or slightly tomentose; inner phyllaries appressed pubescent toward apex. Corolla pink, 1.3–1.6 cm, glabrous; lobes glabrous. Achene brown, oblong, smooth. Pappus elements white, decreasing in length outward, scabrid; innermost pappus elements 12–13 × 0.2–0.3 mm, flattened.

Dry rocky slopes. Xizang [Afghanistan, Kashmir, Pakistan].

No material from China was seen by the present authors, and the description here is based on the original publication and specimens from Kashmir.

40. AMBERBOA Vaillant, Königl. Akad. Wiss. Paris 5: 182. 1754 [*“Amberboi”*], nom. cons.

珀菊属 po ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs, annual or biennial. Stem erect, branched or unbranched. Leaves undivided, lyrate, or pinnatipartite, margin entire or toothed. Capitula heterogamous, solitary at end of stem and branches, sometimes additionally 1 or few subbasal. Involucre glabrous or sparsely arachnoid. Phyllaries imbricate, rigid to subrigid; middle phyllaries broadly rounded; inner phyllaries with scarious apical appendage. Outer florets in 1 row, sterile, with corollas 5–20-cleft; inner florets many, bisexual, in many rows. Corolla yellow or purple. Stigmatic branches long. Achene sericeous-villous, apex with denticulate rim; attachment scar surrounded by conspicuously thickened rim. Pappus elements of one type, scalelike, wider toward apex, scabridulous, rarely absent.

Seven species: C and SW Asia; two species (one introduced) in China.

1a. Corolla yellow; corolla of radiant florets 5–10-cleft; usually at least 1 subbasal capitulum present 1. *A. turanica*

1b. Corolla purplish red or white; corolla of radiant florets 10–20-cleft; all capitula terminal on long peduncles 2. *A. moschata*

1. *Amberboa turanica* Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 30: 110. 1932.

黄花珀菊 huang hua po ju

Herbs 15–35 cm tall, annual. Main stem very short, usually surmounted by side branches; stem and branches floccose. Leaves glabrous. Basal and lower stem leaves petiolate; petiole to 4.5 cm; leaf blade elliptic to lanceolate, undivided, margin denticulate to almost entire, 4–6 × 1.2–2.5 cm. Middle and upper stem leaves sessile or shortly petiolate, pinnatilobed or pinnatipartite; lateral lobes 3 or 4 pairs, lanceolate, margin sparsely toothed or entire. Involucre ovoid, bowl-shaped, or hemispheric, 1–1.7 cm in diam. Phyllaries in ca. 4 rows, lanate-pubescent, glabrescent; outer phyllaries broadly ovate to ovate-elliptic, 4–7 × 4–6 mm, apex obtuse-rounded; middle phyllaries elliptic, 8–12 × ca. 6 mm; inner phyllaries spatulate-elliptic to broadly linear, ca. 12 × 2–4 mm, with triangular to lanceolate apical appendage. Corolla yellow to yellowish; corolla of marginal florets scarcely longer than disk florets, 5–10-cleft, white pubescent at middle. Achene dark brown, cylindric, ca. 5 mm, densely white villous. Pappus ca. 4 mm. Fl. and fr. May–Sep. $2n = 64$.

Sandy areas, wastelands, farmlands; ca. 400 m. Xinjiang (Junggar Pendi) [Afghanistan, Kazakhstan, Russia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

2. *Amberboa moschata* (Linnaeus) Candolle, Prodr. 6: 560. 1838.

珀菊 po ju

Centaurea moschata Linnaeus, Sp. Pl. 2: 909. 1753.

Herbs 30–50 cm tall, annual or biennial. Stem solitary, branched or unbranched; stem and branches sparsely cobwebby floccose. Leaves glabrous or sparsely floccose. Lower stem leaves petiolate; leaf blade spatulate to elliptic, 6–7 × 1.5–2 cm, base attenuate, margin serrulate, apex obtuse to acute. Middle and upper stem leaves shortly petiolate; leaf blade elliptic to narrowly elliptic, lyrate pinnatipartite. Uppermost leaves sessile or subsessile, margin serrulate. Involucre ovoid, 1.2–2 cm in diam. Phyllaries in 3 or 4 rows, sparsely villous; outer phyllaries ovate, ca. 4 × 1.8 mm; middle phyllaries ovate to broadly ovate, 5–10 × 3–7 mm; inner phyllaries spatulate-elliptic to broadly linear, ca. 10 × 3–4 mm, with ovate to orbicular apical appendage. Corolla purple, 10–20-cleft, white villous; corolla of marginal florets much longer than inner ones. Achene brown, cylindric, ca. 5 mm, densely white villous. Pappus ca. 5 mm, rarely absent. $2n = 32$.

Naturalized in Gansu [native to SW Asia].

Amberboa moschata is also grown as a garden ornamental.

41. PLAGIOBASIS Schrenk, Bull. Cl. Phys.-Math. Acad. Imp. Sci. Saint-Pétersbourg 3: 108. 1845.

斜果菊属 xie guo ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs, perennial. Stem branched. Capitula heterogamous, rarely homogamous. Phyllaries imbricate, broadly rounded. Outer florets female or sterile; inner florets bisexual; rarely all florets bisexual. Corolla pink to purple. Stigmatic branches long, divergent. Achene ellipsoid-cylindric, without a rim; attachment scar without a thickened margin. Pappus elements in many rows, bristlelike, not connate into a ring.

One species: China, Kazakhstan, Kyrgyzstan.

1. *Plagiobasis centauroides* Schrenk, Bull. Cl. Phys.-Math. Acad. Imp. Sci. Saint-Pétersbourg 3: 109. 1845.

斜果菊 xie guo ju

Plagiobasis dshungarica Iljin.

Herbs 20–60(–80) cm tall. Stem erect, sparsely branched above middle, striate, glabrous. Leaves thick, glabrous, margin sharply toothed. Basal leaves petiolate; petiole 2–5 cm; leaf blade elliptic to obovate, 4–6 × 1.5–2 cm, base attenuate, apex obtuse to acute. Stem leaves sessile, oblong to lanceolate, base

cuneate to rounded and sometimes semiamplexicaul, apex acute. Capitula few, corymbose to laxly paniculate. Involucre globose to ovate, 1–2.5 cm in diam. Phyllaries in 4 or 5 rows, green to yellow-green, leathery, apex sometimes with purple tinge or with dark triangular or semilunar spot; outer and middle phyllaries suborbicular, ovate, or oblong, 5–15 × 4–7 mm, with a narrow faintly delimited membranous margin, apex rounded; inner and innermost phyllaries elliptic to linear-lanceolate, 15–

19 × 1.5–5 mm, apically hyaline to scarious, apex obtuse. Corolla 1.6–2 cm. Achene brown, narrowly ellipsoid-cylindric, 5–6 × 1–1.5 mm, sparsely pubescent and early glabrescent, not ribbed, apex rounded. Pappus elements white, 5–7 mm, serrulate, easily falling off. Fl. and fr. Jul–Oct.

Arid areas, gravel areas; ca. 800 m. Xinjiang (Junggar Pendi, Tian Shan) [Kazakhstan, Kyrgyzstan].

42. RUSSOWIA C. Winkler, Trudy Imp. S.-Peterburgsk. Bot. Sada 11: 281. 1890.

纹苞菊属 wen bao ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs, annual. Stem richly branched, glabrous. Leaves pinnatisect. Capitula homogamous, at end of stem and branches, laxly paniculate to corymbose-paniculate. Phyllaries imbricate, in ca. 4 rows, without appendage. Florets bisexual. Corolla pale pink to purple. Achene sericeous; attachment scar surrounded by a thickened whitish rim; apex with a denticulate corona. Pappus elements white, in many rows, of one type, serrulate.

One species: Afghanistan, China, Kazakhstan, Tajikistan, Turkmenistan, Uzbekistan.

1. *Russowia sogdiana* (Bunge) B. Fedtschenko, Cons. Fl. Turkestan. 4: 267. 1911.

纹苞菊 wen bao ju

Plagiobasis sogdiana Bunge, Beitr. Fl. Russl. 361. 1852; *Russowia crupinoides* C. Winkler.

Herbs 20–60 cm tall. Stem erect, branched from base or above middle; branches slender. Leaves thin. Basal leaves spatulate; leaf blade lanceolate, base attenuate into a long petiole, margin entire or denticulate. Lower stem leaves lyrate or pinnatisect; lateral segments 2–5 pairs, oblong to linear; terminal segment longest. Middle and upper stem leaves diminished,

sessile, pinnatisect; segments often thickened at apex; lateral segments 1–3 pairs, linear, 3–30 × 0.3–1 mm. Capitula few to many. Involucre cylindric to ovoid-cylindric, 3–8 mm in diam. Phyllaries green with purple tinge, 3- or 5-striate, apex obtuse; outer and middle phyllaries ovate to elliptic, 2–3.5 × ca. 2 mm, margin narrow and membranous; inner and innermost phyllaries elliptic-lanceolate to elliptic-oblongate, 6–10 × 2–2.5 mm. Florets few. Corolla ca. 1 cm, sparsely villous above middle. Achene yellowish brown, narrowly ellipsoid, 3.5–4 mm, sparsely white sericeous. Pappus elements white, 5–7 mm, serrulate. Fl. and fr. Jun–Oct.

Deserts; 800–1000 m. Xinjiang (Junggar Pendi, Tian Shan) [Afghanistan, Kazakhstan, Tajikistan, Turkmenistan, Uzbekistan].

43. SCHISCHKINIA Iljin, Repert. Spec. Nov. Regni Veg. 38: 73. 1935.

白刺菊属 bai ci ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs, dwarf, annual. Stem branched from base. Leaves undivided, margin with rigid white spines. Uppermost leaves concealing capitula. Capitula heterogamous, clustered. Phyllaries imbricate, herbaceous. Receptacle with setae few, rather short. Florets few; outer florets sterile; inner florets bisexual. Corolla yellow or pink, of even thickness, not divided into tube and limb. Style branches short. Achene with a denticulate rim at apex. Pappus elements of two types; outer pappus of scabrid bristles; inner pappus of an annulus bearing 1 rigid basally widened bristle.

One species: Afghanistan, China, Kazakhstan, Pakistan, Tajikistan, Uzbekistan; SW Asia.

1. *Schischkinia albispina* (Bunge) Iljin, Repert. Spec. Nov. Regni Veg. 38: 73. 1935.

白刺菊 bai ci ju

Microlonchus albispinus Bunge, Del. Sem. Hort. Dorpat. 8. 1843; *Centaurea albispina* (Bunge) B. Fedtschenko; *Oligochaeta leucosmerinx* K. H. Rechinger & Köie.

Herbs, annual. Stem very short; stem and branches white, puberulent. Leaves shortly petiolate; leaf blade elliptic, oblanceolate, linear-oblongate, or spatulate, 2–6 × 0.3–0.7(–1.5) cm, glabrous or abaxially sparsely shortly strigose, base cuneate-attenuate, apex acute; marginal spines simple or 2–6-digitate, white, 1–5 mm. Capitula few to many congested at end of

a branch. Involucre narrowly ovoid-ellipsoid, 12–14 × 4–5 mm. Phyllaries in ca. 5 rows, glabrous, apex acuminate and tipped with a short spine; outer phyllaries ovate, 5–6 × 2–3 mm; middle phyllaries elliptic to elliptic-lanceolate, 8–10 × 2–3 mm; inner phyllaries elliptic to linear, ca. 12 × 1.5 mm, scarious, apex often purple tinged. Corolla yellow or pink, 5–6 mm. Achene pale, ellipsoid-obovoid, compressed, ca. 4 × 2 mm, glabrous, shiny; lateral attachment scar almost 1/2 as long as achene; apical rim regularly denticulate. Pappus absent in sterile florets; pappus elements of fertile florets white but inner ones darker at base; outer pappus bristlelike, to 7 mm; inner pappus a single bristle, 8–9 mm, ca. 0.5 mm wide at base. Fl. and fr. Jun.

Sandy areas; ca. 600 m. Xinjiang (Junggar Pendi) [Afghanistan, Kazakhstan, Pakistan, Tajikistan, Uzbekistan; SW Asia].

44. SERRATULA Linnaeus, Sp. Pl. 2: 816. 1753.伪泥胡菜属 *wei ni hu cai shu*

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Mastrucium Cassini.

Herbs, perennial. Stems erect, usually branched in upper half. Leaves pinnatisect or pinnate, rarely undivided, margin dentate or serrate. Capitula heterogamous [or homogamous and plants gynodioecious], few to many, paniculate or corymbose. Involucre ovoid, hemispheric, or bowl-shaped. Phyllaries usually darker toward apex, imbricate, apex acute; inner phyllaries longest. Marginal florets female, scarcely longer than bisexual ones, with staminodes. Corolla purple to pink. Stigmatic branches slender. Achene glabrous, apex rounded. Pappus elements of one type, in several rows, finely serrulate or scabrid.

Two species: Asia, Europe; one species in China.

1. *Serratula coronata* Linnaeus, Sp. Pl., ed. 2, 2: 1144. 1763.伪泥胡菜 *wei ni hu cai*

Mastrucium pinnatifidum Cassini ex Candolle; *Serratula coronata* var. *manshurica* (Kitagawa) Kitagawa; *S. manshurica* Kitagawa.

Herbs 0.6–1.5 m tall. Rhizomes stout, procumbent. Stems erect, apically branched, rarely unbranched, glabrous. Basal and lower stem leaves petiolate, strigose to glabrescent; petiole 5–16 cm; leaf blade oblong to elliptic in outline, to 40 × 12 cm, pinnatisect or pinnate; segments narrowly elliptic, margin dentate or serrate; lateral segments 3–8 pairs, asymmetrical, decurrent on rachis. Middle and upper stem leaves sessile, similar in form and same in division as basal and lower stem leaves but smaller. Capitula heterogamous, few or rarely 1. Involucre

bowl-shaped to campanulate, 1.2–2.5 cm in diam., with brownish lanate to velvety pubescence, rarely glabrescent. Phyllaries imbricate, in 6 or 7 rows, abaxially purplish red; outer phyllaries triangular to ovate, 3–7 × 1.5–4 mm, apex acute and with a spinule; middle and inner phyllaries elliptic, narrowly elliptic, or lanceolate, 10–18 × 3–4 mm, apex acuminate to acute; innermost phyllaries linear, ca. 20 × 1 mm. Corolla purple, 2–2.8 cm in female florets, ca. 2 cm in bisexual florets. Achene oblanceolate-ellipsoid, ca. 7 mm, many striate. Pappus elements yellowish brown, to ca. 1.2 cm, scabrid. Fl. and fr. Jul–Oct. $2n = 22$.

Forests, forest margins on mountain slopes, steppes, meadows, riverbanks; 100–1600 m. Anhui, SE Gansu, Guizhou, Hebei, Heilongjiang, W Henan, NW Hubei, NW Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, S Shaanxi, E Shandong, Shanxi, N Xinjiang [Japan, Kazakhstan, Korea, Kyrgyzstan, Mongolia, Russia; Europe].

45. RHAPONTICOIDES Vaillant, Königl. Akad. Wiss. Paris 5: 165. 1754.欧亚矢车菊属 *ou ya shi che ju shu*

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Bielzia Schur.

Herbs, perennial. Rhizome woody. Stem usually solitary, glabrous, covered with ± lanate remains of old leaves at base. Leaves pinnate, pinnatisect, or bipinnatisect, glabrous, margin argutely toothed; teeth white cartilaginous at apex; leaf segments usually strongly asymmetric at base, decurrent on rachis. Capitula heterogamous, solitary at end of stem and branches. Phyllaries broadly ovate, glabrous, base rounded. Corolla yellow or sulfureous; corolla of marginal florets not or scarcely radiant, sterile, with staminodes. Achene brown, yellowish near base, blackish near apex. Pappus elements of two types; outer pappus elements in many rows, bristlelike, scabrid; inner pappus elements in 1 row, scalelike, much shorter than to almost as long as outer ones, sometimes excurrent into a longer bristle.

About 30 species: N Africa, C and SW Asia, Europe; three species in China.

- 1a. Middle phyllaries with very narrow (ca. 0.2 mm wide) inconspicuous hyaline margin, without apical appendage 1. *R. ruthenica*
- 1b. Middle phyllaries appendaged or with more than 1 mm wide hyaline margin.
 - 2a. Primary segments of lower leaves undivided, oblong to narrowly elliptic 2. *R. kasakorum*
 - 2b. Primary segments of lower leaves irregularly pinnatipartite to pinnatisect 3. *R. dschungarica*

1. *Rhaponticoides ruthenica* (Lamarck) M. V. Agababjan & Greuter, Willdenowia 33: 61. 2003.欧亚矢车菊 *ou ya shi che ju*

Centaurea ruthenica Lamarck, Encycl. 1: 663. 1785; *C. modestii* Fedorov; *Centaureum ruthenicum* (Lamarck) Cassini.

Herbs 40–110 cm tall. Stem usually solitary, erect, apically

few branched. Leaves green. Basal and lower stem leaves petiolate; petiole 4–9 cm, lanate; leaf blade oblanceolate in outline, pinnatisect to pinnate, ca. 18 × 8 cm; lateral segments 8–14 pairs. Middle and upper stem leaves sessile, similar in shape and same in division to basal and lower stem leaves, decreasing in size upward; lateral segments 4–10 pairs, elliptic to linear; basal lateral segments much diminished. Capitula few to several, rarely 1. Involucre ovoid, 1.8–2.5 cm in diam. Phyllaries in

4–6 rows, apex obtuse to rounded; middle phyllaries elliptic to ovate-elliptic, 9–10 × ca. 5 mm, unappendaged, margin ca. 0.2 mm wide and hyaline; inner phyllaries elliptic-lanceolate to lanceolate, 14–18 × 3–5 mm, apical appendage brownish and scarious. Achene narrowly ellipsoid, ca. 7 mm, apically rugulose. Outer pappus elements ca. 4 mm; inner pappus elements 0.8–3.5 mm. Fl. and fr. Jul–Sep. $2n = 30$.

Mountain slopes, meadows; 1200–1900 m. N Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Tajikistan, Uzbekistan; SW Asia, Europe].

2. *Rhaponticoides kasakorum* (Iljin) M. V. Agababjan & Greuter, Willdenowia 33: 60. 2003.

天山矢车菊 tian shan shi che ju

Centaurea kasakorum Iljin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 66. 1937.

Herbs ca. 30 cm tall. Stem usually solitary, erect, apically few branched or unbranched. Leaves green or grayish green. Basal leaves petiolate; petiole to 13 cm; leaf blade elliptic to oblanceolate, 14–22 × 5–8 cm, pinnatisect to pinnate; lateral segments 6–12 pairs, oblong to narrowly elliptic, sometimes with 1 or 2 accessory segments near base; terminal segment elliptic, equal to lateral segments or smaller. Stem leaves several, sessile or shortly petiolate, similar to basal leaves but smaller. Capitula few to several, rarely 1. Involucre ovoid to campanulate, ca. 1.5 cm in diam. Phyllaries in 5 or 6 rows, apex obtuse to rounded; middle phyllaries elliptic to ovate-elliptic, 7–12 × ca. 5 mm, unappendaged, margin ca. 1 mm wide, hyaline, and often lacerate; inner phyllaries elliptic-lanceolate to lanceolate, ca. 15 × 3 mm, apical appendage white, hyaline, and

scarious. Achene 6–8 mm. Outer pappus elements to 7 mm; inner pappus elements short. Fl. and fr. May–Aug.

Mountain slopes; ca. 2300 m. Xinjiang (Xinyuan) [Kazakhstan, Russia].

3. *Rhaponticoides dschungarica* (C. Shih) L. Martins, **comb. nov.**

准噶尔矢车菊 zhun ga er shi che ju

Basionym: *Centaurea dschungarica* C. Shih, Bull. Bot. Res., Harbin 4(2): 65. 1984.

Herbs 40–80 cm tall. Stem usually solitary, erect, apically few branched or unbranched. Leaves green. Basal leaves petiolate; petiole 2.5–6 cm, lanate at base; leaf blade oblanceolate, elliptic, or obovate in outline, 10–15 × 6–7 cm, bipinnatisect or pinnate and lateral segments irregularly pinnatifid to pinnatisect; primary segments ca. 10 pairs, lanceolate to obliquely lanceolate, decreasing in size toward apex; ultimate segment narrowly elliptic. Stem leaves sessile or shortly petiolate, similar in shape and same in division as basal leaves. Capitula few to several, rarely 1. Involucre ovoid to bowl-shaped, 1.2–2.5 cm in diam. Phyllaries in 5 or 6 rows; middle phyllaries elliptic to ovate-elliptic, 7–12 × ca. 6 mm, apical appendage white hyaline to scarious, 2–5 mm, and narrowly decurrent on phyllary; inner phyllaries elliptic-lanceolate to linear-lanceolate, 15–16 × 3–6 mm, gradually transitioning into a scarious white or pale brown appendage. Achene 6–7 mm. Outer pappus elements to 6 mm; inner pappus elements very short. Fl. and fr. Jul–Aug.

Mountain slopes; 1600–2000 m. Xinjiang (Tian Shan) [Kyrgyzstan].

Centaurea ruthenica Lamarck var. *bipinnatifida* Trautvetter, described from Kazakhstan, is possibly a synonym of *Rhaponticoides dschungarica*.

46. PSEPHELLUS Cassini in F. Cuvier, Dict. Sci. Nat. 43: 488. 1826.

矮小矢车菊属 ai xiao shi che ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs, perennial. Leaves tomentose, not decurrent. Capitula heterogamous, solitary at end of stem and branches. Phyllaries with apical appendage; appendage not or shortly decurrent, scarious, not spiny. Marginal florets sterile, radiant, with minute staminodes enclosed in corolla tube. Style branches of bisexual florets connate, divergent only in uppermost part. Achene narrowly ovoid, sparsely pilose. Pappus elements indistinctly of two types, shorter than achene; outer pappus elements in several rows, scabrid; inner pappus elements similar to outer ones, but somewhat wider and shorter than innermost row of outer pappus elements.

About 75 species: C and SW Asia, Europe, Russia; one species in China.

1. *Psephellus sibiricus* (Linnaeus) Wagenitz, Willdenowia 30: 38. 2000.

矮小矢车菊 ai xiao shi che ju

Centaurea sibirica Linnaeus, Sp. Pl. 2: 913. 1753; *Heterolophus sibiricus* (Linnaeus) Cassini.

Herbs 5–15(–30) cm tall. Stems 2 or 3, grayish white, erect or procumbent, simple or with 1 or 2 branches, tomentose to villous. Leaves grayish white, densely tomentose especially on abaxial side. Basal leaves petiolate; leaf blade elliptic, ca. 5 × 2–3 cm, pinnatisect; lateral segments 2–5 pairs, elliptic to

ovate, margin entire; terminal segment ovate, larger than lateral segments. Stem leaves few, similar to basal leaves or undivided, narrowly elliptic to spatulate, margin entire. Capitulum 1(or 2). Involucre campanulate to obconic, 1–2 cm in diam. Phyllaries in ca. 6 rows, appendage yellowish brown; outer phyllaries triangular to lanceolate, arachnoid; middle phyllaries ovate, narrowly ovate to lanceolate, 4–10 × ca. 3 mm, glabrous; appendage of middle phyllaries broadly ovate, elliptic, or suborbicular, scarious, with 4–12 fimbriae on each side; inner phyllaries linear-lanceolate, ca. 11 × 1.5–2 mm; appendage of inner phyllaries suborbicular to spoon-shaped, lacerate. Outer florets ster-

ile, radiant, longer than inner florets. Corolla purple to pink. Achene whitish, obliquely oblong, ca. 6 mm, with an entire apical rim. Outer pappus elements in several rows, bristlelike, to ca. 2 mm, scabrid to serrulate; inner pappus elements bristlelike

to narrowly scalelike, ca. 1.5 mm, scabrid. Fl. and fr. Jul–Aug. $2n = 30$.

Dry mountain slopes; ca. 1200 m. N Xinjiang [Kazakhstan, Russia].

47. CRUPINA (Persoon) Candolle, Ann. Mus. Natl. Hist. Nat. 16: 157. 1810.

半毛菊属 ban mao ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Centaurea subg. *Crupina* Persoon, Syn. Pl. 2: 488. 1807.

Herbs, annual. Stem slender, erect, apically corymbosely to paniculately branched. Leaves unarmed. Basal leaves simple. Stem leaves pinnatisect to pinnate. Capitula heterogamous. Phyllaries imbricate. Florets few; outer florets sterile or functionally male; inner florets 1 to few and bisexual. Achene dark brown, subcylindric to compressed, villous toward apex, apex truncate and with a rim. Pappus elements of two types; outer pappus elements in several rows, bristlelike, scabridulous; inner pappus elements few, in 1 row, scalelike, short.

Two or three species: N Africa, C and SW Asia, Europe; one species in China.

1. *Crupina vulgaris* Persoon ex Cassini in F. Cuvier, Dict. Sci. Nat. 12: 68. 1819.

半毛菊 ban mao ju

Centaurea crupina Linnaeus, Sp. Pl. 2: 909. 1753; *Serratula crupina* (Linnaeus) Villars.

Herbs 20–60 cm tall. Stem solitary, basally pubescent, apically glabrous. Leaves green, with few glochidiate hairs at margin and sometimes sparsely lanate pubescent on adaxial side of rachis. Basal leaves soon decaying, sessile, obovate, scabrid, margin entire or toothed, apex obtuse. Stem leaves sessile; lateral segments 3–5 pairs, linear to broadly linear, 1.4–4 mm wide, margin entire or sparsely minutely denticulate. Capitula 3–6(–15), laxly corymbose. Involucre at anthesis fusiform to

narrowly ellipsoid and 4–6 mm in diam., expanding in fruit to obconic and 7–12 mm in diam. Phyllaries pale green sometimes with purple tinge, in ca. 6 rows, herbaceous, striate, margin narrowly white scarious, apex acute; outer phyllaries broadly ovate to elliptic, 1.5–2.1 mm; middle and inner phyllaries elliptic-lanceolate, 5–11 × 1.5–2.5 mm. Corolla purple, filiform, ca. 1.1 cm, pubescent with richly branched hairs. Achene subcylindric, 3–5 mm, base rounded, villous toward apex; attachment scar basal, suborbicular. Outer pappus elements to ca. 6 mm, very unequal, scabridulous; inner pappus elements 5 or 6(–12), very short. Fl. and fr. Jul. $2n = 30$.

Slopes; ca. 1100 m. NW Xinjiang (Ili Kazak Zizhizhou) [Afghanistan, India, Kashmir, Kazakhstan, Kyrgyzstan, Russia, Tajikistan, Turkmenistan, Uzbekistan; Africa, SW Asia, Europe].

Crupina vulgaris is naturalized in North America.

48. CARTHAMUS Linnaeus, Sp. Pl. 2: 830. 1753.

红花属 hong hua shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Kentrophyllum Necker ex Candolle.

Herbs, annual or perennial. Leaves pinnatilobed, pinnatisect, or undivided, margin usually spiny. Capitula homogamous, 1 to several at end of stem and branches. Involucre ovoid or narrowly ellipsoid. Outer phyllaries leaflike, rigid, spinosely toothed; inner phyllaries thin, sometimes with apical appendages. Florets bisexual. Stigmatic branches short. Achene ivory, ovoid, oblanceolate, or obpyramidal, 4-angled, glabrous, usually rugose toward apex, apex with a rim; outer achenes often without pappus; inner achenes usually with a persistent or connate and deciduous pappus. Pappus elements in many rows or absent.

About 47 species: C and SW Asia, Europe, Mediterranean region; one species (introduced) in China.

Carthamus lanatus Linnaeus is cultivated as an ornamental in the Beijing area and Shaanxi.

1. *Carthamus tinctorius* Linnaeus, Sp. Pl. 2: 830. 1753.

红花 hong hua

Herbs (20–)50–100(–150) cm tall, annual. Stem erect, apically branched; stem and branches white or whitish, smooth, glabrous. Leaves rigid, leathery, glabrous. Lower and middle stem leaves sessile, lanceolate, ovate-lanceolate, or elliptic, sim-

ple, 7–15 × 2.5–6 cm, base attenuate and semiamplexicaul, margin spinosely toothed or entire, apex acute; teeth very rarely pinnatipartite, apically with 1–1.5 mm spinules. Upper stem leaves lanceolate, decreasing in size upward, margin spinosely toothed; teeth apically with a ca. 3 mm spine. Capitula few to many, in a corymbose synflorescence, rarely 1. Involucre ovoid, ca. 2.5 cm in diam. Phyllaries in ca. 5 rows; outer phyllaries leaflike, ovate-lanceolate, 2–4 × ca. 1 cm, spiny; middle phyl-

laries 6–20 × 4–7 mm, constricted between pale parallel-veined basal part and leaflike apical part with green reticulate veins; inner phyllaries oblanceolate-elliptic to oblanceolate, ca. 22 × 5 mm, rigidly scarious, apex attenuate. Corolla red to orange, ca. 2.8 cm. Achene ovoid to ellipsoid, ca. 5.5 mm, 4-angled. Pappus absent. Fl. and fr. May–Aug. $2n = 24^*$.

Widely cultivated in China and occasionally naturalized in saline

and alkaline soils in dry and cold conditions in Gansu, Guizhou, Hebei, Heilongjiang, Jiangsu, Jilin, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Xinjiang, Xizang, Zhejiang [native origin unknown; widely cultivated].

The seeds of *Carthamus tinctorius* yield edible oil, and the florets are used medicinally or for extracting a red pigment used as dye. Because of its long cultivation, the precise origin is uncertain although it is probably SW Asia.

49. CYANUS Miller, Gard. Dict. Abr., ed. 4, [422]. 1754.

蓝花矢车菊属 lan hua shi che ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Herbs, annual [or perennial]. Leaves arachnoid tomentose, often decurrent on stem. Capitula heterogamous, at end of stem and branches. Involucre ovoid. Phyllary appendages long decurrent, margin ciliate or dentate. Florets usually blue, rarely white, cream-colored, pink, or purple; marginal florets sterile, usually without staminodes, radiant, much enlarged. Achene pilose; attachment scar with a tuft of hairs at base. Pappus elements of two types; inner pappus elements similar to outer ones but distinctly shorter than innermost row of outer pappus elements.

About 25–30 species: SW Asia, Europe, Mediterranean region; one species (introduced) in China.

1. *Cyanus segetum* Hill, Veg. Syst. 4: 29. 1762.

蓝花矢车菊 lan hua shi che ju

Centaurea cyanus Linnaeus, Sp. Pl. 2: 911. 1753; *C. cyanocephala* Velenovský.

Herbs 30–70 cm tall, annual or rarely biennial. Stem erect, branched from middle, rarely unbranched; stem and branches grayish white, thinly arachnoid floccose. Leaves abaxially grayish white and sparsely tomentose, adaxially green to grayish green and sparsely arachnoid. Basal and lower stem leaves petiolate; leaf blade narrowly elliptic-oblanceolate to lanceolate, undivided or lyrate pinnatisect; lateral segments 1–3 pairs, narrowly elliptic-lanceolate, linear-lanceolate, or linear, margin entire; terminal segment narrowly elliptic-oblanceolate, margin serrulate. Middle stem leaves sessile, broadly linear to linear-lanceolate, rarely with lateral laciniae near base, 4–9 × 0.3–0.8 cm, base attenuate, margin entire, apex acute. Upper

stem leaves similar in shape to middle stem leaves, decreasing in size upward. Capitula few to many, corymbose or paniculate. Involucre ellipsoid, 5–13 mm in diam., sparsely arachnoid. Phyllaries in ca. 6 rows, appendaged; appendage brownish or white, scarious, fimbriate; outer and middle phyllaries elliptic to narrowly elliptic, 3–6 × 2–4 mm; inner phyllaries elliptic, 10–11 × 3–4 mm. Outer florets blue, white, red, or purple, longer than inner florets; inner florets bluish violet. Achene ellipsoid, ca. 3 mm, striate, sparsely pilose-pubescent. Pappus elements in several rows, scabrid; outer pappus elements bristlelike, 2–3 mm; inner pappus elements bristlelike to narrowly scalelike, 1–2 mm. Fl and fr. Feb–Aug. $2n = 24, 48^*$.

Occasionally naturalized in at least Qinghai and Xinjiang [native to Europe].

Cyanus segetum is widely grown in China as an ornamental. The whole plant is used medicinally, and the seed oil can be used for soap making.

50. CENTAUREA Linnaeus, Sp. Pl. 2: 909. 1753, nom. cons.

矢车菊属 shi che ju shu

Shi Zhu (石铸 Shih Chu); Ludwig Martins

Calcitrapa Vaillant; *Centaurea* sect. *Hyalea* Candolle; *Chartolepis* Cassini; *Cnicus* Linnaeus, nom. cons.; *Hyalea* Jaubert & Spach; *Jacea* Miller.

Herbs, annual, biennial, or perennial. Leaves concolorous. Capitula heterogamous, 1 to numerous or paniculate-corymbose or paniculate-racemose. Involucre globose, ovoid, campanulate, or bowl-shaped. Phyllaries imbricate; apical appendage fimbriate, spiny, or scarious. Florets few to many; outer florets sterile, enlarged and radiant or ± as long as inner ones, without staminodes; inner florets bisexual. Corolla yellow, white, pink, or purple. Stigmatic branches short. Achene sparsely pubescent to glabrescent or glabrous, apical rim denticulate or smooth. Pappus usually present, of two types of elements; outer pappus elements bristlelike, usually in many rows, rarely in 1 row, persistent or caducous, scabrid; inner pappus elements short, usually scalelike.

About 300–450 species: most in C and SW Asia and Mediterranean region; seven species (one introduced) in China.

All of the native species in China occur in Xinjiang. *Centaurea nigrescens* Willdenow, native to Europe, is grown as a garden plant at the Summer Palace in Beijing.

- 1a. Capitula concealed by uppermost leaves; uppermost leaves large 1. *C. benedicta*
1b. Capitula visible; uppermost leaves diminished.

- 2a. Appendage of middle phyllaries unarmed, hyaline, margin entire or slightly lacerate.
 3a. Involucre 12–18 mm in diam.; stem leaves decurrent 2. *C. glastifolia*
 3b. Involucre 4–6 mm in diam.; stem leaves sessile 3. *C. pulchella*
 2b. Appendage of middle phyllaries fimbriate or spiny.
 4a. Appendage of middle phyllaries fimbriate, blackish 4. *C. scabiosa*
 4b. Appendage of middle phyllaries spiny, pale.
 5a. Terminal spine of middle phyllaries straight, (3–)10–25 mm 7. *C. iberica*
 5b. Terminal spine of middle phyllaries arcuate, 1–4 mm.
 6a. Bisexual florets 3–7; pappus present 5. *C. virgata*
 6b. Bisexual florets ca. 12; pappus absent 6. *C. diffusa*

1. *Centaurea benedicta* (Linnaeus) Linnaeus, Sp. Pl., ed. 2, 2: 1296. 1763.

藏掖花 *cang ye hua*

Cnicus benedictus Linnaeus, Sp. Pl. 2: 826. 1753.

Herbs 5–50 cm tall, annual. Stem erect, usually divaricately branched; stem and branches densely setiferous. Leaves setiferous pubescent with multicellular hairs, pinnatifid or pinnatifid, prominently reticulate-veined especially on abaxial side, margin spinose to spinosely toothed. Basal leaves petiolate; leaf blade oblong, ca. 30 × 8 cm, runcinate to pinnatifid, often withered at anthesis. Lower and middle stem leaves petiolate; petiole winged; leaf blade narrowly elliptic, decreasing in size upward, pinnatifid or pinnatifid, base attenuate; lobes triangular, narrowly elliptic-triangular, or narrowly elliptic. Upper stem leaves sessile, base amplexicaul and shortly decurrent onto stem. Uppermost leaves exceeding capitula. Capitula few to several, rarely 1, solitary at end of stem and branches, concealed by subtending leaves. Involucre ovoid, ca. 2 cm in diam. Phyllaries imbricate, in 4 or 5 rows; outer phyllaries ovate, ca. 10 × 5 mm, leaflike, apex acute and tipped with a 3–6 mm spine; middle phyllaries elliptic, elliptic-lanceolate, or lanceolate, ca. 15 × 3–6 mm, apex with a rigid pectinately divided spine; inner phyllaries broadly linear, ca. 20 × 2.5 mm. Sterile florets filiform. Corolla pale yellow. Achene cylindric, ca. 8 mm, conspicuously many ribbed, glabrous, apex with a denticulate rim. Outer pappus elements in 1 row, ca. 1 cm, rigid, scabridulous; inner pappus elements much shorter, ciliate to inconspicuously arachnoid. Fl. and fr. Jun–Jul. $2n = 22$.

Mountain slopes; ca. 2300 m. Xinjiang (Tian Shan) [Afghanistan, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Tajikistan, Turkmenistan, Uzbekistan; N Africa, SW Asia, Europe].

Centaurea benedicta is native to N Africa, C and SW Asia, and Europe but has become naturalized in other areas.

This species is cultivated in Chinese gardens. The whole plant is used medicinally.

2. *Centaurea glastifolia* Linnaeus subsp. ***intermedia*** (Boissier) L. Martins, **comb. et stat. nov.**

薄鳞菊 *bao lin ju*

Basionym: *Chartolepis intermedia* Boissier, Diagn. Pl. Orient., ser. 2, 3: 64. 1856; *Centaurea chartolepis* Greuter.

Herbs 40–100 cm tall, perennial. Stem erect, winged, sparingly branched. Leaves shortly strigose and gland-dotted, margin entire or inconspicuously serrulate. Basal leaves petiolate; petiole 4–20 cm; leaf blade elliptic to elliptic-oblongate,

6–10 × 2–6 cm. Lower stem leaves similar to basal leaves, base decurrent. Middle and upper stem leaves narrowly elliptic, elliptic-lanceolate, or linear-elliptic, decreasing in size upward, base long decurrent. Capitula few to several, in a laxly racemose-corymbose synflorescence. Involucre narrowly ellipsoid to ovoid, 1.2–1.8 cm in diam. Phyllaries in 6 or 7 rows, with an apical membranous appendage; outer and middle phyllaries ovate, 4–10 × 2.5–5 mm; appendage of outer and middle phyllaries ovate to lanceolate, ca. 5 mm wide, white hyaline except for a pale brown triangular area at base; inner phyllaries ovate-lanceolate, much longer than others. Corolla yellow, ca. 2.7 cm; corolla of outer florets 4- or 5-cleft, as long as or slightly shorter than inner ones. Achene ellipsoid, 5–6 mm, sparsely pilose. Outer pappus elements in many rows, bristlelike, to 1 cm, shortly plumose; inner pappus elements scalelike, oblong, very short. Fl. and fr. Jun–Aug.

Lakesides, thickets; ca. 800 m. Xinjiang (Junggar Pendi) [Kazakhstan, Russia; Europe].

3. *Centaurea pulchella* Ledebour, Icon. Pl. 1: 22. 1829.

琉苞菊 *liu bao ju*

Hyalea pulchella (Ledebour) K. Koch.

Herbs (10–)20–70 cm tall, annual. Stem erect, branched, pubescent near base; branches ivory-white or straw-colored, ascending, slender, glabrous. Leaves arachnoid, glabrescent. Basal leaves withered at anthesis, shortly petiolate; leaf blade narrowly elliptic-lanceolate, margin repandly denticulate and sometimes pinnatifid near base. Lower and middle stem leaves sessile, lanceolate to linear-lanceolate, 2–3 × 0.2–0.3 cm, base cuneate-attenuate, margin entire or minutely serrulate, apex acute. Upper stem leaves similar to lower and middle stem leaves, decreasing in size upward. Capitula many, in a corymbose to paniculate synflorescence. Involucre narrowly ellipsoid to obconic, 4–6 mm in diam. Phyllaries in ca. 6 rows, glabrous, with distinct blackish longitudinal line; outer and middle phyllaries ovate to narrowly ovate, 1–5 × 0.7–1.5 mm excluding appendage; appendage of outer and middle phyllaries with a median brown stripe, spoon-shaped, suborbicular, or ovate, hyaline, decurrent on margin of phyllary, margin entire or slightly lacerate, almost completely concealing herbaceous part of phyllaries; inner phyllaries linear-lanceolate to linear, ca. 10 × 1.5 mm excluding appendage. Sterile florets not radiant. Corolla pink or white, ca. 1 cm, of even thickness. Achene obovoid, ca. 3 mm, sparsely pilose to glabrescent, with a shallowly denticulate rim. Outer pappus elements white, to 5 mm, scabridulous; inner pappus elements scalelike, 1–1.5 mm, ciliate and with a tuft of hairs at apex. Fl. and fr. Jun–Sep.

Mountain slopes, sandy areas, deserts; 700–2400 m. N Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Mongolia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

4. *Centaurea scabiosa* Linnaeus subsp. ***adpressa*** (Ledebour) Gugler, Ann. Hist.-Nat. Mus. Natl. Hung. 6: 132. 1907.

糙叶矢车菊 *cao ye shi che ju*

Centaurea adpressa Ledebour, Index Sem. Horti Dorpat. 1824, Suppl. 2: 3. 1824; *C. apiculata* Ledebour subsp. *adpressa* (Ledebour) Dostál; *C. scabiosa* var. *adpressa* (Ledebour) Candolle.

Herbs 50–100 cm tall, perennial. Stems solitary or few, erect, branched above middle; stem and branches sparsely floccose or arachnoid pubescent. Leaves scabrid, sparsely arachnoid. Basal leaves petiolate; petiole brown, fibrous, 5–8 cm; leaf blade oblanceolate to elliptic in outline, 15–20 × ca. 8 cm, pinnatisect; lateral segments 8–11 pairs, narrowly elliptic, broadly linear, narrowly oblanceolate, or spatulate, margin entire; terminal segment usually larger than lateral segments, margin entire or sometimes toothed. Stem leaves similar to basal leaves, decreasing in size upward; lower stem leaves shortly petiolate. Capitula few to many, corymbose or corymbose-paniculate at end of stem and branches. Involucre ovoid to campanulate, 1.2–2 cm in diam. Phyllaries imbricate, in 6 or 7 rows, appendaged; outer and middle phyllaries broadly to narrowly ovate, 4–13 × 3–5 mm, abaxially arachnoid, somewhat glabrescent; appendage of outer and middle phyllaries brown to blackish brown, small, fimbriate, narrowly decurrent on margin of phyllary, apex acute; inner phyllaries broadly linear, ca. 15 × 3 mm; appendage of inner phyllaries brown, scarious, fimbriate. Sterile florets as long as or slightly longer than bisexual ones. Corolla purple. Achene pale brown, ellipsoid, 4–7 mm, sparsely pubescent, with a subentire rim at apex. Outer pappus elements in several rows, bristlelike, to 6 mm, scabrid to serrulate; inner pappus elements scalelike, ca. 1 mm. Fl. and fr. Jun–Sep. $2n = 20$.

Deserts, steppes, flooded lands, farmlands; 400–1400 m. Nei Mongol, N Xinjiang [Kazakhstan, Kyrgyzstan, Russia, Uzbekistan; Europe].

5. *Centaurea virgata* Lamarck subsp. ***squarrosa*** (Boissier) Gugler, Ann. Hist.-Nat. Mus. Natl. Hung. 6: 248. 1907.

小花矢车菊 *xiao hua shi che ju*

Centaurea virgata var. *squarrosa* Boissier, Fl. Orient. 3: 651. 1875, based on *C. squarrosa* Willdenow, Sp. Pl. 3: 2319. 1803, not Roth (1800).

Herbs 25–70 cm tall, perennial. Stems few to several, erect, branched from above middle; branches spreading, rigid; stem and branches grayish green, arachnoid tomentose. Leaves densely minutely gland-dotted, arachnoid tomentose. Basal and lower stem leaves petiolate; petiole 3–7 cm; leaf blade elliptic in outline, 5–8 × 2–4 cm, pinnatipartite to bipinnatipartite; ultimate segments linear to narrowly elliptic, 0.7–3 mm wide. Middle stem leaves sessile, pinnatipartite. Upper leaves diminished, undivided. Capitula many, laxly and broadly paniculate, solitary or in pairs, easily detaching from peduncle after anthesis. Involucre ovoid, ellipsoid-ovoid, or cylindric, 2.5–3.5 mm in diam.

Phyllaries in ca. 6 rows; outer and middle phyllaries elliptic, narrowly elliptic, or linear-lanceolate, 2–8 × 1–1.8 mm, puberulent; appendage of outer and middle phyllaries straw-colored or with a purple tinge, with 4–8 pectinately arranged 1–1.8 mm spinules on each side ending in a 1–2 mm arcuate-recurved spine; inner phyllaries linear-lanceolate, ca. 8 × 1.5 mm; appendage of inner phyllaries triangular to subulate, scarious. Sterile florets few, as long as bisexual ones, not or scarcely radiant; bisexual florets 3–7. Corolla purple to pink. Achene grayish, ovoid, 3–3.5 mm, pilose to subglabrous, apex with an almost smooth inconspicuous rim. Outer pappus elements in few rows, longest ca. 2 mm, scabridulous; inner pappus elements ca. 0.7 mm. Fl. and fr. Jun–Sep. $2n = 36$.

Mountain slopes, wastelands; 500–1500 m. Xinjiang (Tian Shan) [Afghanistan, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia, Europe].

6. *Centaurea diffusa* Lamarck, Encycl. 1: 675. 1785.

铺散矢车菊 *pu san shi che ju*

Herbs 15–50 cm tall, biennial. Stems erect or diffuse, branched from base; stem and branches densely strigose and sparsely arachnoid. Leaves adaxially scabrous. Basal and lower stem leaves petiolate; leaf blade bipinnatisect. Middle stem leaves sessile. Upper leaves sessile, linear, margin entire. Capitula numerous, paniculate at end of stem and branches. Involucre ovoid-cylindric to cylindric, 3–5 mm in diam. Phyllaries in 5 or 6 rows; outer and middle phyllaries lanceolate to elliptic, 3–7 × ca. 1.5 mm; appendage of outer and middle phyllaries straw-colored, with 1–5 pectinately arranged spines on each side ending in a 2–4 mm arcuate-patent spine; inner phyllaries linear, ca. 8 × 1 mm; appendage of inner phyllaries scarious. Sterile florets few, as long as bisexual ones, not radiant; bisexual florets ca. 12. Corolla white. Achene dark brown with paler stripes, narrowly ovoid, ca. 2 mm, sparsely pilose, apex with a minute inconspicuous smooth apical rim. Pappus absent. Fl. and fr. Sep. $2n = 18, 36$.

Collected from Liaoning (Lüshun) but of unknown status as to being cultivated, escaped, or naturalized [native to SW Asia and Europe].

7. *Centaurea iberica* Treviranus ex Sprengel, Syst. Veg., ed. 16, 3: 406. 1826.

镇刺矢车菊 *zhen ci shi che ju*

Calcitrapa iberica (Treviranus ex Sprengel) Schur.

Herbs 20–100 cm tall, annual or biennial. Stem erect, divaricately branched; stem and branches sparsely setiferous; branches exceeding main axis. Leaves sparsely strigose and gland-dotted. Basal leaves petiolate; leaf blade lyrate pinnatipartite or lyrate pinnatisect. Middle stem leaves sessile, pinnatipartite or pinnatisect; lateral lobes or segments ca. 4 pairs, narrowly elliptic, oblanceolate, or linear-oblanceolate, margin inconspicuously denticulate, apex rounded, obtuse, acute, or mucronulate. Upper leaves decreasing in size upward, narrowly elliptic, lanceolate, oblanceolate, or elliptic-oblanceolate, margin denticulate or entire. Capitula in a corymbose-paniculate synflorescence. Involucre ovoid, 1–1.8 cm in diam. excluding spines. Phyllaries in 4–6 rows; outer and middle phyllaries

ovate, broadly ovate, or ovate-elliptic, $5-7 \times 4-8$ mm, with scarious margin and an apical spine; spine of outer and middle phyllaries straw-colored, (0.3–)1–2.5 cm, patent, sulcate, with 1 or 2 pairs of small accessory spines at base, apex pungent; inner phyllaries narrowly to broadly linear, $10-15 \times 3-6$ mm; appendage of inner phyllaries white or pale brown, scarious, margin entire or irregularly and coarsely dentate. Sterile florets not exceeding bisexual ones. Corolla pink to purple. Achene grayish

brown, ellipsoid, 3–4 mm, sparsely pubescent, apex subentire with an inconspicuous rim. Outer pappus elements in few rows, white, bristlelike, to 2 mm, scabrid; inner pappus elements scalelike, ca. 0.5 mm. Fl. and fr. Jun–Sep. $2n = 20$.

Mountain slopes; 500–900 m. NW Xinjiang [Afghanistan, Kashmir, Kazakhstan, Kyrgyzstan, Pakistan, Russia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia, Europe].

3. Tribe CARLINEAE

刺苞菊族 ci bao ju zu

Shi Zhu (石铸 Shih Chu); Werner Greuter

Herbs, biennial or perennial. Leaves alternate, rarely all basal. Capitula homogamous, bisexual, rarely unisexual in dioecious plants, persistent, solitary or several at end of stem and branches. Involucre surrounded by spiny ± divided bracts dissimilar from phyllaries. Phyllaries imbricate, undivided. Receptacle with scales and sometimes bristles, rarely naked. Florets numerous. Corolla actinomorphic, 5-lobed. Stamen filaments glabrous; anther sagittate, base caudate; connective with a sterile apical appendage. Style branches coherent, short, ± truncate. Achene covered with dense long straight appressed hairs, lacking apical rim surrounding pappus insertion. Pappus elements of one or two types of plumose or scabrid bristles, inserted directly on upper edge of achene, not surrounded by a rim.

Five genera and ca. 70 species: N Africa, Asia, Europe; three genera and six species (two endemic) in China.

- 1a. Inner phyllaries longer than florets, with a scarious and colored distal portion spreading when dry 11. *Carlina*
1b. Inner phyllaries shorter than florets, erect and lacking a colored distal portion.
2a. Most leaves cauline; florets bisexual; receptacle covered with scales 12. *Atractylodes*
2b. All leaves in a basal tuft; florets unisexual, plants dioecious; receptacle naked 13. *Tugarinovia*

11. CARLINA Linnaeus, Sp. Pl. 2: 828. 1753.

刺苞菊属 ci bao ju shu

Herbs, biennial [or annual to perennial], with a taproot. Leaves undivided [to bipinnatisect], margin spinulose [to spiny toothed]. Outer bracts similar to leaves; inner bracts more divided. Phyllaries entire; inner phyllaries longer than florets, with a scarious and colored distal portion spreading when dry. Receptacle flat, areolate, with linear scales and bristles basally conrescent in a honey-comb pattern to envelop achenes. Florets bisexual. Achene oblong, terete, costate, apex truncate. Pappus bristles plumose, all of one type, forming a ring, united groupwise at base.

About 28 species: N Africa, Asia, Europe, Macaronesia (Canary Islands); one species in China.

1. *Carlina biebersteinii* Bernhardt ex Hornemann, Suppl. Hort. Bot. Hafn. 94. 1819.

刺苞菊 ci bao ju

Carlina longifolia Reichenbach (1830), not Viviani (1824); *C. longifolia* var. *pontica* Boissier; *C. vulgaris* Linnaeus var. *longifolia* Grabowski; *C. vulgaris* var. *microcephala* Ledebour.

Herbs 20–120 cm tall, biennial. Stem solitary, apically branched, weakly cobwebby. Basal leaves long petiolate. Cauline leaves sessile, undivided, green, concolorous or abaxially paler, lanceolate to linear-lanceolate, 4–15 × 0.5–2 cm, ± thickly papery, glabrous or abaxially sparsely cobwebby, margin with spinules alternating with distant groups of stouter spines. Uppermost cauline leaves grading into bracts. Bracts very numerous, surrounding capitulum; outer bracts similar to

leaves, green, cobwebby; inner bracts gradually smaller upward, brown or dark purple, progressively reduced to bipinnate spines. Capitula 1 to several, corymbose. Involucre hemispheric-obconic, 3.5–4.5 cm in diam. Phyllaries linear, margin entire; outer phyllaries few, completely hidden by bracts, abaxially densely sericeous cobwebby, margins long interwoven ciliate, distal portion purplish, apex acuminate; inner phyllaries much longer, much exceeding florets, abaxially sparsely cobwebby, margin proximally appressed ciliate, distal portion adaxially yellow, scarious, spreading hygroscopically and showy when dry. Corolla purple, 7–9 mm. Achene oblong, 2–4 mm. Pappus bristles connate to varying lengths in groups of 2–4, all basally united into a ring. Fl. and fr. Jun–Sep. $2n = 20$.

Dry meadows, thickets, river terraces; ca. 1000 m. N Xinjiang (Burqin) [Kazakhstan, Russia; Europe].

12. ATRACTYLODES Candolle, Prodr. 7: 48. 1838.

苍术属 cang shu shu

Giraldia Baroni.

Herbs, perennial, rhizomatous. Rhizome with homomorphic adventitious roots. Leaves undivided to pinnatipartite, margin spinulose or with spine-tipped teeth. Bracts (except outermost leaflike ones) pectinately pinnatisect to pinnatipartite. Receptacle flat or concave, densely covered with linear scales. Florets bisexual. Achene obovoid to ovoid, compressed, apex truncate. Pappus bristles in 1 row, plumose, all of one type, basally connate into a ring.

About six species: E Asia; four species (two endemic) in China.

- 1a. Cauline leaves sessile.

- 2a. Cauline leaves undivided; corolla white, ca. 0.8 cm 1. *A. koreana*
 2b. Cauline leaves pinnately lobed or pinnatifid with 6–9 pairs of segments; corolla yellow, ca. 1.3 cm 3. *A. carlinoides*
 1b. Cauline leaves petiolate.
 3a. Corolla white or yellow, to 1.3 cm 2. *A. lancea*
 3b. Corolla purplish red, ca. 1.7 cm 4. *A. macrocephala*

1. *Atractylodes koreana* (Nakai) Kitamura, Acta Phytotax. Geobot. 4: 178. 1935.

朝鲜苍术 chao xian cang shu

Atractylis koreana Nakai, Bot. Mag. (Tokyo) 42: 478. 1928; *A. amplexicaulis* Nakai ex T. Mori (1923), not Poirlet (1804).

Herbs 25–50 cm tall. Rhizome long, stout. Stems solitary or tufted, unbranched or apically branched, glabrous. Leaves \pm thickly papery, green, subconcolorous, glabrous, undivided, apex acuminate to subacute. Basal and lowermost cauline leaves withered at anthesis. Lower and middle cauline leaves \pm narrowly elliptic to ovate-lanceolate, 3.5–10 \times 2–4 cm, base rounded and semiamplexicaul. Upper cauline leaves similar but smaller. Capitula 1 to several. Involucre campanulate to obconic-campanulate, ca. 1 cm in diam. Phyllaries imbricate, abaxially glabrous, apex obtuse to rounded; outer phyllaries ovate, 2–4 \times 1–2 mm; middle phyllaries gradually longer; innermost phyllaries \pm narrowly oblanceolate, ca. 11 \times 4 mm. Corolla white, ca. 8 mm. Achene obovoid, ca. 4 mm. Pappus brown, 6–7 mm. Fl. and fr. Jul–Aug.

Thickets, dry slopes; 200–700 m. Liaoning, Shandong [Korea].

2. *Atractylodes lancea* (Thunberg) Candolle, Prodr. 7: 48. 1838.

苍术 cang shu

Atractylis lancea Thunberg in Murray, Syst. Veg., ed. 14, 729. 1784; *Acarina chinensis* Bunge; *Atractylis chinensis* (Bunge) Candolle; *A. chinensis* var. *liaotungensis* Kitagawa; *A. chinensis* var. *loeseneri* Kitagawa; *A. japonica* (Koidzumi) Kitagawa; *A. ovata* Thunberg; *A. ovata* f. *pinnatifolia* Komarov; *A. ovata* var. *simplicifolia* Loesener; *A. ovata* f. *ternata* Komarov; *A. pinnatifolia* (Komarov) S. Y. Hu; *A. separata* L. H. Bailey; *Atractylodes chinensis* (Bunge) Koidzumi; *A. eroso-dentata* Koidzumi; *A. japonica* Koidzumi; *A. lancea* var. *simplicifolia* (Loesener) Kitamura; *A. lyrata* Siebold & Zuccarini; *A. ovata* (Thunberg) Candolle; *A. ovata* var. *ternata* (Komarov) Koidzumi; *Giraldia stapfii* Baroni.

Herbs (15–)30–100 cm tall. Rhizome thick, horizontal or ascending. Stems solitary or tufted, unbranched or apically few branched, \pm glabrous. Leaves \pm rigidly papery, green, concolorous, glabrous or abaxially sparsely cobwebby. Basal leaves withered at anthesis. Lower and middle cauline leaves petiolate but lower ones sometimes subsessile; petiole 0.5–8 cm; leaf blade 8–12 \times 5–8 cm, undivided or divided almost to base into 3–5(–9) pinnately arranged segments; segments undivided or sometimes near base with few small spiny lobes, \pm narrowly elliptic to oblanceolate or obovate, 3–9 \times 2–6 cm, base cuneate, apex shortly acuminate to rounded. Upper cauline leaves simi-

lar but smaller. Outer bracts few, leaflike; inner bracts numerous, homomorphic, reduced to pectinately arranged pinnate spines, exceeding but not completely hiding involucre. Involucre campanulate, 1–1.5 cm in diam. Phyllaries numerous, imbricate, margin cobwebby, apex rounded to obtuse; outer phyllaries ovate, 3–6 \times 1–3 mm; middle phyllaries gradually longer; innermost phyllaries elliptic to linear, 11–12 \times 2–4 mm. Corolla white or yellowish, 0.9–1.2 cm. Achene obovoid, ca. 5 mm, hairs white. Pappus brown to dirty white, 7–9 mm. Fl. and fr. Jun–Oct.

Grasslands, forests, thickets, rock crevices; 200–2500 m. Anhui, Chongqing, Gansu, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Zhejiang [Japan, Korea, Russia].

Atractylodes lancea is widely cultivated throughout China. The rhizomes are used medicinally.

3. *Atractylodes carlinoides* (Handel-Mazzetti) Kitamura, Acta Phytotax. Geobot. 7: 119. 1938 [*“carolinoides”*].

鄂西苍术 e xi cang shu

Atractylis carlinoides Handel-Mazzetti, Notizbl. Bot. Gart. Berlin-Dahlem 13: 642. 1937.

Herbs 30–50 cm tall. Rhizome horizontal. Stem solitary, usually purplish red, unbranched. Leaves papery, green, concolorous, glabrous. Basal leaves rosulate, petiolate; leaf blade elliptic to oblanceolate, 15–21 \times 3–4 cm, pinnately lobed or pinnatifid; segments triangular; lateral segments 6–9 pairs; terminal segment largest. Cauline leaves several, sessile, elliptic to lanceolate, 5–12 \times 1–3 cm, pinnately lobed to pinnatifid, apex with a long spine. Bracts pinnatifid. Capitula 1 or 2. Involucre campanulate, 2.5–3 cm in diam. Phyllaries few, imbricate; outer phyllaries \pm narrowly elliptic, 7–11 \times 3–4 mm; middle phyllaries gradually longer; innermost phyllaries linear to broadly linear, ca. 21 \times 3 mm. Corolla yellow, ca. 1.3 cm. Achene obovoid, ca. 6 mm. Pappus white, 7–8 mm. Fl. and fr. Sep.

• Slopes; ca. 1600 m. W Hubei (Zigui).

4. *Atractylodes macrocephala* Koidzumi, Fl. Symb. Orient.-Asiat. 5. 1930.

白术 bai shu

Atractylis macrocephala (Koidzumi) Nemoto (1936), not Desfontaines (1799); *A. macrocephala* var. *humanensis* Y. Ling.

Herbs 20–60 cm tall. Rhizome thick. Stem branched from base, glabrous. Leaves papery, glabrous. Middle cauline leaves petiolate; petiole 3–6 cm; leaf blade divided almost to base into 3–5 segments; lateral segments entire or bipartite, oblanceolate to \pm narrowly elliptic, 4.5–7 \times 1.5–2 cm; terminal segment largest. Upper cauline leaves similar but smaller. Outer bracts

sessile, elliptic to narrowly elliptic, margin entire; inner bracts pinnatisect. Capitula 6–10. Involucre broadly campanulate, 3–4 cm in diam. Phyllaries numerous, imbricate, margin white cobwebby, apex obtuse; outer phyllaries ovate to triangular, 6–8 × 3–4 mm; innermost phyllaries lanceolate to broadly linear, 11–20 × 2–3 mm. Corolla purplish red, ca. 1.7 cm. Achene ob-

conic, ca. 7.5 mm, hairs white. Pappus dirty white, ca. 1.7 cm. Fl. and fr. Aug–Oct. $2n = 24^*$.

• Grasslands, forests; 600–2800 m. W Anhui, Chongqing, N Fujian, Guizhou, Hubei, Hunan, W Jiangxi, Zhejiang.

Atractylodes macrocephala is cultivated throughout China. The rhizomes are used medicinally.

13. TUGARINOVIA Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 356. 1928.

革苞菊属 ge bao ju shu

Herbs, perennial, dioecious, stemless. Taproot crowned by a thick woody stock. Leaves all basal, tufted, petiolate; leaf blade leathery, pinnately divided; segments spiny. Flowering scapes lateral, axillary, short. Capitulum solitary, homogamous, female or functionally male. Receptacle naked. Male florets small; female florets larger, with staminodes. Anthers basally with long filiform tails. Pappus elements of two types; inner pappus of distinct scabrid bristles; outer pappus shorter, of few slender tortuous hairs.

One species: China, Mongolia.

1. *Tugarinovia mongolica* Iljin, Izv. Glavn. Bot. Sada S.S.S.R. 27: 357. 1928.

革苞菊 ge bao ju

Woody stock 6–7 cm in diam., densely beset with persistently lanate petiole remains. Petiole 1.5–7 cm, proximal half with dense long silky indumentum; leaf blade elliptic, oblong, or ovate, 3–15 × 1–4 cm, pinnatipartite to pinnately lobed, both surfaces sparsely to densely cobwebby or lanate; segments wide and short, with irregular shallow spine-tipped teeth; spines rigid, 2–4 mm. Flowering scapes solitary or few, decumbent or ascending, unbranched, leafless, 2–4 cm, densely whitish lanate. Bracts leathery, with shallow spiny lobes, abaxially cobwebby; outer bracts leaflike, not always present; inner bracts smaller, grading into phyllaries, with yellow spinules. Male capitula ca. 1 cm; female capitula ca. 2 cm. Involucre obconic to obovoid, ca. 1 cm in diam. Phyllaries few, imbricate, linear-lanceolate, abaxially subglabrous, margin entire and ciliate, apex spiny. Corolla whitish, 0.7–1.4 cm. Style distally thickened, in female florets smooth and with ± divergent triangular-ovate branches, in functionally male florets covered with sweeping hairs at tip; branches coherent, linear. Achene oblong, 8–10 mm, densely

sericeous-villous. Pappus dirty white, inner pappus to 1.5 cm. Fl. and fr. May–Jun.

Stony hillsides, sandy sloping fields, gravelly slopes; 800–1500 m. Nei Mongol [Mongolia].

The roots are used medicinally.

- 1a. Leaf blade narrowly elliptic to oblong 1a. var. *mongolica*
 1b. Leaf blade ovate 1b. var. *ovatifolia*

1a. *Tugarinovia mongolica* var. *mongolica*

革苞菊(原变种) ge bao ju (yuan bian zhong)

Leaf blade narrowly elliptic to oblong.

Stony hillsides, sandy sloping fields; ca. 1500 m. Nei Mongol [Mongolia].

1b. *Tugarinovia mongolica* var. *ovatifolia* Y. Ling & Ma, Fl. Reipubl. Popularis Sin. 75: 248. 1979.

卵叶革苞菊 luan ye ge bao ju

Leaf blade ovate.

• Gravelly slopes; ca. 800 m. Nei Mongol (Ih Ju Meng).

5. Tribe CICHORIEAE

菊苣族 ju ju zu

Shi Zhu (石铸 Shih Chu), Ge Xuejun (葛学军);

Norbert Kilian, Jan Kirschner, Jan Štěpánek, Alexander P. Sukhorukov, Evgeny V. Mavrodiev, Günter Gottschlich

Annual to perennial, acaulescent, scapose, or caulescent herbs, more rarely subshrubs, exceptionally scandent vines, latex present. Leaves alternate, frequently rosulate. Capitulum solitary or capitula loosely to more densely aggregated, sometimes forming a secondary capitulum, ligulate, homogamous, with 3–5 to ca. 300 but mostly with a few dozen bisexual florets. Receptacle naked, or more rarely with scales or bristles. Involucre cylindric to campanulate, \pm differentiated into a few imbricate outer series of phyllaries and a longer inner series, rarely uniseriate. Florets with 5-toothed ligule, pale yellow to deep orange-yellow, or of some shade of blue, including whitish or purple, rarely white; anthers basally calcarate and caudate, apical appendage elongate, smooth, filaments smooth; style slender, with long, slender branches, sweeping hairs on shaft and branches; pollen echinolphate or echinate. Achene cylindric, or fusiform to slenderly obconoidal, usually ribbed, sometimes compressed or flattened, apically truncate, attenuate, cuspidate, or beaked, often sculptured, mostly glabrous, sometimes papillose or hairy, rarely villous, sometimes heteromorphic; pappus of scabrid [to barbellate] or plumose bristles, rarely of scales or absent.

About 95 genera and ca. 2,500 species (and at least 8,000 apomictic and hybrid taxa): chiefly in the temperate to subtropical zones of the N Hemisphere, and extending to tropical and S Africa, tropical Asia, Australia and New Zealand, and South America, also on SE Pacific and mid-Atlantic archipelagos; 35 genera (two endemic, one introduced) and 388 species (190 endemic, 12 introduced) in China.

- 1a. Pappus absent in all or in outer achenes, or in all achenes present but of minute (≤ 0.3 mm) scales or very short (≤ 1.5 mm) bristles.
 - 2a. Pappus a tiny crown of fimbriate 0.1–0.3 mm scales; florets blue 83. *Cichorium*
 - 2b. Pappus absent in all or in outer achenes, or of very short (≤ 1.5 mm) bristles; florets yellow.
 - 3a. Achene dimorphic, outer achenes apically attenuate or shortly beaked, inner ones with a long slender beak strongly exceeding involucre; pappus in all or in inner achenes present.
 - 4a. Outer achenes columnar, curved, with appressed hairs, apically attenuate; pappus of smooth to scabrid 0.2–1.5 mm bristles, shorter in outer, longer in inner achenes; inner phyllaries hardened in fruit 70. *Garhadiolus*
 - 4b. Outer achenes broadly obconical, compressed, lateral ribs strongly winglike and enlarged, shortly beaked; pappus absent in outer achenes, mostly present and of 3–5 mm bristles in inner ones; inner phyllaries not hardened in fruit 69. *Heteracia*
 - 3b. Achene homomorphic, never beaked; pappus in all achenes absent.
 - 5a. Achene body columnar-scorpoid, ca. 1 cm, abaxially with antrorse and apically with retrorse rigid hooked needlelike spines; leaves undivided, narrowly grasslike 53. *Koelpinia*
 - 5b. Achene body narrowly ellipsoid, subcompressed, to ca. 5 mm, with 0 or (1 or) 2–4 main ribs apically prolonged into 0.2–2.2 mm slender hooked appendages; leaves pinnatipartite or pinnatisect 67. *Lapsanastrum*
- 1b. Pappus well developed in all achenes, of soft or stiff bristles, usually more than 1/2 as long as achene.
 - 6a. Pappus bristles all or at least inner ones plumose but often apically scabrid.
 - 7a. Plumose bristles stiffly fimbriately plumose, fimbriae not intertwining; florets yellow or white; leaves never grasslike.
 - 8a. Receptacle with linear scarious scales \pm as long as involucre and enclosing base of florets; stem, leaves, and involucre with rigid simple hairs 81. *Hypochaeris*
 - 8b. Receptacle naked; stem, leaves, and involucre with simple and 2-hooked hairs 82. *Picris*
 - 7b. Plumose bristles softly or lanately fimbriately plumose, fimbriae conspicuously intertwining; florets of some shade of yellow, white, blue, or purple; leaves often grasslike.
 - 9a. Phyllaries in 1(or 2) series, outer series if present never leaflike 55. *Tragopogon*
 - 9b. Phyllaries in several series, or in 2 series but then outer series leaflike and longer than inner series.
 - 10a. Phyllaries in 2 series, outer phyllaries herbaceous, leaflike, usually longer than inner phyllaries, inner usually 5 54. *Epilasia*
 - 10b. Phyllaries in several series, outer phyllaries never leaflike and longer than inner ones.
 - 11a. Leaves undivided, parallel-veined, grasslike or more rarely also lanceolate to ovate 51. *Scorzonera*
 - 11b. Leaves pinnately divided 52. *Podospermum*
 - 6b. Pappus bristles never plumose, all smooth to scabrid.
 - 12a. Pappus white, of numerous fine cottony outer bristles intermixed with some thicker inner ones 63. *Sonchus*
 - 12b. Pappus white or grayish, yellowish, straw-colored, brownish, or reddish brown, of bristles \pm equal in diam. and stiffness.
 - 13a. Leaves, axes, or involucre with various types of hairs, but including stellate hairs and/or multiseriate hairs with projecting cell apices.
 - 14a. Achene 2.5–5 mm, with 8–10 equal ribs apically confluent in an obscure ring 84. *Hieracium*

- 14b. Achene 1–2 mm, with apically distinct ribs not confluent in an obscure ring 85. *Pilosella*
- 13b. Leaves, axes, or involucre glabrous or hairy, but never with stellate hairs or multiseriate hairs with projecting cell apices.
- 15a. Capitulum solitary on a hollow scape (without nodes, leaves, or bracts) single or few from a leaf rosette; achene beak usually longer than achene body, body at least apically mostly spinulose, scaly, and/or tuberculate and usually with an apical cone 71. *Taraxacum*
- 15b. Capitula usually few to numerous, either fascicled or aggregated amid a leaf rosette, or on a branched stem; if capitulum rarely solitary then not on a hollow scape and achene not as above.
- 16a. Rosulate herbs with several to many capitula either on short, wiry unbranched axes (peduncles) directly from and fasciculate amid leaf rosette, or sessile to very shortly pedunculate and densely aggregated on an apically \pm inflated, flat, convex, or more rarely cylindrically elongate rosette shoot.
- 17a. Capitula with 3–6 florets, sessile or on peduncle shorter than involucre; phyllaries in 1 series, hardened in fruit, outer phyllaries absent, inner ones connate in basal part.
- 18a. Florets yellow or pale to medium purplish; achene obconical, compressed, with 5 ribs, apex truncate; pappus bristles caducous 77. *Synalathium*
- 18b. Florets purplish red to blue; achene obovoid, compressed, with winglike lateral ribs and 1 slender rib on either side, apex constricted into a ca. 0.5 mm fragile thin beak; pappus caducous with pappus disk (*M. souliei*) 58. *Melanoseris*
- 17b. Capitula with 4–30 florets, peduncle shorter or longer than involucre; phyllaries in more than 1 series, herbaceous in fruit, outer phyllaries 2 or more, inner ones basally connate or free.
- 19a. Florets blue to bluish purple (*D. amoena* and *D. gombalana*) 76. *Dubyaea*
- 19b. Florets yellow or rarely white.
- 20a. Capitula with 4 or 5 florets, with a peduncle shorter than to \pm as long as involucre and from an apically \pm inflated, flat, convex, or more rarely cylindrically elongate rosette shoot (*Soroseris* spp. 3–7) 80. *Soroseris*
- 20b. Capitula with 12–30 florets, with a peduncle usually longer than involucre, from a non-inflated rosette shoot.
- 21a. Synflorescence hemispheric, of many densely crowded capitula surrounded by a rosette of orbicular to ovate leaves abruptly contracted into an unwinged petiole-like basal portion; florets yellow or white (*Soroseris* spp. 1 and 2) 80. *Soroseris*
- 21b. Synflorescence loosely corymbiform with few to several capitula amid a rosette of \pm spatulate leaves very gradually attenuate toward base; florets yellow 66. *Youngia*
- 16b. Capitula few to numerous on a branched stem a few cm to more than 2 m tall; rarely capitulum solitary on an unbranched stem.
- 22a. Achene isodiametric and with ribs of \pm equal shape and size; pappus white, rarely pale yellowish.
- 23a. Achene with 10 very prominent \pm winglike ribs 74. *Ixeris*
- 23b. Achene with 10–20 \pm prominent but never winglike ribs.
- 24a. Plants delicate; involucre narrowly cylindric, longest outer phyllary $\leq 1/4$ – $1/3$ of inner ones, inner phyllaries abaxially glabrous; capitula with 5–15 florets; achene pale brown, with 10 ribs 72. *Ascellia*
- 24b. Plants usually robust; involucre cylindric to campanulate, longest outer phyllary $1/4$ – $2/3$ or more of inner ones, inner phyllaries abaxially usually with simple and/or glandular hairs along midvein; capitula with (8–)20–70 (and more) florets; achene of some shade of brown, with 10–20 ribs 65. *Crepis*
- 22b. Achene (sometimes except inner ones) somewhat to distinctly compressed and/or with \pm unequal ribs; pappus white, yellowish, or brownish.
- 25a. Pappus yellowish, straw-colored, brownish, or grayish and achene never strongly compressed with dominant lateral ribs and/or with capillaceous beak.
- 26a. Florets reddish to bluish purple, or blue.
- 27a. Involucre broadly campanulate; capitula with many (usually 50–70) florets; stem in upper half and peduncles often with long stiff blackish hairs 76. *Dubyaea*
- 27b. Involucre narrowly cylindric to narrowly campanulate; capitula with 5–30 florets; stem in upper half and peduncles glabrous 56. *Faberia*
- 26b. Florets yellow, or rarely whitish to pale purplish or pale greenish.
- 28a. Involucre 4.5–8 mm; capitula erect.
- 29a. Achene with short slender beak; pappus yellowish to yellowish brown 73. *Ixeridium*
- 29b. Achene apically attenuate but not beaked; pappus ash-gray or yellowish brown 66. *Youngia*
- 28b. Involucre 10–20 mm; capitula often nodding at anthesis.
- 30a. Synflorescence secundly racemiform (*Y. racemifera*) 66. *Youngia*
- 30b. Synflorescence corymbiform or paniculiform, or capitula 1 or 2.

- 31a. Stem, branches, and phyllaries with conspicuous stiff yellowish brown, reddish, purplish brown, or blackish mostly glandular hairs, or glabrous and stem with 1 or 2 nodding capitula only 76. *Dubyaea*
- 31b. Stem, branches, and phyllaries glabrous and stem with some to many capitula, or \pm hairy but never with conspicuous stiff mostly glandular hairs.
- 32a. Leaves grasslike 78. *Hololeion*
- 32b. Leaves pinnately lobed or, if undivided, ovate to triangular-ovate 79. *Nabalus*
- 25b. Pappus white, exceptionally faintly yellowish or brownish but then achene strongly compressed with dominant lateral ribs and/or with capillaceous beak.
- 33a. Plants broomlike and/or achene with body apically scaly and/or tuberculate and beaked (sometimes very shortly) 64. *Chondrilla*
- 33b. Plants never broomlike, achene beaked or not but body never scaly or tuberculate.
- 34a. One of following features applies: 1) achene \pm compressed with \pm dominating or broadened lateral ribs; 2) pappus double and additionally with an outer series of minute hairs (usually ≤ 0.3 mm); 3) florets purplish, bluish, or exceptionally white.
- 35a. Achene black or reddish-purplish (if rarely pale then plant scandent), fusiform to cylindric, without dominating lateral ribs, and apex truncate, attenuate, or shortly (ca. 1 mm) beaked; florets some shade of purple or blue; pappus simple; involucre narrowly cylindric.
- 36a. Achene black, fusiform, weakly compressed, apex attenuate to shortly beaked and often pale 59. *Paraprenanthes*
- 36b. Achene reddish-purplish (rarely pale and plant scandent), fusiform to cylindric, compressed, apex truncate 60. *Notoseris*
- 35b. Achene pale to dark brown, more rarely blackish or reddish brown, gray, or olive green, subcylindric, \pm ellipsoid to obovoid, or \pm fusiform, usually with, rarely without, dominating or broadened (sometimes winglike) lateral ribs and apex truncate to long filiform beaked; pappus simple or double; florets yellow, bluish, or purplish, rarely white; involucre narrowly cylindric, cylindric, campanulate, or broadly campanulate.
- 37a. Achene always strongly compressed, ellipsoid to obovoid, dominating lateral ribs sometimes even winglike, apex with a short stout or with a long filiform beak; pappus always simple; involucre narrowly cylindric at anthesis, inner phyllaries 5 or 8, or if 3 or 4 then plant a subshrub with whitish, rigid, intricately and divaricately branched stems; stems and branches usually glabrous, at least in upper half; capitula always erect; florets some shade of yellow, or blue, bluish purple, purple, or white 61. *Lactuca*
- 37b. Achene \pm compressed, dominating lateral ribs never winglike, apex truncate, attenuate, or with a short stout or slender but never long filiform beak; pappus usually double, more rarely outer series with minute hairs indistinct or missing; involucre narrowly cylindric to broadly campanulate, inner phyllaries 3 to many; capitula erect or nodding; stems and branches glabrous, or hispid, hirsute, or otherwise hairy; florets mostly some shade of blue or purple, exceptionally white, very rarely yellow.
- 38a. Involucre with 5–10 inner phyllaries, 6–10(–12) mm and narrowly cylindric, or cylindric, 11–13 mm, and with longest outer phyllary 1/2–3/4 of inner ones, or to 15 mm, broadly cylindric to campanulate, and herb tall with many-capitellate narrowly racemiform synflorescence to 50 cm; florets always bluish or purplish; achene 4–5 mm 57. *Cicerbita*
- 38b. Involucre broadly cylindric to broadly campanulate, mostly exceeding 15 mm and never with many-capitellate narrowly racemiform synflorescence to 50 cm, or rarely narrowly cylindric but then with either only 3 or 4 inner phyllaries, or > 13 mm, or strongly hirsute, or florets yellow, or achene ≥ 6 mm, or, if rather cylindric, longest outer phyllary to ca. 1/2 of inner ones 58. *Melanoseris*
- 34b. Achene \pm isodiametric or \pm compressed but not with \pm dominating or broadened lateral ribs; pappus always single; florets always of some shade of yellow.
- 39a. Achene apex \pm truncate (at least before shedding of pappus disk if pappus disk caducous).
- 40a. Longest outer phyllary $\leq 1/3$ of inner ones; stem stiff erect; synflorescence narrowly racemiform or paniculiform; pappus caducous (without pappus disk) 75. *Sonchella*
- 40b. Longest outer phyllary 1/2–3/4 of inner ones; stem weak and procumbent to ascending, or long creeping, or if stiff erect then hardened and densely divaricately and intricately branched; synflorescence corymbose to divaricately paniculiform, or capitulum solitary; pappus persistent or caducous together with pappus disk 62. *Launaea*

- 39b. Achene apex distinctly attenuate to beaked.
- 41a. Stem leaves well developed and at least upper ones conspicuously clasping stem, or plant stoloniferous (*Crepidiastrum* spp. 1–6) 68. *Crepidiastrum*
- 41b. Stem leaves absent or present but not clasping stem and plant not stoloniferous.
- 42a. Stems herbaceous to hardened, several to numerous, more rarely only 1, erect, with some to many heads, from a stout woody caudex and plant often caespitose; basal leaves and stem leaves (if present) pinnate to bipinnate with linear, lanceolate, or filiform lobes; involucre 8–12 mm, most phyllaries subapically crested or corniculate (*Crepidiastrum* spp. 7–9) 68. *Crepidiastrum*
- 42b. Stems usually 1 or 2, of various kind, either from an inconspicuous caudex and plant never caespitose, or plants annual; involucre ≤ 7 mm and phyllaries subapically all strictly plane, or involucre to 13 mm and either some phyllaries crested or corniculate but then leaves never pinnate with linear, lanceolate, or filiform lobes, or all strictly plane.
- 43a. Involucre narrowly cylindric, 7–8 mm, all phyllaries subapically plane; perennial rosulate herbs, stem solitary; either stem, branches, and phyllaries white echinulate, or rosette leaves with a pentagonal or triangular lamina and a petiole as long as or longer than lamina (*Ixeridium* spp. 7 and 8) 73. *Ixeridium*
- 43b. Involucre 4–13 mm, phyllaries all subapically plane or some crested or corniculate; annual herbs, or if perennial herbs and rosulate then stem, branches, and phyllaries never white echinulate and leaves never as above 66. *Youngia*

51. SCORZONERA Linnaeus, Sp. Pl. 2: 790. 1753.

鸦葱属 ya cong shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Lasiospora Cassini; *Takhtajaniantha* E. A. Nazarova.

Herbs, perennial [or annual], rarely subshrubs, often with woody caudex and rosulate. Leaves usually linear to linear-elliptic or lanceolate, more rarely also ovate, with parallel veins, not divided, base with semiamplexicaul usually persistent sheath, margin entire, flat, or sometimes undulate. Involucre cylindric to campanulate, usually very conspicuously prolonged toward fruiting. Phyllaries in few to several series, imbricate, often (especially inner phyllaries) with scarious margin; longest outer phyllaries usually to more than 1/2 as long as and often \pm approaching inner phyllaries in length; inner phyllaries lanceolate to linear-lanceolate. Receptacle naked. Florets yellow (and often pinkish on drying) or rarely orange or pale purple, 1.1–2 \times as long as involucre. Achene \pm cylindric to columnar, with numerous smooth or tuberculate longitudinal ribs, glabrous, puberulent, or villous along entire length or apically only, apex truncate or more rarely attenuate. Pappus of strong bristles, persistent or caducous, a few often distinctly longer than remainder; bristles softly fimbriately plumose for most of length and apically scabrid.

About 180 species: N Africa, Asia, Europe; 24 species (four endemic) in China.

Even after exclusion of *Podospermum* and *Epilasia*, *Scorzonera* is still polyphyletic (Mavrodiev et al., Taxon 53: 699–712. 2004). Because a more detailed phylogenetic study and revision of *Scorzonera* s.l. is not yet available, and the circumscription of its diverse elements therefore not clear, the genus is treated here in this wider sense still including *Takhtajaniantha* and *Lasiospora*.

- 1a. Perennial herbs or subshrubs, often hemispheric; stems usually basally woody, virgate, repeatedly divaricately branched; basal leaves early deciduous; stem leaves linear to filiform and small, or larger and spreading.
- 2a. Caudex with scarious leaf sheath residues; stem leaves inconspicuous, to 10 mm; capitula with 4 or 5 florets 1. *S. divaricata*
- 2b. Caudex with fibrous and lacerate leaf sheath residues; stem leaves conspicuous, horizontally spreading to spreading-erect, 1–9 cm; capitula with 7–12 florets 2. *S. pseudodivaricata*
- 1b. Perennial herbs, never hemispheric; stems herbaceous, unbranched or rather weakly branched; basal leaves usually present; stem leaves present or absent, of various shapes.
- 3a. Caudex with conspicuous dark brown fibrous and lacerate leaf sheath residues.
- 4a. Leaves filiform to filiform-linear, 1–1.5 mm wide, almost somewhat curled, glaucous 10. *S. curvata*
- 4b. Leaves not filiform to filiform-linear, 2 mm or more wide, \pm straight, green.
- 5a. Ovary and achene shortly villous along their entire length.
- 6a. Leaves 2–15 mm wide, margin undulate; plants glabrous; achene ca. 10 mm 11. *S. ikonnikovii*
- 6b. Leaves 3–4 mm wide, margin flat; leaves, stems, and phyllaries floccose or lanate when young, soon glabrescent; achene 7–8 mm 12. *S. manshurica*
- 5b. Ovary and achene glabrous.

- 7a. Stem (especially apically) and involucre basally floccose arachnoid hairy; leaves 2–4 mm wide 9. *S. subacaulis*
- 7b. Plants usually glabrous (occasionally leaf sheath margin or apical phyllary margin arachnoid hairy); leaves sometimes as narrow as 2 mm wide, otherwise 0.5–3(–4.5) cm wide.
 - 8a. Basal leaves often rather narrow (linear, linear-lanceolate, or linear-elliptic), margin usually flat 7. *S. austriaca*
 - 8b. Basal leaves often rather broad (broadly ovate, ovate-lanceolate, oblanceolate, elliptic-lanceolate, linear-elliptic, or linear), margin undulate 8. *S. sinensis*
- 3b. Caudex with smooth, usually scarious, rarely with age lacerate or somewhat fibrous but never dark brown fibrous leaf sheath residues, or without leaf sheath residues.
 - 9a. Ovary and achene densely villous along their entire length.
 - 10a. Leaves usually 0.8–1.5 cm wide, leaf blade margin densely undulate; plants with globose tuber some cm below surface 24. *S. circumflexa*
 - 10b. Leaves usually 2–8 mm wide, leaf blade margin flat; plants with or without globose tuber.
 - 11a. Plants without tuber, to 40 cm tall; pappus 2–2.5 cm 22. *S. ensifolia*
 - 11b. Plants with tuber some cm below surface, to 20 cm tall; pappus less than 1.5 cm 23. *S. sericeolanata*
 - 9b. Ovary and achene glabrous or at most \pm villous at pappus disk.
 - 12a. Stems leafless, sparsely leaved, or with reduced leaves, with 1 or few single-capitellate branches, or plants subacaulescent.
 - 13a. Caudex conspicuously dirty white lanate of adaxially thickly lanate leaf sheath residues; leaves broadly lanceolate to ovate, at least in part usually more than 2 cm wide 3. *S. capito*
 - 13b. Caudex not lanate, leaf sheaths adaxially glabrous; leaves at most ca. 1.5 cm wide.
 - 14a. Involucre, base of involucre, and sometimes leaves somewhat arachnoid hairy; florets ca. $2 \times$ as long as involucre 6. *S. radiata*
 - 14b. Plants entirely glabrous; florets less than $1.5 \times$ as long as involucre.
 - 15a. Leaves lanceolate, or narrowly elliptic to linear, 2–15 mm wide 4. *S. parviflora*
 - 15b. Leaves linear, 1–2 mm wide 5. *S. luntaiensis*
 - 12b. Stems leafy, well developed, and usually branched at least basally.
 - 16a. Plants of saline soil, glabrous (but leaf sheaths adaxially often lanate) and grayish to glaucous green; leaves \pm fleshy, narrowly elliptic to lanceolate; stem leaves often partly opposite 21. *S. mongolica*
 - 16b. Plants not of saline soil, glabrous and fresh green or with indumentum; leaves not fleshy, variously shaped; stem leaves always alternate.
 - 17a. Plants with tuber some cm below surface, to 20(–40) cm tall; leaves 1–3 mm wide.
 - 18a. Plants 30–40 cm tall; involucre 2–2.4 cm at anthesis 20. *S. aniana*
 - 18b. Plants to 20 cm tall; involucre 1.3–1.8 cm at anthesis.
 - 19a. Caudex with adaxially lanate leaf sheath residues; involucre ca. 1.8 cm at anthesis; pappus bristles plumose for most of length 18. *S. pusilla*
 - 19b. Caudex with glabrous leaf sheath residues; involucre 1.3–1.5 cm at anthesis; pappus bristles scabrid for most of length 19. *S. pamirica*
 - 17b. Plants without tuber, taller than above; leaves usually wider than above.
 - 20a. Involucre from at least 2 cm at anthesis, to 4 cm in fruit; achene 1.7–2.3 cm, apically conspicuously long attenuate; pappus caducous as an entity 13. *S. albicaulis*
 - 20b. Involucre to 2 cm at anthesis, not more than ca. 3 cm in fruit; achene not more than 1.5 cm, apically not conspicuously attenuate; pappus persistent.
 - 21a. Florets slightly longer than involucre; plants entirely glabrous; achene 7–9 mm 4. *S. parviflora*
 - 21b. Florets distinctly longer than involucre (usually ca. $1.5 \times$ as long as involucre); stem, leaves, or involucre with short branched, dendritic or stellate hairs; achene 1–1.5 cm.
 - 22a. Plants with weak, ascending-erect stems to at most 30 cm tall, usually branched already near base; achene with tuberculate ribs.
 - 23a. Plants with conspicuous gray indumentum; leaves linear, 1–5 mm wide, with flat margin 16. *S. pubescens*
 - 23b. Plants stellate puberulent, glabrescent; leaves narrowly lanceolate or narrowly elliptic, 4–7 mm wide, with mostly undulate margin 17. *S. inconspicua*
 - 22b. Plants with strong erect stems to 75 cm tall, usually branched apically; achene with smooth ribs.

- 24a. Florets yellow 14. *S. iliensis*
 24b. Florets deep orange 15. *S. transiliensis*

1. *Scorzonera divaricata* Turczaninow, Bull. Soc. Imp. Naturalistes Moscou 5: 200. 1832.

拐轴鸦葱 guai zhou ya cong

Subshrubs or perennial herbs, 20–40 cm tall. Rootstock 4–10 mm in diam. Caudex branched, with smooth scarious leaf sheath residues. Stems some to many, grayish green, slender, erect, repeatedly divaricately and intricately branched from base, pubescent or glabrous, basally woody; branches slender, ascending-erect. Basal leaves few, distant, linear, early deciduous. Stem leaves linear to filiform, 2–10 × 1–3 mm, apex usually hooked; upper stem leaves bractlike, inconspicuous. Capitula many, terminal, with 4 or 5 (to 12–15 in var. *sublilacina*) florets. Involucre narrowly cylindric, ca. 1 cm at anthesis, 1.5–1.7 × 0.3–0.4 cm in fruit. Phyllaries puberulent, pubescent, or sparsely pubescent in fruit; outer phyllaries few, ovate to lanceolate, longest ca. 1/2 as long as inner phyllaries; inner phyllaries usually ca. 4. Florets yellow (or pale purple in var. *sublilacina*). Achene pale yellow to yellowish brown, cylindric, 7–9 mm, with smooth ribs, glabrous or apically villous. Pappus straw-colored to brownish, ca. 1.5 cm. Fl. and fr. May–Sep.

Dry riverbeds, lowland sand dunes, gullies, valleys, hills, slopes, plains at base of mountains; 500–2000 m. Gansu, Hebei, Nei Mongol, Ningxia, Shaanxi, Shanxi [Mongolia].

- 1a. Florets yellow; achene glabrous 1a. var. *divaricata*
 1b. Florets pale purple; achene apically villous 1b. var. *sublilacina*

1a. *Scorzonera divaricata* var. *divaricata*

拐轴鸦葱(原变种) guai zhou ya cong (yuan bian zhong)

Scorzonera divaricata var. *intricatissima* Maximowicz.

Florets yellow. Achene glabrous.

Dry riverbeds, lowland sand dunes, gullies, valleys; 500–2000 m. Gansu, Hebei, Nei Mongol, Ningxia, Shaanxi, Shanxi [Mongolia].

1b. *Scorzonera divaricata* var. *sublilacina* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 32: 494. 1888.

紫花拐轴鸦葱 zi hua guai zhou ya cong

Florets pale purple. Achene apically villous.

• Hills, slopes, plains at base of mountains; ca. 1500 m. Gansu, Nei Mongol (Hohhot).

Scorzonera divaricata var. *sublilacina*, originally described by Maximowicz from material from Nei Mongol and Gansu with capitula of up to 15 pale purple florets, was referred by Lipschitz (Fragm. Monogr. *Scorzonera* 2: 124. 1939) to this species rather than to *S. pseudodivaricata* as were the other varieties with more numerous florets than is usual in *S. divaricata*. A reassessment of this taxon and its affinity appears worthwhile considering the frequent confusion between plants of *S. divaricata* and *S. pseudodivaricata*. Because the yellow ligules of both *S. divaricata* and *S. pseudodivaricata* can become pinkish on drying, floret color needs to be established on living plants.

Scorzonera divaricata var. *sublilacina* is used medicinally for treating serious cases of boils.

2. *Scorzonera pseudodivaricata* Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 42: 158. 1933.

帚状鸦葱 zhou zhuang ya cong

Scorzonera divaricata Turczaninow var. *foliata* Maximowicz; *S. divaricata* var. *virgata* Maximowicz; *S. muriculata* C. C. Chang; *S. pseudodivaricata* var. *leiocarpa* C. H. An; *S. rugulosa* C. C. Chang.

Subshrubs or perennial herbs, 7–50 cm tall. Rootstock ca. 9 mm in diam. Caudex unbranched or more rarely branched, with somewhat fibrous and lacerate leaf sheath residues. Stems some to many, grayish green, rigid, herbaceous, sparsely to moderately divaricately branched in apical half, puberulent, glabrescent, or glabrous, leafy; branches virgate, slender, spreading-erect. Basal leaves crowded, linear, early deciduous. Stem leaves linear to filiform, usually 1–9 cm × 0.5–5 mm, horizontally spreading to spreading-erect, straight or somewhat hooked, often falcate, pubescent, glabrescent, or glabrous; upper stem leaves progressively smaller but mostly still leaflike. Capitula many, terminal, with usually 7–12 florets. Involucre cylindric, usually 1.5–1.8 cm at anthesis, 1.8–2.5 × 0.5–0.8 cm in fruit. Phyllaries puberulent; outer phyllaries triangular-ovate to linear-lanceolate, longest 1/2–2/3 as long as inner phyllaries; inner phyllaries usually 5 or 6. Florets yellow. Achene brownish, dark green, or blackish, cylindric, 7–8 mm, with elevated smooth or tuberculate ribs, glabrous. Pappus dirty white to straw-colored, 1.3–1.8 cm. Fl. and fr. May–Oct.

Gravelly deserts, dry slopes, along streams, sandy soils; 600–3100 m. Gansu, Nei Mongol, Ningxia, Qinghai, Shaanxi, ?Sichuan, Xinjiang [Mongolia].

Scorzonera pseudodivaricata has often been confused with *S. divaricata*, hence the name, but both species are actually well distinct.

A report by Ostenfeld (in Hedin, S. Tibet 6(3): 29. 1922) of *Scorzonera divaricata* var. *virgata* Maximowicz (being a synonym of *S. pseudodivaricata*) was erroneously treated by Tzvelev (Rast. Tsentral. Azii 14b: 122. 2008) as “*S. divaricata* Turczaninow var. *virgata* (Candolle) Maximowicz” and, consequently, taken as a substantiation for the presence of the W Himalayan *S. virgata* Candolle in Xinjiang and C Asia, which is, however, clearly erroneous.

3. *Scorzonera capito* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 32: 491. 1888.

棉毛鸦葱 mian mao ya cong

Herbs 5–15 cm tall, perennial, rosulate. Rootstock dark brown, ca. 2 cm in diam. Caudex woody, globose to subglobose, simple or branched, densely covered with scarious entire adaxially abundantly dirty white lanate leaf sheath residues. Stems single or to 5(–7), ascending-erect, unbranched, arachnoid villous, glabrescent. Rosette leaves ovate to spatulate or elliptic, (3–)5–17 × (1–)2–3[–5] cm, somewhat arachnoid hairy, base attenuate, apex rounded, obtuse, or acute. Stem leaves 1–3, sessile, ovate to lanceolate, 0.5–2 × 0.3–1.5 cm, ± leathery, somewhat arachnoid hairy, glabrescent, or glabrous, base cordate and semiamplexicaul. Capitulum solitary. Involucre

broadly campanulate to subglobose, usually $1.6-2 \times 1.2-1.5$ cm at anthesis, to $2.5 \times > 2$ cm in fruit. Phyllaries abaxially arachnoid hairy; outermost phyllaries broadly ovate to broadly lanceolate. Florets yellow. Achene pale yellow, cylindric, 7–9 mm, with tuberculate ribs, apically sparsely villous. Pappus white, 1–1.5 cm. Fl. and fr. May–Aug.

Gravelly deserts, sandy soils, alluvial plains; 1100–1500 m. Nei Mongol, ?Ningxia [Mongolia].

4. *Scorzonera parviflora* Jacquin, Fl. Austriac. 4: 3. 1776.

光鸦葱 guang ya cong

Scorzonera caricifolia Pallas; *S. halophila* Fischer & C. A. Meyer ex Candolle.

Herbs 10–60 cm tall, perennial, rosulate, entirely glabrous. Rootstock creeping, ca. 1.5 cm in diam., usually branched. Caudex with or without scarious leaf sheath residues. Stems solitary or few, ascending to erect, unbranched or rarely sparsely branched. Rosette leaves lanceolate or narrowly elliptic to linear, $7-20 \times 0.2-1.5$ cm, often somewhat fleshy, base attenuate, apex acute to acuminate. Stem leaves few, smaller than rosette leaves, narrowly lanceolate. Capitulum solitary, rarely 2 or 3 per stem and distant. Involucre cylindric, usually $1.5-1.8 \times 0.5-0.8$ cm at anthesis, to $2.5-3 \times 1-1.3(-1.5)$ cm in fruit. Phyllaries abaxially glabrous, apex acute to subobtusate; outermost phyllaries ovate to triangular-ovate. Florets yellow, slightly longer than involucre. Achene yellowish, cylindric, 7–9 mm, with smooth elevated ribs, glabrous. Pappus dirty white, 1.5–1.8 cm. Fl. and fr. Jun–Sep. $2n = 14$.

Wet subsaline meadows, riverbanks, at springs; 900–1700 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Mongolia, Russia (C, E, and S European parts), Turkmenistan, Uzbekistan; SW Asia, C and S Europe].

5. *Scorzonera luntaiensis* C. Shih, Acta Phytotax. Sin. 33: 197. 1995.

轮台鸦葱 lun tai ya cong

Herbs 12–14 cm tall, perennial, rosulate. Rootstock brown, ca. 5 mm in diam. Caudex with pale brown scarious leaf sheath residues. Stem solitary, ca. 1.5 mm in diam., erect, unbranched, subglabrous or glabrous. Rosette leaves linear, $6-10 \times 0.1-0.2$ cm, glabrous, base attenuate, margin flat, apex acuminate. Stem leaves very few, mostly on basal portion of stem, similar to rosette leaves but smaller, subulate to linear. Capitulum solitary. Involucre narrowly cylindric, ca. 1.4×0.5 cm at anthesis. Phyllaries abaxially glabrous; outermost phyllaries ovate, ca. 4×2.2 mm, apex acute. Achene when immature without tubercles, glabrous, not seen when mature. Pappus white, ca. 8 mm. Fl. Jul.

• Damp riverbanks; ca. 1500 m. Xinjiang (N Tarim Pendi).

6. *Scorzonera radiata* Fischer ex Ledebour, Fl. Altaic. 4: 160. 1833.

毛梗鸦葱 mao geng ya cong

Scorzonera radiata var. *rebunensis* (Tatewaki & Kitamura) Nakai; *S. radiata* var. *subacaulis* Lipschitz & Krascheninnikov; *S. rebunensis* Tatewaki & Kitamura.

Herbs (3–)15–30(–50) cm tall, perennial, rosulate. Rootstock ca. 1.5 cm in diam. Caudex with scarious leaf sheath residues. Stems solitary to few, erect, unbranched, arachnoid hairy especially under capitula, glabrescent with age. Rosette leaves linear, linear-lanceolate, or linear-elliptic, $5-30 \times 0.3-1.5[-1.8]$ cm, sometimes sparsely arachnoid hairy, glabrescent, base attenuate, apex acuminate. Stem leaves 0–3, linear to linear-lanceolate, smaller than rosette leaves. Capitulum solitary. Involucre broadly cylindric to campanulate, $1.7-2.1 \times 0.8-1$ cm at anthesis, to 2.6×1.8 cm in fruit. Phyllaries abaxially sparsely arachnoid hairy, glabrescent, apex usually with a red spot; outermost phyllaries ovate to broadly lanceolate. Florets yellow, almost $2 \times$ as long as involucre. Achene cylindric, 0.9–1.3 cm, with smooth elevated ribs, glabrous. Pappus dirty yellow, 1.1–1.4 cm. Fl. and fr. May–Jul. $2n = 14$.

Forest margins, forests, grasslands, gravelly riverbanks; 900–2600 m. Heilongjiang, Jilin, Liaoning, Nei Mongol, Xinjiang [Kazakhstan, Russia (Asian part), Uzbekistan].

7. *Scorzonera austriaca* Willdenow, Sp. Pl. 3: 1498. 1803.

鸦葱 ya cong

Scorzonera austriaca var. *plantaginifolia* Kitagawa; *S. sinensis* (Lipschitz & Krascheninnikov) Nakai f. *plantaginifolia* (Kitagawa) Nakai.

Herbs 5–45 cm tall, perennial, rosulate. Rootstock dark brown. Caudex woody, densely covered with brown fibrous and lacerate leaf sheath residues. Stems solitary or few, erect, unbranched, glabrous. Rosette leaves narrowly linear, linear-lanceolate, linear-elliptic, or narrowly elliptic, usually $3-35 \times 0.2-2.5$ cm, glabrous or occasionally base and sheath marginally arachnoid hairy, base long attenuate, margin flat, apex acute to acuminate. Stem leaves 2 to several, scalelike, lanceolate to subulate-lanceolate, base semiamplexicaul. Capitulum solitary. Involucre cylindric, usually $2.1-2.8 \times 0.6-1.2$ cm at anthesis, to 3.3×1.5 cm in fruit. Phyllaries abaxially glabrous or occasionally inner ones apically arachnoid hairy at margin, apex acute, obtuse, or rounded; outermost phyllaries triangular to triangular-ovate. Florets yellow, usually to $1.5-1.7 \times$ as long as involucre. Achene whitish to pale brown, cylindric, 1.2–1.5 cm, with smooth or sometimes tuberculate ribs, glabrous. Pappus dirty white, usually 1.5–1.7 cm. Fl. and fr. Apr–Jul. $2n = 14^*$.

Slopes, floodplains, grassy riverbanks and lake shores; 400–2000 m. Gansu, Hebei, Henan, Jilin, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shandong, Shanxi, Xinjiang [Kazakhstan, Mongolia, Russia; C and SE Europe].

Scorzonera austriaca is the widespread and name-giving taxon of the highly polymorphic *S. austriaca* complex, to which the following five species belong, and which is in need of a modern revision covering its entire distribution area. The following two species appear to lack clear morphological discontinuities and seem thus doubtfully distinct at species rank.

8. *Scorzonera sinensis* (Lipschitz & Krascheninnikov) Nakai, Rep. Inst. Sci. Res. Manchoukuo 1: 171. 1937.

桃叶鸦葱 tao ye ya cong

Scorzonera austriaca Willdenow subsp. *sinensis* Lipschitz & Krascheninnikov, *Fragm. Monogr. Scorzonera* 1: 120. 1935.

Herbs usually 5–50 cm tall, perennial, rosulate. Rootstock brown to dark brown, ca. 1.5 cm in diam. Caudex woody, often branched, densely covered with fibrous and lacerate leaf sheath residues. Stems solitary or few, erect, unbranched, glabrous. Rosette leaves broadly ovate, ovate-lanceolate, oblanceolate, elliptic-lanceolate, linear-elliptic, or broadly linear, usually 5–20(–30) × (0.5–)1–3(–4.5) cm, glabrous, base long attenuate, margin undulate, apex acute to acuminate. Stem leaves few to several, scalelike, lanceolate to subulate-lanceolate, base semi-amplexicaul. Capitulum solitary. Involucre cylindric, usually 1.8–2.5 × 0.7–1.3 cm at anthesis, to 3.5 × 1.8 cm in fruit. Phyllaries abaxially glabrous, apex obtuse to acute; outermost phyllaries triangular to sometimes obliquely triangular-ovate. Florets yellow, usually to 1.5–1.7 × as long as involucre. Achene whitish to pale brown, cylindric, 1.2–1.4 cm, with smooth ribs, glabrous. Pappus dirty white to dirty yellow, usually 1.5–1.8 cm. Fl. and fr. Feb–Sep.

Mountain slopes, hills, wastelands, thickets; 200–2500 m. Anhui, Gansu, Hebei, Henan, Jiangsu, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shandong, Shanxi [Mongolia].

Scorzonera sinensis is delimited from *S. austriaca* largely by its undulate leaves, which it shares, however, with *S. crispa* M. Bieberstein (*S. austriaca* subsp. *crispa* (M. Bieberstein) Lipschitz & Krascheninnikov) from Crimea and Kazakhstan. According to Lipschitz (*Fragm. Monogr. Scorzonera* 1: 121. 1935; Fl. URSS 29: 68–69. 1964), it differs from the latter by basally more shortly attenuate, green rosette leaves and undivided stems with more numerous bracts. See also note under *S. austriaca*.

9. *Scorzonera subacaulis* (Regel) Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 42: 160. 1933.

小鸦葱 xiao ya cong

Scorzonera austriaca Willdenow var. *subacaulis* Regel, *Trudy Imp. S.-Peterburgsk. Bot. Sada* 6: 323. 1880; *S. austriaca* var. *intermedia* Regel (1867), not Gaudin (1829).

Herbs, acaulescent or to 10 cm, perennial, rosulate. Rootstock dark brown, terete, ca. 8 mm in diam. Caudex woody, with fibrous and lacerate leaf sheath residues. Stems solitary or more rarely 2, unbranched, floccose arachnoid hairy especially apically. Rosette leaves linear, 8–10 × 0.2–0.4 cm, glabrous, apex acuminate. Stem leaves 1 or 2, scalelike, lanceolate. Capitulum solitary. Involucre broadly cylindric, 1–1.5 cm in diam. in fruit. Phyllaries glabrous or basally somewhat arachnoid hairy, apex acute; outermost phyllaries triangular to ovate. Florets yellow, ca. 1.5 × as long as involucre. Corolla ligule with dark red striae. Achene cylindric, 8–10 mm, with smooth ribs, glabrous. Pappus dirty white, ca. 1.2 cm. Fl. and fr. Jun–Jul.

Grassy mountain slopes; above 2600 m. Xinjiang [Kazakhstan, Kyrgyzstan].

The delimitation of *Scorzonera subacaulis* and subacaulescent forms of *S. radiata* (the latter without fibrous and lacerate leaf sheath residues and with the florets 2 × as long as the involucre) appears often somehow blurred in the literature (e.g., Lipschitz, Fl. URSS 29: 67–68. 1964). Regel (*Bull. Soc. Imp. Naturalistes Moscou* 40(3–4): 170. 1867)

considered even an intermediate position of this taxon between both species. See also note under *S. austriaca*.

10. *Scorzonera curvata* (Poplavskaia) Lipschitz, Fl. URSS 29: 72. 1964.

丝叶鸦葱 si ye ya cong

Scorzonera austriaca Willdenow var. *curvata* Poplavskaia, *Trudy Bot. Muz. Imp. Akad. Nauk* 15: 38. 1916; *S. angustifolia* Thomson; *S. humilis* Linnaeus var. *linearifolia* Candolle.

Herbs 4–7 cm tall, perennial, rosulate. Rootstock dark brown, cylindric, ca. 1.5 cm in diam. Caudex densely covered with fibrous and lacerate leaf sheath residues. Stems solitary or few, erect, glabrous. Rosette leaves filiform to filiform-linear, 3–10 cm × 1–1.5 mm, usually flat or twisted, glaucous, glabrous but margin basally arachnoid lanate, apex acuminate. Stem leaves absent or few, scalelike, subulate-lanceolate. Capitulum solitary. Involucre campanulate to narrowly campanulate, ca. 1 cm in diam. in fruit. Phyllaries abaxially glabrous, apex acute to subobtuse; outermost phyllaries triangular to triangular-lanceolate, 5–8 × 2–3 mm. Florets yellow. Achene cylindric, with smooth to tuberculate ribs, shortly villous. Pappus pale brown, ca. 1.2 cm. Fl. and fr. May–Jun.

Hills, dry mountain slopes; 500–2500 m. Heilongjiang, Nei Mongol, Qinghai [Mongolia, E Russia].

See note under *Scorzonera austriaca*.

11. *Scorzonera ikonnikovii* Lipschitz & Krascheninnikov in Lipschitz, *Fragm. Monogr. Scorzonera* 1: 109. 1935.

毛果鸦葱 mao guo ya cong

Scorzonera austriaca Willdenow var. *hebecarpa* C. H. An.

Herbs to 17 cm tall, perennial, rosulate. Rootstock yellow, obconic, ca. 2 cm in diam. Caudex densely covered with brown fibrous and lacerate leaf sheath residues. Stems few, unbranched, glabrous. Rosette leaves narrowly lanceolate, linear-lanceolate, linear-elliptic, or linear, to 15 × 0.2–0.6(–1.5) cm, glabrous, base attenuate, margin undulate, apex usually recurved and acuminate. Stem leaves 2 or 3, brown, scalelike, narrowly lanceolate to subulate-lanceolate. Capitulum solitary. Involucre campanulate to subglobose, to 2–2.5 × 1.5–2 cm in fruit. Phyllaries abaxially glabrous, apex acute to obtuse; outermost phyllaries triangular to ovate-triangular, to 7 × 2.5 mm. Florets yellow. Achene cylindric, ca. 1 cm, with smooth ribs, shortly villous. Pappus dirty yellow, ca. 1.2 cm. Fl. and fr. Apr–May. $2n = 14$.

Mountain slopes; 1300–1800 m. Liaoning, ?Nei Mongol, Xinjiang (Jinghe) [Mongolia].

Scorzonera ikonnikovii is very similar to *S. austriaca* (see also note there) but is distinguished by its villous achenes. Centered in Mongolia, it seems to be rare in China, reaching only into the NW and NE. Its delimitation from *S. manshurica* needs closer consideration.

12. *Scorzonera manshurica* Nakai, Rep. Inst. Sci. Res. Manchoukuo 1: 173. 1937.

东北鸦葱 dong bei ya cong

Scorzonera glabra Ruprecht var. *manshurica* (Nakai) Kitagawa.

Herbs to 14 cm tall, perennial, rosulate. Rootstock obconic, ca. 3 cm in diam. Caudex densely covered with brown fibrous and lacerate leaf sheath residues. Stems few, unbranched, conspicuously floccose or lanate when young, soon glabrescent. Rosette leaves linear, 8–10 × 0.3–0.4 cm, adaxially densely lanate when young, glabrescent, base attenuate, margin flat and basally lanate, apex acute to long acuminate. Stem leaves 1–3, scalelike, subulate-triangular, margin and adaxially lanate. Capitulum solitary. Involucre campanulate, to 2 × 1.8 cm in fruit. Phyllaries abaxially white puberulent and tinged with purple, apex obtuse to acute; outermost phyllaries triangular to ovate-triangular, largest ca. 7 × 3 mm. Achene dirty yellow, cylindric, 7–8 mm, with smooth ribs, sparsely to densely villous. Pappus dirty yellow, 1–1.5 cm. Fl. and fr. Apr–May.

• Dry mountain slopes. Heilongjiang, ?Jilin, Liaoning, Nei Mongol.

Scorzonera manshurica seems close to *S. ikonnikovii*, and the delimitation between the two species should be reassessed. See also note under *S. austriaca*.

13. *Scorzonera albicaulis* Bunge, Enum. Pl. China Bor. 40. 1833.

华北鸦葱 hua bei ya cong

Achyroseris albicaulis (Bunge) Kamelin & Tagaev; *A. macrosperma* Schultz Bipontinus; *Scorzonera albicaulis* f. *flavescens* Nakai; *S. albicaulis* subsp. *macrosperma* (Turczaninow ex Candolle) Voroschilov; *S. albicaulis* var. *macrosperma* (Turczaninow ex Candolle) Kitagawa; *S. albicaulis* f. *rosea* Nakai; *S. macrosperma* Turczaninow ex Candolle; *S. macrosperma* f. *angustifolia* Debeaux.

Herbs to 1.2 m tall, perennial. Rootstock cylindric to obconic, ca. 1.5 cm in diam. Caudex with brown scarious leaf sheath residues. Stem usually solitary, erect, branched apically, floccosely arachnoid hairy especially apically, glabrescent, leafy. Basal leaves rosulate, usually early deciduous, linear to linear-elliptic, to 40 × 0.3–2 cm, glabrous, margin entire, apex acuminate. Stem leaves similar to basal leaves but shorter. Synflorescence sparsely and usually laxly corymbiform, with usually 2–7 capitula. Involucre cylindric, 2–2.5 × 0.5–0.7 cm at anthesis, 3.5–4.2 × 0.8–1.3 in fruit. Phyllaries abaxially glabrous or thinly arachnoid hairy, glabrescent; outermost phyllaries triangular-ovate to ovate-lanceolate, 5–8 × 2–4 mm. Florets yellow, ca. 1.5 × as long as involucre. Achene pale brown, cylindric and from middle third distinctly tapering toward apex, usually 1.7–2.3 cm, with smooth ribs, glabrous. Pappus straw-colored, usually 2.2–2.8 cm, bristles basally connate and caducous as an entity. Fl. and fr. May–Sep. $2n = 14$.

Mountain valleys, forests, forest margins, scrub, feral fields, fields; 200–2500 m. Anhui, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Jiangsu, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan [Korea, Mongolia, Russia (SE Asian part)].

Achyroseris macrosperma Schultz Bipontinus (1845) and *Scorzonera macrosperma* Turczaninow ex Candolle (1838) are, in spite of having the same epithet, independently described heterotypic synonyms.

14. *Scorzonera iliensis* Krascheninnikov, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 1: 178. 1933.

北疆鸦葱 bei jiang ya cong

Herbs 35–70 cm tall, perennial, with a taproot. Caudex with leaf sheath residues. Stems solitary or few, erect, branched apically, glabrous or somewhat floccose and glabrescent, leafy. Basal leaves linear to linear-lanceolate, 10–25 × 0.4–1 cm, margin flat, apex acuminate. Stem leaves similar to basal leaves but smaller. Synflorescence laxly corymbiform, with few capitula. Involucre cylindric, 1.4–1.6 × ca. 0.5 cm at anthesis, to 3 cm in fruit. Phyllaries arachnoid branched hairy; outermost phyllaries triangular to ovate-triangular. Achene cylindric, 1–1.5 cm, with smooth ribs, glabrous. Pappus dirty white, to 2 cm. Fl. and fr. Jul–Aug.

Stony thickets; above 900–1700 m. Xinjiang [Kazakhstan, Kyrgyzstan, Uzbekistan].

See note under the *Scorzonera transiliensis*.

15. *Scorzonera transiliensis* Popov in Lipschitz, Fragm. Monogr. *Scorzonera* 2: 148. 1939.

橙黄鸦葱 cheng huang ya cong

Herbs 25–75 cm tall, perennial, with a taproot. Caudex woody, sometimes branched, with sparse leaf sheath residues. Stems solitary or few, erect, sparsely branched apically, glabrous or weakly floccose with branched hairs, leafy. Basal leaves linear to linear-lanceolate, usually 5–20 × 0.4–0.8 cm, margin flat, apex acuminate. Stem leaves similar to basal leaves but smaller. Synflorescence very loosely corymbiform, with few capitula. Involucre cylindric, ca. 1.5 × 0.5 cm at anthesis, to 3–3.5 cm in fruit. Phyllaries arachnoid branched hairy. Florets dark orange. Achene cylindric, ca. 1.5 cm, with smooth ribs, glabrous. Pappus dirty white, ca. 2 cm.

Meadows on mountain slopes; ca. 1700 m. Xinjiang [Kazakhstan, Kyrgyzstan].

Scorzonera transiliensis is closely related to *S. iliensis* and said to be mainly distinguished by its dark orange florets (Lipschitz, Fl. URSS 29: 84. 1964). It is endemic to the Zailiyskiy and Kungey Alatau (SE Kazakhstan, N Kyrgyzstan) and the Ketmen range of the Tien Shan (SE Kazakhstan) and Tian Shan (NW China). It has been listed for Xinjiang by C. H. An (Fl. Xinjiang. 5: 395. 1999), and the above description is based on that work and the original description. The status of this taxon requires further studies.

16. *Scorzonera pubescens* Candolle, Prodr. 7: 122. 1838.

基枝鸦葱 ji zhi ya cong

Herbs 7–20 cm tall, perennial, with grayish short branched hairs. Rootstock dark brown, cylindric, ca. 1 cm in diam. Caudex densely covered with leaf sheath residues. Stems solitary to few, erect, branched from base, basally leafy; branches ascending-erect. Basal leaves linear, 5–20 × 0.1–0.5 cm, margin flat, apex acuminate. Stem leaves similar to basal leaves but smaller. Synflorescence diffusely corymbiform, with few capitula. Involucre campanulate, 1.3–2 × 0.3–1 cm. Phyllaries abaxially arachnoid hairy; outermost phyllaries ovate to lanceolate. Florets yellow, sometimes ligule adaxially reddish, ca. 1.5 × as long as involucre. Achene cylindric, 1–1.2 cm, with tuberculate

ribs, glabrous. Pappus white tinged with yellow, ca. 1.5 cm. Fl. and fr. Jun.

Mountain slopes, hills, grasslands, dry river valleys; 600–1800 m. Xinjiang [Kazakhstan, Kyrgyzstan, Russia (W Asian part), Tajikistan].

17. *Scorzonera inconspicua* Lipschitz ex Pavlov, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 42: 139. 1933.

皱叶鸦葱 *zhou ye ya cong*

Scorzonera marschalliana C. A. Meyer var. *latifolia* Ruprecht; *S. marschalliana* var. *oblongifolia* Trautvetter; *S. tianshanensis* C. H. An.

Herbs usually 8–25 cm tall, perennial. Rootstock ca. 8 mm in diam. Caudex woody, with dark brown or pale yellow scarious leaf sheath residues. Stems solitary or few, branched from base or from middle with curved-erect branches, stellate puberulent, basally leafy. Basal leaves narrowly elliptic to narrowly lanceolate, 5–20 × 0.4–0.7[–2] cm, stellate puberulent, glabrescent, base attenuate, margin mostly undulate, apex acuminate. Stem leaves few, smaller than basal leaves but otherwise similar. Synflorescence laxly corymbiform, with usually 2–4 long-pedunculate capitula. Involucre cylindric, 1.5–2 × 0.5–0.8 cm at anthesis, to usually 2.5–3 × 1–1.3 cm in fruit. Phyllaries stellate puberulent, glabrescent; outermost phyllaries triangular-ovate, 3–8 × 4–5 mm. Florets yellow, ca. 1.5 × as long as involucre. Achene cylindric, 1–1.4 cm, with tuberculate ribs, glabrous. Pappus dirty white to straw-colored, usually 1.5–2 cm. Fl. and fr. May–Aug. $2n = 14$.

Stony slopes, dry steppes; 800–1700 m. Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

We have not seen material of *Scorzonera tianshanensis* (C. H. An, Fl. Xinjiang. 5: 480. 1999), but, from the description given, the only difference between it and *S. inconspicua* appears to be the presence of “two white membranous wings along the corolla tube,” which perhaps may be an artifact but certainly not a suitable diagnostic feature whatsoever.

18. *Scorzonera pusilla* Pallas, Reise Russ. Reich. 2: 744. 1773.

细叶鸦葱 *xi ye ya cong*

Scorzonera astrachanica Candolle; *S. circinnata* Pallas, nom. illeg. superfl.; *S. popovii* Lipschitz; *Takhtajaniantha pusilla* (Pallas) Nazarova.

Herbs 5–20 cm tall, perennial, with a globose tuber to some cm below surface. Caudex with pale brown adaxially lanate leaf sheath residues becoming somewhat lacerate and subfibrous with age. Stems few, slender, erect, usually apically branched, sparsely pubescent or glabrescent, leafy. Basal leaves linear to filiform-linear, 1–1.5 × 0.1–0.3 cm, arachnoid hairy, margin flat, apex acuminate and often somewhat hooked. Stem leaves similar to basal leaves. Synflorescence sparsely corymbiform, with few capitula or capitulum solitary. Involucre narrowly cylindric, ca. 1.8 × 0.5–0.7 cm at anthesis, prolonged in fruit. Phyllaries abaxially arachnoid hairy; outermost phyllaries ovate, ca. 5 × 3.5 mm, apex acute. Florets yellow. Achene cylindric, ca. 8 mm, with smooth ribs, glabrous. Pappus dirty white, ca. 2.3 cm, plumose for most of length. Fl. and fr. Apr–Jul. $2n = 14$.

Rocky mountain slopes, gravelly deserts, sandy soils, semiconsolidated sand dunes, saline-alkaline areas, roadsides, wastelands, mountain plains, alluvial plains; 500–3400 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Mongolia, Pakistan, Russia (SE European part), Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

19. *Scorzonera pamirica* C. Shih, Acta Phytotax. Sin. 25: 48. 1987.

帕米尔鸦葱 *pa mi er ya cong*

Herbs 4–13 cm tall, perennial, with an ellipsoid tuber to some cm below surface. Caudex with pale brown or pale yellow glabrous leaf sheath residues becoming lacerate and subfibrous with age. Stems few, slender, erect to arched-erect, sparsely branched apically, glabrous, leafy. Basal leaves linear, 4–8 × 0.1–0.2 cm, glabrous, apex acuminate. Stem leaves similar to basal leaves but smaller. Synflorescence sparsely corymbiform, with few capitula or capitulum solitary. Involucre narrowly cylindric, 1.3–1.5 × ca. 0.4 cm at anthesis, more than 2 cm in fruit. Phyllaries abaxially arachnoid hairy, apex acute to obtuse; outermost phyllaries ovate to narrowly ovate, 4–5 × 2–3 mm. Florets yellow. Achene glabrous, not seen when fully mature. Pappus dirty white, ca. 2 cm or more, scabrid apically or for most of length. Fl. and fr. Jun–Aug.

• Alpine plains, alpine meadows; 3300–3600 m. Xinjiang (Taxkorgan).

Scorzonera pamirica is closely related and very similar to the widespread *S. pusilla*, and their delimitation should be reassessed when more material is available. See also note under *S. aniana*.

20. *Scorzonera aniana* N. Kilian, nom. nov.

长茎鸦葱 *chang jing ya cong*

Replaced synonym: *Scorzonera elongata* C. H. An & X. L. He, Fl. Xinjiang. 5: 480. 1999, not *Scorzonera elongata* Willdenow, Sp. Pl. 3: 1508. 1803, nom. illeg. superfl. [*Catananche graeca* Linnaeus, Sp. Pl. 2: 813. 1753].

Herbs 30–40 cm tall, perennial, with a globose tuber some cm below surface. Caudex unbranched or branched, with scarious adaxially densely lanate pale brown leaf sheath residues becoming lacerate and subfibrous with age. Stems few to several, erect to arched-erect, branched apically, leafy. Stem leaves linear-lanceolate, to 15 × 0.2–0.3 cm, base inconspicuously attenuate, apex acuminate and often somewhat hooked. Synflorescence sparsely corymbiform, with few capitula. Involucre narrowly cylindric, 2–2.4 × 0.4–0.5 cm at anthesis. Phyllaries with arachnoid hairy and glabrescent margin; outermost phyllaries ovate to ovate-lanceolate, ca. 4 mm. Florets yellow. Achene columnar, ca. 1 cm, with tuberculate ribs, glabrous. Pappus yellowish, 2.4–2.6 cm. Fl. May.

• Sand dunes; 500–800 m. Xinjiang (Ürümqi).

Scorzonera aniana, the epithet referring to the first author of the replaced synonym, is closely related to *S. pusilla* and *S. pamirica*. No material has been seen by the present authors, and the description is based on Fl. Xinjiang. (loc. cit.).

21. *Scorzonera mongolica* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 32: 492. 1888.

蒙古鸦葱 *meng gu ya cong*

Scorzonera fengtienensis Nakai; *S. hotanica* C. H. An; *S. mongolica* var. *putjatae* C. Winkler.

Herbs 5–35 cm tall, perennial, rosulate. Rootstock cylindric. Caudex with brown to pale yellow scarious leaf sheath residues. Stems few to some, grayish green, ascending to more rarely erect, branched apically, glabrous. Rosette leaves narrowly elliptic, elliptic-lanceolate, or linear-lanceolate, 2–13[–20] × 0.4–1.1[–4] cm, usually ± fleshy, glabrous, somewhat glaucous, base attenuate to long attenuate with an adaxially sometimes lanate sheath, apex acute to acuminate. Stem leaves often partly opposite, similar to rosette leaves but shorter. Synflorescence sparsely corymbiform, with few capitula or more rarely capitulum solitary. Involucre narrowly cylindric, usually 1.7–2.2 × 0.4–0.5 cm at anthesis, to 3 × 0.6–0.7 cm in fruit. Phyllaries abaxially arachnoid hairy and glabrescent or glabrous; outermost phyllaries ovate, 3–5 × 2–5 mm, apex acute. Florets yellow, rarely white, slightly longer than involucre. Achene pale yellow, cylindric, 5–7 cm, with smooth ribs, apex somewhat pilose, otherwise ± glabrous. Pappus white, 2–2.8 cm. Fl. and fr. Apr–Aug.

Saline meadows, saline sands, alkaline lands, dry lake basins, floodplains, lake margins, grassy beaches; near sea level to 3200 m. Gansu, Hebei, Henan, Liaoning, Nei Mongol, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Xinjiang [Kazakhstan, Mongolia].

22. *Scorzonera ensifolia* M. Bieberstein, Fl. Taur.-Caucas. 2: 235. 1808.

剑叶鸦葱 jian ye ya cong

Lasiospora ensifolia (M. Bieberstein) Cassini.

Herbs usually 20–40 cm tall, perennial, sparsely rosulate. Rootstock cylindric. Caudex with entire hardened adaxially abundantly reddish brown lanate leaf sheath residues. Stems solitary or few, ± erect, sparsely branched apically, ± pubescent or rarely glabrous, densely leafy. Rosette leaves linear-lanceolate to linear, to 20 × 0.3–0.8 cm, rather rigid, apex filiform acuminate. Stem leaves many, similar to rosette leaves, sparsely pubescent or glabrous. Synflorescence corymbiform, usually with 2–4 capitula. Involucre cylindric, to 2.5 × 1–1.5 cm. Phyllaries abaxially arachnoid hairy; outermost phyllaries lanceolate, apex acuminate and bent. Florets yellow, ca. 1.5 × as long as involucre. Achene cylindric, usually 7–8 mm, densely villous. Pappus pale brownish, 2–2.5 cm. Fl. and fr. May–Aug. $2n = 12$.

Sand dunes, wastelands, sandy soils; 500–600 m. Xinjiang [Kazakhstan, Russia (C, E, and S European parts); Europe].

23. *Scorzonera sericeolanata* (Bunge) Krascheninnikov & Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 43: 141. 1934.

灰枝鸦葱 hui zhi ya cong

Scorzonera tuberosa Pallas var. *sericeolanata* Bunge, Beitr. Fl. Russl. 200. 1852; *S. rubroviolacea* Godwinski.

Herbs 8–20 cm tall, perennial, with a globose tuber some cm below surface. Stems solitary or few, weak, erect, sparsely branched, white sericeous pubescent. Basal leaves few, linear, 5–20 × 0.2–0.8 cm, arachnoid hairy, glabrescent, or adaxially glabrous, base attenuate, margin flat, apex acuminate. Stem leaves similar to basal leaves but base ± amplexicaul. Synflorescence laxly corymbiform, with 5–7 capitula. Involucre narrowly cylindric to obconic, ca. 6 mm in diam. Phyllaries abaxially densely pubescent; outermost phyllaries narrowly triangular, apex acute. Florets yellow. Corolla with purplish red veins. Achene cylindric, 5–7 mm, densely sericeous. Pappus whitish, usually 1–1.2 cm. Fl. and fr. Apr–Jun.

Deserts, semiconsolidated sand dunes; 300–1400 m. Xinjiang [Kazakhstan, Russia (SW Asian part), Uzbekistan].

C. H. An (in Fl. Xinjiang. 5: 401. 1999) also reported the similar and related *Scorzonera tuberosa* Pallas for Xinjiang. That species is distributed in E and S European Russia and Kazakhstan and had not been reported before from farther east. The corresponding material has not been seen by the present authors, and the report needs confirmation.

24. *Scorzonera circumflexa* Krascheninnikov & Lipschitz, Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol. 43: 148. 1934.

皱波球根鸦葱 zhou bo qiu gen ya cong

Herbs (8–)15–25 cm tall, perennial, with a globose tuber some cm below surface. Caudex rather inconspicuous, reddish brown lanate, with few scarious leaf sheath residues. Stems 1–3, erect, weak, sparsely branched apically, densely pubescent. Basal leaves few, broadly lanceolate, usually 5–15 × 0.8–1.5 cm, densely tomentose, base attenuate, margin undulate, apex acute to acuminate and often curled. Stem leaves similar to basal leaves but not basally attenuate. Synflorescence sparsely corymbiform, with 2 or 3 capitula. Involucre narrowly cylindric to obconic. Phyllaries abaxially densely pubescent; outermost phyllaries triangular-ovate to lanceolate. Florets yellow, purplish red when dry. Achene cylindric, 6–7 mm, densely sericeous. Pappus brownish, ca. 9 mm. Fl. and fr. Apr–May. $2n = 12$.

Stony slopes, mountain plains; ca. 1100 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

52. **PODOSPERMUM** Candolle in Candolle & Lamarck, Fl. Franç. 4: 61. 1805, nom. cons.

柄果菊属 bing guo ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Arachnospermum F. W. Schmidt.

Herbs, [annual or] biennial or perennial, often with woody caudex and rosulate. Leaves pinnately divided, base with semiamplexicaul usually persistent sheath. Involucre cylindric, usually distinctly prolonged toward fruiting. Phyllaries in several series, often

subapically corniculate. Receptacle naked. Achene with conspicuous cylindric carpopodium usually 1/5–1/3 as long as achene body. Pappus of strong bristles; bristles softly fimbriately plumose for most of length and apically scabrid.

About 17 species: N Africa, C and SW Asia, Europe; one species in China.

Molecular phylogenetic analyses by Mavrodiev et al. (Taxon 53: 699–712. 2004) revealed that *Scorzonera* in its wider sense is polyphyletic and provided support for the recognition of *Podospermum* as a separate genus.

1. *Podospermum songoricum* (Karelin & Kirilov) Tzvelev, Rast. Tsentral. Azii 14b: 104. 2008.

准噶尔果菊 zhun ga bing guo ju

Podospermum laciniatum (Linnaeus) Candolle var. *songoricum* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 396. 1842; *Scorzonera songorica* (Karelin & Kirilov) Lipschitz & Vassilczenko.

Herbs usually 15–40 cm tall, biennial to perennial?, rosulate, glabrous or sparsely arachnoid hairy. Caudex with complete leaf sheath residues. Stems few, sparsely branched apically, sparsely leafy. Rosette leaves linear-elliptic or narrowly elliptic to elliptic, pinnatifid to pinnatisect, sometimes not divided, base attenuate and petiole-like; lateral lobes few, in middle third of blade, linear, linear-lanceolate, or narrowly elliptic, to 1 cm; terminal lobe much longer than lateral lobes, narrowly elliptic, linear-elliptic, or linear. Stem leaves linear-

elliptic to linear, mostly undivided. Synflorescence sparsely corymbiform, with few capitula. Capitula long pedunculate. Involucre cylindric, 1–1.2 × 0.5–0.6 cm at anthesis, to 2 × 1 cm in fruit. Phyllaries sparsely arachnoid hairy and glabrescent, often subapically corniculate; outer phyllaries narrowly triangular to lanceolate, longest ca. 1/2 or more as long as inner linear-lanceolate phyllaries. Florets yellow, slightly longer than involucre. Achene gray, cylindric, 1–1.2 cm, ribs smooth, carpopodium 1/5–1/4 as long as achene body. Pappus dirty white, 1.1–1.2 cm. Fl. and fr. May–Jun. $2n = 14, 28$.

Steppes; ca. 1000 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

No material of *Podospermum songoricum* from China has been seen by the present authors, but its presence in Xinjiang is confirmed by C. H. An (Fl. Xinjiang. 5: 389. 1999). The description is based on Lipschitz (Fl. URSS 29: 40. 1964) and material from neighboring countries.

53. KOELPINIA Pallas, Reise Russ. Reich. 3: 755. 1776.

蝎尾菊属 xie wei ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, annual. Stem solitary, delicate. Leaves narrowly grasslike, margin entire. Synflorescence diffuse. Capitula with few to some florets. Involucre small, cylindric at anthesis, spreading in fruit. Phyllaries in 1 outer and 1 inner series. Receptacle naked. Achene columnar-scorpioid, usually with 5 ribs, abaxially and apically hooked spiny. Pappus absent.

Five species: N Africa, C, S, and SW Asia, S Europe; one species in China.

1. *Koelpinia linearis* Pallas, Reise Russ. Reich. 3: 755. 1776.

蝎尾菊 xie wei ju

Rhagadiolus koelpinia Willdenow.

Herbs 5–35 cm tall. Stem solitary, slender, branched from base, glabrous or sparsely pilosulose, remotely leafy. Stem leaves linear to filiform, 4.5–15 × 0.1–0.5(–0.7) cm, glabrous or subglabrous. Synflorescence diffusely racemiform to paniculiform, with 2–5 capitula or capitulum solitary. Capitula with 5–9 florets. Involucre at anthesis cylindric, 5–7 mm. Phyllaries gla-

brous or sparsely hairy, apex acute; outer phyllaries 2 or 3, narrowly triangular, ca. 2 × 0.5 mm; inner phyllaries 5, linear-lanceolate. Florets pale yellow, not or slightly exceeding involucre. Achene brownish, columnar-scorpioid, ca. 1 cm, abaxially with antrorse and apically with retrorse rigid hooked needlelike spines. Fl. and fr. Feb–Jul. $2n = 14, 36, 40, 42, 54, 56$.

Gravelly deserts; 400–1000 m. Xinjiang, SW Xizang [Afghanistan, NW India, Kashmir, Kazakhstan, Kyrgyzstan, Pakistan, Russia (S European part), Tajikistan, Turkmenistan, Uzbekistan; N Africa, SW Asia, SW Europe].

54. EPILASIA (Bunge) Benth in Benth & J. D. Hooker, Gen. Pl. 2: 532. 1873.

鼠毛菊属 shu mao ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Scorzonera sect. *Epilasia* Bunge, Beitr. Fl. Russl. 200. 1852.

Herbs, annual, white pubescent or glabrous. Leaves undivided. Involucre ovoid-cylindric to globose. Phyllaries in 2 rows; outer phyllaries herbaceous, leaflike, usually longer than [or equaling] inner phyllaries; inner phyllaries usually 5. Receptacle naked. Florets pale yellow [or pale red or blue]. Achene blackish [or gray], ± cylindric, ribbed, ribs smooth or spinulose, base with somewhat broadened hollow cylindric carpopore, glabrous, apex truncate or apical half conic, unribbed, and covered and hidden by caplike pappus disk with pappus. Pappus arising from flat of caplike conic pappus disk, grayish or brownish, of soft bristles in several rows, persistent, very densely long lanately softly fimbriately plumose, longer bristles apically scabrid.

About three species: C and SW Asia; two species in China.

- 1a. Apex of achene crowned with flat pappus disk and pappus 1. *E. acrolasia*
 1b. Apical half of achene hidden by conic caplike pappus disk and pappus 2. *E. hemilasia*

1. *Epilasia acrolasia* (Bunge) C. B. Clarke ex Lipschitz, Fragm. Monogr. Scorzonera 2: 29. 1939.

顶毛鼠毛菊 *ding mao shu mao ju*

Scorzonera acrolasia Bunge, Beitr. Fl. Russl. 202. 1852; *Epilasia ammophila* (Bunge) C. B. Clarke ex Tzvelev; *S. ammophila* Bunge.

Herbs 6–25 cm tall, annual. Stem erect, moderately branched often already from base or more rarely unbranched, arachnoid hairy, glabrescent, leafy. Leaves narrowly spatulate, narrowly lanceolate, broadly lanceolate, or rarely ovate-lanceolate, 1–4(–5) × 0.2–1(–2) cm, ± arachnoid hairy, base attenuate and finally semiamplexicaul, margin flat or somewhat undulate and densely microdentate, apex acute to acuminate or more rarely obtuse. Synflorescence diffuse, paniculiform to corymbiform, with several capitula or more rarely capitulum solitary. Involucre ovoid-cylindric to globose, 1.1–1.4 × 0.6–0.8 cm at anthesis, 1.5–1.8 × ca. 1.5 cm in fruit (outer phyllaries not counted). Outer phyllaries linear-lanceolate, usually 2–3.5 cm, herbaceous, similar to upper stem leaves, distinctly longer than inner phyllaries; inner phyllaries lanceolate, leathery, margin somewhat scarious, apex obtuse to acute. Florets pale yellow [or purplish], to 1.3 × as long as involucre. Achene blackish, ± concolorous, cylindric, 4–5 mm, with hollow cylindric 1–1.5 mm carpophore, usually with 5 smooth or somewhat spinulose main ribs and ca. 10 secondary ribs. Pappus gray, usually 8–9 mm. Fl. and fr. May–Jun. $2n = 12$.

Leeward slopes on sand dunes, clay and gravelly areas; 500–1000 m. Xinjiang [Afghanistan, Kazakhstan, Pakistan, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

2. *Epilasia hemilasia* (Bunge) C. B. Clarke ex Kuntze, Trudy Imp. S.-Peterburgsk. Bot. Sada 10: 202. 1887.

鼠毛菊 *shu mao ju*

Scorzonera hemilasia Bunge, Beitr. Fl. Russl. 201. 1852; *Epilasia cenopleura* (Bunge) C. B. Clarke ex Soják; *E. hemilasia* var. *nana* (Boissier & Buhse) Kuntze; *E. intermedia* (Bunge) C. B. Clarke ex Soják; *S. cenopleura* Bunge; *S. intermedia* Bunge; *S. nana* Boissier & Buhse.

Herbs usually 5–50 cm tall, annual. Stem ascending to erect, unbranched or moderately branched often already from base, arachnoid hairy, glabrescent, basally densely and higher up distantly leafy. Leaves narrowly spatulate or narrowly lanceolate to linear-lanceolate, 2–9 × 0.3–1.5 cm, ± arachnoid hairy, base attenuate and finally semiamplexicaul, margin densely microdentate, apex acute to acuminate. Synflorescence diffuse, paniculiform to corymbiform, with several capitula or more rarely capitulum solitary. Involucre ovoid-cylindric to globose, 1.2–1.4 × 0.8–1 cm at anthesis, 1.5–1.7 × ca. 1.5 cm in fruit (outer phyllaries not counted). Outer phyllaries lanceolate, usually 2–4 cm, herbaceous and similar to upper stem leaves, distinctly longer than inner phyllaries, apex acuminate; inner phyllaries lanceolate, leathery, margin somewhat scarious, apex obtuse to acute. Florets pale yellow, slightly longer than involucre. Achene blackish, cylindric, 6–7 mm, with hollow ± cylindric 1–2 mm carpophore, body in lower half with 10 pale narrow raised often somewhat spinulose ribs, upper half covered and hidden by conic caplike pappus disk and pappus. Pappus gray, 8–10 mm. Fl. and fr. Apr–May. $2n = 12$, 24.

Sand or clay areas, grasslands; 800–1500 m. Xinjiang [Afghanistan, Kazakhstan, Pakistan, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

The unique achene of *Epilasia hemilasia* is interpreted here through a modification of the pappus disk. Normally the pappus disk is a ± flat disklike (or because of its central opening for the vascular strands connecting achene and floret actually rather ringlike) structure bearing the pappus bristles and crowning the achene apex. In this species, the pappus disk is modified to a caplike structure covering the equally fertile apical half of the achene. This interpretation is supported by the fact that the outer series of plumose pappus bristles arises from the callose ringlike structure in the middle third of the achene (morphologically indistinguishable from the outer series of bristles on the pappus disk of *E. acrolasia*), while other bristles are basally shortly adnate to and then arise from the unribbed, pale brown surface between the callose ring and the achene apex, and the innermost series of ca. 5 bristles arises at the achene apex. The trichomes covering the surface between the bristles are considered as homologues to those at the base of the bristles in *E. acrolasia* and to the soft fimbriae of the plumose *Scorzonerinae* pappus in general.

55. TRAGOPOGON Linnaeus, Sp. Pl. 2: 789. 1753.

婆罗门参属 *po luo men shen shu*

Shi Zhu (石铸 Shih Chu); Alexander P. Sukhorukov, Evgeny V. Mavrodiev

Herbs, perennial, biennial, or rarely annual, glabrous or tomentulose to floccose [or lanate] especially at leaf bases and below capitula, often glabrescent; if biennial then vertical roots spindle-shaped; if perennial then with well-developed caudex. Stem simple or sparingly branched. Leaves basal and cauline, sessile, linear, lanceolate, or narrowly oblong, margin entire or undulate. Capitulum terminal, solitary or sometimes capitula few to many, large, with (20–)40–180 or more florets; peduncle often apically inflated and normally without bracts. Involucre cylindric at anthesis, mostly 10–20 mm or more in diam. Phyllaries 5–15(or 16), in 1(or 2) row(s), linear-lanceolate, triangular-lanceolate, or linear, ± equal, abaxially glabrous [with intertwining hairs], margins white and narrowly pellucid, apex acute. Receptacle naked. Florets with ligules yellow, mauve, orange, purple, or violet. Achene dark to pale brown, straw-colored, or whitish, heteromorphic, outer ones ± cylindric or curviform (fusiform), central ones cylindric and less tuberculate or smooth; achene body normally tuberculate, with 5 fairly well-differentiated ribs, with or rarely without hollows in pericarp; beak

slender or stout if present; pappus disk \pm pubescent. Pappus persistent, dirty white, yellowish, or slightly fulvous; awns 12–20 or more in 1 or 2 rows, unequal, softly fimbriately plumose, apically scabrid.

More than 150 species: mainly in C and SW Asia and S Europe; 19 species (two endemic, one introduced) in China.

- 1a. Outer achenes (without pappus) 3.7–4.5 cm; ligules violet; cultivated/alien biennial or annual plants 11. *T. porrifolius*
- 1b. Outer achenes (without pappus) not more than 3.5 cm; ligules of various colors; non-cultivated perennial or biennial plants.
 - 2a. Peduncle mostly reduced; small plants to 20 cm tall 18. *T. verrucosobracteatus*
 - 2b. Peduncle not reduced, always well developed; plants also taller.
 - 3a. Pappus awns clearly unequal, longest 2–5 ca. 7 mm and remainder ca. 4 mm; achenes 1–1.3 cm, beakless 19. *T. heteropappus*
 - 3b. Pappus awns slightly unequal, length ratio ca. 1.2:1; outer achenes longer than 2 cm.
 - 4a. Peduncle with dark hairs; ligules violet; plants biennial 17. *T. sibiricus*
 - 4b. Peduncle glabrous or tomentulose to floccose; florets of various colors; plants biennial or perennial.
 - 5a. Perennial polycarpics 10–35(–40) cm tall; ligules mauve, violet, purplish, rarely (*T. gracilis*) adaxially yellow but then abaxially with pink or mauve spot.
 - 6a. Outer achenes (without pappus) 1–2 cm, body pale brown, 1.2–1.6 mm in diam., and terete or sometimes with 5 fairly well-differentiated ribs, beak slender, 0.2–0.6 mm in diam.; hollows in pericarp 40–50 μ m in diam.; pappus dirty white; plants to 20(–30) cm tall.
 - 7a. Ligules adaxially yellow, abaxially with a pink or mauve spot; pappus always slightly longer than achene body 9. *T. gracilis*
 - 7b. Ligules reddish purple; pappus equaling or slightly shorter than achene body 10. *T. subalpinus*
 - 6b. Outer achenes (without pappus) (1.8–)2–2.7(–3) cm, body whitish or sometimes with a tinge of red, (1.7–)1.8–2.6 mm in diam., and always with 5 fairly well-differentiated ribs, beak stout, 0.9–1.1 mm in diam.; hollows in pericarp more than 60 μ m in diam.; pappus fulvous or fulvous tinged with red; plants (15–)20–40 cm tall.
 - 8a. Achene:pappus ratio ca. 1.5:1; basal leaves lanceolate 14. *T. elongatus*
 - 8b. Achene:pappus ratio 1–1.2:1; basal leaves oblong or elliptic.
 - 9a. Peduncle apically distinctly inflated 12. *T. kasachstanicus*
 - 9b. Peduncle apically \pm not inflated.
 - 10a. Plants glabrous 16. *T. montanus*
 - 10b. Plants tomentulose to floccose.
 - 11a. Beak of outer achenes well differentiated from body 13. *T. marginifolius*
 - 11b. Beak of outer achenes slightly differentiated from body 15. *T. ruber*
 - 5b. Biennial monocarpics 40–150 cm tall; ligules yellow or yellowish orange.
 - 12a. Peduncle apically distinctly inflated.
 - 13a. Outer achenes (without pappus) 2–2.3 cm, body 2–2.5 mm in diam., beak 2–5 mm and stout 7. *T. sabulosus*
 - 13b. Outer achenes (without pappus) more than 2.3 cm, body to 2 mm in diam., beak 0.7–1.7 cm and slender.
 - 14a. Phyllaries 6–9 cm; outer achenes with pappus 5.5–7 cm 1. *T. capitatus*
 - 14b. Phyllaries 4–5.5(–6) cm; outer achenes with pappus 4.4–6 cm.
 - 15a. Number of phyllaries 5–8 2. *T. pseudomajor*
 - 15b. Number of phyllaries (8–)10–12(–14) 3. *T. dubius*
 - 12b. Peduncle apically not or only slightly inflated.
 - 16a. Outer achene with beak to 3 mm or without beak; plants floccose 8. *T. stepposus*
 - 16b. Outer achene with beak more than 5 mm; plants glabrous.
 - 17a. Phyllaries slightly longer than florets 4. *T. songoricus*
 - 17b. Phyllaries shorter than florets.
 - 18a. Ligules yellowish orange; outer achenes (without pappus) ca. 1.7 cm 5. *T. altaicus*
 - 18b. Ligules pure yellow; outer achenes (without pappus) (1.8–)2–2.5 cm 6. *T. orientalis*

1. *Tragopogon capitatus* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 257. 1938.

头状婆罗门参 tou zhuang po luo men shen

Herbs 40–100 cm tall, biennial. Stem simple or branched from lower or middle third, glabrous. Basal and lower cauline

leaves linear to lanceolate, 15–35 \times 0.3–0.7 cm. Capitula solitary to few; peduncle inflated, 0.7–1.5 cm in diam. Involucre 6.5–9 cm. Phyllaries 8–12(–14), longer than florets and equaling or 1/4 longer than achenes with pappus. Ligules yellow. Outer achenes 3–3.5 cm; body pale brown, \pm curviform, 1.4–1.8 mm in diam., with 5 fairly well-differentiated ribs,

tuberculate; beak whitish, 1.5–2.2 cm, slender, non-tuberculate or toothed, apically inflated; pappus disk \pm tomentulose. Pappus dirty white, 2.5–3.5 cm. Fl. and fr. Apr–Jun. $2n = 12$.

Stony steppes, grassy slopes, base of mountains, ditches, roadsides; 500–2000 m. Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, Uzbekistan].

2. *Tragopogon pseudomajor* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 258. 1938 [*“pseudomajus”*].

北疆婆罗门参 bei jiang po Luo men shen

Herbs 40–80(–100) cm tall, biennial. Stem simple or branched from lower or middle third, erect, glabrous. Basal and lower cauline leaves linear to lanceolate, 15–30 \times 0.3–0.5 cm. Capitula solitary to few; peduncle inflated, 7–11 mm in diam. Involucre 4–5.5 cm. Phyllaries (5–)7 or 8, longer than florets, equaling or longer than achenes with pappus. Ligules yellow. Outer achenes 2.4–3 cm; body pale brown, \pm curviform, (1.5–)1.7–2 mm in diam., with 5 fairly well-differentiated ribs, tuberculate; beak whitish, 1–1.7 cm, slender, non-tuberculate or toothed, apically \pm inflated; pappus disk \pm pubescent. Pappus dirty white, 2.2–3 cm. Fl. and fr. Apr–Jun.

Meadows, river valleys, dry mountain slopes, plateaus; 1000–2000 m. Xinjiang [Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

3. *Tragopogon dubius* Scopoli, Fl. Carniol., ed. 2, 2: 95. 1772.

霜毛婆罗门参 shuang mao po Luo men shen

Herbs 40–80(–100) cm tall, biennial. Stem erect, simple or branched from lower or middle third, glabrous. Basal and lower cauline leaves lanceolate to linear, 15–40 \times 0.3–0.5 cm. Capitula solitary to few; peduncle inflated, 7–10 mm in diam. Involucre 4–5.5 cm at anthesis, to 7 cm in fruit. Phyllaries 8–12(–14), longer than florets, equaling or longer than achenes with pappus. Ligules yellow. Outer achenes 2.2–3 cm; body pale brown, \pm curviform, 1.4–1.7 mm in diam., with 5 fairly well-differentiated ribs, tuberculate; beak whitish, 1.2–1.6 cm, slender, non-tuberculate or toothed, apically inflated; pappus disk pubescent. Pappus dirty white, 2.2–2.8 cm. Fl. and fr. Apr–Jun. $2n = 12$.

Stony steppes, grassy slopes at base of mountains, ditches; 500–2000 m. Xinjiang [Kazakhstan, W Russia; Europe].

4. *Tragopogon songoricus* S. A. Nikitin, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 1: 198. 1933.

准噶尔婆罗门参 zhun ga er po Luo men shen

Herbs 40–80 cm tall, biennial. Stem erect, branched from middle third or above, glabrous. Basal and lower cauline leaves linear, 15–30 \times 0.2–0.5 cm. Capitula solitary to few; peduncle not inflated, 3–5 mm in diam. Involucre 2.5–3.5 cm. Phyllaries 7 or 8(or 9), equaling or longer than florets, equaling or shorter than achenes with pappus. Ligules yellow, often light blue when dry. Outer achenes 1.8–2.2 cm; body pale brown, \pm curviform or almost straight, 1.5–1.8 mm in diam., with 5 fairly well-differentiated ribs, tuberculate; beak whitish, 7–10 mm, abruptly differentiated from body, slender, non-tuberculate or toothed, apically \pm inflated; pappus disk pubescent. Pappus dirty white, 1.5–2 cm. Fl. and fr. Jun–Aug.

Forest margins, semi-deserts; 500–2200 m. Xinjiang [Kazakhstan, Mongolia, SC Russia].

5. *Tragopogon altaicus* S. A. Nikitin & Schischkin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 260. 1938.

阿勒泰婆罗门参 a le tai po Luo men shen

Herbs, 40–120 cm tall, biennial. Stem erect, strongly branched, glabrous. Basal and lower cauline leaves lanceolate, 15–40 \times 0.4–1(–1.3) cm. Capitula few to many; peduncle not inflated, 3–5 mm in diam. Involucre 2.5–3 cm. Phyllaries 7–9(or 10), ca. 2/3 as long as florets, equaling achenes with pappus. Ligules yellowish orange. Outer achenes 1.3–1.8 cm; body pale brown, \pm curviform or almost straight, 1.4–1.6 mm in diam., not ribbed and slightly tuberculate; beak pale, 2–6 mm, slender, smooth, apically not inflated; pappus disk \pm pubescent. Pappus dirty white, 1–1.5 cm. Fl. and fr. Jun–Aug.

Mountain meadows, stony slopes in hills; 1500–3000 m. N Xinjiang [Kazakhstan, Mongolia, SC Russia].

Tragopogon altaicus has previously been mistaken by C. H. An (Fl. Xinjiang. 5: 380. 1999) for *T. pratensis* Linnaeus, which is not present in China.

6. *Tragopogon orientalis* Linnaeus var. ***latifolius*** C. H. An, Fl. Xinjiang. 5: 479. 1999.

东方婆罗门参 dong fang po Luo men shen

Herbs 40–100 cm tall, biennial. Stem erect, normally branched, glabrous. Basal and lower cauline leaves linear to lanceolate, 15–30 \times 0.3–1 cm. Capitula solitary to few; peduncle not inflated. Involucre 2–3.5 cm. Phyllaries 7–9(or 10), 1.3–1.5 \times as long as florets, equaling or shorter than achenes with pappus. Ligules golden yellow. Outer achenes 1.8–2.5 cm; body pale brown, \pm curviform or almost, 1.4–1.6 mm in diam., tuberculate; beak whitish, 0.8–1.3 cm, slender, non-tuberculate, apically almost not inflated; pappus disk \pm pubescent. Pappus dirty white, 1.5–2.5 cm. Fl. and fr. May–Jul. $2n = 12^*$.

• Mountain meadows; 1000–2100 m. Xinjiang.

The identity of *Tragopogon orientalis* var. *latifolius* needs to be confirmed, including whether or not it belongs to *T. orientalis*. The overall distribution of *T. orientalis* outside of China includes Kazakhstan, Mongolia, and Russia, as well as Europe and North America.

7. *Tragopogon sabulosus* Krascheninnikov & S. A. Nikitin, Otchet Rabotakh Pochv.-Bot. Otryada Kazakhstansk. Eksped. Akad. Nauk S.S.S.R. 4(2): 294. 1930.

沙婆罗门参 sha po Luo men shen

Herbs 50–150 cm tall, biennial. Stem erect, branched from middle third, glabrous. Basal and lower cauline leaves linear to lanceolate, 15–40 \times 0.5–1 cm. Capitula few to 10(–12); peduncle inflated under capitulum, 5–10 mm in diam. Involucre 3.5–5(–6) cm. Phyllaries 8–10(–12), smaller than florets and achenes with pappus. Ligules yellow. Outer achenes 2–2.3 cm; body pale brown, slightly curviform or straight, 2–2.5 mm in diam., tuberculate, with 5 fairly well-differentiated ribs; beak 2–5 mm, attenuate or stout, with inflated apex; pappus disk floccose. Pappus dirty white, 2–2.7 cm. Fl. and fr. May–Jul.

Sand dunes; 800–1500 m. Xinjiang [Kazakhstan, SC Russia].

8. *Tragopogon stepposus* (S. A. Nikitin) Stankov in Stankov & Taliev, *Opred. Vyssh. Rast. Evrop. Chasti S.S.S.R.* 691. 1949.

草原婆罗门参 cao yuan po luo men shen

Tragopogon podolicus (Besser ex Candolle) Artemczuk subsp. *stepposus* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 261. 1938.

Herbs 40–80(–100) cm tall, biennial. Stem erect, branched from middle third, pubescent. Basal and lower cauline leaves linear, 15–30 × 0.2–0.5 cm. Capitula solitary to few; peduncle not inflated. Involucre 1.5–2.5 cm. Phyllaries 7 or 8, equaling or shorter than florets and achenes with pappus. Ligules yellow. Outer achenes 1–1.3 cm; body pale brown, slightly curviform, 0.9–1.2 cm, ca. 1 mm in diam., tuberculate; beak absent or very short and thick; pappus disk ± pubescent. Pappus dirty white, 1–1.3 cm. Fl. and fr. May–Jul. $2n = 12$.

Steppes, semi-deserts; 500–1500 m. Xinjiang [Kazakhstan, Russia (W Asian and E European parts)].

9. *Tragopogon gracilis* D. Don, Mem. Wern. Nat. Hist. Soc. 3: 414. 1821 [*“gracile”*].

纤细婆罗门参 xian xi po luo men shen

Herbs to 20(–30) cm tall, perennial. Caudex stout. Stems few, simple, slender, erect, glabrous. Basal and lower cauline leaves lanceolate-subulate, 7–15 × 0.2–0.4 mm, margin sometimes adaxially rounded. Capitulum solitary; peduncle not inflated. Involucre 1.8–2.3 cm at anthesis, to 3.5 cm in fruit. Phyllaries 5–7, shorter than florets and ± equaling achenes with pappus. Ligules bicolored, abaxially with pink or mauve spot, adaxially yellow. Outer achenes 1.3–1.8 cm; body pale brown, slightly curviform, 1.3–1.6 mm in diam., slightly tuberculate, with small (to 40–50 µm in diam.) hollows in pericarp; beak slender, 5–7 mm. Pappus dirty white, 1.5–2 cm. Fl. and fr. Apr–Jun. $2n = 12$, 24.

Mountain slopes, river terraces; 2500–3500 m. Xinjiang, Xizang [Afghanistan, N India, Kazakhstan, Kyrgyzstan, Nepal, Tajikistan, Uzbekistan].

10. *Tragopogon subalpinus* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 271. 1938.

高山婆罗门参 gao shan po luo men shen

Herbs to 10(–25) cm tall, perennial. Caudex stout. Stems few, simple, slender, erect, glabrous. Basal and lower cauline leaves linear-lanceolate, 10–20 × 0.4–1 cm. Capitula solitary to few; peduncle not inflated. Involucre 1.5–2.5(–3.5) cm. Phyllaries 7 or 8, ± equaling florets and achenes with pappus. Ligules reddish purple. Outer achenes 1.3–1.7 cm; body pale brown, straight or slightly curviform, 1.2–1.4 mm in diam., smooth or slightly tuberculate, with small (to 40–50 µm in diam.) hollows in pericarp; beak slender, ca. 6 mm. Pappus dirty white, ca. 1.5 cm. Fl. and fr. Jun–Jul.

Mountain grasslands; 3000–3500 m. Xinjiang [Kazakhstan, Kyrgyzstan].

11. *Tragopogon porrifolius* Linnaeus, Sp. Pl. 2: 789. 1753.

蒜叶婆罗门参 suan ye po luo men shen

Herbs 40–125 cm tall, biennial or annual. Stem erect, simple or branched from middle third, glabrous or slightly tomentulose. Basal and lower cauline leaves lanceolate or linear, 15–40 × 0.3–0.7 cm, marginally often undulate. 6–12 mm in diam.; peduncle inflated. Capitula solitary to few. Involucre 4–5 cm at anthesis, to 8 cm in fruit. Phyllaries 7 or 8, ca. 1/3 longer than florets and ± equaling achenes with pappus. Ligules violet. Outer achenes 3.7–4.5 cm; body pale brown, curviform, 1.4–1.6 mm in diam.; beak whitish, 2–2.5 cm, slender, smooth, apically inflated; pappus disk ± tomentulose. Pappus dirty white, 2.7–3.7 cm. Fl. and fr. May–Aug. $2n = 12$.

700–2000 m. Naturalized or cultivated in Beijing, Guizhou, Shaanxi, Sichuan, Xinjiang, and Yunnan [native to Europe].

Tragopogon porrifolius is naturalized in S Africa, Asia, Australia, North America, and perhaps Oceania.

This is a polyphyletic taxon. The relationship of Chinese plants requires more investigation.

12. *Tragopogon kasachstanicus* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 268. 1938.

中亚婆罗门参 zhong ya po luo men shen

Herbs 20–35 cm tall, perennial. Caudex stout. Stem single, erect, branched from middle third, glabrous, ± lanate, tomentulose, or glabrescent at nodes and below capitula. Basal and lower cauline leaves lanceolate to narrowly oblong, abaxially keeled, sometimes folded along midvein. Capitula solitary to few; peduncle ± inflated, 4–8 mm in diam. Involucre ca. 3 cm at anthesis, 4.5–5 cm in fruit. Phyllaries 8, equaling or shorter than florets. Ligules purple to violet. Outer achenes 2.2–2.7 cm; body whitish, straight to ± curved, 1.8–2.2 mm in diam., tuberculate, with 5 fairly well-differentiated ribs; beak 3–5 mm, stout, apically ± inflated; pappus disk ± tomentulose. Pappus slightly fulvous, 2.2–2.5 cm. Fl. and fr. Apr–Jun.

Mountain slopes, river valleys, sandy soils; 500–2000 m. Xinjiang [Kazakhstan, Kyrgyzstan].

13. *Tragopogon marginifolius* N. Pavlov, Byull. Moskovsk. Obsch. Isp. Prir., Otd. Biol. 47(2): 83. 1938.

膜缘婆罗门参 mo yuan po luo men shen

Tragopogon gonocarpus S. A. Nikitin.

Herbs 20–35 cm tall, perennial. Caudex stout. Stem single, erect, simple or branched from middle third or higher, glabrous or tomentulose/floccose at nodes and below capitula. Basal and lower cauline leaves lanceolate to oblong, 10–30 × 0.5–2 cm, margin white, ± undulate and membranous. Capitula solitary to few; peduncle not inflated. Involucre 2.5–4 cm. Phyllaries 8, lanceolate, shorter than or equaling florets and achenes with pappus. Ligules purple to mauve. Outer achenes 2–2.5 cm; body whitish, straight to ± curved, 2–2.5 mm in diam., tuberculate, with 5 fairly well-differentiated ribs, abruptly contracted into beak; beak 5–10 mm, stout, apically ± inflated; pappus disk ± tomentulose. Pappus slightly fulvous, often with tinge of red, 2–2.5 cm. Fl. and fr. Apr–Jun. $2n = 12$.

Stony slopes, sandy deserts; 800–1400 m. Xinjiang [Kazakhstan, Kyrgyzstan, Russia (E and S European parts), Uzbekistan].

14. *Tragopogon elongatus* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 269. 1938.

长茎婆罗门参 chang jing po luo men shen

Herbs 15–35 cm tall, perennial. Caudex stout. Stem single, erect, simple or branched from middle or upper third, glabrous or tomentulose/floccose at nodes and below capitula. Basal and lower cauline leaves lanceolate, 10–20 × 4–8 cm, margin membranous and sometimes ± crisp. Capitula solitary to few; peduncle not inflated. Involucre 2–3 cm. Phyllaries 7 or 8, often darkly colored. Ligules purple to mauve. Outer achenes 1.8–2.2 cm; body whitish, straight to ± curved, 2–2.5 mm in diam., tuberculate, with 5 fairly well-differentiated ribs; beak 7–10 mm, stout, apically ± inflated; pappus disk ± tomentulose. Pappus slightly fulvous, 1.5–1.8 cm. Fl. and fr. Apr–Jun.

Mountain grasslands, stony deserts and semi-deserts; 500–1200 m. Qinghai, Xinjiang [Kazakhstan, Kyrgyzstan].

15. *Tragopogon ruber* S. G. Gmelin, Reise Russland 2: 198. 1774.

红花婆罗门参 hong hua po luo men shen

Tragopogon ruber var. *leucocarpus* C. H. An.

Herbs 15–35 cm tall, perennial. Caudex stout. Stem single, erect, simple or branched from middle third or above, glabrous or tomentulose/floccose at nodes and below capitula. Basal and lower cauline leaves lanceolate to oblong, 10–30 × 0.5–2 cm, margin white, ± undulate, and membranous. Capitula solitary to few; peduncle not inflated. Involucre 3.5–6 cm. Phyllaries 8, lanceolate, equaling or shorter than florets and achenes with pappus. Ligules purple to mauve. Outer achenes 2–2.5 cm; body whitish, straight to ± curved, 1.8–2.2 mm in diam., tuberculate, with 5 fairly well-differentiated ribs; beak 5–10 mm, stout, apically ± inflated; pappus disk ± tomentulose. Pappus slightly fulvous, often with tinge of red, 2–2.5 cm. Fl. and fr. Apr–Jun. $2n = 12$.

Mountains, sand dunes; 500–1500 m. Xinjiang [Kazakhstan, Russia (S European part)].

16. *Tragopogon montanus* S. A. Nikitin, Bot. Mater. Gerb. Bot. Inst. Komarova Akad. Nauk S.S.S.R. 7: 270. 1938.

山地婆罗门参 shan di po luo men shen

Herbs 15–35 cm tall, perennial. Caudex stout. Stem erect, branched from lower or middle third but sometimes simple, glabrous. Basal and lower cauline leaves lanceolate to oblong, 10–25 × 0.5–2 cm, margin white, ± undulate, and membranous. Capitula solitary to few; peduncle not inflated. Involucre 3–6 cm. Phyllaries 8, lanceolate, equaling or shorter than florets and achenes with pappus. Ligules purple to mauve. Outer achenes 2–2.5 cm; body whitish, straight to ± curved, 1.8–2.5 mm in

diam., tuberculate, with 5 fairly well-differentiated ribs, gradually attenuate into beak; beak 5–10 mm, stout, apically ± inflated; pappus disk ± tomentulose. Pappus slightly fulvous, 2–2.5 cm. Fl. and fr. Apr–Jun. $2n = 12$.

Mountains; 1200–2500 m. Xinjiang [Kazakhstan, Kyrgyzstan, SC Russia, Tajikistan, Uzbekistan; SW Asia].

17. *Tragopogon sibiricus* Ganeschin, Trudy Bot. Muz. Imp. Akad. Nauk 13: 225. 1915.

西伯利亚婆罗门参 xi bo li ya po luo men shen

Herbs 0.5–1 m tall, biennial. Stem erect, simple or branched from middle third, glabrous. Basal and lower cauline leaves lanceolate to linear, 15–40 × 0.4–1 cm, margin flat. Capitula solitary to few; peduncle with dark hairs, ± inflated. Phyllaries 7 or 8, ca. 1/3 longer than florets and equaling achenes with pappus. Ligules violet. Outer achenes 1.8–2.4 cm; body smooth or subtuberculate on 5 fairly well-differentiated ribs; beak 0.6–1.4 cm, slender, ± inflated; pappus disk ± tomentulose. Pappus dirty white, 1.5–2 cm. Fl. and fr. Jun–Aug. $2n = 12$.

Forest margins; ca. 1700 m. Xinjiang [Russia (W Asian and E European parts)].

18. *Tragopogon verrucosobracteatus* C. H. An, Fl. Xinjiang. 5: 479. 1999.

瘤苞婆罗门参 liu bao po luo men shen

Herbs to 20 cm tall, perennial. Stem simple, densely covered with lanceolate or linear leaves, gradually decreasing in size toward apex. Capitulum solitary; peduncle mostly reduced, not inflated. Phyllaries 8(–10), lanceolate. Ligules yellow. Outer achenes 1.5–2 cm, beakless. Pappus dirty white, ca. 2 cm. Fl. and fr. Jun–Aug.

• Semi-deserts, stony places; ca. 500 m. Xinjiang.

Tragopogon verrucosobracteatus is poorly known and requires more investigation.

19. *Tragopogon heteropappus* C. H. An, Fl. Xinjiang. 5: 479. 1999.

长苞婆罗门参 chang bao po luo men shen

Herbs 30–50 cm tall, perennial. Stem simple. Basal and lower stem leaves lanceolate. Capitula solitary to few. Phyllaries 8(–10), lanceolate. Ligules yellow. Outer achenes 1–1.3 cm, almost beakless. Pappus short; awns clearly unequal, longest 2–5 ca. 7 mm, remainder ca. 4 mm. Fl. Jun.

• Semi-deserts, stony places; 1000–1300 m. Xinjiang.

Tragopogon heteropappus is poorly known and requires more investigation.

56. *FABERIA* Hemsley, J. Linn. Soc., Bot. 23: 479. 1888.

花佩菊属 hua pei ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Faberiopsis C. Shih & Y. L. Chen.

Herbs, perennial, often rosulate, with rhizomes. Stem leafy or ± leafless. Leaves lyrate pinnate or undivided, leathery. Capitula

with 5–30 florets. Involucre \pm narrowly cylindric to \pm narrowly campanulate. Phyllaries mostly glabrous; outer phyllaries in several series, gradually longer centripetally, often conspicuously imbricate, longest ca. 1/2 as long as inner ones; inner phyllaries 5–14, \pm equal in length, \pm linear-lanceolate to linear. Receptacle naked. Florets reddish to bluish purple. Achene brown to reddish brown, subcylindric to narrowly ellipsoid, rather weakly compressed, with 5 main ribs and 1 or 2 narrower ribs in between, apex truncate. Pappus brownish, single, of strong scabrid bristles.

- Seven species: China.

Systematic placement and circumscription of the genus have been revised based on molecular phylogenetic analyses of subtribes Lactucinae and Crepidinae (J. W. Zhang & N. Kilian, in prep.; N. Kilian et al., in prep.). N. Kilian et al. (in V. A. Funk et al., Syst. Evol. Biogeogr. Compositae, 348–350, 2009) placed *Faberia* in subtribe Crepidinae, but now ITS phylogenies show it on a very basal branch in subtribe Lactucinae. Recent additions to the genus by Sennikov (Komarovia 5: 109–110, 2008) are based on a different genus concept and are, as far as relevant for the flora of China, not supported. Karyological studies (Y. Liu, T. Deng & Q. E. Yang, pers. comm.) have revealed that the four species investigated have the unusual basic chromosome number of $x = 17$, perhaps indicating a hybrid origin of this genus.

Prenanthes glandulosa Dunn (J. Linn. Soc., Bot. 35: 514, 1903), which was initially placed by the first author in *Notoseris* (*N. glandulosa* (Dunn) C. Shih), is only known from the holotype at K, a piece of a flowering plant raised from seeds collected in “West China.” It seems to be a distinct species, perhaps referable to *Faberia*, as may be assumed from the involucre (purplish, inner phyllaries ca. 6, outer ones linear as in *F. lancifolia*), the 10–12 blue (or purple?) florets, and the pale straw-colored pappus. The lower leaves have a broadly ovate blade with cordate base and a distinct, basally sheathlike widened and clasping petiole. The axes of the paniculiform to corymbiform synflorescence are densely glandular hairy, a feature otherwise not known from *Faberia*.

- 1a. Leaves lyrate-pinnatifid to lyrate-pinnatisect.
 - 2a. Leaves with terminal lobe much larger than lateral lobes, to 2/3 of entire leaf; involucre 1.4–1.5 cm; inner phyllaries usually 12–14; capitula with 20–30 florets 3. *F. sinensis*
 - 2b. Leaves with terminal lobe never conspicuously larger than lateral lobes; involucre 1.1–1.3 cm; inner phyllaries ca. 8; capitula with 10–15 florets 4. *F. ceterach*
- 1b. Leaf blade not divided or at most coarsely sinuate-dentate.
 - 3a. Leaf blade lanceolate to narrowly elliptic or oblanceolate, at least ca. 3 \times as long as wide.
 - 4a. Capitula many in a leafless narrowly paniculiform synflorescence 1. *F. lancifolia*
 - 4b. Capitula 1–3 on short branchlets subtended by upper stem leaves 2. *F. nanchuanensis*
 - 3b. Leaf blade broadly elliptic, ovate, or pentagonal, mostly not more than ca. 2 \times as long as wide.
 - 5a. Leaves on stem, with petiole usually shorter than blade; leaf blade triangular-ovate to pentagonal; capitula with 5 florets; inner phyllaries 5 7. *F. faberi*
 - 5b. Most leaves basal, with petiole distinctly longer than blade; leaf blade broadly elliptic to ovate; capitula with 10–20 florets; inner phyllaries at least 8.
 - 6a. Leaf blade mostly more than 5 cm; synflorescence corymbiform, with some capitula; florets bluish purple 5. *F. cavaleriei*
 - 6b. Leaf blade at most ca. 4 cm; synflorescence sparsely branched, with 1–4 capitula only; florets purplish, drying yellowish 6. *F. thibetica*

1. *Faberia lancifolia* J. Anthony, Notes Roy. Bot. Gard. Edinburgh 18: 196, 1934.

披针叶花佩菊 pi zhen ye hua pei ju

Lactuca glabra C. C. Chang (1934), not Candolle (1838).

Herbs 30–70 cm tall, perennial. Rhizomes short, oblique, with many slender roots. Stem erect, \pm branched from middle, sparsely hairy especially apically, leafy especially in basal portion. Basal leaves lanceolate and attenuate into a petiole-like basal portion to 1/3 of its length, 9–21 \times 1–2.5 cm, base narrow, margin entire, apex acute to acuminate. Stem leaves usually 4 or 5, rather distant, similar to basal leaves but successively smaller; uppermost stem leaves reduced to linear-lanceolate bracts. Synflorescence narrowly paniculiform, with many capitula; branches wiry, spreading-erect, mostly 3–7 cm, with (1 or) 2–6 capitula. Capitula with ca. 10 florets; peduncle 0.5–2 cm, conspicuously bracteate; bracts linear-lanceolate, 2–3 mm, spreading. Involucre purplish, 1–1.3 cm. Outer phyllaries linear-lanceolate, longest 5–6 mm; inner phyllaries ca. 6. Florets dark bluish purple. Achene pale brown, 3–4 mm. Pappus 5–6 mm. Fl. and fr. Aug–Sep.

- Crevices and ledges of cliffs by streams; 2100–2500 m. Yunnan (Tengchong).

Faberia lancifolia is a conspicuous but rare species, apparently only known from the type collection made in 1912.

2. *Faberia nanchuanensis* C. Shih, Acta Phytotax. Sin. 33: 195, 1995.

假花佩菊 jia hua pei ju

Faberiopsis nanchuanensis (C. Shih) C. Shih & Y. L. Chen.

Herbs 30–40 cm tall, perennial. Rhizomes short, horizontal. Roots long stretching. Stem solitary, dark purple, erect and weakly zigzag, slightly diverging at each node from perpendicular, weakly branched in apical portion, glabrous except for somewhat brown lanate leaf axils, distantly leafy. Basal leaves few to some; petiole \pm purplish, 5–12 cm; leaf blade narrowly elliptic, 4–14 \times 1–3 cm, base cuneate, margin inconspicuously mucronulately sinuate-dentate, apex acuminate. Stem leaves usually 5–7; petiole 1–9 cm, shorter upward; leaf blade narrowly elliptic to lanceolate but uppermost ones narrowly lan-

ceolate, otherwise like basal leaves, abaxially somewhat tinged purplish. Synflorescence of 1 to few short branchlets subtended by upper stem leaves, each with 1–3 capitula. Capitula with usually 15–20 florets. Involucre green and tinged purple, 1.1–1.3 cm. Phyllaries with apex obtuse to acute; outer phyllaries triangular-ovate to lanceolate, longest ca. 5 mm, margin \pm ciliate; inner phyllaries usually 9–12, apically ciliate. Florets bluish purple. Achene not seen when mature. Pappus 7–8 mm. Fl. Jun–Aug. $2n = 34^*$.

- Wet places in ravines, on banks of pools and creeks; 600–700 m. Chongqing (Nanchuan).

C. Shih and Y. L. Chen (Acta Phytotax. Sin. 34: 439. 1996) described the ligule of the florets on the basis of the holotype as trisect with a larger 3-dentate middle segment and founded on this particularity the new genus *Faberiopsis*. Other collections of *Faberia nanchuanensis*, however, show the usual 5-dentate ligule of the Cichorieae, and both morphological and molecular data (J. W. Zhang et al., in prep.) corroborate its placement in *Faberia*. The species is morphologically closest to *F. lancifolia*.

3. *Faberia sinensis* Hemsley, J. Linn. Soc., Bot. 23: 479. 1888.

花佩菊 hua pei ju

Crepis hieracium H. Léveillé; *Faberia hieracium* (H. Léveillé) H. Léveillé; *Lactuca faberia* Franchet, nom. illeg. superfl.; *Prenanthes sinensis* (Hemsley) Stebbins ex Babcock (1947), not *P. chinensis* Thunberg (1784).

Herbs 40–90 cm tall, perennial, rosulate. Rhizomes short, oblique, with many slender roots. Stem erect, branched apically and sparsely brown hairy, usually leafless except for linear bracts subtending branches. Rosette leaves 7–50 \times 3.5–8 cm, lyrate pinnatifid to lyrate pinnatisect, abaxially pale green and brown hairy, adaxially green and glabrous; lateral lobes few to many, opposite or alternate along petiole-like basal portion, semiobicular, semielliptic, or triangular-ovate, to 1 \times 2.5 cm, gradually smaller toward leaf base; terminal lobe elliptic, ovate, or lanceolate, 4–40 cm, base cordate, rounded, or subtruncate, margin sinuate to lyrate lobed and distantly shortly mucronulately dentate, apex acuminate. Synflorescence corymbiform, with few to some capitula. Capitula with usually 20–30 florets; peduncle 1–7 cm, slender. Involucre 1.4–1.5 cm. Phyllaries apically tinged purple, ciliate at margin with brownish hairs, otherwise glabrous or inner phyllaries also abaxially sparsely hairy near apex, apex \pm acute; outer phyllaries triangular-ovate to lanceolate, longest 5–6 mm; inner phyllaries usually 12–14. Florets purplish to bluish. Achene reddish brown, 3.5–4.5 mm. Pappus 7–8 mm. Fl. and fr. Jun–Sep. $2n = 34^*$.

- Forest margins, forests, moist places under rocks; 600–3200 m. Sichuan, Yunnan.

The entire plant of *Faberia sinensis* is used medicinally for promoting semen production.

4. *Faberia ceterach* Beauverd, Bull. Soc. Bot. Genève 2: 51. 1910.

滇花佩菊 dian hua pei ju

Herbs 25–70 cm tall, perennial, rosulate, ?with rhizomes. Stem erect, basally brown hairy, apically branched and \pm glabrous, leafless except for linear bracts subtending branches or

with usually 1 or 2 leaves similar to rosette leaves. Rosette leaves narrowly elliptic to oblanceolate, 7–18 \times 2–5 cm, lyrate pinnatifid to lyrate pinnatisect, abaxially pale glaucous and brown hairy, adaxially dark green and glabrous, base cuneate to petiole-like for 1–3 cm, apex acute to acuminate; lateral lobes 7–15, semiobicular to ovate, gradually smaller toward leaf base; terminal lobe lanceolate. Synflorescence narrowly paniculiform, with usually 10–20 capitula. Capitula with 10–15 florets. Involucre 1.1–1.3 cm. Phyllaries purplish red, abaxially glabrous; outer phyllaries triangular-ovate to lanceolate, longest 3–4 mm, apex acute; inner phyllaries ca. 8, apex obtuse. Florets purplish to bluish. Achene reddish brown, 3.5–4.5 mm. Pappus 6–7 mm. Fl. and fr. Jul.

- 2200–2600 m. Yunnan (Kunming).

Faberia ceterach seems only to be known from a few collections made in the early 20th century.

5. *Faberia cavaleriei* H. Léveillé, Bull. Géogr. Bot. 24: 252. 1914.

贵州花佩菊 gui zhou hua pei ju

Faberia tsiangii (C. C. Chang) C. Shih; *Hieracium tsiangii* C. C. Chang; *Prenanthes cavaleriei* (H. Léveillé) Stebbins ex Lauener.

Herbs 60–80 cm tall, perennial, rosulate, glabrous or sparsely hairy. Rhizomes with many slender roots. Stem erect, branched apically, sparsely leafy. Basal leaves rosulate; petiole 12–14 cm; leaf blade broadly elliptic to ovate, 9–14 \times 4–6 cm, base cordate, truncate, or shortly cuneate, margin shallowly sinuate and distantly shortly mucronulately dentate, apex acute to acuminate. Stem leaves with petiole 1–3 cm; leaf blade lanceolate, smaller and narrower but otherwise similar to basal leaves, apex acuminate. Synflorescence corymbiform. Capitula with usually 10–20 florets, sessile or pedunculate; peduncle (when present) 2–5 cm, slender. Involucre 1.2–1.4 cm. Phyllaries purplish red, abaxially glabrous; outer phyllaries triangular-ovate to lanceolate, longest 0.5–0.7 mm, apex acute to obtuse; inner phyllaries 8, apex obtuse. Florets bluish purple. Achene reddish dark brown, 4–4.5 mm. Pappus 7–8 mm. Fl. and fr. Jun–Jul. $2n = 34^*$.

- Densely shaded woods; 900–1500 m. Guangxi (Ziyuan), Guizhou (Guiding).

Faberia cavaleriei is rare and only known from a few collections.

6. *Faberia tibetica* (Franchet) Beauverd, Bull. Soc. Bot. Genève 2: 50. 1910.

光滑花佩菊 guang hua hua pei ju

Lactuca tibetica Franchet, J. Bot. (Morot) 9: 293. 1895.

Herbs 15–35 cm tall, perennial, rosulate. Rhizomes with many slender roots. Stem erect, simple or sparsely branched, glabrous, not or very sparsely leafy. Basal leaves rosulate; petiole 4–11 cm; leaf blade triangular-ovate, 2–4 \times 1–3 cm, base cordate or unequally cordate, margin shallowly to coarsely sinuate-dentate, or irregularly coarsely dentate, apex acute to acuminate. Stem leaves similar to basal leaves but with shorter

petiole and smaller narrower blade. Synflorescence sparsely branched, with 1–4 capitula. Capitula nodding at anthesis, with usually 15–25 florets. Involucre ca. 1.5 cm. Phyllaries abaxially glabrous; outer phyllaries triangular-ovate to linear-lanceolate, longest 1/2–2/3 as long as inner phyllaries, apex acute; inner phyllaries 10–12, apex subacute. Florets purplish, drying yellowish. Achene brown, ca. 5 mm. Pappus ca. 8 mm. Fl. and fr. Jul. $2n = 34^*$.

• Grasslands on mountain slopes; ca. 2700 m. Sichuan (Kangding).

Faberia tibetica is rare and only known from a few collections.

7. *Faberia faberi* (Hemsley) N. Kilian, Z. H. Wang & J. W. Zhang, *comb. nov.*

狭锥花佩菊 xia zhui hua pei ju

Basionym: *Prenanthes faberi* Hemsley, J. Linn. Soc., Bot. 23: 486. 1888 [*“Faberii”*]; *Lactuca hemsleyi* Franchet, nom. illeg. superfl.; *P. vitifolia* Diels.

Herbs 1.2–2.5 m tall, perennial. Rhizomes horizontal, 1–2 cm in diam. Stem solitary, erect, \pm glabrous, leafy, apically with or without branches as leafy as main stem. Stem leaves with petiole 2–6 cm; leaf blade triangular-ovate to pentagonal, 8–15

\times 5–12 cm, glabrous or very sparsely with stiff hairs, base hastate to cordate, margin shallowly sinuately mucronately dentate and mucronately denticulate, apex acute to acuminate; lower stem leaves rarely with a single pair of small, elliptic, entire, and subopposite to opposite lateral lobes. Synflorescences contracted paniculiform, with some to many capitula; branches short, wiry, often pilose. Capitula rather clustered, each with ca. 5 florets; peduncle 0–2 mm. Involucre ca. 10×3 mm. Phyllaries green, \pm shortly white ciliate; outer phyllaries broadly ovate-triangular, longest 2.5–3(–5) mm, apex acute; inner phyllaries 5, apex obtuse. Florets pale purple. Achene brown, 3.5–4 mm. Pappus 6–8 mm. Fl. and fr. Jun–Aug.

• Mountain slopes, forest margins; 1800–3000 m. Chongqing, Guizhou, Sichuan, Yunnan.

Molecular phylogenetic analyses by N. Kilian et al. (in prep.) fully confirm the morphological affinity to *Faberia* of *F. faberi*, previously classified under *Prenanthes* (e.g., FRPS 80(1): 189. 1997).

The syntypes of *Prenanthes vitifolia*, collected by Rosthorn in Chongqing in 1891 and conserved at O with the annotation in Diels’s hand “*Prenanthes vitifolia* Diels” on the printed label of O, are evidence that *P. vitifolia* is conspecific with *Faberia faberi*. The sheet at O with the collection number “470” on an original handwritten label is **designated here as the lectotype** of the name ***Prenanthes vitifolia* Diels.**

57. *CICERBITA* Wallroth, Sched. Crit. 433. 1822.

岩参属 yan shen shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Cephalorrhynchus Boissier; *Galathenium* Nuttall; *Mycelis* Cassini.

Herbs, perennial, often with rhizomes. Stem leafy. Leaves pinnate, lyrate-pinnate, or undivided. Capitula with 5–20[–30] florets. Involucre narrowly to broadly cylindric or campanulate. Phyllaries glabrous [or abaxially appressed hairy]; outer phyllaries in several series, gradually longer centripetally, \pm imbricate, longest ca. 1/2(–3/4) as long as inner ones; inner phyllaries 5–10, \pm equal in length, \pm linear-lanceolate to linear. Receptacle naked. Florets bluish or purplish, exceptionally white. Achene some shade of brown, subcylindric, \pm ellipsoid, or \pm fusiform, weakly to distinctly compressed, with 5 main ribs (2 lateral and sometimes strongly enlarged, 1 median ventrally, and 2 median dorsally), also with 0–2 slender ribs in between main ribs, apex truncate, attenuate, or beaked. Pappus white, single of slender scabrid bristles or double and with an additional outer row of short hairs.

Probably ca. 20–30 species: C and SW Asia, Europe; seven species (five endemic) in China.

The circumscription of *Cicerbita* has been heavily in debate since its creation. The genus is used here in a revised circumscription inferred from most recent molecular phylogenetic and morphological studies of the entire subtribe (N. Kilian et al., in prep.), but its circumscription is still not settled, in particular concerning the species of C and SW Asia. Its concept with respect to the taxa occurring in China is therefore tentative and aims at keeping the nomenclatural changes to a minimum. Molecular phylogenetic analyses by N. Kilian et al. (in prep.) revealed that *Chaetoseris* as treated in FRPS (80(1): 266–283. 1997) is diphyletic. Whereas the larger part of the genus, including *C. lyriformis* (= *Melanoseris beesiana*), which provides the type of the generic name, is nested in the genus *Melanoseris*, the smaller part forms a distant clade close to *Cicerbita* (generic name typified by *C. alpina* Wallroth). The latter clade includes *Chaetoseris* sect. *Roborovskia* Tzvelev (Rast. Tsentral. Azii 14b: 98. 2008) and *Cicerbita azurea*. We place this clade here tentatively in *Cicerbita*. We, moreover, follow Tzvelev (Bot. Zhurn. 92: 1756. 2007; Rast. Tsentral. Azii 14b: 100. 2008) in placing *Youngia* sect. *Cyanoglossa* S. W. Liu & T. N. Ho (originally with two species described by S. W. Liu & T. N. Ho, Acta Phytotax. Sin. 39: 553–556. 2001; further two species added by Tzvelev, loc. cit.: 2007) in close proximity to *Chaetoseris* sect. *Roborovskia*. It was so far not possible to study material of any of these species, as the material was not made available on loan to us. We place this group (*Chaetoseris* sect. *Cyanoglossa* (S. W. Liu & T. N. Ho) Tzvelev) tentatively in *Cicerbita*. Finally, we leave *Cicerbita thianschanica*, which has not been included so far in the aforementioned molecular phylogenetic studies, in *Cicerbita*.

- 1a. Plants robust, 0.6–1.5 m tall and synflorescence racemiform 1. *C. thianschanica*
- 1b. Plants mostly rather delicate, mostly less than 0.6 m tall but sometimes to 0.9 m tall and then synflorescence paniculiform.
 - 2a. Basal leaves and lower and middle stem leaves usually with triangular-ovate to orbicular leaf blade contracted into a well-developed long unwinged petiole; involucre 11–13 mm 4. *C. azurea*
 - 2b. Leaves not as above, or if basal leaves with triangular-ovate to orbicular leaf blade and well-developed petiole present then involucre \leq 8 mm; involucre 6–10(–12) mm.

- 3a. Basal leaves at anthesis usually missing; stem throughout leafy with well-developed conspicuously auriculate to sagittately clasping leaves.
 4a. Capitula with usually 10–12 florets; involucre (8–)9–10(–12) mm; inner phyllaries 8 2. *C. roborowskii*
 4b. Capitula with ca. 5 florets; involucre 7–9 mm; inner phyllaries 5 3. *C. auriculiformis*
- 3b. Basal leaves at anthesis usually present; stem leaves few, reduced, undivided except for lowermost, and base not clasping.
 5a. Involucre 9–10 mm; synflorescence divaricately branched; capitula with curved-erect peduncle 7. *C. neglecta*
 5b. Involucre 6–9 mm; synflorescence not divaricately branched; capitula with straight spreading-erect peduncle.
 6a. Basal and stem leaves usually entire or more rarely few basal leaves with a few broadly triangular lobes; florets blue 5. *C. zhenduoi*
 6b. Basal and lowermost stem leaves runcinate; florets mauve 6. *C. ladyginii*

1. *Cicerbita thianschanica* (Regel & Schmalhausen) Beauverd, Bull. Soc. Bot. Genève 2: 123. 1910.

天山岩参 tian shan yan shen

Mulgedium thianschanicum Regel & Schmalhausen, Trudy Imp. S.-Peterburgsk. Bot. Sada 6: 329. 1880.

Herbs 0.6–1.5 cm tall, perennial. Rhizomes thick, woody. Stem solitary, erect, branched from middle or apically. Basal and lower stem leaves with petiole 8–9 cm, winged, semi-amplexicaul; leaf blade oblanceolate, to 16[–50] × 7–8[–9] cm, lyrate pinnatifid to lyrate pinnatisect, margin coarsely mucronately dentate; lateral lobes 2 or 3 pairs, elliptic; terminal lobe larger than lateral lobes, triangular-hastate, to 9 × 8 cm, apex acute to acuminate. Middle stem leaves sessile, auriculate clasping, similar to lower stem leaves. Upper stem leaves lanceolate to narrowly elliptic, smaller, less or not divided. Synflorescence narrowly racemiform to 50 cm, with many capitula often clustered at nodes. Capitula with usually 10–20 florets; peduncle wiry, 1–3(–5) cm. Involucre broadly cylindric to campanulate, ca. 1.2 cm at anthesis, to 1.5 × 0.8 cm in fruit. Phyllaries glabrous or sparsely pubescent; outer phyllaries triangular-ovate to lanceolate, largest 7–9 × 1.5–2 mm; inner phyllaries ca. 8. Florets pale purple [to blue]. Achene brown, narrowly ellipsoid, ca. 5 mm, somewhat compressed, lateral ribs somewhat broadened, apex truncate. Pappus double, outer hairs 0.2–0.4 mm, bristles 6–7 mm. Fl. and fr. Jul–Sep. $2n = 18$.

Mountain valleys, forests, along rivers; 1600–2000 m. Xinjiang [Kazakhstan, Tajikistan].

2. *Cicerbita roborowskii* (Maximowicz) Beauverd, Bull. Soc. Bot. Genève 2: 135. 1910.

川甘岩参 chuan gan yan shen

Lactuca roborowskii Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 29: 177. 1883; *Chaetoseris albiflora* Tzvelev; *C. potaninii* Tzvelev; *C. prattii* (Dunn) Tzvelev; *C. roborowskii* (Maximowicz) C. Shih; *L. prattii* Dunn.

Herbs 20–90 cm tall, perennial. Rhizomes very short. Stem solitary, erect, apically branched and glabrous or with white, stiff, subulate, and partly glandular hairs. Basal and lower leaves with winged clasping petiole to 10(–15) cm; leaf blade narrowly obovate to elliptic, 4.5–16 × 1.5–6 cm, pinnatifid to pinnatisect or lyrate so, glabrous, margin entire or with few larger teeth; lateral lobes 2–7 pairs, lanceolate, elliptic, or linear, recurved, apex acute to obtuse; terminal lobe triangu-

lar-ovate, ovate-sagittate, linear, or lanceolate, apex acute to obtuse. Middle and upper stem leaves shortly petiolate or sessile; leaf blade elliptic to lanceolate, smaller, narrower, and less divided than lower leaves, base sagittately to auriculate clasping. Synflorescence paniculiform, with numerous capitula. Capitula with 10–12 florets. Involucre narrowly cylindric, (8–)9–10(–12) × 3–4 mm. Phyllaries glabrous or with subulate hairs, apex acute to obtuse; outer phyllaries triangular-ovate to linear-lanceolate, longest ca. 3/4 as long as inner phyllaries; inner phyllaries 8. Florets blue to purplish blue, rarely white. Achene 4–5 mm; body dark reddish to blackish brown, ellipsoid, compressed, with broad lateral ribs; beak greenish to brownish, 1–1.5 mm, slender. Pappus double, outer hairs ca. 0.2 mm, bristles ca. 7 mm. Fl. and fr. Jul–Sep.

• Thickets, grasslands; 1900–4200 m. Gansu, Ningxia, Qinghai, Sichuan, Xizang.

Chaetoseris albiflora, with white florets and strongly recurved leaf lobes, recently described from Xizang, hardly deserves recognition as a separate taxon and is here placed in the synonymy of *Cicerbita roborowskii*. Another recently described species from Xizang and based on a single 19th century collection, *Chaetoseris potaninii* is said to be closely related to *Cicerbita roborowskii* but to have a strongly reduced outer pappus and leaves with only 1–3 pairs of lateral lobes each with 1 or 2 large teeth. As the division of the leaves in *C. roborowskii* shows some variation, this feature, although conspicuous, does not preclude conspecificity of *Chaetoseris potaninii*, neither does the stated pappus feature. A closer inspection of the material is pending, but for the time being *C. potaninii* is included in *Cicerbita roborowskii*. As no discontinuity could be observed between plants having leaves with narrow (linear to linear-lanceolate or narrowly elliptic), ± entire lateral and terminal lobes on the one hand and those having leaves with wider (broadly lanceolate to ovate), 1- or 2-toothed lobes (originally described as *Lactuca prattii*) on the other hand, the inclusion of this latter species starting with Beauverd in 1910 is therefore maintained.

3. *Cicerbita auriculiformis* (C. Shih) N. Kilian, **comb. nov.**

抱茎岩参 bao jing yan shen

Basionym: *Stenoseris auriculiformis* C. Shih, Acta Phytotax. Sin. 33: 195. 1995; *Chaetoseris qiliangshanensis* S. W. Liu & T. N. Ho.

Herbs 45–80 cm tall, perennial. Stem solitary, erect, branched apically, glabrous. Lower stem leaves with petiole 6–11 cm, narrowly winged, ± clasping; leaf blade narrowly ovate, not divided or lyrate or non-lyrate pinnatisect; lateral lobes if present 1 or 2 pairs, obliquely ovate to oblong, recurved; terminal lobe 6.5–8.5 × 3.5–4.5 cm, base cordate, margin entire

or shallowly sinuate-dentate, apex acute to obtuse. Middle and upper stem leaves similar to lower leaves but with broadly winged, sagittately to auriculate clasp petiole-like basal portion or sessile; lateral lobes 2–4 pairs, ca. 3×0.7 –1 cm; terminal lobe triangular-hastate to lanceolate. Synflorescence paniculiform, with numerous capitula. Capitula with ca. 5 florets. Involucre narrowly cylindric, 7 – $9 \times$ ca. 2 mm. Phyllaries green, glabrous; outer phyllaries triangular-ovate to linear-lanceolate, longest ca. 1/2 as long as inner phyllaries; inner phyllaries 5. Florets bluish purple. Achene ca. 4 mm; body ellipsoid, compressed, with broad lateral ribs; beak ca. 1 mm and thick. Pappus double, outer hairs 0.1–0.2 mm, bristles ca. 5 mm. Fl. and fr. Jul–Aug.

• Mountain slopes, along rivers, forests; 2000–2300 m. Gansu (Yuzhong), W Nei Mongol, Qinghai.

Cicerbita auriculiformis is closely related to *C. roborowskii*, although well distinct by its smaller capitula with only 5 inner phyllaries. This relationship was clearly expressed by S. W. Liu and T. N. Ho (Fl. Qinghai. 3: 512. 1996) when publishing it under the name *Chaetoseris qiliangshanensis*. However, the species had been known before, but it was, for its small capitula, misplaced in *Stenosseris* as *S. auriculiformis* (e.g., FRPS 80(1): 286. 1997).

4. *Cicerbita azurea* (Ledebour) Beauverd, Bull. Soc. Bot. Genève 2: 123. 1910.

岩参 yan shen

Sonchus azureus Ledebour, Fl. Altaic. 4: 138. 1833; *Cicerbita azurea* var. *glabra* Sennikov; *C. glabra* (Sennikov) Tzvelev; *Lactuca azurea* (Ledebour) Danguy; *Mulgedium azureum* (Ledebour) Candolle.

Herbs 30–60 cm tall, perennial. Rhizomes horizontal to oblique. Stem solitary, erect, branched apically, \pm with brownish glandular hairs or glabrous. Basal and lower stem leaves with petiole 4.5–5.5(–18) cm, narrowly winged or unwinged, base \pm expanded and semiamplexicaul to clasping; leaf blade pinnatisect, abaxially sparsely villous but glabrescent, margin sinuate-dentate; lateral lobes 1 pair, elliptic-triangular to triangular; terminal lobe cordate, ovate, triangular-hastate, or rarely reniform, 2 – 8×1.5 –6 cm, apex acuminate to rounded. Middle and upper stem leaves with winged petiole; leaf blade smaller, lateral lobes 1 pair or absent. Synflorescence racemiform to more rarely paniculiform, with few to many capitula. Capitula with usually 11–18 florets. Involucre cylindric, 1.1 – 1.3×0.4 –0.6 mm. Phyllaries usually tinged deep violet, glandular hairy along midvein or glabrous; outer phyllaries lanceolate to linear-lanceolate, longest 6–9 mm; inner phyllaries 8–10, abaxially sparsely villous but glabrescent. Florets deep blue. Achene pale brown, narrowly ellipsoid, 4–5 mm, weakly compressed, constricted for ca. 0.2 mm below pappus disk. Pappus double, outer hairs inconspicuous and ca. 0.1 mm, bristles 6–8 mm. Fl. and fr. Jul–Oct.

Forest margins, mountain slopes, open areas in forests, grasslands on flats; 600–2900 m. N Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, SC Russia].

5. *Cicerbita zhenduoi* (S. W. Liu & T. N. Ho) N. Kilian, **comb. nov.**

振铎岩参 zhen duo yan shen

Basionym: *Youngia zhenduoi* S. W. Liu & T. N. Ho, Acta Phytotax. Sin. 39: 554. 2001; *Chaetoseris cyanea* (S. W. Liu & T. N. Ho) Tzvelev (2007), not (D. Don) C. Shih (1991); *C. zhenduoi* (S. W. Liu & T. N. Ho) Tzvelev; *Y. cyanea* S. W. Liu & T. N. Ho.

Herbs 15–30 cm tall, perennial, rosulate. Rhizomes short. Stem erect, branched from base or higher up, glabrous or white pubescent. Rosette leaves glabrous or pubescent, margin \pm entire. Early leaves with distinct 1.3–3 cm petiole; leaf blade triangular-ovate, 1 – 1.8×0.6 –0.8 cm, base sagittate, truncate, or cuneate, apex obtuse to acute. Leaf blade of later rosette leaves elliptic to lanceolate, 4 – 8.5×0.3 –0.8 cm, undivided to rarely weakly pinnatifid with few triangular lobes, base gradually attenuate, apex acute to long acuminate. Stem leaves similar to later rosette leaves, narrowly ovate-elliptic to narrowly lanceolate; uppermost leaves bractlike. Synflorescence loosely racemiform or paniculiform, glabrous or pubescent, with few to some capitula. Capitula with usually 4–7 florets. Involucre narrowly cylindric, 6 – 8×1.5 –2 mm. Phyllaries glabrous or pubescent; outer phyllaries ovate to lanceolate, longest ca. 4×1 mm, apex acute; inner phyllaries apically blackish purple, apex obtuse. Florets blue. Achene fusiform and apically attenuate, ca. 4 mm, somewhat compressed. Pappus 4–5 mm. Fl. and fr. Sep.

• Moist slopes, riverbanks; 3600–3700 m. Qinghai (Yushu).

We have not seen material of *Cicerbita zhenduoi*; therefore, its inclusion follows Tzvelev (Rast. Tsentral. Azii 14b: 100. 2008), and its description is taken from the original publication. We are not convinced that *Youngia cyanea*, described also from the environment of Jiangxigou, distinguished chiefly by the shape of the rosette leaves and the absence or presence of pubescence, represents a different species. From the variation experienced in the subtribe, the differences in either feature may well be within the usual range found. The corresponding combination under *Chaetoseris* provided by Tzvelev is illegitimate as a later homonym of *Chaetoseris cyanea* (D. Don) C. Shih, and the epithet is also not available in *Cicerbita*. Until closer study of the material, we prefer to treat both as conspecific.

6. *Cicerbita ladyginii* (Tzvelev) N. Kilian, **comb. nov.**

高原岩参 gao yuan yan shen

Basionym: *Chaetoseris ladyginii* Tzvelev, Bot. Zhurn. 92: 1756. 2007.

Herbs 20–50 cm tall, perennial. Stem solitary, erect, branched in apical half, glabrous. Basal leaves few, pinnatifid with lateral lobes broadly lanceolate to broadly triangular. Stem leaves 3–6, sessile, narrowly lanceolate to linear, undivided. Synflorescence glandular hairy. Involucre narrowly cylindric, 8–9 mm. Phyllaries almost glabrous, margin shortly ciliate; outer phyllaries with longest 3–4 mm. Florets mauve. Achene fusiform, not seen when mature. Pappus single, caducous. Fl. and fr. Jul–Aug.

• 4000–4100 m. Xizang.

We have not seen material of *Cicerbita ladyginii*; therefore, its description is taken from the original publication.

7. *Cicerbita neglecta* (Tzvelev) N. Kilian, **comb. nov.**

光苞岩参 guang bao yan shen

Basionym: *Chaetoseris neglecta* Tzvelev, Bot. Zhurn. 92: 1756. 2007.

Herbs 40–70 cm tall, perennial. Stem erect, branched from base or higher up. Basal leaves runcinately pinnate, with conspicuous terminal lobe. Lower stem leaves like basal leaves but others linear-lanceolate, undivided, base auriculately clasping, margin entire. Synflorescence divaricately paniculiform. Capitula with peduncle curved-erect, glandular hairy. Involucre nar-

rowly cylindric, 9–10 mm. Phyllaries green, glabrous; outer phyllaries with longest 3–5 mm. Florets lilac. Achene 3.5–4 mm; body reddish brown, with thick lateral ribs; beak 0.7–1 mm. Pappus with outer hairs ca. 0.2 mm. Fl. and fr. Sep.

• 4000–4100 m. Xizang.

We have not seen material of *Cicerbita neglecta*; therefore, its description is taken from the original publication.

58. MELANOSERIS Decaisne in Jacquemont, Voy. Inde 4(Bot.): 101. 1843.

毛鳞菊属 mao lin ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Chaetoseris C. Shih; *Kovalevskiella* Kamelin; *Stenoseris* C. Shih.

Herbs, perennial, sometimes rosulate, rarely acaulescent, glabrous, glandular hairy, pilose, or hispid. Stems solitary or several, usually leafy. Leaves pinnate, lyrate pinnate, or undivided. Capitula often nodding, with 3–40 florets. Involucre narrowly cylindric to broadly campanulate. Phyllaries glabrous or with soft or rigid hairs; outer phyllaries mostly in several series, gradually longer centripetally, mostly to more than 1/2 as long as inner ones and often even \pm approaching them in length, more rarely very short, absent in one species with a secondary capitulum (*Melanoseris souliei*); inner phyllaries 3 to many, \pm equal in length, \pm linear-lanceolate to linear. Receptacle naked. Florets bluish, purplish, sometimes yellow, or rarely white. Achene some shade of brown, mostly ellipsoid and strongly compressed, more rarely subcylindric to \pm fusiform and weakly compressed, with (4 or) 5 main ribs (2 mostly strongly broadened lateral, 1 median ventrally, and (1 or) 2 median dorsally) and with 0–2 slender ribs in between main ribs, apex truncate, attenuate, or with a stout beak. Pappus white or rarely yellowish, single of slender scabrid bristles or more frequently double and with an additional outer row of minute hairs.

Probably ca. 60–80 species: Africa, Asia, Himalayan region; 25 species (16 endemic) in China; one additional species (endemic) is tentatively placed with *Melanoseris*.

The generic name *Melanoseris*, based on *M. lessertiana*, is one of the oldest in subtribe Lactucinae but has never found recognition. Molecular phylogenetic analyses of subtribe Lactucinae (N. Kilian et al., in prep.) revealed, however, that the bulk of *Chaetoseris*, including the type of the name, the genus *Stenoseris*, and a number of species formerly placed in *Cicerbita*, *Lactuca*, *Mulgedium*, and *Prenanthes*, are all members of a sizable *Melanoseris* clade. The genus chiefly seems to represent the important branch in the evolution of subtribe Lactucinae that successfully colonized subtropical and drier tropical regions.

- 1a. Plants rosulate and acaulescent; capitula sessile, densely congested in a secondary capitulum; phyllaries only in 1 row 25. *M. souliei*
- 1b. Plants neither rosulate nor acaulescent; capitula without secondary capitula; phyllaries in 2 or more rows.
 - 2a. Capitula with 3–9 florets; inner phyllaries 3–5(or 6).
 - 3a. Involucre 1.5–1.8 mm; capitula with 7–9 florets; plants, including involucre, strongly hirsute with pale hairs 7. *M. hirsuta*
 - 3b. Involucre 0.9–1.4(–1.6) mm; capitula with 3–6 florets; plants, including involucre, glabrous or \pm hairy, but never strongly hirsute with pale hairs.
 - 4a. Involucre 1.3–1.6 mm; inner phyllaries 4; achene 9–11 mm including a slender 3–4 mm beak 10. *M. henryi*
 - 4b. Involucre 0.9–1.4(–1.5) mm; inner phyllaries 3–5(or 6); achene 4–7 mm and unbeaked or with less than 2 mm beak.
 - 5a. Outer phyllaries with longest 4–5 mm; inner phyllaries 5(or 6); florets 4–6 23. *M. violifolia*
 - 5b. Outer phyllaries with longest \leq 3 mm; inner phyllaries 3–5; florets 3–5.
 - 6a. Leaf blade of all leaves not divided.
 - 7a. Involucre with 3 or 4 inner phyllaries; capitula with 3 or 4 bluish purple florets; anther tube ca. 2 mm 16. *M. tenuis*
 - 7b. Involucre with 4 or 5 inner phyllaries; phyllaries with reddish hairs; capitula with 4 or 5 yellow florets; anther tube ca. 4 mm 26. *Lactuca scandens*
 - 6b. Leaf blade of at least lower and middle leaves pinnatisect or lyrate pinnatisect.
 - 8a. Involucre 1.2–1.5 cm at anthesis and in fruit; outer phyllaries with longest to 3 mm; achene 6–7 mm 18. *M. graciliflora*
 - 8b. Involucre 0.9–1.1 cm at anthesis and in fruit; outer phyllaries with longest to 2 mm; achene 4–5 mm.
 - 9a. Achene unbeaked 20. *M. oligolepis*
 - 9b. Achene contracted into a distinct stout beak of 0.5–1 mm.

- 10a. Rachis of leaves usually pectinate; leaf blade terminal lobe ovate to ovate-lanceolate, base truncate, shallowly cordate, or broadly cuneate 17. *M. triflora*
- 10b. Rachis of leaves not pectinate; leaf blade terminal lobe elliptic to lanceolate, base cuneate 19. *M. leptantha*
- 2b. Capitula with 10 or more florets; inner phyllaries at least (7 or)8.
 - 11a. Peduncle bracts regularly conspicuous, usually purplish red when dry, lanceolate, to 1.5 cm, \pm semiamplexicaul 24. *M. bracteata*
 - 11b. Peduncle without or with inconspicuous bracts.
 - 12a. Outer phyllaries with white densely fimbriate margin.
 - 13a. Capitula with ca. 40 florets; involucre conspicuously thick and large, 1.8–2.3 \times 1–1.5 cm 3. *M. macrantha*
 - 13b. Capitula with ca. 15 florets; involucre only ca. 1.5 \times 0.8 cm 4. *M. ciliata*
 - 12b. Outer phyllaries with glabrous margin.
 - 14a. Florets yellow (cyanic florets sometimes drying yellowish, corolla teeth then keeping original color).
 - 15a. Leaves pinnately lobed, lobes narrowly elliptic, elliptic, or lanceolate; involucre 1.1–1.5 mm 1. *M. yunnanensis*
 - 15b. Leaves pinnately lobed, lobes rhombic to irregularly rhombic; involucre 9–10 mm 2. *M. rhombiformis*
 - 14b. Florets purple, purplish red, blue, or exceptionally white.
 - 16a. Plants 5–50 cm tall; stems either several, weak, and sparsely branched or with solitary dominant stem branched from base or else stem delicate.
 - 17a. Plants 5–30 cm tall; capitula with usually 12–24 florets; involucre to 10 mm in diam. in fruit; branches, peduncles, and involucre often reddish villous; pappus without a row of minute outer hairs 21. *M. lessertiana*
 - 17b. Plants 20–50 cm tall; capitula with usually 10–15 florets; involucre \leq 5 mm in diam. in fruit; branches, peduncles, and involucre never reddish villous; pappus with a row of minute outer hairs 22. *M. macrorrhiza*
 - 16b. Plants taller; stem strong, with dominant main stem apically branched.
 - 18a. Lower and middle stem leaves gradually attenuate into a petiole or petiole-like basal portion, at least middle stem leaves with blade usually clasping stem; blade shape not as below.
 - 19a. Involucre at fruiting 1–1.5 cm wide; capitula with usually 25–35 florets 12. *M. atropurpurea*
 - 19b. Involucre at fruiting less than 1 cm wide; capitula with usually 10–16 florets.
 - 20a. Capitula with ca. 10 florets 14. *M. likiangensis*
 - 20b. Capitula with 12–16 florets.
 - 21a. Involucre 1.7–2 cm; leaf blade lateral lobes 1 or 2 pairs 13. *M. leirolepis*
 - 21b. Involucre ca. 1.5 cm; leaf blade lateral lobes 5–7 pairs 15. *M. pectiniformis*
 - 18b. Lower and middle stem leaves abruptly contracted from a basally broad blade into a narrowly winged petiole; leaf blade undivided and triangular-ovate to broadly lanceolate or pinnately lobed with 1–3 pairs of elliptic to lanceolate lateral lobes.
 - 22a. Lower and middle stem leaves with 2 or 3 pairs of lateral lobes; leaf blade terminal lobe usually much narrower than blade.
 - 23a. Involucre ca. 1.5 cm in fruit; capitula with usually 15–20 florets 8. *M. sichuanensis*
 - 23b. Involucre ca. 2 cm in fruit; capitula with ca. 30 florets 9. *M. taliensis*
 - 22b. Lower and middle stem leaves undivided or with 1 or 2 pairs of lateral lobes; leaf blade terminal lobe at least in some leaves as wide or almost as wide as blade.
 - 24a. Involucre 1.7–2.1 cm; capitula with ca. 40 florets 11. *M. macrocephala*
 - 24b. Involucre 1.2–1.7 cm; capitula with usually 15–30 florets.
 - 25a. Lower and middle stem leaves undivided or single leaves with 1 pair of elliptic lateral lobes; involucre 1.3–1.7 cm 5. *M. cyanea*
 - 25b. Lower and middle stem leaves with 1 or 2 pairs of elliptic lateral lobes; involucre 1.2–1.5 cm 6. *M. beesiana*

1. *Melanoseris yunnanensis* (C. Shih) N. Kilian & Z. H. Wang, **comb. nov.**

云南毛鳞菊 yun nan mao lin ju

Basionym: *Chaetoseris yunnanensis* C. Shih, Acta Phytotax. Sin. 29: 410. 1991; *C. lutea* (Handel-Mazzetti) C. Shih; *C. teniana* (Beauverd) C. Shih; *Cicerbita cyanea* (D. Don) Beauverd var. *lutea* Handel-Mazzetti; *C. cyanea* var. *teniana* Beauverd.

Herbs ca. 1 m tall or more, perennial. Root slenderly turniplike. Stem solitary, erect, apically branched and glandular hairy. Lower and middle stem leaves with petiole 3–10 cm, narrowly winged, not clasping; leaf blade elliptic to ovate, 10–15 × 4–9 cm, pinnatipartite or pinnatisect to bipinnately lobed, pilose and hispid glandular hairy, margin dentate; lateral lobes 2–6 pairs, opposite or alternate, elliptic to lanceolate, apex acute; secondary lobes if present 1 or 2 pairs, broadly triangular to lanceolate; terminal lobe elliptic to lanceolate. Upper stem leaves similar to middle stem leaves but petiole shorter; leaf blade smaller and less divided; uppermost leaves linear-lanceolate, undivided. Synflorescence racemiform to narrowly paniculiform, with few to many capitula. Capitula nodding, with usually 15–20 florets; peduncle wiry, 0.2–2(–5) cm. Involucre purplish green, cylindric, 1.1–1.5 × 0.4–0.8 cm. Phyllaries ± acute at apex; outer phyllaries triangular-ovate to linear-lanceolate, glabrous or abaxially hispid on midvein, longest approaching inner phyllaries in length. Florets yellow to whitish. Achene ca. 7 mm; body dark reddish brown, ellipsoid, compressed, lateral ribs broadened, apex contracted into a ca. 2 mm paler beak. Pappus double, outer hairs 0.1–0.2 mm, bristles 7–8 mm. Fl. and fr. Sep–Oct.

• Grasslands on mountain slopes, river valleys, forests; 700–3400 m. Sichuan, Yunnan.

Melanoseris yunnanensis and *Chaetoseris lutea* show many transitions between each other and actually seem to be conspecific. According to the fragmentary type material of *Cicerbita cyanea* var. *teniana* preserved at G (the type material in herb. Bonati, formerly at LA, is presumably lost), it represents a strongly glandular form of *M. yunnanensis*.

2. *Melanoseris rhombiformis* (C. Shih) N. Kilian & Z. H. Wang, **comb. nov.**

菱裂毛鳞菊 ling lie mao lin ju

Basionym: *Chaetoseris rhombiformis* C. Shih, Acta Phytotax. Sin. 29: 409. 1991.

Herbs 60–70 cm tall, perennial. Stem solitary, erect, apically with slender glabrous branches. Lower stem leaves with petiole 3–5 cm, basally widened; leaf blade narrowly elliptic, 14–17 × 5–8 cm, pinnatipartite, margin dentate; lateral lobes 6–9 pairs, ± rhombic to rarely triangularly hastate, base broadly petiolulate or sessile, apex acuminate; terminal lobe rhombic, hastate-rhombic, or triangular-hastate-rhombic, apex acute. Middle stem leaves similar to lower stem leaves but with fewer lateral lobes. Upper stem leaves similar to middle stem leaves but broadly triangular to broadly ovate, base broadly winged, petiole-like, and auriculate clasping, margin entire; lateral lobes 2 pairs, irregularly triangular-hastate, basally attenuate;

terminal lobe irregularly triangular-hastate. Synflorescence paniculiform, with numerous capitula. Capitula ?nodding, with ca. 10 florets. Involucre cylindric, 8–10 × ca. 3 mm. Phyllaries abaxially glabrous, apex acute to obtuse; outer phyllaries narrowly triangular to linear-lanceolate. Florets yellow. Achene 4–5 mm; body dark brown, ellipsoid, compressed, lateral ribs broadened, apex contracted into a ca. 1 mm beak. Pappus double, outer hairs inconspicuous, bristles ca. 4 mm. Fl. and fr. Sep–Oct.

• Thickets; ca. 2500 m. Yunnan (Eryuan).

3. *Melanoseris macrantha* (C. B. Clarke) N. Kilian & J. W. Zhang, **comb. nov.**

缘毛毛鳞菊 yuan mao mao lin ju

Basionym: *Lactuca macrantha* C. B. Clarke, Compos. Ind. 267. 1876; *Chaetoseris macrantha* (C. B. Clarke) C. Shih; *Cicerbita macrantha* (C. B. Clarke) Beauverd.

Herbs 0.5–1.5 m tall, perennial. Stem stout, erect, apically branched and glandular hairy. Lower and middle stem leaves with petiole long (lowermost leaves) to sessile with an expanded and clasping base; leaf blade narrowly spatulate, elliptic, or narrowly lanceolate, 14–40(or more) × 4–8 cm, pinnatipartite to pinnatisect (in lowermost leaves); lateral lobes 2–5 pairs but to 8-paired in lowermost leaves, abaxially glabrous, margin coarsely dentate, apex acute; terminal lobe narrowly triangular, narrowly ovate, or irregular rhombic, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but smaller and less divided. Synflorescence racemiform to corymbosely paniculiform, lax, with few capitula. Capitula with ca. 40 florets; peduncle (2–)5–14 cm. Involucre dark purplish green, broadly campanulate, 1.8–2.3 × 1–1.5 cm. Phyllaries with apex acute to obtuse; outer phyllaries ovate to lanceolate, margin white densely fimbriate; inner phyllaries without a fimbriate margin. Florets blue to bluish purple. Achene 6–7 mm; body brown, ellipsoid, compressed, lateral ribs broadened, apex tapering into a barely differentiated thick beak of 1–2 mm. Pappus double, outer hairs 0.1–0.2 mm, bristles ca. 8 mm. Fl. and fr. Jul–Sep. $2n = 16$.

Forests, thickets; 3200–4100 m. Xizang [Bhutan, N India, Nepal].

4. *Melanoseris ciliata* (C. Shih) N. Kilian, **comb. nov.**

景东毛鳞菊 jing dong mao lin ju

Basionym: *Chaetoseris ciliata* C. Shih, Acta Phytotax. Sin. 29: 403. 1991.

Herbs ca. 50 cm tall. Stem erect, apically branched and sparsely glandular hairy. Lower and middle stem leaves with petiole 3–5 cm, narrowly winged, basally widened and auriculate clasping; leaf blade lyrate pinnatisect, abaxially or both surfaces with squarrose hairs on veins; lateral lobes 1 pair, elliptic, apex acute to obtuse; terminal lobe triangular, 6–8 × 3–4 cm, base truncate, apex acute. Upper stem leaves similar to middle stem leaves but smaller; uppermost stem leaves sessile, lanceolate to linear-lanceolate, undivided. Synflorescence racemiform, with few capitula. Capitula with ca. 15 florets. Involucre broadly cylindric to campanulate, ca. 1.5 × 0.8 cm. Phyllaries dark green, abaxially glabrous, apex acute to obtuse;

outer phyllaries broadly triangular to linear-lanceolate, margin white fimbriate. Florets bluish. Achene beaked but only immature ones seen. Pappus ?single, bristles ca. 6 mm. Fl. Nov.

- Mountain slopes; 2800–2900 m. Yunnan (Jingdong).

Melanoseris ciliata is a little-known species in need of closer examination on the basis of additional material with mature achenes.

5. *Melanoseris cyanea* (D. Don) Edgeworth, Trans. Linn. Soc. London 20: 81. 1846.

蓝花毛鳞菊 lan hua mao lin ju

Sonchus cyaneus D. Don, Prodr. Fl. Nepal. 164. 1825; *Chaetoseris cyanea* (D. Don) C. Shih; *C. hastata* (Candolle) C. Shih; *C. hispida* C. Shih; *Cicerbita cyanea* (D. Don) Beauverd; *C. cyanea* var. *glandulifera* (Franchet) Beauverd; *C. cyanea* var. *hastata* (Candolle) Beauverd; *Lactuca fumebris* W. W. Smith; *L. hastata* Candolle; *L. hastata* var. *glandulifera* Franchet; *Melanoseris hastata* (Candolle) Edgeworth; *Mulgedium cyaneum* (D. Don) Candolle.

Herbs 0.8–1.8 m tall, perennial. Root slenderly turniplike. Stem solitary, erect, branched apically, ± glabrous to densely covered with purplish to brownish glandular hairs. Lower and middle stem leaves with petiole to 12 cm, narrowly winged, not or rarely very faintly sagittately clasping; leaf blade ovate to triangular, 5–11 × 3.5–8.5 cm, undivided or with 1 pair of ± elliptic lateral lobes, margin coarsely dentate, base of blade or terminal lobe cuneate, truncate, cordate, or hastate, apex acute. Upper stem leaves shortly petiolate to sessile; leaf blade similar to middle stem leaves but smaller, narrowly elliptic, undivided to shallowly pinnatifid. Synflorescence paniculiform, often with rather long virgate branches, with several to numerous capitula. Capitula with usually 20–30 florets. Involucre cylindric, 1.3–1.7 × 0.5–0.8 cm. Phyllaries with midvein white or purplish hispid except in innermost ones, apex acute; outer phyllaries triangular-ovate to lanceolate. Florets blue to purplish. Achene 7–8 mm; body dark brown, ellipsoid, compressed, lateral ribs broadened, apex attenuate into a pale 2–3 mm slender beak. Pappus double, outer hairs 0.1–0.3 mm, bristles ca. 7 mm. Fl. and fr. Sep–Nov. $2n = 16^*$.

Moist places under forests, thickets in mountain valleys, forest margins, grassy slopes, wastelands on mountain slopes; 1500–3100 m. Chongqing, Guizhou, Sichuan, Xizang, Yunnan [Bhutan, N India, Kashmir, Myanmar, Nepal].

Plants with less glandular hairy to almost glabrous branches, as they occur in various species besides strongly glandular plants, were originally described as *Lactuca hastata* and recognized as *Chaetoseris hastata* in FRPS (80(1): 275. 1997) but have been considered as conspecific with *C. cyanea* by most authors, a treatment which is also followed here. Plants from Chongqing earlier described as a separate species, *C. hispida*, were later recognized by its author as conspecific with *C. cyanea*, and the name was sunk in the synonymy of that species.

6. *Melanoseris beesiana* (Diels) N. Kilian, **comb. nov.**

毛鳞菊 mao lin ju

Basionym: *Lactuca beesiana* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 201. 1912; *Chaetoseris beesiana* (Diels) C. Shih; *C. lyriformis* C. Shih.

Herbs ca. 1 m tall, perennial. Stem solitary, erect, apically branched and glandular hairy. Lower and middle stem leaves with petiole 3–7 cm, ± winged, basally semiamplexicaul; leaf blade 7–17 × 4–13 cm, lyrate pinnatisect, abaxially glandular hairy, base cuneate, margin dentate; lateral lobes 1 or 2 pairs, ± elliptic; terminal lobe broadly triangular-hastate, ovate, or triangular, comprising most of blade, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but smaller; uppermost leaves sessile, linear-lanceolate to elliptic, not divided. Synflorescence narrowly racemiform or paniculiform, with few to several capitula. Capitula with usually 15–25 florets; peduncle 0.5–3 cm. Involucre cylindric to narrowly campanulate, 1.2–1.5 × 0.4–0.7 cm. Phyllaries dark green, abaxially densely glandular hispid, apex acute to obtuse; outer phyllaries narrowly triangular to lanceolate. Florets purple. Achene ca. 5 mm; body dark brown, broadly ellipsoid, compressed, lateral ribs broadened, apex attenuate into a pale 1–2 mm beak. Pappus double, outer hairs ca. 0.1 mm, bristles ca. 7 mm. Fl. and fr. Aug–Oct. $2n = 16^*$.

- Forests, wastelands, farmlands; 700–3700 m. Sichuan, Xizang, Yunnan.

Melanoseris beesiana was established by C. Shih (Acta Phytotax. Sin. 29: 405. 1991) as *Chaetoseris lyriformis* (providing the type of the generic name *Chaetoseris*), but *Lactuca beesiana* provides an older epithet. It is, no doubt, closely related to the more widespread *M. cyanea* and mainly distinguished from the latter by its regularly lyrate pinnatisect lower and middle stem leaves and somewhat smaller involucre. With some reservation, species rank is maintained for this taxon, but future research may reveal that subspecies rank is perhaps more appropriate.

7. *Melanoseris hirsuta* (C. Shih) N. Kilian, **comb. nov.**

鹤庆毛鳞菊 he qing mao lin ju

Basionym: *Chaetoseris hirsuta* C. Shih in Y. Ling & C. Shih, Fl. Reipubl. Popularis Sin. 80(1): 282. 1997, based on *Lactuca hirsuta* Franchet, J. Bot. (Morot) 9: 258. 1895, not *Lactuca hirsuta* Muhlenberg ex Nuttall, Gen. N. Amer. Pl. 2: 124. 1818.

Herbs 15–30 cm tall, perennial, with a taproot ?and shoot-bearing lateral roots, strongly hirsute of pale partly glandular hairs. Stem solitary, erect, leafy. Lower and middle stem leaves oblanceolate to obovoid in outline, ca. 12 × 5 cm, lyrate pinnatisect, basally abruptly contracted into a ± winged petiole-like portion, base semiamplexicaul to weakly clasping, margin densely and sharply sinuate-dentate and denticulate; lateral lobes 1 or 2 pairs, triangular to rhombic, apex acute to obtuse; terminal lobe broadly ovate to broadly triangular, very much larger than lateral lobes, base cordate, apex acute. Upper stem leaves ovate to lanceolate, smaller, ± without petiole-like basal portion, otherwise similar to middle stem leaves. Synflorescence narrowly paniculiform, leafy, with few to some capitula. Capitula nodding, with ca. 8 florets; peduncle less than 1 cm. Involucre cylindric, 1.5–1.8 cm. Phyllaries abaxially hirsute as remainder of plant; outer phyllaries few, ± inconspicuous; inner phyllaries 5. Florets yellowish. Achene brown, narrowly ellipsoid, ca. 1 cm, subcompressed, apex attenuate into a short stout beak. Pappus single, yellowish, ca. 7 mm, caducous. Fl. and fr. Aug–Oct.

• Meadows, below rocks, alongside paths; 1700–3300 m. Sichuan, Yunnan (Dali).

A well-delimited yet little-known species, this taxon is placed here with some hesitation.

8. *Melanoseris sichuanensis* (C. Shih) N. Kilian, *comb. nov.*

四川毛鳞菊 *si chuan mao lin ju*

Basionym: *Chaetoseris sichuanensis* C. Shih, Acta Phytotax. Sin. 29: 408. 1991.

Herbs ca. 80 cm tall, perennial. Stem solitary, erect, apically branched and sparsely glandular hairy. Middle stem leaves with petiole 2.5–4 cm, very narrowly winged; leaf blade ovate to elliptic, 9–11 × 6–7 cm, pinnatisect to subpinnatisect, base ± truncate, margin dentate; lateral lobes 2 or 3 pairs, lanceolate, apex acute, acuminate, or obtuse; upper and middle lobes 2–4.5 × 1–1.5 cm; lower lobes smaller; terminal lobe elliptic-lanceolate, ca. 4 × 1.5 cm. Upper stem leaves similar to middle stem leaves but smaller; uppermost leaves linear. Synflorescence narrowly paniculiform, with numerous capitula. Capitula with usually 15–20 florets. Involucre cylindric to campanulate, ca. 1.5 × 0.5 cm. Phyllaries with an obtuse to acute apex; outer phyllaries lanceolate, hispid. Florets purplish. Achene ca. 6 mm; body pale brown, ellipsoid, compressed, lateral ribs broadened, apex contracted into a ca. 2 mm beak. Pappus double, outer hairs inconspicuous, bristles ca. 8 mm. Fl. and fr. Aug–Oct.

• Mountain slopes; 2700–3700 m. Sichuan (Mianning), Yunnan.

9. *Melanoseris taliensis* (C. Shih) N. Kilian & Z. H. Wang, *comb. nov.*

戟裂毛鳞菊 *ji lie mao lin ju*

Basionym: *Chaetoseris taliensis* C. Shih, Acta Phytotax. Sin. 29: 402. 1991.

Herbs ca. 50 cm tall, perennial. Rhizomes tuberlike. Stem solitary, erect, apically branched and glandular hairy. Lower and middle stem leaves with petiole 4–5 cm, winged, basally broadened and clasping; leaf blade narrowly ovate, 10–15 × ca. 6 cm, runcinately pinnatifid to subpinnatisect, margin dentate, apex acute to obtuse; lateral lobes 2 or 3 pairs, elliptic to irregularly rhombic, increasing in size toward leaf apex; terminal lobe lanceolate, irregularly rhombic, or falcate, much narrower than lateral lobes, with few small semiorbicular lobes. Upper stem leaves similar to lower and middle stem leaves but smaller; uppermost leaves linear-lanceolate, undivided. Synflorescence racemiform to sparsely paniculiform, with few capitula. Capitula with ca. 30 florets. Involucre campanulate, ca. 2 × 1 cm. Phyllaries glabrous, apex acute to obtuse; outer phyllaries triangular-lanceolate. Achene 8–9 mm; body dull brown, narrowly ellipsoid, compressed, lateral ribs broadened, apex tapering into a paler 2–3 mm beak. Pappus double, outer hairs ca. 0.1 mm, bristles ca. 7 mm. Fl. and fr. Oct. $2n = 16^*$.

• Mountaintops; 2800–3000 m. Yunnan (Dali, Lijiang).

10. *Melanoseris henryi* (Dunn) N. Kilian, *comb. nov.*

普洱毛鳞菊 *pu er mao lin ju*

Basionym: *Lactuca henryi* Dunn, J. Linn. Soc., Bot. 35: 512. 1903.

Herbs to 1 m tall, perennial. Stem solitary, erect, apically branched, glabrous, leafy. Lower stem leaves not seen. Middle stem leaves spatulate, to 12 × 3 cm, pinnatifid to pinnatifid, somewhat setose, base attenuate, margin sinuate-dentate, apex obtuse to acute; lateral lobes 1 or 2 pairs, semiorbicular to broadly ovate; terminal lobe ovate to lanceolate, as wide as lateral lobes. Upper stem leaves similar to middle stem leaves but smaller and less divided, apex acute to acuminate; uppermost stem leaves narrowly elliptic, undivided. Synflorescence paniculiform with some to many capitula. Capitula with 4 or 5? florets; peduncle wiry, sparsely setose. Involucre narrowly cylindric, 1.3–1.6 × ca. 0.3 cm. Phyllaries glabrous, apex obtuse; outer phyllaries lanceolate to linear-lanceolate, longest ca. 1/2 as long as inner ones; inner phyllaries 4. Florets ?purplish. Achene 0.9–1.1 cm; body reddish, narrowly ellipsoid, compressed, apex tapering into a paler 3–4 mm beak. Pappus ca. ?7 mm.

• About 1500 m. Yunnan (Pu'er).

Lactuca henryi, based on the collection *A. Henry 13494*, was omitted from FRPS and by X. Zhuang (Fl. Yunnan. 13. 2004), but, as confirmed by the electronic image of an isotype at NY, it represents a species well characterized by its slender involucre and long-beaked achene. It can fairly safely be assigned to *Melanoseris*.

11. *Melanoseris macrocephala* (C. Shih) N. Kilian & J. W. Zhang, *comb. nov.*

大头毛鳞菊 *da tou mao lin ju*

Basionym: *Chaetoseris macrocephala* C. Shih, Acta Phytotax. Sin. 29: 404. 1991.

Herbs 50–100 cm tall, perennial. Stem solitary, erect, apically branched and glandular hairy. Lower and middle stem leaves with petiole 5–10 cm, narrowly winged; leaf blade ovate to ± broadly lanceolate, 10–14 × 5–6 cm, undivided or pinnatisect, abaxially sparsely glandular hairy, base ± truncate, margin dentate, apex acute to acuminate; lateral lobes (0 or) 1 or 2 pairs, elliptic, apex obtuse to acute; terminal lobe ovate to broadly lanceolate, often hastate and comprising most of blade, apex acute to acuminate. Upper stem leaves with shorter petiole and smaller, otherwise similar to middle stem leaves; uppermost stem leaves sessile, lanceolate, base cuneate, apex acuminate. Synflorescence racemiform or paniculiform, with few to several capitula. Capitula with ca. 40 florets; peduncle 1–5 cm. Involucre broadly campanulate, 1.7–2.1 × ca. 1 cm. Phyllaries glandular hispid, apex acute; outer phyllaries triangular to lanceolate. Florets purplish red. Achene ca. 5 mm; body dark brown, ellipsoid, compressed, lateral ribs broadened, apex attenuate into a pale 1–2 mm beak. Pappus double, outer hairs 0.1–0.2 mm, bristles ca. 7 mm. Fl. and fr. Aug–Sep.

• Forest margins, thickets, grasslands; 2000–3500 m. Xizang (Nyalam).

12. *Melanoseris atropurpurea* (Franchet) N. Kilian & Z. H. Wang, *comb. nov.*

大花毛鳞菊 *da hua mao lin ju*

Basionym: *Lactuca atropurpurea* Franchet, J. Bot. (Morot) 9: 260. Jul 1895; *Chaetoseris dolichophylla* C. Shih; *C. grandis*

flora C. Shih, nom. illeg. superfl.; *Cicerbita grandiflora* Beauverd, nom. illeg. superfl.; *L. grandiflora* Franchet, nom. illeg. superfl.; *L. pseudosonchus* H. Léveillé.

Herbs 50–100 cm tall, perennial. Root turniplike. Stems solitary or few, erect, apically branched and glandular hairy. Basal leaves elliptic and basally attenuate into a long narrow petiole-like portion, 20–30 × 10–15 cm, pinnatipartite to pinnatisect and often lyrate, margin dentate; lateral lobes 3–5 pairs, elliptic to rhombic, gradually smaller toward leaf base, apex obtuse to acute; terminal lobe triangular, ± irregularly rhombic, elliptic, or lanceolate, much larger than lateral lobes, base hastate to rounded, apex acute to obtuse. Lower and middle stem leaves shortly petiolate to sessile and clasping, similar to basal leaves but smaller; lateral lobes 3–7 pairs. Upper stem leaves sessile, less divided and smaller. Synflorescence racemiform or paniculiform, with few to several capitula. Capitula nodding before anthesis, with usually 25–35 florets; peduncle (1–)2–6(–10) cm. Involucre dark purplish green, broadly campanulate, 1.7–2.1 × 1–1.5 cm. Phyllaries glabrous or rarely glandular hispid, apex acute; outer phyllaries triangular-ovate to lanceolate. Florets blue to bluish purple. Achene 6–7 mm; body dark brown, ellipsoid, compressed, lateral ribs broadened, apex tapering into a pale 1–2 mm thick beak. Pappus double, outer hairs 0.2–0.3 mm, bristles ca. 8 mm. Fl. and fr. Jul–Nov. $2n = 16^*$.

Forests, forest margins, thickets, alpine meadows; 2800–4000 m. Sichuan, Xizang, Yunnan [Myanmar].

Franchet published the name “*Lactuca atropurpurea*” twice in 1895, in July (J. Bot. (Morot) 9: 260) and in August (J. Bot. (Morot) 9: 294), the latter name for a species of *Dubyaea* and illegitimate as a later homonym but under to Art. 58.1 of the *Vienna Code* the epithet is available for use in the new name *D. atropurpurea* Stebbins. In October 1895 (J. Bot. (Morot) 9: 368), Franchet unfortunately renamed the legitimate earlier homonym to *L. grandiflora*, which is thus illegitimate, as are the combinations in *Chaetoseris* and *Cicerbita* based on it. *Chaetoseris dolichophylla* seems not actually distinct from *Melanoseris atropurpurea* and is here tentatively included in this species.

13. *Melanoseris leirolepis* (C. Shih) N. Kilian & J. W. Zhang, comb. nov.

光苞毛鳞菊 guang bao mao lin ju

Basionym: *Chaetoseris leirolepis* C. Shih, Acta Phytotax. Sin. 29: 402. 1991.

Herbs to 1 m tall, perennial. Stem solitary, erect, apically branched and glandular hairy. Lower and middle stem leaves narrowly elliptic and basally attenuate into winged ± clasping petiole-like portion, 10–14 × 2.5–4 cm, lyrate, pinnatipartite to lyrate pinnatipartite, sparsely glandular hairy, margin shallowly sinuate-dentate; lateral lobes 1 or 2 pairs, semiobicular to elliptic, apex rounded to obtuse; terminal lobe narrowly ovate to lanceolate, 5–8 × 2.5–4 cm, margin ± sinuate, apex acute to acuminate. Upper stem leaves ± sessile, narrowly elliptic to linear-lanceolate, smaller, lyrate pinnatid or not divided. Synflorescence racemiform or sparsely paniculiform, with few to several capitula. Capitula nodding, with usually 12–16 florets. Involucre campanulate, 1.7–2 × 0.7–1 cm. Phyllaries glabrous, apex acute to obtuse; outer phyllaries triangular-ovate to lanceolate. Florets purple. Achene 6–7 mm; body brown to dark

brown, ellipsoid, compressed, lateral ribs broadened, apex tapering into a paler 1–2 mm beak. Pappus double, outer hairs 0.1–0.2 mm, bristles ca. 8 mm. Fl. and fr. Oct.

• Mountain slopes; ca. 2500 m. Yunnan (Jingdong).

14. *Melanoseris likiangensis* (Franchet) N. Kilian & Z. H. Wang, comb. nov.

丽江毛鳞菊 li jiang mao lin ju

Basionym: *Lactuca likiangensis* Franchet, J. Bot. (Morot) 9: 259. 1895; *Chaetoseris bonatii* (Beauverd) C. Shih; *C. likiangensis* (Franchet) C. Shih; *Cicerbita bonatii* Beauverd; *C. likiangensis* (Franchet) Beauverd; *L. bonatii* (Beauverd) H. Léveillé; *L. forrestii* W. W. Smith.

Herbs 40–60 cm tall, perennial. Rhizomes thick. Stem solitary, erect, apically branched and mostly densely glandular hairy. Basal and lower stem leaves narrowly ovate to narrowly elliptic and basally attenuate into a ± winged petiole-like portion, 12–25 × 3–10 cm, pinnatipartite to pinnatisect, margin ± coarsely sinuate-dentate; lateral lobes 3–7 pairs, lowermost small and triangular, others elliptic to suborbicular, apex acute to obtuse; terminal lobe triangular-ovate to lanceolate, distinctly larger than lateral lobes, apex acuminate to acute. Middle and upper stem leaves similar to lower leaves but smaller and sessile with an auriculate clasping base; uppermost leaves lanceolate to elliptic-lanceolate, less divided or undivided. Synflorescence paniculiform, with several to many capitula. Capitula drooping to nodding, with ca. 10 florets; peduncle wiry, 0.5–3 cm. Involucre cylindric, 1.3–1.8 × 0.4–0.6 cm. Phyllaries purplish green, glandular hispid; outer phyllaries triangular-ovate to lanceolate; inner phyllaries ca. 8. Florets blue to bluish purple. Achene 6–8 mm; body brownish red, narrowly ellipsoid, compressed, lateral ribs broadened, apex contracted into a paler ca. 2 mm beak. Pappus double, outer hairs 0.1–0.2 mm, bristles 6–8 mm. Fl. and fr. Aug–Oct. $2n = 16^*$.

• Forests, open boulder-strewn slopes, grasslands; 1900–3100 m. Yunnan.

According to the type material preserved at G, *Chaetoseris bonatii*, based on *Cicerbita bonatii*, is apparently conspecific.

15. *Melanoseris pectiniformis* (C. Shih) N. Kilian & J. W. Zhang, comb. nov.

栉齿毛鳞菊 zhi chi mao lin ju

Basionym: *Chaetoseris pectiniformis* C. Shih, Acta Phytotax. Sin. 29: 408. 1991.

Herbs ca. 90 cm tall, perennial. Stem purplish red below middle, branched from middle or apically and sparsely glandular hairy. Lower stem leaves narrowly elliptic and basally attenuate into a short petiole-like portion, pinnatipartite to subpinnatisect, margin dentate. Middle stem leaves to 10 × 1.5 cm, basally with an auriculate or sagittately clasping petiole-like portion; lateral lobes 5–7 pairs, opposite to obliquely opposite, lanceolate to elliptic, gradually smaller toward leaf base, rachis sometimes pectinate, apex acute to obtuse; terminal lobe lanceolate. Upper stem leaves narrowly elliptic, smaller, less divided, margin entire. Synflorescence racemiform, with few capit-

ula. Capitula with ca. 15 florets. Involucre cylindric, ca. 1.5×0.6 cm. Phyllaries glandular hispid, apex acute to obtuse; outer phyllaries lanceolate to linear-lanceolate. Florets purplish red. Achene ca. 6 mm; body dark brown, ellipsoid, compressed, lateral ribs broadened, apex attenuate into a 2–3 mm beak. Pappus double, outer hairs 0.1–0.2 mm, bristles ca. 7 mm. Fl. and fr. Aug.

- Forests in mountain valleys; ca. 3200 m. Xizang (Mainling).

16. *Melanoseris tenuis* (C. Shih) N. Kilian, comb. nov.

全叶细莴苣 *quan ye xi wo ju*

Basionym: *Stenoseris tenuis* C. Shih, Acta Phytotax. Sin. 29: 412. 1991.

Herbs 0.5–1.5 m tall, perennial. Stem solitary, erect, apically branched and glandular hairy. Lower and middle stem leaves with petiole 5–8 cm, basally slightly widened and not clasping; leaf blade triangular to triangular-ovate, 5–14 \times 5–10 cm, undivided, glandular hairy, glabrescent, base somewhat cuneate to truncate, shallowly cordate, or shallowly hastate, margin mucronulate-dentate, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but with shorter petiole and smaller; uppermost stem leaves sessile or subsessile. Synflorescence paniculiform, with usually numerous capitula and capillaceous branches. Capitula with 3 florets; peduncle capillaceous. Involucre green, narrowly cylindric, 11–13 \times ca. 1.5 mm. Phyllaries glabrous; outer phyllaries ovate to lanceolate, longest ca. 3 \times 1 mm, apex acute; inner phyllaries 3. Florets bluish purple. Achene ca. 5 mm; body brown, narrowly ellipsoid to obcolumnar, compressed, lateral ribs broadened, apex contracted into a thick ca. 1 mm beak. Pappus \pm single, ca. 6 mm. Fl. and fr. Aug–Sep.

- Forest margins, forests, thickets; 2400–3100 m. S and SE Xizang (Bomi, Nyalam, Yadong), NW Yunnan.

17. *Melanoseris triflora* (C. C. Chang & C. Shih) N. Kilian, comb. nov.

栉齿细莴苣 *zhi chi xi wo ju*

Basionym: *Stenoseris triflora* C. C. Chang & C. Shih, Acta Phytotax. Sin. 29: 413. 1991.

Herbs to 1.2 m tall, perennial. Stem stout, apically branched and glandular hairy. Middle stem leaves with petiole 9–11 cm, pectinate, basally slightly widened; leaf blade lyrate pinnatisect with pectinate rachis, glandular hairy, glabrescent; lateral lobes 1 or 2 pairs, elliptic, ovate, or lanceolate, much smaller than terminal lobe, base rounded, margin coarsely mucronulate-dentate, apex acute to shortly acuminate; terminal lobe ovate to ovate-lanceolate, 9–11 \times 7–9 cm, base truncate, shallowly cordate, or broadly cuneate, apex acuminate to acute. Upper stem leaves smaller, with shorter pectinate petiole, and 1 pair of lateral lobes, otherwise similar to middle stem leaves; uppermost leaves lanceolate, \pm undivided, apex acuminate. Synflorescence paniculiform, with numerous capitula and capillaceous branches. Capitula with 3 florets; peduncle capillaceous. Involucre narrowly cylindric, 9–11 \times 1–1.5 mm. Phyllaries glabrous; outer phyllaries ovate, longest ca. 1.5 \times 0.5–1 mm, apex obtuse to acute; inner phyllaries 3. Florets purplish

red. Achene ca. 4 mm; body pale brown, ellipsoid, compressed, lateral ribs broadened, apex constricted into a thick 0.5–1 mm beak. Pappus \pm single, ca. 6 mm. Fl. and fr. Oct.

- Forest margins, forests; 2000–2800 m. Yunnan (Fugong, Lüchun).

18. *Melanoseris graciliflora* (Candolle) N. Kilian, comb. nov.

细莴苣 *xi wo ju*

Basionym: *Lactuca graciliflora* Candolle, Prodr. 7: 139. 1838; *Cicerbita taliensis* (Franchet) Beauverd; *L. taliensis* Franchet; *Stenoseris graciliflora* (Candolle) C. Shih; *S. taliensis* (Franchet) C. Shih.

Herbs 0.5–2.5 m tall, perennial. Root slenderly turniplike. Stem solitary, erect, apically branched and glabrous or sparsely glandular hairy. Lower and middle stem leaves with petiole 4–7 cm, basally slightly widened; leaf blade pinnatisect to lyrate pinnatisect, glandular hairy, margin shallowly mucronulate-dentate; lateral lobes 2 or 3 pairs but uppermost pair often incompletely separated from terminal lobe, opposite or alternate, sessile or shortly petiolulate, elliptic to lanceolate, 1.5–4.5 \times 1–2 cm, base cuneate to truncate, apex acute to acuminate; terminal lobe triangular-ovate to lanceolate, 5.5–11 \times 4–9 cm, base hastate, cordate, truncate, or cuneate, apex acute. Upper stem leaves shortly petiolate to subsessile, smaller, less or not divided, otherwise similar to middle stem leaves. Synflorescence paniculiform, with numerous capitula and capillaceous branches. Capitula with usually 3 or 4 florets; peduncle capillaceous. Involucre narrowly cylindric, 12–15 \times ca. 1.5 mm. Phyllaries glabrous; outer phyllaries triangular-ovate to lanceolate, largest ca. 3 \times 1 mm, apex acute; inner phyllaries 3. Florets bluish purple. Achene 6–7 mm; body brown, narrowly ellipsoid to obcolumnar, compressed, lateral ribs broadened, apex contracted into a thick 1–1.5 mm beak. Pappus \pm single, 6–7 mm. Fl. and fr. Jun–Sep. $2n = 16^*$.

- Thickets, forest margins, grasslands; 2800–3500 m. Guizhou, Sichuan, Xizang, Yunnan [Bhutan, India, Myanmar, Nepal].

19. *Melanoseris leptantha* (C. Shih) N. Kilian, comb. nov.

景东细莴苣 *jing dong xi wo ju*

Basionym: *Stenoseris leptantha* C. Shih, Acta Phytotax. Sin. 29: 414. 1991.

Herbs 50–70 cm tall, perennial. Stem solitary, erect, apically branched and sparsely glandular hairy. Lower and middle stem leaves with petiole 1–4 cm, basally slightly widened; leaf blade lyrate pinnatisect, glabrous, margin mucronulate-dentate; lateral lobes 1 pair, elliptic, ca. 2 \times 1 cm, apex obtuse to rounded; terminal lobe elliptic to lanceolate, 5.5–10 \times 3–4 cm, apex acuminate. Upper stem leaves petiolate or sessile, lanceolate to elliptic, 7–9 \times ca. 1.5 cm, undivided, base cuneate, otherwise similar to middle stem leaves. Synflorescence paniculiform, with numerous capitula and capillaceous branches. Capitula with ca. 3 florets; peduncle capillaceous. Involucre narrowly cylindric, ca. 10 \times 2 mm. Phyllaries purplish red, glabrous; outer phyllaries ovate, largest ca. 1 \times 0.5 mm, apex obtuse; inner phyllaries 3. Florets bluish purple. Achene ca. 4 mm; body yellowish brown, narrowly ellipsoid to obcolumnar,

compressed, lateral ribs broadened, apex contracted into a thick ca. 1 mm beak. Pappus \pm single, ca. 5 mm. Fl. and fr. Nov. $2n = 16^*$.

• Moist areas on mountain slopes; 2500–3200 m. Sichuan (Muli), Yunnan (Jingdong).

Melanoseris leptantha appears rather similar to *Stenosseris triflora*, and its specific distinctness needs confirmation.

20. *Melanoseris oligolepis* (C. C. Chang ex C. Shih) N. Kilian, comb. nov.

大理毛鳞菊 da li mao lin ju

Basionym: *Cicerbita oligolepis* C. C. Chang ex C. Shih, Acta Phytotax. Sin. 29: 398. 1991.

Herbs 0.6–1.3 m tall, perennial. Stem solitary, erect, apically branched and \pm brownish pilose, leafy. Lower and middle stem leaves with petiole to 6 cm, unwinged; leaf blade obovate to oblanceolate, pinnatisect, margin faintly sinuate-dentate; lateral lobes 1 or 2 pairs, narrowly elliptic, $2.5\text{--}4 \times 1\text{--}1.5$ cm, apex acute to acuminate; terminal lobe ovate to lanceolate, $4\text{--}10 \times 2\text{--}4$ cm, apex acute to acuminate. Synflorescence narrowly paniculiform, with numerous capitula and capillaceous branches. Capitula with 4 florets; peduncle capillaceous. Involucre narrowly cylindric, $9\text{--}11 \times$ ca. 2 mm. Phyllaries glabrous; outer phyllaries triangular-ovate to lanceolate, longest ca. 2 mm; inner phyllaries 4. Florets blue. Achene brown, narrowly ellipsoid, 4–5 mm, compressed, lateral ribs broadened, apex truncate. Pappus double, outer hairs to 0.1 mm, bristles ca. 7 mm. Fl. and fr. Aug.

• Forests on mountain slopes; 2100–3000 m. Yunnan (Dali).

Originally placed in *Cicerbita*, *Melanoseris oligolepis* is morphologically near and apparently closely related to the preceding four species.

21. *Melanoseris lessertiana* (Candolle) Decaisne in Jacquemont, Voy. Inde 4(Bot.): 102. 1843.

黑苞毛鳞菊 hei bao mao lin ju

Mulgedium lessertianum Candolle, Prodr. 7: 251. 1838; *Cicerbita lessertiana* (Candolle) Mamgain & R. R. Rao; *C. lessertiana* subsp. *lyrata* (Decaisne) Mamgain & R. R. Rao; *Lactuca lessertiana* (Candolle) C. B. Clarke; ?*L. monocephala* C. C. Chang; *Melanoseris lyrata* Decaisne; ?*Mulgedium monocephalum* (C. C. Chang) C. Shih; ?*M. qinghaicum* S. W. Liu & T. N. Ho.

Herbs 5–30[–40] cm tall, perennial. Root slenderly turnip-like. Stems usually several, weak, sparsely branched, glabrous to apically reddish villous, rarely with a solitary dominant stem branched from base. Basal and lower stem leaves elliptic to oblanceolate, $6\text{--}9\text{--}15 \times 1\text{--}2\text{--}3.5$ cm, undivided to lyrate pinnatisect, base cuneate to petiole-like, margin entire to shallowly sinuate-dentate, apex acute to shortly acuminate; lateral lobes 2 or 3 pairs, ovate, triangular-ovate, or \pm elliptic; terminal lobe ovate to triangular-ovate. Middle and upper stem leaves smaller and narrower, less or not divided, basally less attenuate; uppermost leaves linear to linear-lanceolate. Synflorescence racemiform, with 1 to several capitula. Capitula with usually 12–24 florets; peduncle mostly 1–2 cm. Involucre campanulate, 1–1.3

cm at anthesis, to $1.8 \times 0.7\text{--}1$ cm in fruit. Phyllaries acute at apex; outer phyllaries lanceolate, abaxially \pm villous; inner phyllaries 8. Florets purplish red to bluish. Achene 6–8(–10) mm; body dark to blackish brown, ellipsoid, compressed, lateral ribs broadened, apex contracted into a concolorous to pale 2–3(–5) mm slender beak. Pappus single, 6–8 mm. Fl. and fr. Aug–Sep. $2n = 16$.

Grasslands on mountain slopes; 2700–4500 m. ?Qinghai, Xizang, NW Yunnan [Bhutan, N India, Kashmir, Nepal, Pakistan].

Melanoseris lessertiana shows considerable variation in habit, leaf shape, and achene beak length over its distribution area, which is worth closer investigation. The single-headed *Lactuca monocephala* has tentatively been included, considering it a depauperate form, because otherwise the type image matches *M. lessertiana*. The type material of *Mulgedium qinghaicum* has not been available for loan, but from the description and figure it appears likely conspecific and has also tentatively been included.

22. *Melanoseris macrorhiza* (Royle) N. Kilian, comb. nov.

头嘴菊 tou zui ju

Basionym: *Mulgedium macrorhizum* Royle, Ill. Bot. Himal. Mts. 251, t. 61, f. 1. 1835; *Cephalorrhynchus albiflorus* C. Shih; *C. macrorhizus* (Royle) Tuisl; *C. saxatilis* (Edgeworth) C. Shih; *Cicerbita duthieana* Beauverd; *C. laevigata* (Candolle) Beauverd; *C. macrorhiza* (Royle) Beauverd; *C. macrorhiza* var. *saxatilis* (Edgeworth) Beauverd; *Lactuca hoffmeisteri* Klotzsch; *L. laevigata* (Blume) Candolle var. *saxatilis* (Edgeworth) C. B. Clarke; *L. macrorhiza* (Royle) J. D. Hooker; *Melanoseris saxatilis* Edgeworth; *Mulgedium laevigatum* Candolle.

Herbs 20–50 cm tall, perennial. Taproot slenderly turnip-like. Stems solitary or few, slender, ascending-erect to erect, branched from base or higher up, glabrous [or purplish brown pilose], leafy. Lower and middle stem leaves with petiole of lower ones not basally expanded and middle ones expanded and auriculate; leaf blade elliptic to spatulate, $6\text{--}14.5\text{--}20 \times 1\text{--}4.5$ cm, lyrate pinnatifid to lyrate pinnatisect, rachis glabrous [or \pm hispid with purplish brown hairs], margin entire; lateral lobes 2–4(–6) pairs, orbicular to elliptic, apex obtuse to rounded; terminal lobe largest, ovate-cordate, reniform, or elliptic, apex rounded to acute. Upper stem leaves similar to middle stem leaves but smaller; uppermost leaves lanceolate to broadly linear, undivided. Synflorescence loosely to paniculately corymbiform, with usually to 8–10 capitula and slender branches. Capitula with usually 10–15 florets; peduncle capillaceous. Involucre cylindric to narrowly campanulate, $(1\text{--})1.2\text{--}1.5 \times 0.4\text{--}0.5$ cm. Phyllaries dark purplish green, glabrous; outer phyllaries triangular-ovate to lanceolate, longest ca. $1/2$ as long as inner ones; inner phyllaries 8. Florets purple, bluish purple, or rarely white. Achene 4–5 mm; body dark brown, narrowly ellipsoid, subcompressed, lateral ribs weakly broadened, apex attenuate into pale 1–3 mm stout beak. Pappus double, outer row of hairs 0.1–0.2 mm, bristles 6–7 mm. Fl. and fr. Jul–Oct. $2n = 16$.

Mountain valleys, forests, thickets, grasslands; 2700–4000 m. Xizang, Yunnan [Afghanistan, Bhutan, N India, Kashmir, Myanmar, Nepal, Pakistan; SW Asia].

Whereas, according to the molecular phylogenetic analysis by N. Kilian et al. (in prep.), *Cephalorrhynchus* in the sense of its type (*C.*

glandulosus Boissier) is a congener of *Cicerbita*, *Melanoseris macro-rhiza*, previously treated as a member of *Cephalorrhynchus* (e.g., FRPS 80(1): 291. 1997), clearly belongs to *Melanoseris*. The white-flowered *C. albiflorus* is considered as a mere albino form of this species, as is known also occasionally in other species, and therefore treated as conspecific.

23. *Melanoseris violifolia* (Decaisne) N. Kilian, *comb. nov.*

西藏毛鳞菊 xi zang mao lin ju

Basionym: *Prenanthes violifolia* Decaisne in Jacquemont, Voy. Inde 4(Bot.): 100. 1843 [“*violaefolia*”]; *Cicerbita sikkimensis* (J. D. Hooker) C. Shih; *C. violifolia* (Decaisne) Beauverd; *Lactuca hookeri* (C. B. Clarke ex J. D. Hooker) Stebbins; *L. sikkimensis* (J. D. Hooker) Stebbins; *P. alata* J. D. Hooker & Thomson ex C. B. Clarke (1876), not (Hooker) D. Dietrich (1847); *P. hookeri* C. B. Clarke ex J. D. Hooker; *P. sikkimensis* J. D. Hooker.

Herbs 50–70 cm tall, perennial. Stem solitary, erect, branched apically, glabrous or sparsely strigose. Basal, lower, and middle stem leaves with petiole 5–6 cm, slender, ± broadly winged toward base; leaf blade undivided or lyrate pinnatisect, margin sparsely sinuate-dentate to subentire; lateral lobes if present 1 pair, sessile or with a 7–8 mm winged petiolule, lanceolate to elliptic, to 2×1 cm; terminal lobe broadly triangular to triangular-ovate, 3–8 \times 3–7 cm, base hastate, cordate, sagittate, or truncate, apex obtuse to rounded. Upper stem leaves similar to middle stem leaves or with much shorter winged basally narrow to clasping petiole and smaller blade with a basally cuneate terminal lobe. Synflorescence paniculiform, with several to 30 capitula and slender branches. Capitula with 4–6 florets; peduncle capillaceous. Involucre narrowly cylindric, 1.2–1.4 \times ca. 0.3 cm. Phyllaries glabrous, apex acute to obtuse; outer phyllaries lanceolate, longest 4–5 mm; inner phyllaries 5 (or 6). Florets bluish to reddish purple. Achene dark brown, narrowly ellipsoid, 6–7 mm, subcompressed, lateral ribs weakly broadened, apex truncate. Pappus double, outer hairs ca. 0.1 mm, bristles 6–8 mm. Fl. and fr. Jun–Aug.

Forests, forest margins, meadows; 3000–3700 m. Xizang [Bhutan, N India, Kashmir, Nepal].

Melanoseris violifolia, formerly treated as a member of *Cicerbita* (e.g., FRPS 80(1): 223. 1997, under *C. sikkimensis*) is, as inferred from morphology, closely related to *M. macro-rhiza* and can therefore safely be considered as a member of *Melanoseris* too.

24. *Melanoseris bracteata* (J. D. Hooker & Thomson ex C. B. Clarke) N. Kilian, *comb. nov.*

苞叶毛鳞菊 bao ye mao lin ju

Basionym: *Lactuca bracteata* J. D. Hooker & Thomson ex C. B. Clarke, Compos. Ind. 270. 1876; *Mulgedium bracteatum* (J. D. Hooker & Thomson ex C. B. Clarke) C. Shih.

Herbs, perennial. Root slender. Stem solitary, 20–120 cm, erect, branched apically, strongly glandular hairy to glandular hispid. Basal and lower stem leaves ovate, elliptic-ovate, or oblanceolate, 3–6[–11] \times 1–2.5[–4] cm, glandular hairy, base attenuate and auriculate clasping, margin sinuate-dentate, apex acute. Middle and upper stem leaves smaller, oblanceolate to

lanceolate, apex acuminate, otherwise similar to lower leaves. Leaves in synflorescence usually purplish red when dry, lanceolate, base ± semiamplexicaul, margin entire, apex acuminate. Synflorescence racemiform or sparsely paniculiform, leafy, with several to 20 capitula. Capitula nodding at anthesis, with usually 20–30 florets; peduncle with lanceolate bracts to 1.5 cm. Involucre campanulate, 1.2–1.4 cm at anthesis, to 1.9×1 cm in fruit. Phyllaries purplish red when dry, abaxially glabrous, apex obtuse to acute; outer phyllaries lanceolate, not much shorter than inner phyllaries. Florets pale blue to mauve. Achene 5–9 mm; body grayish brown, fusiform, compressed, lateral ribs weakly broadened, apex attenuate into a slender beak $1/3$ – $1/2$ as long as achene body. Pappus indistinctly double, 7–8 mm. Fl. and fr. Sep. $2n = 16$.

Forests; 800–3000 m. Xizang [Bhutan, NE and NW India, Nepal].

25. *Melanoseris souliei* (Franchet) N. Kilian, *comb. nov.*

康滇毛鳞菊 kang dian mao lin ju

Basionym: *Lactuca souliei* Franchet, J. Bot. (Morot) 9: 257. 1895; *Synclathium orbiculariforme* C. Shih; *S. souliei* (Franchet) Y. Ling.

Herbs 2–5 cm tall, perennial, rosulate, ± acaulescent, with a taproot. Rosette shoot terminally hollow, inflated to secondary capitulum. Leaves with petiole 1–5 cm, basally widened; leaf blade of outer leaves undivided, broadly triangular, triangular-ovate, orbicular, or obovate, 0.5–2 \times 0.5–1.5 cm; leaf blade of more inner leaves 1.5–7 \times 1–2.5 cm, lyrate pinnatifid to pinnatisect, margin sinuate-dentate or entire; lateral lobes 1–3 pairs, elliptic, semi-orbicular, triangular, or suborbicular; terminal lobe elliptic, ovate, suborbicular, or triangular-ovate, 1–3 \times 0.8–2.5 cm, base cordate to truncate, apex rounded to acute. Secondary capitulum (1–)2–7 cm in diam., with few to many sessile densely congested capitula with 1 elliptic subtending leaf. Capitula with 4–6 florets. Involucre narrowly cylindric, 1–1.4 \times 0.4–0.5 cm. Phyllaries 5, in 1 row, equal, lanceolate, connate for basal $1/3$ – $1/2$. Florets purplish red to blue. Achene ca. 4 mm; body dark to blackish brown, obovoid, compressed, with winglike lateral ribs and 1 slender rib on either side, apex constricted into a ca. 0.5 mm fragile thin beak. Pappus single, ca. 8 mm, caducous with pappus disk. Fl. and fr. Aug. $2n = 16^*$.

Alpine meadows, scree slopes, stony areas, marshes, forest margins; 2300–4300 m. Sichuan, Xizang, Yunnan [Bhutan, Myanmar].

Recent works, corroborating the observation by Stebbins (Mem. Torrey Bot. Club 19(3): 47–50. 1940) on the peculiarity of *Melanoseris souliei* inferred from achene morphology, have shown that *M. souliei* is misplaced in *Synclathium* and the Crepidinae (J. W. Zhang et al., Bot. J. Linn. Soc. 154: 79–87. 2007; N. Kilian et al. in V. A. Funk et al., Syst. Evol. Biogeogr. Compositae, 348–350. 2009; J. W. Zhang et al., Taxon 60: 15–26. 2011) and the striking overall similarity to the species of that genus purely a result of convergent evolution in response to the environmental changes following the uplift of the Qinghai-Xizang Plateau. The inclusion of *Synclathium orbiculariforme* by X. Zhuang (Fl. Yunnan. 13: 764. 2004) has been supported also by molecular studies (J. W. Zhang et al., loc. cit. 2011). The molecular phylogenetic analysis of subtribe Lactucinae (N. Kilian et al., in prep.) reveals the species to be nested in the *Melanoseris* clade. It is here therefore tentatively assigned to *Melanoseris*, admitting that this is debatable in the light of its peculiar morphology and the still not settled circumscription of the genus.

Lactuca scandens C. C. Chang, Contr. Biol. Lab. Sci. Soc. China, Bot. Ser. 9: 133. 1934.

攀援岩参 pan yuan yan shen

Herbs, perennial. Stem semiscandent, pale purplish red, with reddish bristles. Basal leaves unknown. Lower and middle stem leaves with red bristles and with slender basally ± widened, ± winged petiole to ca. 9 cm; leaf blade suborbicular or subreniform, 4.5–5.5 × 4.5–7.5 cm, base cordate, margin faintly denticulate, apex acuminate. Uppermost stem leaves sessile or with short, winged, clasping petiole and ovate to narrowly elliptic-ovate blade, otherwise similar to middle stem leaves. Synflorescence racemiform, branches 1–1.5 cm with 2 or 3 capitula. Capitula with 4 or 5 florets. Involucre narrowly cylindric, ca. 1.2 cm. Phyllaries blackish green, reddish setose; outer phyllaries inconspicuous; inner phyllaries 4 or 5, apex

subacute. Florets yellow. Achene not seen when mature. Pappus white, ca. 6.5 mm.

• Chongqing (Baxian).

No material has been available of *Lactuca scandens*, based on and only known from the collection T. T. Yü 1702 made in October 1932 in the “vicinity of Pa-hsien” (deposited in the herbarium of the Science Society of China at Nanking). C. C. Chang compared it with, and considered it to be related to, the insufficiently known *L. hirsuta* Franchet, placed here in *Melanoseris* not without doubt (see above). *Lactuca scandens* is diagnosed rather clearly, and in its combination of characters it resembles only few known species of Cichorieae in China (even if the presumed scandent habit is ignored) but matches none in a way that conspecificity could be proposed with sufficient confidence. A safe generic assignment, however, is not possible from the original description; thus, its treatment under *Melanoseris* is very tentative and a formal transfer not justified.

59. PARAPRENANTHES C. C. Chang ex C. Shih, Acta Phytotax. Sin. 26: 418. 1988.

假福王草属 jia fu wang cao shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, perennial or more rarely annual. Stem usually solitary, erect, branched apically, glabrous or glandular hairy, leafy or rarely ± leafless. Leaves pinnately lobed or more rarely undivided. Synflorescence with capillaceous branches. Capitula often pendent at anthesis, with 4–15 florets; peduncle capillaceous. Involucre narrowly cylindric. Phyllaries usually green and tinged pale purplish red, glabrous; outer phyllaries few, gradually longer centripetally, mostly much shorter than inner phyllaries; inner phyllaries usually 5 or 8, ± equal in length, ± linear-lanceolate to linear. Receptacle naked. Florets pale reddish or purple. Achene body dark to blackish brown, fusiform, weakly compressed, with 5 main ribs (2 lateral, 1 median ventrally, and 2 median dorsally) and 2 rather similar secondary ribs in between, apically attenuate and pale but without or rarely with a short beak. Pappus white, single, of slender scabrid bristles.

Twelve species: E and SE Asia; 12 species (11 endemic) in China.

1a. Involucre with 5(or 6) inner phyllaries.

- 2a. Stem leafless or with a single or very few leaves; leaves mostly undivided or more rarely with 1 pair of very small ovate lateral lobes 6. *P. umbrosa*
- 2b. Stem leafy throughout; leaves with 1–7 pairs of lateral lobes or more rarely undivided.
 - 3a. Lower and middle stem leaves pinnatisect to subpinnatisect, with 4–7 pairs of ± narrowly elliptic lateral lobes, rachis for most part not or narrowly winged 10. *P. dolichophylla*
 - 3b. Lower and middle stem leaves lyrate pinnatifid to pinnatisect, with 1–4 pairs of elliptic to triangular lobes or more rarely undivided, rachis for most part at least broadly winged.
 - 4a. Stem leaves with mostly a slender cuneately winged petiole and undivided blade or blade lyrate pinnatifid to lyrate pinnatisect with 1 or 2(or 3) pairs of lobes 8. *P. diversifolia*
 - 4b. Stem leaves with an unwinged petiole and lyrate pinnatifid to lyrate pinnatifid blade with 3 or 4 pairs of lobes 9. *P. heptantha*

1b. Involucre with ca. 8 inner phyllaries.

- 5a. Middle and upper stem leaves auriculately to sagittately clasping stem.
 - 6a. Leaves sagittately clasping stem; outer phyllaries longest 5–8 mm 2. *P. yunnanensis*
 - 6b. Leaves auriculately clasping stem; outer phyllaries longest 4–5 mm 3. *P. auriculiformis*
- 5b. Stem leaves not clasping stem and except for uppermost ± petiolate.
 - 7a. Stem leaves all palmately 3-lobed or palmately 3-cleft 11. *P. multiformis*
 - 7b. Stem leaves undivided or pinnately lobed with 1–8 pairs of lateral lobes.
 - 8a. Middle stem leaves sessile, 3-parted, with to 20 cm linear terminal lobe and 1 pair of very small broadly linear-lanceolate lateral lobes at its base 12. *P. longiloba*
 - 8b. Middle stem leaves petiolate, undivided or pinnately divided with (1 or) 2–5 pairs of lateral lobes.
 - 9a. Middle stem leaves lyrate pinnate, pinnatifid, or pinnatisect with broader lateral or terminal lobes or rarely undivided.
 - 10a. Leaves adaxially glaucous, margin shallowly and distantly dentate; synflorescence corymbiform; achene ca. 5 mm, attenuate into a pale stout ca. 1 mm beak 1. *P. polypodiifolia*

- 10b. Leaves adaxially green, margin usually strongly dentate; synflorescence narrowly paniculiform; achene 4–5 mm, attenuate into a pale ca. 1 mm beaklike apex 7. *P. sororia*
- 9b. Middle stem leaves pinnatisect with conspicuously narrow and longish (most of them linear or linear-lanceolate) lateral and terminal lobes.
- 11a. Basal leaves undivided but other leaves pinnatisect with 1–3 (or 4) pairs of lateral lobes 4. *P. prenanthoides*
- 11b. All but uppermost leaves pinnatisect, with 2–8 pairs of lateral lobes 5. *P. glandulosissima*

1. *Paraprenanthes polypodiifolia* (Franchet) C. C. Chang ex C. Shih, Fl. Reipubl. Popularis Sin. 80(1): 181. 1997.

蕨叶假福王草 jue ye jia fu wang cao

Lactuca polypodiifolia Franchet, J. Bot. (Morot) 9: 265. 1895; *Mulgedium meridionale* C. Shih; *M. polypodiifolium* (Franchet) C. Shih; *Paraprenanthes meridionalis* (C. Shih) Sen-nikov.

Herbs 50–110 cm tall, perennial. Stem apically densely glandular hairy. Leaves glaucous, glabrous, all with unwinged or weakly winged petiole, margin of leaf blade shallowly and distantly mucronulately dentate. Basal leaves, lower stem leaves, and middle stem leaves with petiole 9–12 cm; leaf blade lyrate pinnatifid to pinnatisect, margin sinuate; lateral lobes 1 or 2 (–4) pairs, elliptic-rhombic, ovate, or triangular-ovate, much smaller than terminal lobe, apex obtuse to acute; terminal lobe triangular-ovate to lanceolate, 5–8 × 3.5–6 cm, base cordate, truncate, or cuneate, apex acute to shortly acuminate. Upper stem leaves smaller, with a shorter petiole; leaf blade similar to middle stem leaves or undivided and ovate to broadly lanceolate. Synflorescence corymbiform, with some to many capitula on somewhat divaricating branchlets. Capitula with usually 10–15 florets. Involucre 9–11 × ca. 3 mm. Outer phyllaries triangular-ovate to linear-lanceolate, longest ca. 3 × 1 mm, apex acute; inner phyllaries 8, apex ± obtuse. Florets purplish red or rarely white. Achene ca. 5 mm, apically attenuate into a stout ca. 1 mm beak. Pappus ca. 6 mm. Fl. and fr. May–Jun.

• Trailsides on mountain slopes, forests in mountain valleys; 800–2000 m. Guangxi, Sichuan, Yunnan.

2. *Paraprenanthes yunnanensis* (Franchet) C. Shih, Acta Phytotax. Sin. 26: 421. 1988.

云南假福王草 yun nan jia fu wang cao

Lactuca yunnanensis Franchet, J. Bot. (Morot) 9: 264. 1895; *Paraprenanthes sagittiformis* C. Shih.

Herbs 0.6–1.5 m tall, perennial. Stem glabrous. Basal and lower leaves with petiole ca. 15 cm, winged; leaf blade to 30 × 15 cm, undivided and triangular-ovate with a cordate or truncate to cuneate base or pinnatisect with an additional 1 or 2 pairs of small lateral lobes; lateral lobes when present rhombic, triangular-ovate, or lanceolate, recurved, apex acute. Middle stem leaves with a short winged sagittately clasping petiole or sessile; leaf blade elliptic to oblanceolate, pinnatifid to pinnatisect, glabrous to weakly glandular hairy, base sagittately clasping if sessile, margin ± sinuate and mucronulately dentate; lateral lobes 1–3 (–5) pairs, 2–7 × 0.5–2 (–4) cm; terminal lobe to 13 × 4 cm, otherwise like lower leaves. Upper stem leaves sessile, smaller, lanceolate, mostly not divided, base sagittately clasping; uppermost leaves linear-lanceolate, base not clasping,

margin entire. Synflorescence paniculiform, with many capitula. Capitula with usually 10–15 florets. Involucre 10–13 × 3–4 mm. Outer phyllaries triangular to linear-lanceolate, largest 5–8 × ca. 1 mm, apex acute; inner phyllaries ± 8, apex obtuse to acute. Florets pale purple. Achene ca. 4 mm, attenuate into an almost beaked apex. Pappus 6–7 mm. Fl. and fr. Jul–Aug.

• River valleys, forests; 1500–2700 m. Yunnan.

The leaf shape of *Paraprenanthes yunnanensis* shows considerable variation even within a population, and we follow X. Zhuang (Fl. Yunnan. 13: 741. 2004) in considering *P. sagittiformis* as conspecific with *P. yunnanensis*. *Lactuca parishii* Craib from Myanmar and Thailand is very close to this species and may perhaps be conspecific.

3. *Paraprenanthes auriculiformis* C. Shih, Acta Phytotax. Sin. 26: 421. 1988.

圆耳假福王草 yuan er jia fu wang cao

Herbs, annual. Stem glabrous. Basal leaves unknown. Lower and middle stem leaves sessile, lanceolate, 10–14 × 3.5–6 cm, pinnatifid, glabrous, base auriculately clasping, margin weakly sinuate and mucronulately dentate; lateral lobes 2 or 3 pairs, elliptic to narrowly triangular, apex rounded and mucronulate to acute; terminal lobe lanceolate to narrowly triangular, apex acute to acuminate. Upper stem leaves lanceolate, triangular, or narrowly elliptic, undivided, margin inconspicuously dentate or entire, apex acuminate. Synflorescence paniculiform, with some to many capitula. Capitula with usually 10 florets. Involucre 9–11 × ca. 3 mm. Outer phyllaries triangular-ovate to lanceolate, largest 4–5 × ca. 1 mm, apex acute; inner phyllaries ± 8, apex ± obtuse. Florets purple. Achene 3–4 mm, attenuate into a stout ca. 1 mm beaklike apex. Pappus 7–8 mm. Fl. and fr. Jul.

• Grasslands on mountain slopes; ca. 1900 m. Yunnan (Menghai).

Paraprenanthes auriculiformis is a little-known species in need of further studies with affinity to *P. yunnanensis*.

4. *Paraprenanthes prenanthoides* (Hemsley) C. Shih, Acta Phytotax. Sin. 26: 423. 1988.

异叶假福王草 yi ye jia fu wang cao

Crepis prenanthoides Hemsley, J. Linn. Soc., Bot. 23: 477. 1888; *Lactuca chungkingensis* Stebbins.

Herbs 30–130 cm tall, perennial. Stem apically densely glandular hairy. Basal leaves often present at anthesis; petiole 6–10 cm, unwinged; leaf blade triangular-ovate to broadly lanceolate, 3–11 × 3–7 cm, glabrous, base conspicuously cordate to hastate, margin sinuate and mucronulate-dentate, apex acute to shortly acuminate. Lower and middle stem leaves with a shorter petiole; leaf blade to 17 cm, pinnatisect, margin entire to very shallowly mucronulate-dentate, base cuneate; lateral lobes

1–3(or 4) pairs, opposite or alternate, rhombic-elliptic, lanceolate, or linear and sometimes falcate, to 8 cm, apex acute; terminal lobe narrowly elliptic, broadly lanceolate, or linear-lanceolate, to 13 cm, apex acute to acuminate. Upper stem leaves sessile, smaller, pinnatisect, lobes \pm linear-lanceolate. Synflorescence paniculiform, with some to many capitula. Capitula with usually 12–15 florets. Involucre 9–11 \times ca. 3 mm. Phyllaries with an obtuse to acute apex; outer phyllaries triangular-ovate to lanceolate, largest ca. 3 \times 0.6–0.8 mm; inner phyllaries (7 or)8. Florets purplish red. Achene ca. 4 mm, attenuate into a stout ca. 1 mm beaklike apex. Pappus 5–6 mm. Fl. and fr. Apr–May.

- Forests; 500–1200 m. Guangxi, Guizhou, Sichuan.

5. *Paraprenanthes glandulosissima* (C. C. Chang) C. Shih, Fl. Reipubl. Popularis Sin. 80(1): 182. 1997.

密毛假福王草 mi mao jia fu wang cao

Lactuca glandulosissima C. C. Chang, Contr. Biol. Lab. Sci. Soc. China, Bot. Ser. 9: 130. 1934.

Herbs 40–100 cm tall, annual. Stem apically densely glandular hairy. Basal leaves, lower stem leaves, and middle stem leaves with petiole 3–7 cm, unwinged, basally not or scarcely widened; leaf blade pinnatisect, \pm glabrous, margin very shallowly mucronulate-dentate or entire; lateral lobes 2–8 pairs, opposite to obliquely opposite; basal lateral lobes rhombic to elliptic, 5–20 \times 4–10 mm; other lateral lobes linear-elliptic to linear-lanceolate, 2.5–6 \times 0.5–2 cm, apex acute to acuminate; terminal lobe linear-elliptic to linear-lanceolate, 6–10 \times 0.3–1.5 cm, apex acute to acuminate. Upper stem leaves shortly petiolate or sessile, similar to middle stem leaves or 3-parted; uppermost stem leaves linear-elliptic, undivided. Synflorescence paniculiform to corymbosely so, with many capitula. Capitula with usually 10–15 florets. Involucre 9–11 \times ca. 3 mm. Outer phyllaries triangular to lanceolate, largest ca. 3 \times 0.3–0.5 mm, apex acute; inner phyllaries 8, apex \pm obtuse. Florets bluish purple. Achene ca. 4 mm, attenuate into a ca. 1 mm beaklike apex. Pappus 5–6 mm. Fl. and fr. Apr–May.

- Forests, forest margins; 500–2300 m. Sichuan, Yunnan.

Paraprenanthes glandulosissima appears closely allied to *P. prenanthoides*, and its specific distinctness should be critically assessed by further studies.

6. *Paraprenanthes umbrosa* (Dunn) Sennikov, Bot. Zhurn. 82(5): 111. 1997.

伞房假福王草 san fang jia fu wang cao

Lactuca umbrosa Dunn, J. Linn. Soc., Bot. 35: 513. 1903; *Mulgedium umbrosum* (Dunn) C. Shih.

Herbs 40–140 cm tall, annual. Stem glabrous, leafless, with a single leaf, or with very few leaves. Basal leaves with petiole 4–17 cm, unwinged; leaf blade mostly triangular to triangular-ovate, 6–13 \times 5–10 cm, undivided, base cordate, hastate, or sagittate, margin entire or sinuate and remotely unequally mucronulately dentate; leaf blade more rarely lyrate pinnatisect with 1 pair of small ovate lateral lobes. Stem leaves if any triangular-hastate, undivided, otherwise like basal

leaves. Synflorescence corymbiform to corymbosely paniculiform, with few to many capitula. Capitula with usually 6–10 florets. Involucres cylindric, 10–13 \times 2–3 mm. Phyllaries glabrous, apex acute; outer phyllaries triangular-ovate to lanceolate, largest 5–7 \times 1–2 mm; inner phyllaries 5(or 6). Florets purplish red. Achene ca. 6 mm, contracted into a ca. 1 mm beak. Pappus 6–7 mm. Fl. and fr. Oct.

- River valleys; ca. 1200 m. Yunnan.

Paraprenanthes umbrosa has previously been placed in *Mulgedium* (e.g., FRPS 80(1): 72. 1997). Its reclassification by Sennikov is convincing and is followed here.

7. *Paraprenanthes sororia* (Miquel) C. Shih, Acta Phytotax. Sin. 26: 422. 1988.

假福王草 jia fu wang cao

Lactuca sororia Miquel, Ann. Mus. Bot. Lugduno-Batavi 2: 189. 1866; *L. sororia* f. *glabra* Y. Ling; *L. sororia* var. *glabra* Kitamura; *L. sororia* var. *glandulosa* Kitamura; *L. sororia* var. *nudipes* (Migo) Kitamura; *L. sororia* var. *pilipes* (Migo) Kitamura; *L. thirionnii* H. Léveillé; *Mycelis sororia* (Miquel) Nakai; *M. sororia* var. *nudipes* Migo; *M. sororia* var. *pilipes* Migo; *Paraprenanthes hastata* C. Shih; *P. luchunensis* C. Shih; *P. pilipes* (Migo) C. Shih; *P. thirionnii* (H. Léveillé) C. Shih.

Herbs 0.5–1.5[–1.8] m tall, perennial. Stem glabrous or more rarely glandular hairy. Basal leaves withered at anthesis. Lower and middle stem leaves with petiole 3–7 cm, unwinged; leaf blade undivided and triangular-ovate to lanceolate or \pm lyrate pinnatifid to \pm lyrate pinnatisect, glabrous, base cordate, truncate, or cuneate, margin \pm sinuate and mucronulately dentate; lateral lobes 1 or 2(or 3) pairs, sometimes alternate or unpaired, ovate to irregularly rhombic, 1–11 \times 1–7 cm, smaller toward leaf base, apex rounded to acute; terminal lobe broadly triangular to broadly lanceolate, 5.5–15 \times 5.5–15 cm, base hastate, cordate, truncate, or cuneate, margin often coarsely sinuate, apex acute. Upper stem leaves sessile or with a shorter winged petiole, smaller, less or not divided. Synflorescence narrowly paniculiform, with many capitula. Capitula with usually 10–15 florets. Involucre 9–11 \times ca. 3 mm. Outer phyllaries ovate to lanceolate, longest ca. 4 \times 1 mm, apex acute; inner phyllaries \pm 8, apex obtuse to rounded. Florets purplish. Achene 4–5 mm, attenuate into a ca. 1 mm beaklike apex. Pappus 7–8 mm. Fl. and fr. May–Aug. $2n = 18^*$.

Mountain slopes, thickets in mountain valleys, forests; 200–3200 m. Anhui, Chongqing, Fujian, Guangdong, Guangxi, ?Guizhou, ?Hainan, Hubei, Hunan, ?Jiangsu, Jiangxi, Sichuan, Taiwan, ?Xizang, Yunnan, Zhejiang [Japan, Vietnam].

Paraprenanthes sororia is the most widespread species of the genus and one of the two species distributed also outside China. Its circumscription and delimitation differ in the literature. *Paraprenanthes pilipes* and *P. sylvicola* have been considered either as specifically distinct or as conspecific, and *Lactuca diversifolia* (here treated as *P. diversifolia*) has been treated as a separate species and, more recently, as conspecific. This last species, however, clearly differs and is readily distinguished from *P. sororia* by its smaller capitula with only 5 inner phyllaries and 4–6 florets and by its endemic status in China. In contrast, *P. sylvicola* as treated in FRPS (80(1): 172. 1997), delimited by undivided leaves and glabrous upper stem portion, actually comprises

plants (or specimens) with undivided leaves of both *P. sororia* and *P. diversifolia*. The type of the name *P. sylvicola* represents *P. diversifolia*. Glandular hairy plants, which occur throughout the distribution range of *P. sororia*, were formally described as a variety (*Mycelis sororia* var. *pilipes*) from Japan and later upvalued to species rank as *P. pilipes*. However, the co-occurrence of entirely glabrous and apically glandular hairy plants is also known from other species in subtribe Lactucinae and is of no taxonomic value. *Paraprenanthes pilipes* is therefore treated as synonymous with *P. sororia*. *Paraprenanthes hastata*, with conspicuous undivided lanceolate to lanceolate-hastate middle stem leaves and glandular hairy upper stem portion, which is only known from the incomplete type material collected in Chongqing on Jinyun Shan, is here considered merely as a depauperate form of *P. sororia*. *Paraprenanthes luchunensis*, finally, combines two different elements, and we follow X. Zhuang (Fl. Yunnan. 13: 741. 2004) who included that name in the sense of its type in *P. sororia*; other collections cited in the protologue represent *P. polypodiifolia*.

8. *Paraprenanthes diversifolia* (Vaniot) N. Kilian, **comb. nov.**

林生假福王草 *lin sheng jia fu wang cao*

Basionym: *Lactuca diversifolia* Vaniot, Bull. Acad. Int. Géogr. Bot. 12: 245. 1903; *Paraprenanthes gracilipes* C. Shih; *P. sylvicola* C. Shih; *Prenanthes diversifolia* (Vaniot) C. C. Chang (1934), not Ledebour ex Sprengel (1826).

Herbs 0.5–1.5 m tall, annual. Stem glabrous or apically glandular hairy. Lower stem leaves with petiole 4–9 cm, slender cuneately winged, base not clasping; leaf blade triangular, triangular-ovate, or broadly lanceolate, 7–18 × 4–24 cm, usually undivided, glabrous or sparsely glandular hairy, base cuneate, truncate, cordate, or hastate, margin sinuate and mucronately dentate, apex acute. Middle and upper stem leaves with a shorter narrow to broader winged petiole; leaf blade with a rather cuneate base, undivided and otherwise similar to lower leaves or lyrate pinnatifid to lyrate pinnatisect; lateral lobes if present 1 or 2 (or 3) pairs, triangular-ovate to elliptic; terminal lobe triangular-ovate to lanceolate, apex acute. Uppermost leaves sessile, elliptic to narrowly rhombic, undivided, base narrow and not clasping, apex acute. Synflorescence narrowly paniculiform, with some to numerous capitula. Capitula with 4–6 florets. Involucre 10–11 × 1.5–2 mm. Outer phyllaries ovate-triangular to lanceolate, largest ca. 3 × 0.5 mm, apex acute; inner phyllaries 5, apex acute to obtuse. Florets purplish red to sometimes whitish. Achene ca. 4 mm, attenuate into an almost beaked apex. Pappus 5–6 mm. Fl. and fr. Feb–Aug.

• Mountain valleys, forests; 500–2500 m. Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Yunnan, Zhejiang.

Paraprenanthes diversifolia has often not been recognized properly in the past but confused with *P. sororia*. However, it is very well characterized by its small capitula with only 5 inner phyllaries and 4–6 florets. In contrast, leaf shape and indumentum do not actually distinguish it from *P. sororia* (see also note there) and *P. pilipes*.

9. *Paraprenanthes heptantha* C. Shih & D. J. Liu, Acta Phytotax. Sin. 26: 423. 1988.

雷山假福王草 *lei shan jia fu wang cao*

Herbs 0.8–2 m tall, annual. Stem glabrous. Basal leaves

unknown. Lower and middle stem leaves with petiole 2.5–10 cm, ± unwinged; leaf blade narrowly elliptic, 12–24 × 8.5–13 cm, lyrate pinnatifid or unequally pinnatifid, margin sinuate and mucronately dentate; lateral lobes 3 or 4 pairs, opposite or alternate, elliptic, triangular, or irregularly rhombic, apex obtuse to rounded; terminal lobe irregularly rhombic, lanceolate, or narrowly triangular. Upper stem leaves shortly petiolate; leaf blade linear-elliptic, ca. 10 × 1.3 cm, base cuneate, apex acuminate, otherwise similar to middle stem leaves. Synflorescence narrowly paniculiform, with many capitula. Capitula with 7 or 8 florets. Involucre ca. 9 × 2 mm. Outer phyllaries triangular-ovate to lanceolate, largest ca. 3 × 1 mm, apex acute; inner phyllaries 5, apex obtuse. Florets bluish purple. Achene ca. 4 mm, attenuate into an almost beaked apex. Pappus ca. 5 mm. Fl. and fr. May–Jul.

• Grasslands on mountain slopes, forests; 600–1200 m. Guangxi, Guizhou (Leishan), Hunan, Jiangsu, Sichuan.

Paraprenanthes heptantha shows affinities to *P. diversifolia*, and future studies should assess the delimitation between both species.

10. *Paraprenanthes dolichophylla* (C. Shih) N. Kilian & Z. H. Wang, **comb. nov.**

长叶假福王草 *chang ye jia fu wang cao*

Basionym: *Notoseris dolichophylla* C. Shih, Acta Phytotax. Sin. 27: 459. 1989.

Herbs ca. 45 cm tall, perennial. Stem densely glandular hairy. Basal and lower stem leaves unknown. Middle stem leaves with petiole 1–1.5 cm, unwinged; leaf blade obovate to narrowly oblanceolate, 20–22 × 4–13 cm, pinnatisect to subpinnatisect, glabrous, margin sinuate to sublobate and mucronately dentate; lateral lobes 4–7 pairs, opposite or alternate, sometimes petiolulate, ± narrowly elliptic, longest pair each 2.5–8 × 1–2.5 cm, decreasing in size toward base and if more than 4 pairs also toward leaf apex, lowermost pair smallest; terminal lobe elliptic to narrowly elliptic, apex acute to acuminate. Synflorescence paniculiform, with numerous capitula. Capitula with ca. 5 florets. Involucre 9–10 × 2–3 mm. Outer phyllaries ovate to lanceolate, largest ca. 3 × 1 mm, apex acute; inner phyllaries 5, linear-lanceolate, equal in length, apex obtuse. Florets purple. Achene 4–5 mm. Pappus ca. 7 mm. Fl. May.

• Forests on mountain slopes; 1600–1700 m. Sichuan (Tianquan).

Paraprenanthes dolichophylla was originally described on the basis of flowering material only. Recently collected material with ripe achenes revealed that the species is a member of *Paraprenanthes*, which has also been supported by the molecular analysis of that material.

11. *Paraprenanthes multiformis* C. Shih, Acta Phytotax. Sin. 26: 420. 1988.

三裂假福王草 *san lie jia fu wang cao*

Herbs 40–90 cm tall, annual. Stem apically densely glandular hairy. Basal leaves unknown. Middle stem leaves with petiole 3–10 cm, unwinged, basally not widened; leaf blade triangular-ovate, 6–8 × 5–7 cm, 3-lobed or 3-parted, base cordate, margin ± sinuate and mucronately dentate; lateral lobes tri-

angular-ovate to semiorbicular, somewhat smaller or \pm equal in size to terminal lobe, apex rounded to acute; terminal lobe \pm triangular-ovate, apex acute. Upper stem leaves with petiole shorter and \pm winged; leaf blade triangular, smaller and less divided than in middle stem leaves or not divided, base cuneate, apex acuminate. Uppermost leaves lanceolate, triangular-lanceolate, or narrowly elliptic, pilose as upper stem, margin dentate or entire, apex acuminate. Synflorescence narrowly paniculiform, with some to many capitula. Capitula with usually 10–15 florets. Involucre 9–11 \times ca. 3 mm. Outer phyllaries triangular-ovate to lanceolate, largest 2–3 \times ca. 1 mm, apex acute; inner phyllaries 8, apex \pm obtuse. Florets reddish. Achene ca. 4 mm, attenuate into an almost beaked apex. Pappus ca. 6 mm. Fl. and fr. May–Aug.

• Forests, forest margins; 600–800 m. Fujian, Hunan (Zhijiang), Jiangxi, Sichuan.

12. *Paraprenanthes longiloba* Y. Ling & C. Shih, Acta Phytotax. Sin. 26: 421. 1988.

狭裂假福王草 xia lie jia fu wang cao

Herbs, annual. Stem glabrous. Basal leaves unknown. Middle stem leaves sessile, 3-parted; lateral lobes 1 pair, broadly linear-lanceolate, very small; terminal lobe narrowly linear, to 20 \times 1 cm, margin subundulate or inconspicuously dentate, apex long acuminate. Upper stem leaves gradually smaller, similar to middle stem leaves. Synflorescence paniculiform, with numerous capitula. Capitula with usually 8–12 florets. Involucre 9–11 \times ca. 3 mm. Outer phyllaries triangular-ovate to linear-lanceolate, largest 3–4 \times ca. 0.5 mm, apex acute; inner phyllaries 8, apex obtuse. Florets purple. Achene 4.5–5 mm, attenuate into an almost beaked apex. Pappus 5–6 mm. Fl. and fr. Jul.

• Mountain slopes; ca. 2000 m. Yunnan (Kunming).

60. **NOTOSERIS** C. Shih, Acta Phytotax. Sin. 25: 196. 1987.

紫菊属 zi ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, perennial. Stem erect, rarely scandent and \pm zigzag, branched apically, glabrous or glandular hairy, leafy. Leaves pinnately lobed, more rarely undivided. Synflorescence with few to numerous capitula and capillaceous branchlets. Capitula pendent at anthesis, with 3–12 florets; peduncle capillaceous. Involucre narrowly cylindric. Phyllaries often tinged purple; outer phyllaries few, gradually longer centripetally, longest ca. 1/2 as long as inner ones; inner phyllaries 3(or 4), 5, or ca. 8, \pm equal in length, \pm linear-lanceolate to linear. Receptacle naked. Florets some shade of purple. Achene usually purplish to brownish red, cylindric to subfusiform, compressed, with 5 main ribs and 2 secondary ribs in between, apex truncate. Pappus white, single, of slender scabrid bristles.

About 11 species: China, Himalayan region; ten species (eight endemic) in China.

- 1a. Herbs scandent; stem \pm zigzag.
 - 2a. Inner phyllaries ca. 8; capitula with 10–12 florets 1. *N. yakoensis*
 - 2b. Inner phyllaries 4 or 5; capitula with 5–8 florets 2. *N. scandens*
- 1b. Herbs not scandent; stem straight, erect.
 - 3a. Inner phyllaries 3 or 4; capitula with 3 or 4 florets; base of petiole often expanded and auriculate claspings 10. *N. triflora*
 - 3b. Inner phyllaries 5; capitula with 4–6 florets; base of petiole never expanded and clasping.
 - 4a. Blade of lower and middle stem leaves not divided.
 - 5a. Lower and middle stem leaves hastate-triangular to rhombic; involucre at anthesis and in fruit less than 1.2 cm 3. *N. nanchuanensis*
 - 5b. Lower and middle stem leaves ovate to triangular-ovate; involucre at anthesis and in fruit 1.2–1.5 cm.
 - 6a. Middle stem leaves narrowly ovate, base cuneate, petiole winged; upper stem leaves sessile 4. *N. guizhouensis*
 - 6b. Middle stem leaves ovate to triangular-ovate, base cordate, truncate, or cuneate, petiole unwinged; upper stem leaves shortly petiolate 6. *N. macilenta*
 - 4b. Blade of lower and middle stem leaves pinnately lobed.
 - 7a. Terminal lobe of lower and middle stem leaves narrowly elliptic to lanceolate, always much exceeded in width by upper pair of lateral lobes separated by winged or unwinged rachis 8. *N. porphyrolepis*
 - 7b. Terminal lobe of lower and middle stem leaves ovate, triangular-ovate, or broadly rhombic, not or slightly exceeded in width by upper pair of lateral lobes separated by winged or unwinged rachis.
 - 8a. Involucre at anthesis ca. 1.2 cm and in fruit to 1.6 cm 7. *N. melanantha*
 - 8b. Involucre at anthesis and in fruit 0.9–1.2 cm.
 - 9a. Involucre at anthesis ca. 1 cm and in fruit to 1.2 cm; achene basally more attenuate than apically; pappus not distinctly exceeding involucre in fruit 5. *N. yunnanensis*
 - 9b. Involucre at anthesis ca. 0.9 cm and in fruit to 1 cm; achene apically more attenuate than basally; pappus distinctly exceeding involucre in fruit 9. *N. wilsonii*

1. *Notoseris yakoensis* (Jeffrey) N. Kilian, *comb. nov.*垭口紫菊 *ya kou zi ju*

Basionym: *Prenanthes yakoensis* Jeffrey, Notes Roy. Bot. Gard. Edinburgh 5: 203. 1912; *P. volubilis* Merrill.

Vines 3–4 m, herbaceous, perennial. Stem scandent, \pm zigzag, flexible, apically branched and glandular hairy, leafy. Stem leaves with petiole 1–3 cm, unwinged, \pm glandular hairy, basally not widened; leaf blade triangular-ovate to lanceolate, 4–15 \times 2–6 cm, both surfaces \pm glandular hairy, base cordate to hastate, margin mucronately dentate, apex acuminate. Synflorescence terminal and in axils of upper leaves, divaricately paniculiform, with few to several capitula. Capitula with usually 10–12 florets; peduncle usually less than 1 cm. Involucre 1.1–1.4 \times 0.3–0.5 cm. Phyllaries tinged purplish red; outer phyllaries ovate to lanceolate, largest 5–6 \times ca. 1 mm, glandular hairy, apex acute to obtuse; inner phyllaries ca. 8, glabrous to sparsely glandular hairy, apex rounded to obtuse. Florets purplish red. Achene pale to dark purple, cylindric to subfusiform, 4–5 mm, basally more attenuate than apically, somewhat attenuate below pappus disk. Pappus ca. 8 mm. Fl. and fr. Aug–Dec.

Forests, forest margins; 1300–2800 m. Yunnan [N Myanmar].

2. *Notoseris scandens* (J. D. Hooker) N. Kilian, *comb. nov.*藤本紫菊 *teng ben zi ju*

Basionym: *Prenanthes scandens* J. D. Hooker in Bentham & J. D. Hooker, Gen. Pl. 2: 527. 1873.

Vines, herbaceous, perennial. Stem scandent, \pm zigzag, flexible, apically branched and glandular hairy, leafy. Stem leaves with petiole 1–4 cm, unwinged, glandular hairy, basally not widened; leaf blade ovate, triangular-ovate, or lanceolate, 4–15 \times 2–4[–7] cm, both surfaces \pm glandular hairy, margin mucronately dentate, apex acuminate. Synflorescence terminal and in axils of upper leaves, divaricately corymbosely paniculiform, with several to many capitula. Capitula with usually 5–8 florets; peduncle usually less than 1 cm. Involucre 11–14 \times 2–3 mm. Phyllaries tinged purplish red; outer phyllaries ovate to linear-lanceolate, largest 4–6 \times ca. 1 mm, glandular hairy, apex acute; inner phyllaries 4 or 5, glabrous or sparsely glandular hairy, apex acute. Florets blue [?or dull violet to reddish purple]. Achene pale [?to dark purple], cylindric to subfusiform, 4–5 mm, basally more attenuate than apically, somewhat attenuate below pappus disk. Pappus ca. [0.7–]1 cm. Fl. and fr. Nov–Dec.

Forests, forest margins; 900–2000 m. Xizang, Yunnan [NE India].

3. *Notoseris nanchuanensis* C. Shih, Acta Phytotax. Sin. 27: 457. 1989.金佛山紫菊 *jin fo shan zi ju*

Herbs 40–80 cm tall, perennial. Stem erect, branched apically, glabrous, leafy. Lower and middle stem leaves with petiole to 5 cm, winged, basally not widened and not clasping; leaf blade triangular to rhombic, 7–9.5 \times 5.5–6 cm, undivided, base hastate to cuneate, margin mucronately dentate, apex acuminate. Upper stem leaves similar to middle stem leaves or sessile,

lanceolate to irregularly rhombic, 10–12 \times 2–4 cm; uppermost leaves linear, 1.5–2.5 cm. Synflorescence narrowly paniculiform, with numerous capitula and capillaceous branches. Capitula with ca. 5 florets; peduncle capillaceous. Involucre ca. 10 \times 2 mm. Phyllaries purple, abaxially glabrous; outer phyllaries ovate to lanceolate, largest ca. 3 \times 1 mm, apex acute; inner phyllaries 5, apex obtuse to rounded. Florets purple. Achene subfusiform, ca. 5 mm. Pappus ca. 7 mm. Fl. and fr. Aug–Sep.

• Mountain slopes; 1500–2000 m. Chongqing (Nanchuan).

4. *Notoseris guizhouensis* C. Shih, Acta Phytotax. Sin. 25: 196. 1987.全叶紫菊 *quan ye zi ju*

Herbs. Stem solitary, erect, branched apically, glabrous, leafy. Middle stem leaves with petiole to 10 cm, distinctly winged, basally not widened and not clasping; leaf blade narrowly ovate, to 10 \times 4.5 cm, undivided, base cuneate, margin mucronately dentate, apex acuminate. Upper stem leaves sessile, narrowly elliptic, lanceolate, or narrowly elliptic-lanceolate, 8.5–17 \times 1.5–4.5 cm. Synflorescence paniculiform, with numerous capitula and capillaceous branches. Capitula with ca. 5 florets; peduncle capillaceous. Involucre 12–14 \times 2–3 mm. Phyllaries purplish red, abaxially glabrous; outer phyllaries broadly ovate to lanceolate, largest ca. 5 \times 1–1.5 mm, apex obtuse to acute; inner phyllaries 5. Florets purplish red. Achene subfusiform. Pappus ca. 8 mm. Fl. and fr. Sep. $2n = 18^*$.

• Mountain slopes, shaded and moist areas by trails, thickets; ca. 2000 m. Chongqing, Guizhou (Pu'an).

5. *Notoseris yunnanensis* C. Shih, Acta Phytotax. Sin. 25: 200. 1987.云南紫菊 *yun nan zi ju*

Herbs, 1–2.7 m tall. Stem solitary, erect, branched apically, glabrous, leafy. Middle stem leaves glabrous; petiole 5–20 cm, unwinged; leaf blade ovate, 16–22 \times 12–15 cm, lyrate pinnatisect, margin mucronately dentate; lateral lobes 1–3 pairs, narrowly elliptic, 6–10 \times 2–5 cm, apex obtuse; terminal lobe rhombic to elliptic, 10–13 \times 4–10 cm, base cuneate, apex acuminate. Upper stem leaves with shorter petiole to sessile, usually smaller and less divided to undivided, otherwise similar to middle stem leaves. Synflorescence paniculiform, with numerous capitula. Capitula with 4 or 5 florets. Involucre ca. 10 \times 2.5–3 mm at anthesis, to 1.2 cm in fruit. Phyllaries purplish red, abaxially glabrous, apex obtuse; outer phyllaries linear-lanceolate to narrowly elliptic, largest 4–6 \times ca. 1 mm; inner phyllaries 5. Florets purple. Achene ca. 5 mm, basally more attenuate than apically. Pappus 7–8 mm. Fl. and fr. Sep–Oct.

• Dense forests; 1200–2200 m. S Yunnan (Yanshan).

6. *Notoseris macilenta* (Vaniot & H. Léveillé) N. Kilian, *comb. nov.*光苞紫菊 *guang bao zi ju*

Basionym: *Prenanthes macilenta* Vaniot & H. Léveillé, Bull. Soc. Bot. France 53: 550. 1906; *Notoseris psilolepis* C. Shih.

Herbs 30–130 cm tall, perennial. Stem solitary, erect, branched apically, glabrous or glandular hairy, leafy. Basal, lower, and middle stem leaves with petiole 8–25 cm, unwinged, basally not or slightly widened; leaf blade ovate, triangular-ovate, or more rarely suborbicular, 7–30 × 4.5–23 cm, adaxially ± glandular hairy, base cordate, truncate, or cuneate, margin mucronulately dentate, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but smaller and with petiole shorter and often apically cuneately winged; leaf blade triangular to narrowly rhombic, basally usually cuneate, apically acute to acuminate. Uppermost leaves sessile, narrowly rhombic to narrowly elliptic, base cuneate, apex acuminate. Synflorescence paniculiform, with numerous capitula. Capitula with 5 florets. Involucre ca. 12 × 2–3 mm at anthesis, ca. 1.5 cm in fruit. Phyllaries purple, abaxially glabrous; outer phyllaries triangular-ovate to linear-lanceolate, longest ca. 7 × 1 mm; inner phyllaries 5, apex acute. Florets purplish red. Achene 5–6 mm, basally more attenuate than apically. Pappus 8–9 mm. Fl. and fr. Sep–Nov.

• By water in mountain valleys, forests; 800–2300 m. Chongqing, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Yunnan.

The name *Prenanthes macilentia* predates the previously accepted name *Notoseris psilolepis*. *Notoseris macilentia* is closely related to *N. melanantha* and is distinguished by its leaves undivided throughout.

7. *Notoseris melanantha* (Franchet) C. Shih, Acta Phytotax. Sin. 25: 198. 1987.

黑花紫菊 hei hua zi ju

Lactuca melanantha Franchet, J. Bot. (Morot) 9: 291. 1895; *Notoseris formosana* (Kitamura) C. Shih; *N. gracilipes* C. Shih; *N. henryi* (Dunn) C. Shih; *N. rhombiformis* C. Shih; *Prenanthes formosana* Kitamura; *P. henryi* Dunn.

Herbs 0.5–2 m tall, perennial. Stem solitary, erect, apically branched and glabrous or glandular hairy, leafy. Lower and middle stem leaves with petiole 3–17 cm, ± unwinged, basally not widened; leaf blade pinnatipartite to pinnatisect or lyrate, rarely some leaves undivided, margin mucronulately dentate (sometimes very coarsely so) and sometimes ± sinuate; lateral lobes 1–3 pairs, opposite to subopposite, elliptic, irregularly rhombic, or obovate, 1–10 × 0.5–6 cm, base truncate, cuneate, or subpetiolulate, apex obtuse to acute; terminal lobe broadly elliptic, triangular-ovate, or rhombic, 4–22 × 3–20 cm, base cordate, truncate, or cuneate, apex obtuse, rounded, or acute. Upper stem leaves similar to middle stem leaves but with shorter petiole to sessile, smaller and less or not divided. Synflorescence narrowly paniculiform, with numerous capitula. Capitula with 5 (or 6) florets. Involucre ca. 12 × 2–3 mm at anthesis, to 1.6 cm in fruit. Phyllaries purplish, abaxially glabrous; outer phyllaries triangular, linear-elliptic, or lanceolate, largest 4–6 × 1–1.5 mm, apex acute; inner phyllaries 5, apex ± rounded. Florets bluish purple to pink. Achene 4–6 mm, basally more attenuate than apically. Pappus 7–9 mm. Fl. and fr. Jun–Dec. 2n = 18*.

• Forests, forest margins; 1300–2700 m. Chongqing, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Sichuan, Taiwan, Yunnan.

Notoseris melanantha is here treated in a wide sense, including several other species previously distinguished only by rather subtle leaf

and indumentum features. As here treated, it is well characterized by its pinnatipartite to pinnatisect leaves with a broad, triangular to triangular-ovate or broadly rhombic terminal lobe and its 1.2–1.6 cm involucre with 5 inner phyllaries. Comparing the type material of *N. melanantha* and *N. henryi*, which were apparently described independently of each other a few years apart, with a larger number of specimens referable to either of them, it becomes evident that a continuous variation in leaf shape closely knits all of these specimens. The rich type material of *N. melanantha* represents a form with pinnatipartite to pinnatisect lower and middle stem leaves, the rachis of which is distinctly to broadly winged at least between the broad, triangular-ovate terminal lobe and the upper pair of lateral lobes and narrowly winged to unwinged between the pairs of lateral lobes, and the lateral lobes of which have a broad base. The syntypes of *N. henryi*, *A. Henry 7022* and *A. Henry 11214*, in contrast, have pinnatisect lower and middle stem leaves with usually unwinged rachis, lateral lobes with narrow or even subpetiolulate base, and a broad, triangular-ovate to rhombic terminal lobe. This latter leaf shape appears to be much more common. As *N. melanantha* predates the name *N. henryi* for a few years, the former is the correct name for the commonest and most widespread *Notoseris* species. Three further species, *N. formosana*, *N. gracilipes*, and *N. rhombiformis*, apparently each represent only part of this continuous variation, making their delimitation practically impossible. Of these, *N. rhombiformis* refers to plants with a broad, distinctly rhombic terminal lobe separated by the unwinged rachis from the uppermost pair of lateral lobes, a form also represented by the syntype *A. Henry 11214* and approximately by part of the material of the syntype *A. Henry 7022* of *N. henryi*, while *N. gracilipes* and *N. formosana* refer to pinnatisect-leafy plants with a broadly triangular terminal lobe and were moreover distinguished by indumentum characters.

8. *Notoseris porphyrolepis* C. Shih, Acta Phytotax. Sin. 25: 201. 1987.

南川紫菊 nan chuan zi ju

Herbs 0.7–1.5 m tall, perennial. Stem solitary, erect, branched apically, glabrous, leafy. Basal and middle stem leaves with petiole ca. 4.5 cm, unwinged, basally not widened; leaf blade pinnatipartite to subpinnatisect, margin mucronulately dentate and lobe margin mucronate or with 1 large triangular tooth on one side; lateral lobes 2 or 3 pairs, narrowly elliptic to narrowly rhombic, 3–4 × 1–1.5 cm, base truncate, apex acute to acuminate; terminal lobe narrowly elliptic to obliquely narrowly elliptic, 3–4 × 1–1.5 cm, apex acute to acuminate. Upper stem leaves narrowly elliptic to narrowly elliptic-lanceolate, ca. 5.5 × 1 cm, undivided, apex acuminate. Synflorescence paniculiform, with numerous capitula. Capitula with ca. 5 florets. Involucre 13–15 × 2–3 mm. Phyllaries purple, abaxially glabrous, apex rounded to obtuse; outer phyllaries lanceolate to linear-lanceolate, longest ca. 6 × 1–1.5 mm; inner phyllaries 5. Florets purple. Achene ca. 5 mm, basally more attenuate than apically. Pappus ca. 8 mm. Fl. and fr. Sep. 2n = 18*.

• Forests on mountain slopes; 1800–1900 m. Chongqing (Nanchuan), Guizhou.

Notoseris porphyrolepis is closely related to *N. melanantha* and mainly distinguished by the leaf shape, as given in the key.

9. *Notoseris wilsonii* (C. C. Chang) C. Shih, Acta Phytotax. Sin. 25: 202. 1987.

峨眉紫菊 e mei zi ju

Prenanthes wilsonii C. C. Chang, Bull. Fan Mem. Inst. Biol., Bot. 5: 322. 1934.

Herbs to 1 m tall, perennial. Stem erect, apically branched and glandular hairy, basally glabrous, leafy. Lower and middle stem leaves with petiole 3.5–8 × 2–2.5 cm, ± unwinged and base slightly widened in lower leaves, narrowly winged and base sometimes somewhat auriculate widened in middle leaves; leaf blade pinnatipartite to pinnatisect and sometimes lyrate so, margin ± sinuate and mucronulately dentate and sometimes sublobately so; lateral lobes 1–4 pairs, opposite or alternate, sessile to subpetiolulate, ovate, triangular-ovate, or elliptic, 1–7 × 1–4 cm, often unequal, upper ones sometimes subdividing terminal lobe; terminal lobe triangular, triangular-ovate, or rhombic, 7–12 × 3–10 cm, base truncate to cuneate, margin sometimes lobulate, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but sessile or with shorter usually broader winged petiole, sometimes smaller and fewer. Synflorescence paniculiform, with numerous capitula. Capitula with 4 or 5 florets. Involucre 9–10 × ca. 2 mm. Phyllaries purple, glabrous; outer phyllaries triangular-ovate to linear-lanceolate, largest 4–5 mm; inner phyllaries 5. Florets purplish blue. Achene 4–6 mm, apically usually more attenuate than basally. Pappus 6–7 mm, exserted from involucre at maturity. Fl. and fr. May–Jul.

• Forests, forest margins; 1000–2800 m. Sichuan (Emei Shan, Wenchuan).

10. *Notoseris triflora* (Hemsley) C. Shih, Acta Phytotax. Sin. 25: 202. 1987.

三花紫菊 san hua zi ju

Lactuca triflora Hemsley, J. Linn. Soc., Bot. 23: 485.

1888; *Prenanthes triflora* (Hemsley) C. C. Chang.

Herbs, to 1 m tall, perennial. Stem solitary, erect, branched apically, sparsely glandular hairy, leafy. Lower and middle stem leaves with petiole to 17 cm, narrowly winged, basally usually slightly widened; leaf blade lyrate pinnatipartite to subpinnatisect, margin ± sinuate and mucronulately dentate; lateral lobes 1 or 2(or 3) pairs, ± elliptic, 2–6 × 1–4 cm, base cuneate to petiolulate, apex rounded to obtuse; terminal lobe triangular to triangular-ovate, 12–19 × 11–20 cm, base shallowly cordate, hastate, cuneate, or rounded, apex acuminate to acute. Upper stem leaves with petiole shorter, basally slightly widened, or distinctly widened and ± auriculate claspings or ± sessile and auriculate claspings; leaf blade smaller and often less divided, otherwise similar to middle stem leaves; uppermost leaves narrowly elliptic, narrowly rhombic, or broadly linear, undivided. Synflorescence paniculiform, with numerous capitula. Capitula with 3 or 4 florets. Involucre 10–12 × 1.5–2 mm. Phyllaries purple, glabrous; outer phyllaries narrowly ovate to linear-lanceolate, longest ca. 5 × 1 mm, apex acute; inner phyllaries 3 or 4, apex obtuse to acute. Florets bluish purple. Achene 4–5 mm, basally more attenuate than apically. Pappus ca. 7 mm. Fl. and fr. Jul–Oct. $2n = 18^*$.

• Grasslands, forests; 1400–3000 m. Chongqing, Sichuan (Emei Shan), Yunnan (Tengchong).

Notoseris triflora seems to have a scattered, disjunct distribution in C and SW China. It is apparently closely related to *Notoseris khasiana* (C. B. Clarke) N. Kilian, **comb. nov.** (basonym: *Prenanthes khasiana* C. B. Clarke, Compos. Ind. 273. 1876), which has a scattered distribution in NW Myanmar, NE India (Assam), and perhaps Bhutan. The available material of *N. triflora* shows some variation with respect to leaf shape; therefore, a comparative study of its disjunct populations, as well as those of *N. khasiana*, would be desirable.

61. **LACTUCA** Linnaeus, Sp. Pl. 2: 795. 1753.

莴苣属 wo ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Agathysus D. Don; *Lactucopsis* Schultz Bipontinus ex Visiani; *Lagedium* Soják; *Mulgedium* Cassini; *Phaenioxop* Cassini; *Pterocypsela* C. Shih; *Scariola* F. W. Schmidt; *Steptorhamphus* Bunge.

Herbs, perennial or annual, more rarely subshrubs (only *Lactuca orientalis* in China). Stems usually leafy. Leaves pinnate or undivided. Capitula with 4–30 or more florets. Involucre narrowly cylindric. Phyllaries glabrous or hairy; outer phyllaries gradually longer centripetally, ± imbricate, often ca. 1/2 as long as inner phyllaries or even ± approaching them in length; inner phyllaries usually 3, 5, or 8, ± linear-lanceolate to linear, often of unequal length in fruit. Receptacle naked. Florets some shade of yellow or blue. Achene narrowly or broadly ellipsoid, body subcompressed to compressed, between 2 thicker or wider lateral ribs with 1 to several slender ribs on either side; beak usually present, stout, slender, or filiform. Pappus white or sometimes with a faint yellow tinge, single, of slender scabrid bristles [or double with an additional outer row of minute hairs].

Probably ca. 50–70 species: mostly in C and SW Asia, Europe, North America; 12 species (one endemic, one introduced) in China.

The circumscription of the genus is not yet settled, and species numbers given in the literature therefore vary greatly. The concept of the genus applied here on the basis of molecular and morphological studies by N. Kilian et al. (in prep.) is wider than the one adopted in FRPS (80(1): 233–239. 1997) and includes, as far as China is concerned, the former segregates *Mulgedium*, *Pterocypsela*, and *Scariola*.

- 1a. Subshrubs, stems whitish, rigid, and intricately and divaricately branched; stem leaf bases with linear auricles adnately long decurrent on stem; capitula with 4(or 5) florets 8. *L. orientalis*
- 1b. Annual to perennial herbs, stems not as above; stem leaf bases never adnately decurrent on stem; capitula with usually 8–30 florets.
 - 2a. Achene body strongly compressed with distinctly winged margin.
 - 3a. Inner phyllaries 5(or 6); achene with 3(–5) prominent ribs on either side 4. *L. raddeana*
 - 3b. Inner phyllaries ca. 8; achene with 1(or 2) prominent rib(s) on either side.

- 4a. Leaves not clasping or scarcely clasping stem 6. *L. indica*
- 4b. Middle and upper stem leaves distinctly clasping stem.
 - 5a. Achene beak stout, 0.1–0.5 mm, apically pale 5. *L. triangulata*
 - 5b. Achene beak filiform, 2–3.5 mm, pale to greenish 7. *L. formosana*
- 2b. Achene body strongly compressed to subcompressed but margin not winged.
 - 6a. Achene subcompressed, very narrowly ellipsoid, apically attenuate or contracted into a stout 1–2 mm beak.
 - 7a. Lower and middle stem leaves usually pinnately lobed, base usually narrowed and semiamplexicaul; achene with 5–7 prominent ribs on either side between marginal ribs, marginal ribs slightly thicker than other main ribs 9. *L. tatarica*
 - 7b. Lower and middle stem leaves entire or more rarely sinuate-dentate to pinnately lobed, base usually semiamplexicaul to auriculate; achene with 4 or 5 narrow ribs in middle third of either face and with very thick marginal ribs 10. *L. sibirica*
 - 6b. Achene compressed, apically contracted into a filiform (2–)4–12 mm beak.
 - 8a. Beak of achene 10–12 mm, base with rodlike appendages; achene body with 1 rib on either side; involucre to 2.3 cm in fruit 1. *L. undulata*
 - 8b. Beak of achene to 5 mm, base without appendages; achene body with 3–9 ribs on either side; involucre to 1.6 cm in fruit.
 - 9a. Florets blue; achene body with 3–5 ribs on each side.
 - 10a. Lower leaves obovate to elliptic, always pinnately lobed with broader segments; capitula ca. 6 mm at anthesis, to 1.3 cm in fruit; achene beak white 2. *L. dissecta*
 - 10b. All leaves linear, margin entire or lower ones pinnately lobed with linear entire segments; capitula 9–10 mm at anthesis, to 1.6 cm in fruit; achene beak greenish 3. *L. dolichophylla*
 - 9b. Florets yellow; achene body with 5–9 ribs on each side.
 - 11a. Stem leaves undivided, abaxially with smooth midrib; phyllaries usually erect in fruit; achene with 5–7 ribs on each surface 11. *L. sativa*
 - 11b. Stem leaves pinnately lobed, abaxially usually with prickly setose midrib; phyllaries usually reflexed in fruit; achene with 7–9 ribs on each surface 12. *L. serriola*

1. *Lactuca undulata* Ledebour, Icon. Pl. 2: 12. 1830.

飘带果 piao dai guo

Lactuca undulata var. *albicaulis* C. H. An; *L. undulata* var. *pinnatipartita* Turczaninow.

Herbs 10–35 cm tall or more, annual. Stems solitary or few, erect, divaricately branched from base or higher up, glabrous. Leaves glaucous green to glaucous; lower and middle stem leaves oblanceolate to narrowly elliptic, 2–5 × 1–2 cm, glabrous, base clasping stem and auriculate, margin sinuate-dentate to pinnatisect; lateral lobes 2–6 pairs; terminal lobe lanceolate to elliptic. Upper stem leaves smaller and less or not divided; uppermost stem leaves linear-lanceolate, margin entire or subentire, apex acuminate. Capitula numerous, terminal, with 8–12 florets; peduncle wiry, usually shorter than capitulum. Involucre narrowly cylindric and 7–9 mm at anthesis, longish ovoid and to 2.3 × 0.5–0.6 cm in fruit. Phyllaries glabrous, with an apical purplish spot; outer phyllaries ovate to linear-lanceolate, longest ca. 3/4 as long as inner phyllaries, apex acute; inner phyllaries ca. 5, apex subobtusate to acute. Florets pale blue to purple. Achene body pale to dark brown, obovoid, ca. 3 mm, compressed, with 1 rib on either side; beak whitish, filiform, 1–1.2 cm, base with 2 rodlike pendent appendages. Pappus 4–5 mm. Fl. and fr. May–Sep. 2n = 18.

Moist areas on mountain slopes, mountain valleys; 500–2000 m. Xinjiang [Afghanistan, Kashmir, Kazakhstan, Kyrgyzstan, Pakistan, SC Russia, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

2. *Lactuca dissecta* D. Don, Prodr. Fl. Nepal. 164. 1825.

裂叶莴苣 lie ye wo ju

Lactuca auriculata Candolle.

Herbs ca. 40 cm tall, annual. Stem solitary, erect, simple or divaricately branched from base; branches slender, glabrous. Leaves glabrous, base sagittately to auriculate clasping stem. Lower and middle stem leaves obovate, spatulate, or elliptic, 3–7 × 1–3.5 cm, pinnatipartite to subpinnatisect, margin entire or sparsely dentate; lateral lobes 3–6 pairs, rhombic, flabelliform, or orbicular, apex rounded to acute; terminal lobe rhombic, apex acute. Upper stem leaves lanceolate to linear-lanceolate, smaller, less or not divided, apex acuminate. Synflorescence corymbiform, with some to numerous capitula. Capitula with ca. 15 florets; peduncle capillaceous, usually longer than capitulum. Involucre narrowly cylindric and ca. 6 mm at anthesis, longish ovoid and to 1.3 × 0.3–0.4 cm in fruit. Phyllaries abaxially purplish red, glabrous, apex acute; outer phyllaries ovate to linear-lanceolate, approaching inner phyllaries to 3/4 their length; inner phyllaries ca. 5. Florets blue to bluish purple [or pale yellowish]. Achene body pale brown to blackish, obovoid, ca. 2.5 mm, compressed, with 3 ribs on either side; beak white, filiform, 4–4.5 mm. Pappus 3–4 mm. Fl. and fr. Jun. 2n = 16.

Grasslands; ca. 2000 m. Xinjiang, ?Xizang [Afghanistan, Bhutan, India (Sikkim), Kashmir, Kazakhstan, Kyrgyzstan, Nepal, Pakistan, Tajikistan; SW Asia].

3. *Lactuca dolichophylla* Kitamura in H. Hara, Fl. E. Himalaya, 341. 1966.

长叶莴苣 chang ye wo ju

Mulgedium sagittatum Royle, Ill. Bot. Himal. Mts. 252, t. 61, f. 2. 1835; *Lactuca handeliana* S. Y. Hu; *L. longifolia* Candolle (1838), not Michaux (1803); *L. wallichiana* Tuisl, nom. illeg. superfl.

Herbs ca. 1 m tall, annual or biennial. Stem solitary, erect, paniculate apically, glabrous. Lower stem leaves linear to linear-lanceolate, undivided or pinnately lobed, base sagittately clasping stem, apex acuminate; lobes when present linear, apex acute. Upper stem leaves undivided, smaller, otherwise similar to lower leaves. Synflorescence paniculiform, with numerous capitula. Capitula with 12–20 florets; peduncle wiry. Involucre narrowly cylindric and 9–10 mm at anthesis, ovoid and to 1.6 × 0.8 cm in fruit. Phyllaries apically purplish red, abaxially glabrous, apex acute; outer phyllaries triangular-ovate to linear-lanceolate, approaching inner phyllaries to 3/4 their length; inner phyllaries ca. 5. Florets blue. Achene body dark brown, narrowly ellipsoid to obcolumnar, 4.5–5 mm, compressed, with 3–5 ribs on either side; beak greenish, filiform, 2.5–3 mm. Pappus 6–7 mm. Fl. and fr. Sep. $2n = 16$.

Thickets; ca. 3200 m. Xizang, Yunnan [Afghanistan, Bhutan, India, Kashmir, Myanmar, Nepal, Pakistan].

4. *Lactuca raddeana* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 19: 526. 1874.

毛脉翅果菊 mao mai chi guo ju

Lactuca alliariifolia H. Léveillé & Vaniot; *L. elata* Hemsley; *L. raddeana* var. *elata* (Hemsley) Kitamura; *L. vaniotii* H. Léveillé; *Prenanthes hieraciifolia* H. Léveillé; *Pterocypsela elata* (Hemsley) C. Shih; *P. raddeana* (Maximowicz) C. Shih.

Herbs 0.8–2 m tall, biennial or perennial. Roots ramose. Stem solitary, erect, basal half ± densely hispid, apical half glabrous and branched. Lower and middle stem leaves with basal portion cuneate or winged petiole-like, 2–10 cm; apical portion ovate, elliptic, or triangular, 5–16 × 2–8.5 cm, undivided, pinnatifid, or lyrate pinnatifid, ± hispid, margin dentate and coarsely sinuate-dentate; lateral lobes 1–3 pairs, elliptic, apex acute; terminal lobe triangular, ovate-triangular, or subrhombic, apex acute. Upper stem leaves with basal portion shorter, winged, and petiole-like to cuneate, apical portion ovate, elliptic, or lanceolate. Synflorescence narrowly paniculate, with numerous capitula on wiry branches. Capitula with 8–11 florets. Involucre cylindric, 8–10 mm at anthesis, 9–11 × 4–5 mm in fruit. Phyllaries often pale purplish red; outer phyllaries triangular-ovate to lanceolate, largest ca. 5 × 1–2 mm, apex obtuse; inner phyllaries 5(or 6), apex obtuse. Florets bright yellow. Achene 3–4 mm; body reddish to dark brown, ellipsoid, compressed, broadly winged, 1.5–2 mm wide, with 3(–5) prominent ribs on either side, apically contracted into a concolorous or apically pale stout 0.2–0.4 mm beak. Pappus 6–7 mm, ± caducous. Fl. and fr. May–Oct. $2n = 18$.

Forests, forest margins, thickets, moist areas on mountain slopes, mountain valleys, fields, trailsides; 200–3000 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangxi, Jilin, Liaoning, Shaanxi, Shandong, Shanxi, Sichuan, Yunnan [Japan, Korea, E Russia, Vietnam].

Although the range of variation in leaf shape is considerable, plants with undivided leaves (formerly referred to as *Lactuca elata*) and those with pinnatifid leaves represent extremes of a ± continuous variation and indicate a certain genetic plasticity in this respect. Probably the various leaf shapes are a response to environmental factors. It is

also indicative that comparable variation in leaf shape can also be observed in *L. indica* and *L. formosana*.

5. *Lactuca triangulata* Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 177. 1859.

翼柄翅果菊 yi bing chi guo ju

Lactuca triangulata var. *sachalinensis* Kitamura; *Pterocypsela triangulata* (Maximowicz) C. Shih.

Herbs to 1 m tall or more, biennial or perennial. Roots ramose. Stem solitary, usually purplish red, erect, branched in apical half or third, glabrous. Lower and middle stem leaves ± glabrous, margin with unequal and triangular teeth; basal portion winged petiole-like, 6–13 cm, base broadly auriculate to hastately clasping stem; apical portion triangular, broadly ovate, or broadly ovate-cordate, 8.5–13 × 9–16 cm. Upper stem leaves similar to middle stem leaves or basally shortly cuneate or winged petiole-like and auriculate or sagittately clasping and apically elliptic to rhombic. Uppermost leaves with semiamplexicaul base. Synflorescence rather narrowly paniculiform, with numerous capitula. Capitula with 10–16 florets. Involucre cylindric, 1–1.1 cm at anthesis, to 1.5 × 0.5–0.6 cm in fruit. Outer phyllaries narrowly triangular to lanceolate, longest ca. 7 × 1 mm, apex acute; inner phyllaries 8, usually purplish red, apex acute to obtuse. Florets yellow. Achene 4–6 mm; body blackish, reddish, or dark brown, ellipsoid, compressed, broadly winged, 2–2.5 mm wide, with 1(or 2) prominent rib on either side, apically contracted into an apically pale stout 0.1–0.5 mm beak. Pappus 6–8 mm, caducous. Fl. and fr. Jun–Sep. $2n = 18$.

Grasslands on mountain slopes, mountain forests, forest margins, trailsides; 700–1900 m. Hebei, Heilongjiang, Jilin, Liaoning, Shanxi [Japan, Korea, SE Russia].

6. *Lactuca indica* Linnaeus, Mant. Pl. 2: 278. 1771.

翅果菊 chi guo ju

Brachyramphus sinicus Miquel; *Lactuca amurensis* Regel & Maximowicz ex Regel; *L. brevirostris* Champion ex Benth; *L. cavaleriei* H. Léveillé; *L. indica* f. *indivisa* (Maximowicz) H. Hara; *L. indica* f. *runcinata* (Maximowicz) Kitamura; *L. kouyangensis* H. Léveillé; *L. laciniata* (Houttuyn) Makino (1903), not Roth (1797); *L. squarrosa* (Thunberg) Miquel; *L. squarrosa* var. *dentata* Komarov; *L. squarrosa* f. *indivisa* Maximowicz; *L. squarrosa* var. *integrifolia* Komarov; *L. squarrosa* var. *laciniata* (Houttuyn) Kuntze; *L. squarrosa* f. *runcinata* Maximowicz; *L. squarrosa* var. *runcinatopinnatifida* Komarov; *Prenanthes laciniata* Houttuyn; *P. squarrosa* Thunberg; *Pterocypsela indica* (Linnaeus) C. Shih; *P. laciniata* (Houttuyn) C. Shih.

Herbs 0.4–2 m tall, annual or perennial. Roots narrowly thickened. Stem solitary, stout, erect, branched apically, glabrous. Lower and middle stem leaves 13–37 × 0.5–20 cm, glabrous, base semiamplexicaul to weakly amplexicaul, margin entire or sparsely dentate, apex obtuse to acuminate; shape and incision extremely variable; shape ranging from linear-lanceolate, linear-elliptic, lanceolate, spatulate, to elliptic; incision ranging from entire, pinnatifid, deeply pinnatifid, to bipinnatifid, with segments mostly narrow, linear, falcate, triangular-lanceolate, or

elliptic, apex acute to acuminate. Upper leaves smaller, linear-lanceolate, linear, or elliptic, less incised to entire. Synflorescence paniculiform to racemiform-paniculiform, with numerous capitula. Capitula with usually 20–30 florets. Involucre cylindric, 1–1.1 cm at anthesis, 1.2–1.5 × 0.6–0.8 cm in fruit. Phyllaries usually with a purplish margin, apex usually obtuse to rounded; outer phyllaries ovate to lanceolate, longest ca. 6 × 1.5–2 mm; inner phyllaries 8. Florets pale yellow, bluish purple on drying. Achene 3–5 mm; body reddish brown, dark brown, or blackish brown, ellipsoid, compressed, broadly winged, 1.2–2.5 mm wide, with 1 prominent rib on either side, apically contracted into an apically pale to greenish subfiliform 0.4–1.6 mm beak. Pappus 7–8 mm, caducous. Fl. and fr. Apr–Nov. $2n = 18^*$.

Mountain valleys, forests, forest margins, thickets, ravines, grasslands, fields, wastelands; 200–3000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Heilongjiang, Henan, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [Bhutan, India, Indonesia, Japan, Korea, Philippines, E Russia, Thailand, Vietnam; introduced elsewhere].

Lactuca indica is one of the commonest species of tribe Cichorieae in China. Leaf shape shows a similarly strong variation as that in *L. raddeana* and is in a quite similar way ± continuous. Leaf shape is therefore not suitable for species delimitation in this group of species. In China, *L. indica* also shows considerable variation in achene beak length; therefore, the differences with *L. formosana* are sometimes not so clear-cut. See note under the latter species.

7. *Lactuca formosana* Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 19: 525. 1874.

台湾翅果菊 tai wan chi guo ju

Lactuca morii Hayata; *L. sonchus* H. Léveillé & Vaniot; *Pterocypsela formosana* (Maximowicz) C. Shih; *P. sonchus* (H. Léveillé & Vaniot) C. Shih.

Herbs 0.5–1.5 m tall, annual or ?perennial. Roots ramose. Stem solitary, erect, loosely branched apically, ± hirsute, glabrescent. Lower and middle stem leaves with narrow petiole-like amplexicaul basal portion to 5 cm or with conspicuously expanded and semiamplexicaul base; leaf blade elliptic, lanceolate, or oblanceolate, 8–18 × 4–8 cm, hirsute, main rib echinulate, undivided and with coarsely dentate margin or pinatifid with 2–5 pairs of elliptic to broadly falcate lateral lobes, faintly to strongly dentate on margin, and a lanceolate or triangular terminal lobe. Upper stem leaves similar to middle stem leaves, margin mostly ± entire. Synflorescence loosely corymbose, with ca. 10 to many capitula. Capitula with usually 25–30 florets. Involucre cylindric, 1–1.1 cm at anthesis, to 1.8 × 0.8 cm in fruit. Phyllaries acute to acuminate at apex; outer phyllaries broadly obovate to lanceolate, longest ca. 8 × 1–2 mm; inner phyllaries 8. Florets yellow. Achene 4.5–6.5 mm; body reddish brown, dark brown, or blackish brown, ellipsoid, compressed, broadly winged, 2–2.3 mm wide, with 1 prominent rib on either side, apically contracted into a usually pale to greenish filiform 2–3.5 mm beak. Pappus 7–8 mm, caducous. Fl. and fr. Apr–Nov. $2n = 18^*$.

• Grasslands on mountain slopes and in valleys, thickets or forests on mountain slopes, fields, along trails; 100–2000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Ningxia, Shaanxi, Sichuan, Taiwan, Yunnan, Zhejiang.

Lactuca formosana is similar to *L. raddeana*, *L. triangulata*, and *L. indica*, and the leaf shape of *L. formosana* in mainland China shows some variation. Instead of the typically lyrate-pinnatifid leaves with irregularly incised to dentate margin, plants sometimes have narrow, weakly pinnatifid leaves more similar to those of *L. indica*. However, usually both species can be distinguished by the shape of the synflorescence (corymbiform in *L. formosana*, paniculiform to racemiform-paniculiform in *L. indica*) and the indumentum of stem and leaves (hirsute and with echinulate main rib in *L. formosana*, glabrous in *L. indica*). Conspicuous, occasionally occurring plants with all or most leaves undivided, as are sometimes the upper stem leaves in usually pinnately lobed plants, have been treated as a separate species, *Lactuca sonchus* or *Pterocypsela sonchus*, respectively (e.g., FRPS 80(1): 231. 1997), but are here considered as a mere form of *L. formosana*, easily recognizable by the distinctive long beak of this species.

8. *Lactuca orientalis* (Boissier) Boissier, Fl. Orient. 3: 819. 1875.

雀苣 que ju

Phaenopus orientalis Boissier, Voy. Bot. Espagne 2: 390. 1841; *Lactuca viminea* J. Presl & C. Presl var. *erostis* Regel; *Scariola orientalis* (Boissier) Soják.

Subshrubs (10–)20–60 cm tall, glabrous or subglabrous, spinescent, branched from base. Stems whitish, rigid, intricately and divaricately branched. Leaves glaucous green. Basal leaves rosulate, sinuate-dentate to pinnately lobed; lateral lobes 2–4 pairs, triangular, retrorse, apex acute. Stem leaves similar to basal leaves but smaller, less incised, and basally with linear auricles adnately long decurrent on stem. Capitulum solitary, terminal and pedunculate or lateral and sessile, with 4(or 5) florets; peduncle (when present) subulate, remaining as a spine after shedding of capitulum. Involucre narrowly cylindric, 7–10 mm at anthesis, to 1.5 cm in fruit. Phyllaries green to bluish purple; outer phyllaries ovate, abaxially pubescent; inner phyllaries 3(or 4), apex obtuse. Florets pale yellow. Achene 7–8 mm; body brownish, narrowly ellipsoid, 1–1.3 mm wide, with 5–7 ribs on either side; beak concolorous, stout, 2–3 mm. Pappus 7–8 mm, caducous. $2n = 18, 36$.

Mountain slopes and scree, on clay or loamy soil, on lime deposits, on gravel, in dry ravines; below 3800 m. Xinjiang [Kashmir, Kazakhstan, Kyrgyzstan, Pakistan, Tajikistan; SW Asia].

Lactuca orientalis reaches China apparently only in the extreme northwest. No material from China was seen; the description is based on material from outside of China and the habitat data is from Fl. URSS (29: 321. 1964).

9. *Lactuca tatarica* (Linnaeus) C. A. Meyer, Verz. Pfl. Casp. Meer. 56. 1831.

乳苣 ru ju

Sonchus tataricus Linnaeus, Mant. Pl. 2: 572. 1771; *Agathyrsus tataricus* (Linnaeus) D. Don; *Crepis charbonnellii* H. Léveillé; *Lactuca multipes* H. Léveillé & Vaniot; *Lagedium tataricum* (Linnaeus) Soják; ?*Mulgedium alatoicum* C. H. An; *M. roborovskii* Tzvelev; *M. runcinatum* Cassini; *M. tataricum* (Linnaeus) Candolle; *S. lactucoides* Bunge.

Herbs 15–60 cm tall, perennial, with a taproot, roots shoot bearing. Stem erect; branched apically, glabrous, leafy mainly in basal part. Leaves grayish green to glaucous, rigid, glabrous.

Lower and middle stem leaves elliptic, narrowly elliptic, or linear, 6–19 × 2–6 cm, narrowed toward base, pinnatisect, pinnatifid, or coarsely dentate, apex acute to obtuse; lateral lobes 2–5 pairs, subelliptic to triangular, margin entire, denticulate, or spinulose; terminal lobe lanceolate to narrowly triangular, margin entire, denticulate, or spinulose. Upper stem leaves similar to middle stem leaves but smaller and less incised. Synflorescence racemiform to corymbosely paniculiform, almost leafless, usually with numerous capitula. Capitula with ca. 20 florets. Involucre cylindric, 1.1–1.4 × 0.3–0.5 cm at anthesis, to 2 cm in fruit. Phyllaries usually tinged purplish red, glabrous, apex acute to obtuse; outer phyllaries ovate to lanceolate; inner phyllaries ca. 8. Florets usually purplish blue to blue, rarely white. Achene 5–6 mm; body dark gray, columnar to very narrowly ellipsoid, subcompressed, with 5–7 ribs on either side, apically attenuate or contracted into a concolorous or pale stout 1–2 mm beak. Pappus ca. 1 cm. Fl. and fr. Jun–Sep. $2n = 18$.

Riverbanks and terraces, by lakes, meadows, by fields, consolidated sand dunes, gravelly places; 1200–4300 m. Gansu, Hebei, Henan, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shanxi, Xinjiang, Xizang [Afghanistan, NW India, Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, Pakistan, C and W Russia, Tajikistan, Uzbekistan; SW Asia, Europe, North America].

Lactuca tatarica is a very widespread and considerably variable species. *Mulgedium roborovskii* is considered not to exceed the variation of the species and is included here. *Mulgedium alatoicum* is tentatively included here from the insufficient original description, as no type material has been seen.

10. *Lactuca sibirica* (Linnaeus) Benth. ex Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 19: 528. 1874.

山莴苣 shan wo ju

Sonchus sibiricus Linnaeus, Sp. Pl. 2: 795. 1753; *Lagedium sibiricum* (Linnaeus) Soják; *Mulgedium kamschatcicum* Ledebour; *M. sibiricum* (Linnaeus) Lessing.

Herbs 50–100 cm tall, perennial, with a taproot. Stem usually pale purplish red, erect, branched apically, glabrous, regularly leafy. Leaves thin, glabrous, abaxially glaucous green, adaxially green. Lower and middle stem leaves sessile, lanceolate, narrowly elliptic-lanceolate, or narrowly oblong-lanceolate, 10–26 × 2–3 cm, undivided or more rarely sinuate-dentate to pinnately lobed, base attenuate, auriculately or sagittately clasping, margin entire to faintly denticulate, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but smaller. Synflorescence corymbiform to corymbosely paniculiform, with many capitula. Capitula with ca. 20 florets. Involucre cylindric, 0.9–1.3 cm. Phyllaries often purplish tinged or mottled; outer phyllaries triangular-ovate to lanceolate, apex acute; inner phyllaries ca. 8, apex subobtuse. Florets blue, rarely white. Achene brown to olive green, narrowly ellipsoid, ca. 4 mm, subcompressed, either marginal rib almost as thick as ca. 1/3 of achene diam., middle third with 4 or 5 narrow ribs on either side, apically attenuate or with a ca. 1 mm beak. Pappus 5–7 mm. Fl. and fr. Jul–Sep. $2n = 18^*$.

Forests, forest margins, meadows, riverbanks, moist places, by lakes; 300–2100 m. Gansu, Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol, Qinghai, Shaanxi, Shanxi, Xinjiang [Japan, Kazakhstan, Korea, Mongolia, Russia; N and NE Europe].

11. *Lactuca sativa* Linnaeus, Sp. Pl. 2: 795. 1753.

莴苣 wo ju

Lactuca scariola Linnaeus var. *sativa* (Linnaeus) Moris.

Herbs 25–100 cm tall, annual or biennial. Stem solitary, whitish, yellowish green, or glaucous green, erect, branched apically, glabrous. Leaves green, glabrous, rather soft. Basal and lower stem leaves sessile, oblanceolate to elliptic-oblanceolate, 6–15 × 1.5–6.5 cm, undivided, base cordate to sagittate and semiamplexicaul, margin sinuate-dentate, apex acute, acuminate, or rounded. Upper stem leaves similar to lower stem leaves or lanceolate, smaller; uppermost leaves ovate, very small, base cordate to sagittate and clasping, margin entire. Synflorescence corymbosely paniculiform, with very numerous capitula. Capitula with usually 10–30 florets. Involucre narrowly cylindric and 0.9–1.3 cm at anthesis, ovoid and ca. 6 mm in diam. in fruit. Phyllaries green to pale yellowish green, glabrous, usually erect in fruit, apex obtuse; outer phyllaries broadly triangular to lanceolate, approaching inner phyllaries in length; inner phyllaries ca. 8. Florets yellow. Achene body pale brown, narrowly obovoid, ca. 4 mm, compressed, with 5–7 ribs on either side; beak white, filiform, 2–4 mm. Pappus 3–4 mm. Fl. and fr. Feb–Sep. $2n = 18^*$.

Cultivated throughout China [probably originating from E Mediterranean to SW Asia].

Lactuca sativa was first known in cultivation in ancient Egypt. It is widely cultivated as a vegetable in China. Leaves of the species contain Vitamins A, B9, C, and K and can be eaten as a salad. *Lactuca sativa* has many cultivars, which are usually treated as varieties. *Lactuca sativa* var. *angustata* Irish ex Bremer is the most commonly cultivated variety in China, where the thick stems are cooked as a vegetable.

12. *Lactuca serriola* Linnaeus, Cent. Pl. 2: 29. 1756.

野莴苣 ye wo ju

Lactuca altaica Fischer & C. A. Meyer; *L. scariola* Linnaeus.

Herbs 50–80 cm tall, annual. Stem solitary, pale, erect, usually branched only apically, glabrous or prickly setose in basal part. Leaves rather rigid, usually held in vertical plane in sunshine, midrib abaxially often prickly setose. Lower and middle stem leaves oblanceolate to narrowly elliptic, 3–7.5 × 1–4.5 cm, pinnatifid, pinnatisect, or more rarely not divided and leaf broadly linear, base auriculately clasping, margin spinulose; lateral lobes usually 3–6 pairs, truncate, falcate, triangular-falcate, or ovate-falcate; terminal lobe triangular-ovate, rhombic, or broadly linear. Uppermost stem leaves smaller, otherwise similar to middle stem leaves or lanceolate, linear-lanceolate, or linear, margin entire. Synflorescence paniculiform and much branched to almost racemiform in meager plants, with numerous capitula. Capitula with 15–25 florets. Involucre narrowly cylindric and 8–10 mm at anthesis, ovoid and ca. 6 mm in diam. in fruit. Phyllaries usually reflexed in fruit, apex acute; outer phyllaries ovate to lanceolate, approaching inner phyllaries in length; inner phyllaries ca. 8. Florets yellow. Achene body pale brown, narrowly obovoid, ca. 3.5 mm, compressed, with 7–9 ribs on either side; beak whitish, filiform, 3.5–5 mm. Pappus ca. 5 mm, ± caducous. Fl. and fr. Jun–Aug. $2n = 18$.

Wastelands, roadsides, gravel areas on floodplains, rock crevices, grasslands on mountain slopes, mountain valleys; 500–2000 m. Taiwan (introduced), Xinjiang [Afghanistan, N India, Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, W Russia, Tajikistan; N and NE Africa, SW Asia, Europe].

Because molecular analyses supported the earlier assumptions on

morphological grounds that *Lactuca altaica* cannot be delimited from *L. serriola* they are treated as conspecific.

Lactuca serriola was first recorded in Taiwan in 2007 (C. M. Wang & C. H. Chen, *Taiwania* 55: 331–333, 2010) and seems to be naturalized there. It has also been introduced to S Africa, NE Asia, Australia, North America, Pacific islands (New Zealand), the Russian Far East, and S South America.

62. LAUNAEA Cassini in F. Cuvier, Dict. Sci. Nat. 25: 321. 1822.

栓果菊属 shuan guo ju shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Ammoseris Endlicher; *Brachyramphus* Candolle; *Hexinia* H. L. Yang; *Lomatolepis* Cassini; *Microrhynchus* Lessing; *Paramicrorhynchus* Kirpichnikov; *Rhabdotheca* Cassini.

Herbs, perennial, often rosulate, sometimes acaulescent, (almost) glabrous. Stem erect, ascending-erect, procumbent, or creeping. Leaves undivided and subentire or sinuate-dentate to pinnately divided. Synflorescence corymbiform or paniculiform, with few to numerous capitula or sometimes capitulum solitary. Capitula with 5–20(–30) florets. Involucre cylindric. Phyllaries with indistinct to conspicuous white scarious margin; outer phyllaries in several series, gradually longer centripetally, \pm imbricate with longest $1/2$ – $3/4$ as long as inner ones; inner phyllaries 5–8, \pm equal in length, \pm linear-lanceolate. Receptacle naked. Florets yellow. Achene whitish, grayish, blackish, or brownish, homomorphic and all with 5 main ribs or dimorphic and inner with 4 and outer with 5 main ribs, usually accompanied by 2 secondary ribs, smooth or transversely wrinkled, apex truncate to attenuate. Pappus white, of equal faintly scabrid bristles, caducous with pappus disk or persistent.

Fifty-four species: Africa, C, S, and SW Asia, S Europe; four species (one endemic) in China.

- 1a. Subshrubs; flowering stems hardened, intricately and divaricately branched, erect, with numerous capitula on subulate and after shedding of capitula subspinescent peduncles 2. *L. polydichotoma*
- 1b. Herbs; flowering stems herbaceous, creeping, procumbent, or erect, weak, if divaricately branched then never intricate and never with subulate later subspinescent peduncles.
 - 2a. Plants with flagelliform branching runners on nodes with small leaf rosettes and solitary pedunculate capitula 4. *L. sarmentosa*
 - 2b. Plants with procumbent to erect stems or acaulescent.
 - 3a. Phyllaries (especially inner ones) with narrow to inconspicuous white scarious margin; achene 4–7 mm, homomorphic, with 5 main ribs; pappus persistent 1. *L. acaulis*
 - 3b. Phyllaries (especially outer ones) with broad and conspicuously white scarious margin; achene 2–4 mm, dimorphic, inner ones whitish to grayish with 4 thick main ribs, outer ones brownish to grayish, \pm compressed, and with 5 main ribs; pappus caducous with pappus disk 3. *L. procumbens*

1. *Launaea acaulis* (Roxburgh) Babcock ex Kerr in Craib, Fl. Siam. 2: 299. 1936.

光茎栓果菊 guang jing shuan guo ju

Prenanthes acaulis Roxburgh, Fl. Ind., ed. 1832, 3: 403. 1832; *Crepis acaulis* (Roxburgh) J. D. Hooker; *Lactuca glabra* Candolle; *Launaea glabra* (Candolle) Franchet; *Microrhynchus glaber* Wight; *Youngia acaulis* (Roxburgh) Candolle.

Herbs 10–35 cm tall, perennial, subacaulescent or caulescent, rosulate, glabrous. Rootstock thick, woody, with shoot-bearing roots. Stems few to some, slender, ascending-erect, sparsely branched or simple, leafless or rarely with a few leaves near base. Rosette leaves (sometimes a few extended to basal portion of flowering shoot) spatulate to lanceolate, 5–14 \times 0.5–1 cm, base cuneate, margin denticulate and subentire to shallowly sinuate-dentate, apex acute, obtuse, or rounded. Synflorescence sparsely corymbiform, with 1 to a few capitula. Capitula with usually 10–14 florets. Involucre cylindric, 1.2–1.5 cm at anthesis, to 1.7 cm in fruit. Phyllaries with narrow or indistinct scarious margin; outer phyllaries triangular-ovate to lanceolate, longest ca. $1/2$ as long as inner phyllaries; inner phyl-

laries 5–9. Achene whitish, homomorphic, columnar, cylindric, or subfusiform, 4–7 mm, with 5 main ribs, apex truncate. Pappus 6–8 mm, persistent. Fl. and fr. Apr–May. $2n = 18$.

Roadsides on mountain slopes, wastelands, sparsely forested steppes; 300–3600 m. Guangxi, Guizhou, Hainan, Sichuan, Yunnan [Bangladesh, Bhutan, India, Kashmir, Laos, Myanmar, Nepal, N Thailand, N Vietnam].

2. *Launaea polydichotoma* (Ostenfeld) Amin ex N. Kilian, Englera 17: 166. 1997.

河西菊 he xi ju

Chondrilla polydichotoma Ostenfeld in Hedin, S. Tibet 6(3): 29. 1922; *Hexinia polydichotoma* (Ostenfeld) H. L. Yang; *Zollikoferia polydichotoma* (Ostenfeld) Iljin.

Herbs 15–50 cm tall, perennial, spheroid. Caudex without residue of fibrous and lacerate sheath, with many stems. Stems erect, hardened to herbaceous, intricately and divaricately branched from base. Lower stem leaves sessile, linear, 0.5–4 \times 0.2–0.5 cm, base semiamplexicaul, apex obtuse; leaves higher up on stem reduced and narrowly spatulate to narrowly lan-

ceolate and finally reduced to ovate-acute bracts. Synflorescence divaricately paniculiform, with numerous capitula. Capitula with 5–11 florets; peduncle subulate and after shedding of capitulum hardened and subspinescent. Involucre cylindric, 9–12 × 2–3 mm. Phyllaries glabrous, with indistinct scarious margin; outer phyllaries triangular-ovate to lanceolate, longest ca. 3/4 as long as inner phyllaries; inner phyllaries (4 or) 5. Achene pale yellow to yellowish brown, homomorphic, cylindric to obcolumnar, 3–5 mm, with 5 main ribs, transversely wrinkled, apex truncate. Pappus 7–10 mm, deciduous. Fl. and fr. May–Sep.

• Sandy soils, edges of sandy soils, between sand dunes; 400–2100 m. Gansu, Xinjiang.

Molecular phylogenetic analyses by N. Kilian (unpubl.) corroborate the classification of *Launaea polydichotoma* in *Launaea*, where it is closely related to *L. acanthodes* (Boissier) Kuntze of SW Asia.

3. *Launaea procumbens* (Roxburgh) Ramayya & Rajagopal, Kew Bull. 23: 465. 1969.

假小喙菊 jia xiao hui ju

Prenanthes procumbens Roxburgh, Fl. Ind., ed. 1832, 3: 404. 1832; *Launaea fallax* (Jaubert & Spach) Kuntze; *Microhynchus fallax* Jaubert & Spach; *Paramicrorhynchus procumbens* (Roxburgh) Kirpicznikov; *Sonchus lakouensis* S. Y. Hu; *S. mairei* H. Léveillé (1915), not H. Léveillé (1913); ?*Youngia alashanica* H. C. Fu; *Zollikoferia fallax* (Jaubert & Spach) Boissier.

Herbs, perennial, rosulate, branched from base, procumbent to ascending. Taproot with shoot-bearing lateral roots. Stems 5–30 cm, divaricately branched, puberulent or glabrous, with few leaves or leafless. Rosette leaves spatulate, 5–7 × 2–3 cm, sinuate-dentate to variously pinnately lobed, tapering into a narrow base, margin white cartilaginous denticulate; lateral lobes 3 or 4 pairs, elliptic to triangular, apex rounded to obtuse; terminal lobe lanceolate to elliptic, apex obtuse. Stem leaves smaller, base often clasping, otherwise similar to rosette leaves. Synflorescence divaricately paniculiform, with capitula frequently clustered. Capitula with 15–20(–30) florets. Involucre cylindric, 10–12 × ca. 3 mm. Phyllaries glabrous, margin broadly white scarious, apex acute to obtuse; outer phyllaries triangular-ovate to linear-lanceolate, to 2/3 as long as inner phyllaries; inner phyllaries 8. Achenes dimorphic, 2–4 mm, apex pointed to subtruncate; outer achenes grayish to brown, ± fusiform, ± compressed, with 5 main ribs, transversely wrinkled; inner achenes whitish to grayish, columnar, with 4 thick,

soft main ribs, smooth. Pappus 8–9 mm, caducous with pappus disk. Fl. and fr. Jun–Oct. $2n = 18$.

Alkaline areas, steppes, meadows, irrigated land, floodplains; 1500–2000 m. Gansu, Nei Mongol (Alxa Meng), Sichuan, Xinjiang, Yunnan [Afghanistan, India, Kashmir, Kazakhstan, Myanmar, Nepal, Pakistan, Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

Molecular phylogenetic analyses by N. Kilian (unpubl.) corroborate his previous conclusion inferred from achene morphology (N. Kilian, Englera, 17. 1997) that *Launaea procumbens* is very closely related to the following species, *L. sarmentosa*, which provides the type of the name *Launaea*, therefore refuting its generic segregation as *Paramicrorhynchus*. The species enters China both from the south (Sichuan, Yunnan) and the northwest (Gansu, W Nei Mongol, Xinjiang). Its presence in W Nei Mongol was reported by Tzvelev (Rast. Tsentral. Azii 14b: 79. 2008). The description and illustration of *Youngia alashanica* (H. C. Fu in Ma, Fl. Intramongol., ed. 2, 4: 849. 1993) from Ejin Qi, Nei Mongol, with high probability actually also refer to *L. procumbens* and would confirm its occurrence there.

4. *Launaea sarmentosa* (Willdenow) Kuntze, Revis. Gen. Pl. 1: 350. 1891.

匍枝栓果菊 fu zhi shuan guo ju

Prenanthes sarmentosa Willdenow, Phytographia, 10. 1794; *Launaea pinnatifida* Cassini; *Microhynchus sarmentosus* (Willdenow) Candolle.

Herbs, perennial, rosulate, creeping, glabrous. Taproot with trailing shoot-bearing lateral roots. Stems several, flagelliform, creeping, 20–90 cm, branched; nodes 4–15 cm apart, with adventitious roots and secondary leaf rosettes. Rosette leaves spatulate, 3–8 × 0.6–1 cm, sinuate-dentate to pinnately lobed, attenuate toward base, margin weakly to distinctly denticulate, apex acute, obtuse, or rounded. Capitulum solitary, terminating secondary leaf rosettes along stems, with usually 14–18 florets; peduncle wiry, 1–3 cm. Involucre cylindric, 1.1–1.4 cm. Phyllaries with distinct white scarious margin, apex acute to obtuse; outer phyllaries triangular-ovate to linear-lanceolate, longest ca. 1/2 as long as inner phyllaries; inner phyllaries 8. Achenes weakly dimorphic, brownish to blackish, columnar to cylindric, 3–5 mm; outer achenes with 5 thick soft ribs, smooth, apex pointed to subtruncate; inner achenes with 4 ribs. Pappus 4–8 mm, caducous with pappus disk. Fl. and fr. Jun–Sep. $2n = 18$.

Open sandy coastal areas just above high tide mark. Guangdong, ?Guangxi, Hainan [India, Indonesia (Java), Myanmar, Sri Lanka, Thailand, Vietnam; E and SE Africa, W Australia].

63. *SONCHUS* Linnaeus, Sp. Pl. 2: 793. 1753.

苦苣菜属 ku ju cai shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, annual, biennial, or perennial. Stem erect, not or sparsely branched below synflorescence, leafy. Leaves pinnate to undivided. Synflorescence corymbiform or paniculiform, with few to numerous capitula. Capitula with usually 70–300 florets. Involucre campanulate to broadly campanulate, as peduncle often with stipitate glandular hairs and basally ± white tomentose. Phyllaries green, glabrous or glandular hairy; outer phyllaries in several series, gradually longer centripetally, ± imbricate with longest 1/2–3/4 as long as inner ones; inner phyllaries 8–15, ± equal in length, linear-lanceolate to linear. Receptacle naked. Florets yellow. Achene

brownish, ovoid to ellipsoid, compressed, narrowed toward both ends, with (4 or) 5 main ribs usually accompanied by 2 secondary ribs, smooth or transversely wrinkled. Pappus white, caducous or persistent, of numerous soft fine outer bristles intermixed with some thicker often \pm easily caducous inner bristles.

About 90 species in its wider circumscription: Africa, Asia, Australia, Europe, Pacific islands (New Zealand); five species (two introduced) in China.

The revised, wider circumscription of *Sonchus* is based on molecular phylogenetic analyses by S. C. Kim et al. (Molec. Phylogen. Evol. 44: 578–597. 2007) and includes several former segregates, which, however, are not present in China.

The main diversity of this genus is in E Africa, the W Mediterranean region, and the mid-Atlantic archipelagos.

- 1a. Achene distinctly oblanceolate in outline, strongly or distinctly compressed, space between slender ribs much wider than main ribs; annuals (or biennials).
 - 2a. Achene strongly compressed, \pm winged, smooth when fully mature; auricles of middle stem leaves rounded and appressed 4. *S. asper*
 - 2b. Achene distinctly compressed, not winged, distinctly wrinkled when fully mature; auricles of middle stem leaves usually acutely prostrate 5. *S. oleraceus*
- 1b. Achene narrowly ellipsoid, moderately to weakly compressed, space between ribs usually narrower than ribs; perennials.
 - 3a. Outer phyllaries triangular-ovate to lanceolate, 1.5–3 mm wide; peduncles and involucre never glandular hairy; pappus persistent, 1.1–1.2 cm 1. *S. brachyotus*
 - 3b. Outer phyllaries \pm linear-lanceolate, 1–2 mm wide; peduncles and involucre mostly glandular hairy or more rarely non-glandular; pappus persistent or caducous, 6–9 mm.
 - 4a. Pappus persistent; peduncles and involucre glandular hairy or not; achene \pm elliptic in cross section, with 1(or 2) weakly prominent main rib(s) on either face; plants with a taproot 2. *S. wightianus*
 - 4b. Pappus caducous \pm as a unit; peduncles and involucre always glandular hairy; achene \pm quadrangular in cross section, with 1 very strongly prominent main rib on either face; plants with a short thick rhizome 3. *S. palustris*

1. *Sonchus brachyotus* Candolle, Prodr. 7: 186. 1838.

长裂苦苣菜 *chang lie ku ju cai*

Sonchus arenicola Voroschilov; *S. arvensis* Linnaeus subsp. *arenicola* (Voroschilov) Voroschilov; *S. arvensis* f. *brachyotus* (Candolle) Kirpicznikov; *S. arvensis* subsp. *brachyotus* (Candolle) Kitamura; *S. brachyotus* var. *potaninii* Tzvelev; *S. cavaleriei* H. Léveillé; *S. chinensis* Fischer; *S. fauriei* H. Léveillé & Vaniot; *S. taquetii* H. Léveillé.

Herbs 30–100 cm tall, perennial. Taproot with shoot-bearing lateral roots. Stem usually unbranched below synflorescence, glabrous. Basal and lower stem leaves narrowly elliptic to oblanceolate, 5–20 \times 1–3(–5) cm, undivided or rarely pinnatifid to pinnatipartite, glabrous, base semamplexicaul to shortly auriculate clasping, margin denticulate and often sinuate-dentate, apex rounded, obtuse, or subacute; lateral lobes triangular to narrowly triangular if any. Middle and upper stem leaves similar to lower leaves but smaller. Synflorescence corymbiform, with few to several capitula. Capitula with very many (usually 170–300) florets; peduncle 0.5–7 cm, slender, glabrous or more rarely white tomentose apically and glabrescent. Involucre broadly campanulate, ca. 1.5 cm, glabrous or more rarely basally faintly white tomentose. Phyllaries mostly glabrous, apex acute; outer phyllaries triangular-ovate to lanceolate, 1.5–3 mm wide. Corolla 1.6–2.6 cm. Achene narrowly ellipsoid, 2–4 mm, subcompressed, with 1–3 main ribs on either face, weakly rugose. Pappus 1.1–1.2 cm, persistent. Fl. and fr. May–Sep. *2n* = 18.

Grassy slopes in mountains, by rivers, alkaline areas; 300–4000 m. ?Fujian, Gansu, Guangdong, Guangxi, Hebei, Heilongjiang, Henan, ?Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Qing-

hai, Shaanxi, Shandong, Shanxi, Sichuan, Xinjiang, Xizang, Yunnan, ?Zhejiang [Japan, Kazakhstan, Kyrgyzstan, Mongolia, SE Russia, Thailand].

The diploids *Sonchus brachyotus* and *S. wightianus* together with the diploid Mediterranean and SW to C Asian *S. maritimus* Linnaeus and the chiefly European polyploid *S. arvensis* Linnaeus (see also note under *S. wightianus*) form a group of closely related species. Identity and delimitation of *S. brachyotus*, *S. wightianus*, and *S. arvensis* (incl. *S. uliginosus* M. Bieberstein) had long been misunderstood, before Boulos (Bot. Not. 126: 155–196. 1973) clarified their taxonomy. Due to the confusion in the past, the distribution of *S. brachyotus* in China is probably still incompletely known. Two conceptual problems surrounded this species. 1) The name *S. transcaspicus* Nevski was applied (e.g., FRPS 80(1): 66. 1997) for plants of this group with glabrous, non-glandular involucre and undivided leaves, and that species was considered as widely distributed in China, except for the southeast. *Sonchus transcaspicus*, however, is a name coined for C Asian populations of *S. maritimus* (see, e.g., Kirpicznikov, Fl. URSS 29: 244–260. 1964). The alleged minor differences in leaf shape are not consistent and do not justify the recognition of two taxonomic entities, as has been concluded already by Boulos (loc. cit.) and more recently confirmed by Sennikov (Bot. Zhurn. 85(12): 90–94. 2000). The easternmost occurrences of *S. maritimus*/*S. transcaspicus* are in Tajikistan and Kyrgyzstan (according to Sennikov, loc. cit.) or, more likely, even further west in E Turkmenistan (Boulos, loc. cit.; Tzvelev, Rast. Tsentral. Azii 14b: 77. 2008). The species is also not given in the treatment of *Sonchus* for the immediately adjacent Chinese province of Xinjiang (C. H. An, Fl. Xinjiang. 5: 434–438. 1999). *Sonchus transcaspicus* sensu FRPS (80(1): 66. 1997) instead refers to the frequent undivided-leafy form of *S. brachyotus*. The latter species, like *S. arvensis* and in contrast to *S. maritimus*, does not actually have a rhizome, although often stated in the literature, but has lateral roots that produce new shoots even after the root system has been fragmented. Moreover, *S. maritimus*/*S. transcaspicus* is a species with glaucous leaves, smaller capitula with 80–150 florets, a corolla with the tube much shorter than the ligule, achene of 2–3 mm only, and

a caducous pappus. 2) The name *S. uliginosus* has been applied (e.g., FRPS 80(1): 68. 1997) for plants of this group with glabrous, non-glandular involucre and pinnately lobed leaves with broadly triangular-obovate to semiorbicular lateral lobes. For the most part, this includes plants of *S. wightianus* (also referred to as *S. wightianus* subsp. *wallichianus*). Some records, however, from the northern provinces especially, apparently refer to the rarer pinnately leafy form of *S. brachyotus*.

2. *Sonchus wightianus* Candolle, Prodr. 7: 187. 1838.

苣荬菜 ju mai cai

Sonchus lingianus C. Shih; *S. picris* H. Léveillé & Vaniot; *S. wallichianus* Candolle; *S. wightianus* subsp. *wallichianus* (Candolle) Boulos.

Herbs 30–150 cm tall, perennial, with a taproot. Stem branched from base or higher, glabrous below synflorescence. Basal and lower stem leaves oblanceolate to elliptic, 6–24 × 1.5–6 cm, undivided or pinnatifid to pinnatipartite, glabrous, base narrowed (in basal leaves) to auriculate claspings (in lower stem leaves), margin denticulate to mucronately dentate, apex obtuse to acute; lateral lobes if present 2–5 pairs, lanceolate, ovate, semiorbicular, or sometimes triangular-ovate; terminal lobe narrowly ovate to elliptic, ± large, apex obtuse to acuminate. Middle and upper stem leaves elliptic to lanceolate, smaller, otherwise similar to lower leaves. Synflorescence corymbiform, with several to many capitula. Capitula with very many (usually 180–300) florets; peduncle slender, apically white tomentose, densely glandular hairy or non-glandular. Involucre broadly campanulate, 1.2–1.5 cm, base ± white villous to tomentulose and glandular hairy or not. Phyllaries with or without glandular hairs, apex long acuminate; outer phyllaries lanceolate, 1–1.5 mm wide. Corolla 1.2–1.4 cm. Achene narrowly ellipsoid, 3.5–4.5 mm, moderately compressed, ± elliptic in cross section, weakly rugose, between lateral ribs and with 1 (or 2) weakly prominent main rib(s) and several secondary ribs on either face. Pappus 6–9 mm, ± persistent. Fl. and fr. Jan–Oct. $2n = 18$.

Grasslands on mountain slopes, grasslands in forests, forest margins, thickets, beside fields, moist places or near water, wastelands on mountain slopes, gravelly areas by rivers; 300–2300 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangsu, Ningxia, Shaanxi, Sichuan, Taiwan, Xinjiang, Xizang, Yunnan, Zhejiang [NE Afghanistan, Bhutan, India, Indonesia (Java), Kashmir, Laos, Malaysia (Peninsular), Myanmar, Nepal, N Pakistan, N Philippines (Luzon), Sri Lanka, N Thailand, N Vietnam].

Sonchus wightianus has frequently been misidentified with the habitually similar *S. arvensis*, which is chiefly restricted to Europe (but also introduced to North America) and a hybridogenous species, in which a tetraploid ($2n = 36$) *S. arvensis* subsp. *uliginosus* (M. Bieberstein) Nyman (with non-glandular capitula and peduncles) and a hexaploid ($2n = 54$) *S. arvensis* subsp. *arvensis* (with glandular capitula and peduncles) are distinguished. *Sonchus arvensis* is probably derived from hybridization, in which *S. brachyotus* and/or *S. wightianus* on the maternal side and *S. maritimus* and/or *S. crassifolius* Pourret ex Willdenow on the paternal side are involved (S. C. Kim et al., Molec. Phylogen. Evol. 44: 576–597. 2007). The diploid *S. wightianus* has adaxially often reddish marginal florets and does not, in contrast to *S. arvensis* and *S. brachyotus*, produce shoot-bearing roots. Also, in *S. wightianus* plants with non-glandular or glandular peduncles and capitula

occur. The former have been distinguished as *S. wightianus* subsp. *wallichianus* and referred to in FRPS (80(1): 66. 1997) as *S. uliginosus* (= *S. arvensis* subsp. *uliginosus*), but they seem to be neither geographically nor ecologically separated. Absence of glandular indumentum is a variation not uncommon in *Sonchus*, as in the case of *S. wightianus*, and apparently is without systematic value. *Sonchus lingianus*, described from China, is a mere form of *S. wightianus* with spatulate to narrowly elliptic, undivided leaves.

3. *Sonchus palustris* Linnaeus, Sp. Pl. 2: 793. 1753.

沼生苦苣菜 zhao sheng ku ju cai

Herbs to 1.8 m tall, perennial. Rhizome short, 4–5 cm thick. Stems stout, base ca. 3 cm in diam., branched apically. Lower stem leaves sessile, oblanceolate to lanceolate, 15–35 × 5–20 cm, undivided to pinnatipartite, glabrous, base sagittately clasping, margin denticulate, apex acuminate; lateral lobes if present 1–3 pairs, lanceolate, apex acute; terminal lobe triangular to triangular-lanceolate. Middle and upper stem leaves lanceolate; uppermost stem leaves reduced, linear-lanceolate to linear. Synflorescence corymbiform to paniculately corymbiform, with many capitula. Capitula with many (usually 70–90) florets; peduncle slender, densely glandular hairy. Involucre campanulate, to 1.5 cm. Phyllaries abaxially glandular hairy, apex acute to acuminate; outer phyllaries linear-lanceolate, 1–2 mm wide; inner phyllaries linear-lanceolate. Corolla ca. 1.2 cm. Achene narrowly ellipsoid, ca. 4 mm, weakly compressed, ± quadrangular in cross section, weakly rugose, between lateral ribs usually with 1 very strongly prominent main rib and several secondary ribs on either face. Pappus 7–8 mm, caducous ± as a unit. Fl. and fr. Jun–Sep. $2n = 18$.

By water and lakes; 400–900 m. Xinjiang [Kazakhstan, Kyrgyzstan, W Russia, Tajikistan, Turkmenistan, Uzbekistan; Europe].

4. *Sonchus asper* (Linnaeus) Hill, Herb. Brit. 1: 47. 1769.

花叶滇苦菜 hua ye dian ku cai

Sonchus oleraceus Linnaeus var. *asper* Linnaeus, Sp. Pl. 2: 794. 1753; *S. spinosus* Lamarck.

Herbs 20–50 cm tall, annual. Stem usually unbranched and glabrous below synflorescence. Basal and lower stem leaves extremely variable, obovate, spatulate, or elliptic, 7–13 × 2–5 cm, undivided or ± irregularly pinnatisect, glabrous, adaxially dark green and ± glossy, base attenuate and ± auriculate, margin usually densely spinulosely dentate, apex acute, acuminate, or obtuse; lateral lobes ± triangular, semiorbicular, or elliptic. Middle and upper stem leaves spatulate to lanceolate, base auriculate claspings with conspicuous rounded and appressed auricles, otherwise similar to lower leaves. Synflorescence densely corymbiform, with few to some capitula. Capitula with many florets; peduncle 0.5–5 cm, slender, glabrous or densely glandular hairy. Involucre ± campanulate, ca. 1.2 cm. Phyllaries abaxially glabrous or more rarely glandular hairy, apex acute; outer phyllaries narrowly lanceolate, 1–2 mm wide. Corolla ca. 1 cm. Achene ± broadly obcolumnar, 2–3 mm, strongly compressed, ± winged, between lateral ribs usually with 3 slender ribs on either side, space between slender ribs much wider than ribs, smooth with only lateral ribs usually antrorsely finely spinulose. Pappus ca. 7 mm, ± caducous. Fl. and fr. May–Oct. $2n = 18$.

Mountain slopes, forest margins, by water, field margins, ruderal areas; 1500–3700 m. Naturalized in Guangxi, Hubei, Jiangsu, Shandong, Sichuan, Taiwan, Xinjiang, Xizang, and Zhejiang [presumably originating from Europe and Mediterranean region].

Sonchus asper is naturalized in areas adjacent to China including Afghanistan, Bhutan, India, Japan, Kashmir, Kazakhstan, Korea, Kyrgyzstan, Nepal, Pakistan, Russia, Tajikistan, Thailand, Turkmenistan, Uzbekistan, and Vietnam. The species is also naturalized in sub-Saharan Africa, Asia, Australia, New Guinea, North and South America, and Pacific islands (New Zealand).

5. *Sonchus oleraceus* Linnaeus, Sp. Pl. 2: 794. 1753.

苦苣菜 *ku ju cai*

Sonchus ciliatus Lamarck; *S. mairei* H. Léveillé (1913), not H. Léveillé (1915).

Herbs 40–150 cm tall, annual or sometimes biennial. Stem below synflorescence simple or branched, glabrous. Basal and lower stem leaves with basal portion petiole-like and attenuate, mostly smaller than middle stem leaves, otherwise similar. Middle and upper stem leaves extremely variable, elliptic, oblanceolate, or lanceolate, 6–20 × 2–9 cm, almost entire to ± irregularly pinnatisect, soft, glabrous, adaxially dull green, base auriculate clasping with auricles usually acutely prostrate,

margin ± coarsely spinulosely dentate, apex acute; lateral lobes triangular to elliptic, usually recurved, apex acute to acuminate; terminal lobe larger than others, broadly triangular, broadly hastate, or obovate-cordate. Synflorescence shortly corymbiform or racemiform, with few to several capitula. Capitula with many florets; peduncle 0.5–3(–5) cm, slender, glabrous, glandular hairy, or apically white tomentose. Involucre ± campanulate, 1–1.2 cm. Phyllaries glabrous or with few glandular hairs, apex ± obtuse; outer phyllaries triangular to narrowly lanceolate, 1–3 mm wide. Corolla 1–2 cm. Achene obcolumnar, 2.5–4 mm, distinctly compressed, between lateral ribs with 3(–5) slender ribs on either side, space between slender ribs much wider than ribs, distinctly rugose when fully mature. Pappus 6–8 mm, ± persistent. Fl. and fr. May–Dec. $2n = 32$.

Mountain slopes, forests, forest margins, fields, near water, open land, ruderal areas; 1700–3200 m. Naturalized in Anhui, Fujian, Gansu, Guangxi, Guizhou, Hainan, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Liaoning, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Xinjiang, Xizang, Yunnan, and Zhejiang [presumably originating from Europe and Mediterranean region].

Sonchus oleraceus is naturalized in all countries neighboring China and is anthropogenically distributed almost worldwide.

The entire plants are used medicinally.

64. *CHONDRILLA* Linnaeus, Sp. Pl. 2: 796. 1753.

粉苞菊属 *fen bao ju shu*

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, perennial [or rarely annual], with or without basal leaf rosette, often broomlike, glabrous or with simple bristles, arachnoid hairy, or tomentose. Synflorescence of individual axes in broomlike plants sparsely racemiform or with a single terminal capitulum. Capitula with usually 5–12 florets. Involucre narrowly cylindric. Phyllaries glabrous, arachnoid hairy, or with simple bristles; outer phyllaries few, only slightly longer centripetally, longest ca. 1/4 as long as inner ones; inner phyllaries 5(–7) or ca. 8, ± equal in length, ± linear-lanceolate. Receptacle naked. Florets yellow. Achene body subcylindric, somewhat narrowed toward base, with 5 main ribs, each rib usually divided into 3 secondary ribs, apically or from middle with tubercles or scales, apically usually with a corona of 5 entire or 3-lobed ± membranous scales; beak usually present, short and stout to longer and filiform, when fully mature with or without fine transversal articulation preforming rupture of beak. Pappus white, simple, of scabrid bristles.

About 30 species: mostly in C and SW Asia and the Mediterranean region; ten species in China.

The noxious weed *Chondrilla juncea* Linnaeus has been introduced to Australia, North and South America, and Pacific islands (New Zealand) but has not yet been reported from China.

- 1a. Capitula with 5 or 6 florets; inner phyllaries 5(–7).
 - 2a. Achene with a conspicuous 0.5–1.5 mm beak, body with well-developed apical corona of scales 9. *C. pauciflora*
 - 2b. Achene shortly attenuate into a rudimentary stout beak of 0.1–0.3 mm, body without apical corona of scales or corona at most very indistinct 10. *C. ambigua*
- 1b. Capitula with 9–12 florets; inner phyllaries ca. 8.
 - 3a. Beak of mature achene without fine transversal articulation preforming rupture of beak; plants rosulate but rosette leaves withered at anthesis.
 - 4a. Stem leaves linear-lanceolate to linear, to 0.6 cm wide, subglabrous; stem and branches glabrous; achene body with corona of 5 variably shaped entire to weakly 3-lobed scales to 0.5 mm 1. *C. brevirostris*
 - 4b. Stem leaves lanceolate to broadly ovate, 1–3 cm wide, pubescent; stem and branches arachnoid pubescent to tomentose; achene body with corona of 5 linear-lanceolate, entire to sometimes 3-lobed, and acute scales to 1 mm 2. *C. aspera*
 - 3b. Beak of mature achene with fine transversal articulation preforming rupture of beak; plants never rosulate.
 - 5a. Achene beak articulation approximately in its middle; inner phyllaries dark green or blackish, bristles blackish if present.
 - 6a. Achene body below corona smooth or with isolated tubercles, beak constricted at articulation 3. *C. phaeocephala*
 - 6b. Achene body below corona with few scales, beak not constricted at articulation 4. *C. ornata*

- 5b. Achene beak articulation distinctly below its middle, near its base, or below or slightly above upper edge of corona; inner phyllaries green, light green, or grayish green, bristles pale if present.
- 7a. Corona scales of achene of approximately quadrangular shape, upper margin weakly 3-lobed or entire.
- 8a. Achene body below corona usually without scales or more rarely with few very small toothlike scales, beak 0.8–1.5 mm 5. *C. piptocoma*
- 8b. Achene body below corona with few rows of conspicuous quadrangular scales similar to corona scales, beak 1–2.5 mm 6. *C. laticoronata*
- 7b. Corona scales of achene distinctly triangular and undivided or deeply divided with distinctly triangular lobes.
- 9a. Corona scales of achene deeply and \pm equally to very unequally (with dominating middle lobe) 3-lobed; achene body below corona with few rows of tubercles and narrow scales; beak 1.3–3(–4) mm, articulation below its middle and above upper edge of corona terminating basal conical portion 7. *C. leiosperma*
- 9b. Corona scales of achene undivided and narrowly triangular; achene body below corona with few rows of short and wide scales; beak 1.2–2.3 mm, articulation at its base near upper edge of corona 8. *C. rouillieri*

1. *Chondrilla brevirostris* Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 3: 32. 1837.

短喙粉苞菊 duan hui fen bao ju

Chondrilla filifolia Iljin.

Herbs 30–60 cm tall, perennial, rosulate, becoming broom-like. Stem strongly erect-spreadingly branched from base, basally somewhat setaceous otherwise glabrous; branches slender, virgate. Rosette leaves spatulate to elliptic, 7–11 \times 0.5–1.5 cm, withered at anthesis, runcinately pinnate, glabrous or abaxially with sparse rigid hairs. Lower and middle stem leaves lanceolate to linear, 2–11 cm \times 1–5 mm, weakly but \pm sharply incised or entire, glabrous or abaxially with sparse rigid hairs. Capitula with usually 9–12 florets. Involucre 1–1.2 cm, arachnoid hairy, occasionally with very few bristles. Phyllaries grayish green; outer phyllaries broadly triangular-ovate, longest ca. 2 mm; inner phyllaries 8. Achene body 4–5 mm, with a corona of 5 variably shaped entire to weakly 3-lobed erect scales of 0.2–0.5 mm, below corona with 1 to few rows of short rounded scales; beak 0.5–2.5 mm, without articulation. Pappus 6–9 mm. Fl. and fr. Jun–Sep. $2n = 15$.

Desert steppes, grasslands in forests; ca. 1300 m. Xinjiang [Kazakhstan, Kyrgyzstan, Russia (W Asian and E and S European parts)].

2. *Chondrilla aspera* Poiret, Encycl. Suppl. 2: 329. 1811.

硬叶粉苞菊 ying ye fen bao ju

Prenanthes aspera Schrader ex Willdenow, Sp. Pl. 3: 1539. Dec 1803, not Michaux (Mar 1803); *Chondrilla stricta* Ledebour; *Youngia aspera* (Poiret) Steudel.

Herbs 60–110 cm tall, perennial, rosulate. Stem erect, branched particularly higher up, basally densely hirsute otherwise grayish white tomentose. Rosette leaves and lower stem leaves narrowly obovate to oblanceolate, 6–18 \times to 5 cm, withered at anthesis, runcinately pinnate, leathery, abaxially with arachnoid hairs and with long bristles on veins. Middle and upper stem leaves broadly ovate to lanceolate, base subamplexicaul, margin dentate, smaller than lower stem leaves but otherwise similar. Synflorescence paniculiform. Capitula with

usually 9–12 florets. Involucre 1.2–1.4 cm, arachnoid hairy. Phyllaries grayish green; outer phyllaries triangular-ovate, longest ca. 2 mm; inner phyllaries 8, usually \pm with bristles on midvein. Achene body 3–4 mm, apically with a corona of 5 unlobed or sometimes to \pm 3-lobed erect linear-lanceolate scales to 1 mm, below corona with tubercles and short scales in several rows; beak (1–)3–4(–5) mm, without articulation. Pappus 6–8 mm. Fl. and fr. Jul–Sep.

Mountain slopes; 1100–1400 m. Xinjiang [Kazakhstan, Kyrgyzstan, SC Russia, Tajikistan].

Chondrilla canescens Karelin & Kirilov, which is distinguished from *C. aspera* chiefly by 3-lobed corona scales of the achene body (Leonova, Fl. URSS 29: 562–563. 1964), was also treated in FRPS (80(1): 296. 1997) as a species from Xinjiang but was not included by C. H. An (Fl. Xinjiang. 5: 430. 1999). According to Tzvelev (Rast. Tsentral. Azii 14b: 84. 2008) the two are probably conspecific. We follow C. H. An, treating the Chinese plants all as *C. aspera*.

3. *Chondrilla phaeocephala* Ruprecht, Zap. Imp. Akad. Nauk 14: 59. 1869.

暗粉苞菊 an fen bao ju

Chondrilla maracandica Bunge.

Herbs 30–70 cm tall, perennial, broomlike. Stem basally erect-spreadingly and higher up divaricately branched; branches slender, glabrous or arachnoid hairy, \pm leafy. Lower stem leaves narrowly elliptic, 4–4.5 \times 0.2–1 cm, early deciduous, margin subentire to weakly runcinately dentate. Middle and upper stem leaves linear-elliptic, linear, or subfiliform, 2–4 cm \times 0.5–1.5 mm, margin entire. Capitula with usually 10–12 florets. Involucre 1.1–1.2 cm, arachnoid hairy and with or without blackish bristles. Phyllaries dark green to blackish; outer phyllaries triangular-ovate to lanceolate, longest ca. 2.5 mm; inner phyllaries 8, abaxially with or without long bristles along midvein. Achene body 3–5 mm, with a corona of 5 short unlobed to \pm unequally 3-lobed (middle lobe longest) erect scales of ca. 0.2 mm, below corona smooth or with isolated tubercles, sometimes corona inconspicuous or absent; beak stout, 0.8–2.3 mm, constricted and with distinct fine articulation approximately in its middle. Pappus 6–7 mm. Fl. and fr. Jun–Sep.

Gravelly areas in deserts; 900–4000 m. Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Tajikistan, Uzbekistan].

Chondrilla maracandica, treated as a species of the flora of Xinjiang by C. H. An (Fl. Xinjiang. 5: 430. 1999; see also Leonova, Fl. URSS 29: 578. 1964; Tzvelev, Rast. Tsentral. Azii 14b: 84. 2008), appears not convincingly distinct from *C. phaeocephala* and is here tentatively considered as conspecific.

4. *Chondrilla ornata* Iljin, Bjull. Otdel. Kaučuk. 3: 43. 1930.

中亚粉苞菊 zhong ya fen bao ju

Herbs 40–70 cm, perennial, broomlike. Stem strongly branched from base, basally arachnoid hairy; branches yellowish green, slender, virgate, glabrous, ± leafy. Lower stem leaves narrowly elliptic to linear, early deciduous, abaxially with bristles on midrib and at margin, margin denticulate. Middle and upper stem leaves filiform, 1–3 cm × ca. 1 mm, glabrous, margin entire. Capitula with ca. 11 florets. Involucre ca. 1.1 cm, scattered arachnoid hairy. Phyllaries dark green; outer phyllaries triangular-ovate, longest ca. 1.5 mm; inner phyllaries 8. Achene body 3–5 mm, apically with a corona of 5 wide entire to weakly and obtusely 3-lobed scales of 0.1–0.2 mm, below corona with few further scales; beak stout, 0.5–1 mm, with fine articulation approximately in its middle. Pappus 5–7 mm. Fl. and fr. Jul–Sep. $2n = 20$.

Rocky gravelly slopes; 400–1000 m. Xinjiang [Kyrgyzstan].

No material of *Chondrilla ornata* has been seen by the present authors. The description is based on Iljin (loc. cit.), Leonova (Fl. URSS 29: 579. 1964), and C. H. An (Fl. Xinjiang. 5: 429. 1999).

5. *Chondrilla piptocoma* Fischer, C. A. Meyer & Avé-Lallemant, Index Sem. Hort. Petrop. 8: 54. 1842.

粉苞菊 fen bao ju

Chondrilla piptocoma subsp. *soongarica* (Stscheglejew) Iljin; *C. soongarica* Stscheglejew.

Herbs 35–120 cm tall, perennial, ± broomlike. Stem basally erect-spreadingly and higher up divaricately branched; branches slender, densely arachnoid hairy to more rarely ± glabrous, ± leafy. Lower stem leaves narrowly oblanceolate, 3.5–7 cm × ca. 4 mm, early deciduous, margin runcinately pinnate or sparsely dentate. Middle and upper stem leaves linear to filiform, 4–6 cm × 0.5–1 mm, glabrous or arachnoid hairy, margin entire. Capitulum with 9–12 florets. Involucre 1–1.3 cm, ± densely arachnoid hairy. Phyllaries grayish to light green; outer phyllaries narrowly triangular-ovate, longest ca. 2 mm; inner phyllaries 8. Achene body 3–5 mm, with ± quadrangular corona scales with margin weakly 3-lobed or entire, below corona without scales or with few very small toothlike scales; beak 0.8–1.5 mm, with fine articulation near its base below or slightly above upper edge of corona. Pappus 6–8 cm. Fl. and fr. Jun–Sep. $2n = 10$.

Gravelly areas on floodplains; 600–3300 m. Xinjiang [Kazakhstan, SC Russia].

According to Iljin (Bjull. Otdel. Kaučuk. 3: 36. 1930) and Leonova (Fl. URSS 29: 574. 1964) the achene body below the corona in *Chondrilla piptocoma* is without or with few scales only. Chinese material with rather well-developed scales below the corona but with a

short, stout beak approaches and has been treated as *C. laticoronata* (see also FRPS 80(1): 296. 1997), necessitating a reassessment of the delimitation between both species.

6. *Chondrilla laticoronata* Leonova, Fl. URSS 29: 754. 1964.

宽冠粉苞菊 kuan guan fen bao ju

Herbs 20–60 cm tall, perennial, ± broomlike. Stem erect-spreadingly branched from base, basally usually densely arachnoid hairy and sometimes with sparse rigid hairs; branches light green, slender, ± leafy. Leaves glabrous or with arachnoid hairs. Lower stem leaves narrowly lanceolate, ca. 3 cm × 3–7 mm, early deciduous, margin entire or weakly dentate. Middle and upper stem leaves linear, narrowly linear, or almost filiform, 1.5–2.5(–5) cm × 0.5–2 mm, margin entire. Capitula with 9–11 florets. Involucre 1–1.3 cm, ± white tomentose. Phyllaries whitish grayish green; outer phyllaries narrowly triangular-ovate, longest ca. 2 mm; inner phyllaries 8, sometimes with a few pale bristles on midvein. Achene body 3.5–4.5 mm, with approximately quadrangular corona scales with truncate and entire to somewhat erose margin, below corona with few rows of conspicuous quadrangular scales similar to corona scales; beak 1–2.5 mm, with fine articulation near its base below or slightly above upper edge of corona. Pappus white, 6–7 mm. Fl. and fr. Jul–Sep.

Gravelly areas; 1000–2200 m. Xinjiang [Kazakhstan, SC Russia].

The delimitation between *Chondrilla laticoronata* and *C. piptocoma* should be reassessed. See note under the latter species, above.

7. *Chondrilla leiosperma* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 14: 456. 1841.

北疆粉苞菊 bei jiang fen bao ju

Chondrilla articulata L. E. Rodin; *C. brevicollis* Iljin; *C. coronifera* Iljin.

Herbs 30–120 cm tall, perennial, ± broomlike. Stem erect-spreadingly branched at base, basally ± densely arachnoid hairy, sometimes with few rigid hairs; branches slender, rather sparsely branched, glabrous or pubescent, ± leafy. Lower stem leaves narrowly elliptic to lanceolate, 3–10 × 0.4–1.2 cm, early deciduous, glabrous or arachnoid hairy, margin dentate to weakly ± runcinately pinnate to more rarely almost entire. Middle and upper stem leaves narrowly elliptic, narrowly lanceolate, or linear, 1–5(–7) cm × 1–2 mm, glabrous or with arachnoid hairs, margin entire. Capitula with 9–11 florets. Involucre 1–1.3 cm, arachnoid hairy. Phyllaries grayish green; outer phyllaries triangular-ovate, longest ca. 3 mm; inner phyllaries 8, abaxially sometimes with pale bristles on midvein. Achene body 3–5 mm, with corona scales deeply and ± equally to very unequally 3-lobed with middle lobe then dominating, below corona with few rows of tubercles and narrow scales; beak 1.3–3(–4) mm, with fine articulation below its middle and above upper edge of corona terminating basal conical portion. Pappus 5–8 mm. Fl. and fr. May–Sep. $2n = 15$.

Mountain slopes; 200–1500 m. Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Tajikistan, Uzbekistan].

8. *Chondrilla rouillieri* Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 14: 456. 1841.

基叶粉苞菊 ji ye fen bao ju

Herbs 40–90 cm tall, perennial. Stem erect, branched particularly higher up or more rarely from base, basally usually arachnoid hairy and with sparse rigid hairs or more rarely glabrous; branches slender, virgate, glabrous or sometimes apically sparsely arachnoid hairy. Lower stem leaves narrowly elliptic to narrowly lanceolate, 4–6 × 0.3–0.6 cm, early deciduous, with bristles on margin and abaxially on midvein, margin remotely dentate. Middle and upper stem leaves linear to almost filiform, 0.5–5 × 0.1–0.4(–0.6) cm, glabrous, margin entire. Capitula with 9–11 florets. Involucre 1–1.3 cm, densely arachnoid hairy. Phyllaries grayish green to light green; outer phyllaries triangular-ovate, longest ca. 2 mm; inner phyllaries 8, sometimes with a few bristles on midvein. Achene body 3.5–4(–5) mm, with corona scales narrowly triangular and undivided, below corona with few rows of short and wide scales; beak 1.2–2.3 mm, with fine articulation at its base near upper edge of corona. Pappus 6–7 mm. Fl. and fr. Jun–Sep. $2n = 15$.

Gravelly areas in river valleys, sandy soil, forests; 700–900 m. Xinjiang [Kazakhstan, SC Russia].

9. *Chondrilla pauciflora* Ledebour, Fl. Altaic. 4: 148. 1833.

少花粉苞菊 shao hua fen bao ju

Chondrilla kossinskyi Iljin; *C. saisanensis* Iljin; *C. squamata* Iljin; *C. thoracifera* Iljin.

Herbs 40–110 cm tall, perennial, broomlike, basally sometimes woody. Stem ± intricately basally erect-spreadingly and higher up divaricately branched; branches slender, glabrous or sometimes apically indistinctly arachnoid hairy, ± leafy. Lower stem leaves lanceolate, 2.5–3.5 × 0.2–0.6 cm, early deciduous, glabrous, margin entire. Middle and upper stem leaves narrowly lanceolate to linear, 1–3 cm × 0.3–1.5 mm, early deciduous, glabrous, margin entire. Capitula with 5(–7) florets. Involucre 1.1–1.5 cm, sparsely arachnoid hairy especially basally. Phyllaries green to dark green; outer phyllaries broadly triangular-

ovate, 1–2 mm; inner phyllaries 5(–7). Achene 5–7.5 mm; body apically with a corona of 5 erect 3-lobed to irregularly lobed scales of (0.1–)0.2–0.3 mm with lobes of ± equal length, below with 1 or 2 series of tubercles and/or scales; beak stout, 0.5–1.5(–2) mm, without articulation. Pappus 7–9 mm. Fl. and fr. May–Sep. $2n = 15$.

Gravel steppes; 500–1500 m. Xinjiang [Kazakhstan, Russia (E European part), Uzbekistan].

C. H. An (Fl. Xinjiang. 5: 433. 1999) also includes for Xinjiang *Chondrilla macrocarpa* Leonova, a species otherwise only known from Kyzyl Kum and distinguished from *C. ambigua* by its achene with a body of up to 1.1 cm. The corresponding material has not been seen by the authors, but from the distribution this report appears very questionable (see also Tzvelev, Rast. Tsentral. Azii 14b: 86. 2008); also, from the description given by C. H. An it seems that a confusion probably exists with material of *C. pauciflora*, perhaps with rather indistinctly developed corona.

10. *Chondrilla ambigua* Fischer ex Karelin & Kirilov, Bull. Soc. Imp. Naturalistes Moscou 15: 398. 1842.

沙地粉苞菊 sha di fen bao ju

Herbs 40–100 cm tall, perennial, broomlike, basally sometimes woody. Stem basally erect-spreadingly and higher up densely and intricately divaricately branched; branches slender, glabrous, ± leafy. Lower stem leaves linear-lanceolate to lanceolate, 3–7 × 0.2–0.5 cm, early deciduous, glabrous, margin entire or sometimes very scarcely dentate, apex acute. Middle and upper stem leaves linear-lanceolate to filiform, usually shorter and only 1–1.5 mm wide, otherwise like lower stem leaves. Capitula with ca. 5 florets. Involucre 1.2–1.4 cm, glabrous or sparsely arachnoid hairy especially basally. Phyllaries green to yellowish green; outer phyllaries broadly triangular-ovate, 1–2 mm; inner phyllaries 5. Achene cylindric, 5–7 mm, without or very faintly with scales or tubercles, without apical corona of scales, apically shortly attenuate into a rudimentary stout beak of 0.1–0.3 mm without articulation. Pappus 6–8 mm. Fl. and fr. May–Sep. $2n = 10$.

Sand dunes, gravel and loess areas; 300–800 m. Xinjiang [Kazakhstan, Russia (S European part), Turkmenistan, Uzbekistan].

65. CREPIS Linnaeus, Sp. Pl. 2: 805. 1753.

还阳参属 huan yang shen shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Barkhausia Moench; *Berinia* Brignoli; *Hieracioides* Vaillant; *Lepicaune* Lapeyrouse; *Soyeria* Monnier.

Herbs, perennial, biennial, or annual, rhizomatous or with a taproot. Stems leafy or leafless. Leaves pinnate or not divided, margin entire or toothed. Synflorescence corymbiform, paniculiform, or racemiform, rarely a solitary capitulum. Capitula erect, medium to large in size. Involucre cylindric to campanulate. Phyllaries in several series; outer phyllaries ± imbricate, centripetally gradually longer, longest 1/4–2/3 or more as long as inner ones; inner phyllaries usually equal in length, linear-lanceolate, abaxially usually with simple and/or glandular hairs, rarely glabrous, adaxially glabrous or with appressed silky hairs. Receptacle naked [or more rarely paleate or with bristles]. Florets yellow [or more rarely reddish purple]. Achene cylindric to fusiform, with 10–20 equal finely spinulose or smooth and glabrous ribs, apex distinctly attenuate, constricted, or beaked. Pappus white to pale yellowish, soft to rigidulous, scabrid, persistent or caducous.

About 200 species: Africa, Asia, Europe, North America; 18 species (five endemic) in China.

1a. Plants with a horizontal, vertical, or oblique rhizome.

2a. Leaf blade of at least some leaves pinnately lobed, otherwise stem leafless; stem leafless or leafy.

- 3a. Stem leafless or almost so.
- 4a. Phyllaries abaxially densely with white arachnoid hairs, and stiff, greenish, glandular hairs along midvein; anther tube 1–2 mm 1. *C. multicaulis*
- 4b. Phyllaries abaxially sparsely with white arachnoid hairs, and with blackish glandular hairs along midvein; anther tube 2–3 mm 2. *C. elongata*
- 3b. Stem leafy with leaves ± clasping stem.
- 5a. Involucre 7–9 mm, abaxially with short blackish glandular hairs and often with setaceous simple hairs; achene 3.5–4 mm 3. *C. lyrata*
- 5b. Involucre 10–13 mm, abaxially glabrous or sparsely white hairy (especially at apex) or with black long simple hairs on midvein; achene 4–6 mm 6. *C. coreana*
- 2b. Leaf blade not divided and stem always leafy.
- 6a. Involucre 1.4–1.6 cm or longer.
- 7a. Stem especially apically with white arachnoid and with stiff subulate greenish hairs; leaf blade margin irregularly and coarsely toothed; involucre abaxially densely with pale stiff subulate hairs especially on midvein 5. *C. sibirica*
- 7b. Stem sparsely apically arachnoid hairy and densely so under capitula, also with long dark green to blackish hairs; leaf blade margin subentire; involucre abaxially white arachnoid hairy and with dark green to blackish long hairs 9. *C. chrysantha*
- 6b. Involucre 0.8–1.3 cm.
- 8a. Involucre 1–1.3 cm, abaxially glabrous to sparsely white hairy (especially at apex) or with black long simple hairs on midvein 6. *C. coreana*
- 8b. Involucre 0.8–1 cm, abaxially with stipitate blackish glandular hairs on midvein 17. *C. shihii*
- 1b. Plants without rhizomes but with a taproot.
- 9a. Synflorescence racemiform to very narrowly paniculiform with some to numerous capitula 14. *C. napifera*
- 9b. Synflorescence of a solitary capitulum or corymbiform and of 2 to numerous capitula.
- 10a. Inner phyllaries adaxially appressed hairy (as seen with a lens).
- 11a. Stem leafy; leaves sagittately clasping stem, margin of upper stem leaves revolute; synflorescence of some to many capitula; involucre 0.7–0.9 cm 4. *C. tectorum*
- 11b. Stem leafless or sparsely leafy; leaves not clasping stem, margin not revolute; synflorescence of a solitary capitulum or of few capitula; involucre 0.9–1.5 cm.
- 12a. Involucre 0.9–1.1 cm; phyllaries abaxially with white arachnoid hairs along midvein but without thicker yellow hairs 7. *C. oreades*
- 12b. Involucre 1–1.5 cm; phyllaries abaxially with ± white arachnoid hairs and especially along midvein with thicker yellowish glandular or partly non-glandular hairs 8. *C. crocea*
- 10b. Inner phyllaries adaxially glabrous (as seen with a lens).
- 13a. Plants only with well-developed basal leaves or with basal leaves and lower stem leaves well developed and these larger than upper stem leaves, largest leaves oblanceolate to elliptic and 2–5 cm wide.
- 14a. Plants subcaulescent, 3–5 cm tall 18. *C. tianshanica*
- 14b. Plants with well-developed stems, 20–60 cm tall.
- 15a. Stems leafless or almost so with stem leaves (if present) much reduced and not clasping stem 15. *C. subscaposa*
- 15b. Stems with well-developed leaves clasping stem 16. *C. darvazica*
- 13b. Basal leaves or lower stem leaves reduced, linear-subulate, triangular, or bractlike, middle and upper stem leaves well developed, largest stem leaves lanceolate to linear and 1–25 mm wide.
- 16a. Middle and upper stem leaves lanceolate, elliptic, or narrowly elliptic-lanceolate, 0.3–2.5 cm wide 10. *C. phoenix*
- 16b. Middle and upper stem leaves linear, 1–10 mm wide.
- 17a. Leaf blade soft in texture, dark green; stems smooth and dark green; capitula with 18–30 florets 11. *C. bodinieri*
- 17b. Leaf blade rigid in texture, usually pale yellowish green; stems angular and pale green; capitula with 7–12 florets (only exceptionally more).
- 18a. Plants sparsely to moderately and divaricately branched from base, above middle, or at apex; stem leaves to 8 cm 12. *C. rigescens*
- 18b. Plants strongly and fastigiately branched from base or below middle; stem leaves to 3 cm 13. *C. lignea*

1. *Crepis multicaulis* Ledebour, Icon. Pl. 1: 9. 1829.

多茎还阳参 duo jing huan yang shen

Aracium multicaule (Ledebour) D. Dietrich; *Crepis multicaulis* subsp. *congesta* (Regel & Herder) Babcock; *C. multicaulis* var. *congesta* Regel & Herder; *C. multicaulis* var. *laxa*

Regel & Herder; *C. multicaulis* subsp. *subintegrifolia* Tolmachev & Rebrikova; *C. stoliczkae* C. B. Clarke.

Herbs 8–60 cm tall, perennial, with a short \pm oblique rhizome, rosulate. Stems few to numerous, rarely solitary, rather slender, erect or curved-ascending, branched apically, glabrous or basally with sparse arachnoid hairs, usually \pm leafless. Rosette leaves narrowly elliptic-lanceolate, ovate-ob lanceolate, elliptic, or spatulate, $3.5\text{--}11 \times 0.7\text{--}2$ cm, undivided or pinnatifid to pinnatipartite, both surfaces short white pubescent, base attenuate into a petiole-like portion, margin entire or sinuate-dentate, apex acute, obtuse, or rounded; lateral lobes (if present) triangular, narrowly triangular, or elliptic, gradually smaller toward leaf base, apex obtuse to acute. Stem leaves 0–2, much reduced in size, linear, margin entire. Synflorescence paniculiform or corymbosely so, with few to several capitula. Capitula with 30–40 florets; peduncle slender, often curved-erect, with dense white arachnoid hairs and stiff greenish glandular hairs. Involucre cylindric, $7\text{--}9 \times 3\text{--}5$ mm. Outer phyllaries triangular-ovate to lanceolate, longest to 3 mm, apex acute to obtuse; inner phyllaries 8–10, abaxially with white arachnoid hairs and stiff greenish glandular hairs along midvein, adaxially glabrous, margin scarious, apex acute to obtuse. Anther tube 1–2 mm. Achene reddish brown, fusiform, straight or subcurved, ca. 4 mm, with 10–12 ribs. Pappus white, ca. 4 mm. Fl. and fr. May–Aug. $2n = 10$.

Forests, forest margins, open places in forests, grasslands, gravelly areas by streams and water, floodplains; 1600–3600 m. Xinjiang [Kashmir, Kazakhstan, Kyrgyzstan, Mongolia, Pakistan, C and SW Russia, Tajikistan; SW Asia, N Europe].

Crepis multicaulis and *C. elongata* are closely related, and their delimitation needs reassessment.

2. *Crepis elongata* Babcock, Univ. Calif. Publ. Bot. 14: 326. 1928.

藏滇还阳参 zang dian huan yang shen

Crepis tibetica Babcock.

Herbs, perennial, with a horizontal or oblique rhizome. Stem solitary to few, 25–65 cm tall, erect, unbranched or moderately branched from basal third or higher up, with conspicuously erect and usually rather long branches, apically \pm densely with blackish long glandular hairs. Leaves mostly basal, rosulate to crowded, oblanceolate to elliptic, $(3\text{--})5\text{--}16\text{--}(22) \times 0.8\text{--}2.2$ cm including a winged petiole $1/3\text{--}1/2$ rest of leaf, both faces with long yellowish hairs, base cuneate-attenuate to abruptly narrowed, margin sinuate-dentate to pinnatifid with triangular segments, apex obtuse to rounded. Stem leaves 0–2, similar to basal leaves or bractlike and reduced, \pm linear, margin entire. Synflorescence corymbiform to paniculately corymbiform, with (1–)3–12 capitula. Capitula with 30–40 florets; peduncle slender, 0.5–5 cm, sparsely to more densely white tomentose and with \pm dense blackish glandular hairs. Involucre green to dark green, cylindric to campanulate, $7\text{--}11 \times 3\text{--}5$ mm. Phyllaries abaxially sparsely arachnoid hairy and with blackish glandular hairs along midvein; outer phyllaries triangular-ovate to lanceolate, longest to $1/2$ (sometimes even more) as long as inner ones, apex acuminate to acute; inner phyllaries 12–14,

apex acuminate. Anther tube 2–2.5 mm. Style branches dark (\pm blackish when dry). Achene \pm dark brown, fusiform, 4–5 mm, with 10 ribs, distinctly attenuate toward apex. Pappus white, ca. 4 mm. Fl. and fr. Jun–Aug.

Mountain slopes, thickets, forests, forest margins, meadows; 2600–4200 m. W Sichuan (Kangding), Xizang, Yunnan [Bhutan, NE India, Nepal].

Babcock's names *Crepis elongata* and *C. tibetica* are of equal priority. The first synonymization of the latter with the former name in FRPS (80(1): 114. 1997) has therefore established the priority of *C. elongata* over *C. tibetica*.

3. *Crepis lyrata* (Linnaeus) Froelich in Candolle, Prodr. 7: 170. 1838.

琴叶还阳参 qin ye huan yang shen

Hieracium lyratum Linnaeus, Sp. Pl. 2: 803. 1753.

Herbs 20–80[–110] cm tall, perennial, with a short slender \pm oblique rhizome and short caudex. Stem solitary, erect, sparsely and shortly branched apically, sparsely pubescent with yellow glandless hairs, sparsely leafy. Basal and lower stem leaves narrowly obovate to spatulate and gradually attenuate into a winged petiole-like basal portion, $10\text{--}22\text{--}[30] \times 3\text{--}6$ cm, almost undivided to lyrate pinnatisect, sparsely pubescent with short yellow hairs, base narrow to narrowly auriculate-amplexicaul, margin sinuate-dentate and denticulate; lateral lobes ovate, triangular-ovate, or elliptic, apex rounded to more rarely acute; terminal lobe ovate to lanceolate, much larger than lateral lobes, apex acute to rounded. Middle stem leaves spatulate to lanceolate, similar to lower stem leaves but smaller, base broader and more clasping; uppermost stem leaves bractlike. Synflorescence small, corymbiform, with few capitula. Capitula with 35–45 florets; peduncle slender, with dense short blackish glandular hairs. Involucre dark green, campanulate, $7\text{--}9 \times 4\text{--}8$ mm. Phyllaries abaxially with short blackish glandular and often with setaceous simple hairs; outer phyllaries linear, longest $1/4\text{--}1/2$ as long as inner ones, apex acute; inner phyllaries adaxially glabrous, apex acute. Anther tube ca. 3.5 mm. Achene brown, fusiform, 3.5–4 mm, with 20 slender ribs, apex slightly constricted. Pappus white, 4–5 mm, persistent. Fl. Jun–Jul. $2n = 12$.

Moist meadows, stream banks; 1200–2400 m. Xinjiang [Kazakhstan, C Russia].

4. *Crepis tectorum* Linnaeus, Sp. Pl. 2: 807. 1753.

屋根草 wu gen cao

Hieracioides tectorum (Linnaeus) Kuntze.

Herbs 30–90 cm tall, annual or biennial, \pm rosulate, with taproot. Stem usually solitary, erect, branched from base or middle, subglabrous to arachnoid pubescent, sparsely glandular and with white bristles, leafy. Basal and lower stem leaves linear-lanceolate, lanceolate, or oblanceolate and attenuate into a winged petiole-like basal portion, $5\text{--}15 \times 0.5\text{--}1$ cm, undivided or more rarely sinuate to pinnatisect, subglabrous to pubescent with glandular and simple hairs, base cuneate-attenuate, margin sparsely dentate, apex acute; lobes (if present) lanceolate to linear. Middle stem leaves similar to lower stem leaves but usu-

ally undivided and rather without a petiole-like basal portion, base \pm sagittately clasping. Upper stem leaves linear-lanceolate to linear, margin entire and revolute; uppermost stem leaves bractlike. Synflorescence corymbiform to corymbosely paniculiform, with some to many capitula. Capitula with 30–70 florets. Involucre narrowly cylindric to narrowly campanulate, 7.5–8.5 \times 5–7 mm in fruit. Phyllaries abaxially with sparse arachnoid and stipitate glandular hairs; outer phyllaries linear, longest 1/3–1/2 as long as inner ones, apex acute; inner phyllaries adaxially appressed hairy, margin white scarious, apex acute. Anther tube 2.5–3 mm. Achene dark or purplish brown, fusiform, 3–4 mm, with 10 ribs, apically contracted. Pappus white, ca. 4 mm. Fl. and fr. Jul–Oct. $2n = 8$.

Forest margins, grasslands in valleys, fields, wastelands; 900–1800 m. Heilongjiang, Nei Mongol, Xinjiang [Kazakhstan, Mongolia, Russia; Europe].

5. *Crepis sibirica* Linnaeus, Sp. Pl. 2: 807. 1753.

西伯利亚还阳参 xi bo li ya huan yang shen

Aracium sibiricum (Linnaeus) Schultz Bipontinus; *Crepis ruprechtii* Boissier; *Hapalostephium sibiricum* (Linnaeus) D. Don; *Hieracioides ruprechtii* (Boissier) Kuntze; *Hieracium sibiricum* (Linnaeus) Lamarck; *Lepicaune sibirica* (Linnaeus) K. Koch; *Sonchus caucasicus* Biehler; *S. flexuosus* Ledebour; *Soyeria sibirica* (Linnaeus) Monnier.

Herbs 0.5–1.5 m tall, perennial, with stout horizontal to oblique rhizomes. Stem solitary, stout, apically rather sparsely branched, especially apically with white arachnoid hairs and stiff subulate greenish hairs, leafy. Basal leaves and lower stem leaves with a winged petiole 6–15 cm or more; leaf blade narrowly oblong-elliptic, oblong-ovate, ovate, or elliptic, 16–20 \times 5.5–10 cm, abaxially scabrid and white hispid and hirsute on veins, adaxially glabrous, margin hispid, base abruptly narrowed to rarely attenuate, margin \pm coarsely dentate, apex acute to acuminate. Middle stem leaves similar to lower stem leaves but petiole shorter, more broadly winged, dentate, and basally clasping; leaf blade ovate to lanceolate, basally attenuate. Upper stem leaves sessile and smaller, otherwise similar to middle stem leaves; uppermost stem leaves elliptic to linear-lanceolate, reduced in size, margin entire. Synflorescence laxly corymbiform, with few to several capitula. Capitula many flowered; peduncle (1–)2–15 cm, stout. Involucre campanulate, ca. 1.5[–2] \times 1–1.5 cm, dark green in fruit. Phyllaries abaxially with dense stiff subulate hairs especially on midvein; outer phyllaries ovate-lanceolate to narrowly elliptic-lanceolate, longest more than 1/2 as long as inner ones, apex acute to obtuse; inner phyllaries adaxially glabrous, apically subacute. Achene dark brown to reddish brown, fusiform, 9–10 mm, subcurved, with 20 ribs, apically attenuate. Pappus white or pale yellowish white, 8–9 mm. Fl. and fr. May–Sep.

Mountain slopes, forest margins, forests, thickets, grasslands in forests; 1000–2700 m. Heilongjiang, Liaoning, Nei Mongol, Xinjiang [Kazakhstan, Kyrgyzstan, Mongolia, Russia, Tajikistan; E Europe].

6. *Crepis coreana* (Nakai) H. S. Pak, Fl. Coreana 7: 378. 1999.

宽叶还阳参 kuan ye huan yang shen

Hieracium coreanum Nakai, Bot. Mag. (Tokyo) 29: 9. 1915.

Herbs 25–55 cm tall, perennial, with a short \pm oblique rhizome. Stem solitary, erect, branched from middle or in apical portion, rarely unbranched, sparsely arachnoid hairy sometimes mixed with black rigid hairs especially in synflorescence. Basal leaves present at anthesis; petiole 1.5–11.5 cm, winged; leaf blade spatulate to elliptic, 4–8 \times 2–3.5 cm, glabrous or sparsely arachnoid hairy, margin sharply and pectinately dentate to rarely lyrate pinnatifid, base cuneately attenuate, apex obtuse, rounded, or acute. Lower stem leaves with winged petiole 3.5–6 cm, base subclasping or not; leaf blade elliptic, 7–13 \times 2–2.5 cm, margin sharply and pectinately dentate, otherwise similar to basal leaves. Middle stem leaves sessile, elliptic, 7–11.5 \times 2–4 cm, base cordate and clasping, apex acute to acuminate, otherwise similar to lower stem leaves. Upper stem leaves similar to middle stem leaves but smaller upward on stem and apex more acuminate. Synflorescence corymbiform, with few to several capitula. Capitula with many florets; peduncle 1.5–4 cm or more. Involucre dark green to blackish, broadly cylindric to campanulate, 1–1.3 \times 0.7–1 cm. Phyllaries abaxially glabrous or sparsely white hairy (especially at apex) or with black long simple hairs on midvein, apex acute; outer phyllaries narrowly triangular to lanceolate, longest ca. 6[–7] mm. Anther tube 3.5–4 mm. Achene \pm cylindric to fusiform, 4–6 mm. Pappus white, ca. 6 mm. Fl. and fr. Jul–Sep.

Forests, forest margins, meadows, steppes; 1600–2200 m. Jilin, Liaoning [NE Korea].

Crepis coreana was originally described and until recently included in *Hieracium*. H. S. Pak (Fl. Coreana 7: 378. 1999) and Sennikov and I. D. Illarionova (Bot. Zhurn. 86(3): 37–59. 2001) first stated its actual affinity to *Crepis* and transferred the species correspondingly. It is possibly related to *C. sibirica*.

7. *Crepis oreades* Schrenk ex Fischer & C. A. Meyer, Enum. Pl. Nov. 2: 32. 1842.

山地还阳参 shan di huan yang shen

Crepis oreades var. *cinerascens* Fischer & C. A. Meyer; *Hieracioides oreades* (Schrenk ex Fischer & C. A. Meyer) Kuntze.

Herbs 10–25[–30] cm tall, perennial, rosulate, with taproot sometimes shoot-bearing. Caudex 1–3 cm, covered with brown leaf bases of former leaves, simple or branched and thus with 1 or few leaf rosettes. Stems one or a few, slender, ascending to erect, simple or forked, sparsely white arachnoid hairy apically [sometimes additionally with long dark green to blackish glandular hairs], usually \pm leafless. Rosette leaves numerous, oblanceolate to elliptic, 4–8 \times 0.5–1 cm, shallowly pinnatifid to pinnatisect, abaxially weakly white arachnoid hairy [sometimes additionally with glandular hairs], base attenuate into a petiole-like portion, margin sinuate-dentate or entire; lateral lobes narrowly triangular, lanceolate, or sublinear, apex acute; terminal lobe triangular to lanceolate, apex acute. Stem leaves 0–2, \pm linear, reduced in size, margin entire, apex acute. Capitula 1 or 2 per stem, with many florets. Involucre narrowly campanulate, 9–12 \times 5–8 mm. Phyllaries abaxially white arachnoid hairy especially along midvein [sometimes additionally with long dark green to blackish glandular hairs]; outer phyllaries linear-lanceolate, longest ca. 5 mm, apex acute; inner phyllaries ca. 12, adaxially appressed hairy, margin scarious, apex acute. Anther tube ca. 4 mm. Achene orangish brown, fusiform, 5–6 mm,

straight or subcurved, with 10–15 ribs, apex weakly attenuate. Pappus white, 4–6 mm. Fl. Jul.

Gravelly areas on mountain slopes; 1000–3800 m. Qinghai, Xinjiang [Afghanistan, Kazakhstan, Kyrgyzstan, Tajikistan].

The diploid *Crepis oreades* and the tetraploid, hybridogenous *C. crocea* (presumably *C. oreades* × *C. bungei* Ledebour ex Candolle) are very similar. In China, *C. oreades* is of much more restricted distribution, and the very limited material seen is of the (typical) form with involucre and peduncles exclusively white arachnoid hairy, whereas in adjacent Kyrgyzstan and Tajikistan the form (described as *C. oreades* var. *cinerascens*) additionally with blackish glandular hairs on involucre and peduncles prevails.

8. *Crepis crocea* (Lamarck) Babcock, Univ. Calif. Publ. Bot. 19: 400. 1941.

北方还阳参 bei fang huan yang shen

Hieracium croceum Lamarck, Encycl. 2: 360. 1786; *Berinia crocea* (Lamarck) Schultz Bipontinus; *Crepis aurea* Reichenbach var. *crocea* (Lamarck) Candolle; *C. gmelinii* Schultes var. *grandifolia* Tausch; *C. pallasii* Turczaninow, nom. illeg. superfl.; *C. turczaninowii* C. A. Meyer; *Hieracioides crocea* (Lamarck) Kuntze.

Herbs 8–30 cm tall, perennial, rosulate, with taproot frequently shoot-bearing. Caudex 0.5–2 cm, simple or usually very shortly branched and thus with 1 or few leaf rosettes, covered with brown leaf bases of former leaves. Stems 1 or a few, slender, ascending to erect, simple or 1- to few forked, arachnoid hairy and with yellow longer and shorter strong glandular and non-glandular hairs especially apically, usually ± leafless. Rosette leaves numerous, oblanceolate to elliptic, 2.5–10 × 1–2.5 cm, shallowly pinnatifid to pinnatisect, both faces white arachnoid hairy and with strong yellowish glandular hairs, base attenuate into a petiole-like portion, margin sinuate-dentate or entire; lateral lobes narrowly triangular, lanceolate, or sublinear, apex acute; terminal lobe triangular to lanceolate, apex acute. Stem leaves 0–3, reduced in size, undivided, otherwise similar to rosette leaves or sessile. Capitula 1–4 per stem, with many florets. Involucre narrowly campanulate, 1–1.5 × 0.7–1 cm. Phyllaries green in fruit, abaxially with arachnoid hairs and with yellowish to yellowish green, strong, longer and shorter glandular and non-glandular hairs along midvein; outer phyllaries linear-lanceolate, longest 5–8 mm; inner phyllaries 12–14, adaxially weakly appressed hairy, margin conspicuously scarious, apex acute. Anther tube 4.5–5.5 mm. Achene dark to blackish brown, fusiform, 5–6 mm, straight or subcurved, with 10–15 ribs, apically attenuate. Pappus white, 7–8 mm. Fl. and fr. May–Aug.

Mountain slopes, loess hills, wastelands; 800–2900 m. Gansu, Hebei, Nei Mongol, Qinghai, Shaanxi, Shanxi [Mongolia, E Russia].

Crepis pallasii is a homotypic synonym of *Hieracium croceum*.

9. *Crepis chrysanth* (Ledebour) Turczaninow, Bull. Soc. Imp. Naturalistes Moscou 11: 96. 1838.

金黄还阳参 jin huang huan yang shen

Hieracium chrysanthum Ledebour, Fl. Altaic. 4: 129. 1833; *Berinia chrysanth* (Ledebour) Schultz Bipontinus;

Crepis polytricha (Ledebour) Turczaninow; *Hieracioides chrysanth* (Ledebour) Kuntze; *Hieracium frigidum* Steven ex Candolle; *H. polytrichum* Ledebour; *Soyeria chrysanth* (Ledebour) D. Dietrich.

Herbs 10–25 cm tall, perennial, with a vertical to oblique rhizome. Stems solitary or several, green or basally tinged with purple, unbranched or 1-branched, sparsely arachnoid hairy but apically densely so under capitula and with dark green to blackish long hairs. Basal leaves crowded, oblanceolate, narrowly elliptic-oblanceolate, or spatulate, 3–7 × 0.4–1.5 cm, glabrous or adaxially sparsely arachnoid hairy, base attenuate into a petiole-like portion, margin sinuate-dentate to subentire, apex obtuse. Stem leaves 2 or 3 (or 4), similar to basal leaves but smaller and narrower, base attenuate, margin subentire, apex obtuse to acute. Capitulum solitary or 2, many flowered. Involucre dark green to blackish, campanulate, 1.4–1.6 × 0.8–1.2 cm. Phyllaries abaxially white arachnoid hairy and with dark green to blackish long hairs, apex acute to obtuse; outer phyllaries lanceolate, longest to 2/3 as long as inner ones, spreading-erect; inner phyllaries 15–18, adaxially appressed hairy. Anther tube 4–5 mm. Achene reddish brown to dark purple, fusiform, ca. 7 mm, straight or subcurved, with 12–15 ribs, apically attenuate. Pappus white, 5–7 mm, persistent. Fl. and fr. Jul–Sep.

Gravelly areas on floodplains, stony slopes; 500–1500 m. Xinjiang [Kazakhstan, Mongolia, Russia].

10. *Crepis phoenix* Dunn, J. Linn. Soc., Bot. 35: 511. 1903.

万丈深 wan zhang shen

Herbs 15–70 cm tall, perennial, with a strong taproot. Caudex woody, simple or branched, leafless. Stem dark green, erect, apically branched and setose, basally glabrous and with few scalelike leaves only in and above middle with well-developed leaves. Lower scalelike stem leaves lanceolate, 0.5–2 × ca. 0.3 mm, apex acute. Middle stem leaves sessile, lanceolate, narrowly elliptic, or narrowly elliptic-lanceolate, 2–8 × 0.3–2.5 cm, glabrous to setose, base cuneate, margin entire or sinuate-dentate, apex acute. Upper stem leaves similar to middle stem leaves but smaller, uppermost ones bractlike. Synflorescence corymbiform, with few to some capitula. Capitula with 20–25 florets; peduncle shorter or slightly longer than capitulum, slender. Involucre cylindric, 8–11 × 3–4 mm. Phyllaries abaxially somewhat tomentose and setose on midvein; outer phyllaries linear to linear-lanceolate, longest to 1/2 as long as inner ones, apex acute to obtuse; inner phyllaries 12–14, adaxially glabrous, margin broadly scarious, apex obtuse. Anther tube 4–5 mm. Achene brown, fusiform, 4–5 mm, with 10 ribs, apically attenuate. Pappus white, 5.5–6.5 mm. Fl. and fr. Jul–Oct.

● Mountain slopes; ca. 2000 m. Yunnan.

The entire plants are used medicinally.

Crepis phoenix and the following three species of fairly restricted distribution in chiefly S China are closely related and seem to form a complex, in which introgression and hybridization and diploid and polyploid cytotypes in all species occur. Delimitation of species in this complex is difficult and has already been stated as tentative by Babcock (Univ. Calif. Publ. Bot. 22: 632ff. 1947). A revision of the complex based on field and population studies is still needed.

11. *Crepis bodinieri* H. Lévêillé, Bull. Géogr. Bot. 25: 15. 1915.

果山还阳参 guo shan huan yang shen

Herbs 40–50 cm tall, perennial, with a strong taproot. Caudex woody, simple or branched, leafless. Stems solitary or several, green, dark green, or tinged with purple, erect, apically branched, smooth, glabrous, basally only with a few scalelike leaves, in and above middle with well-developed leaves. Lower scalelike stem leaves linear-lanceolate, 5–10 × 1–3 mm. Middle stem leaves sessile, linear, 2–14 × 0.1–1 cm, abaxially somewhat canescent tomentulose, margin entire and revolute, apex acute to acuminate. Upper stem leaves similar to middle stem leaves but smaller, uppermost ones bractlike. Synflorescence corymbiform, with few to some capitula. Capitula with 18–30 florets; peduncle shorter or slightly longer than capitulum, slender. Involucre cylindric, 8–10 × 3–4 mm. Phyllaries tomentulose; outer phyllaries linear to linear-lanceolate, longest 1/2–2/3 as long as inner ones, apex acute; inner phyllaries adaxially glabrous, apex obtuse. Anther tube ca. 4 mm. Achene brown, fusiform, ca. 4 mm, with 14 ribs, apically attenuate. Pappus white, 4–6 mm. Fl. and fr. Jun–Jul.

- Forests, thickets; 1500–2900 m. Xizang, Yunnan.

See remarks under *Crepis phoenix*, above.

12. *Crepis rigescens* Diels, Notes Roy. Bot. Gard. Edinburgh 5: 202. 1912.

还阳参 huan yang shen

Crepis rigescens subsp. *lignescens* Babcock.

Herbs 20–60 cm tall, perennial, with a strong taproot. Caudex woody, simple or branched, leafless. Stems solitary or several, erect, basally woody, sparsely to moderately and ± divaricately branched from base, middle, or near apex; branches sulcate to angular, yellowish striate, leafy, lower ones often sterile. Leaves pale yellowish green, glabrous; basal leaves very small, scalelike; middle stem leaves sessile, linear, 3–8 × 0.1–5 cm, rigid in texture, margin entire and revolute, apex acute. Synflorescence ± divaricately corymbiform, with few to several capitula. Capitula with 10–12 (sometimes more) florets. Involucre narrowly cylindric, 8–9 × 2–2.5 mm. Phyllaries glabrous or arachnoid hairy; outer phyllaries linear to lanceolate, longest ca. 1/2 as long as inner ones, apex acute; inner phyllaries with white scarious margin, apex acute. Anther tube ca. 3.5–(4.5) mm. Achene dark brown, fusiform, ca. 4 mm, with 10–16 ribs, apically attenuate. Pappus white, 4–5 mm. Fl. and fr. Feb–Jul.

Forest margins, along streams, wastelands, roadsides; 1600–3000 m. Sichuan, Yunnan [N Myanmar].

See note under *Crepis phoenix*, above.

13. *Crepis lignea* (Vaniot) Babcock, Univ. Calif. Publ. Bot. 22: 644. 1947.

绿茎还阳参 lü jing huan yang shen

Lactuca lignea Vaniot, Bull. Acad. Int. Géogr. Bot. 12: 318. 1903.

Herbs 15–40 cm tall, perennial, with a strong taproot. Cau-

dex woody, simple or branched, leafless. Stem dark green to grayish green, erect, usually strongly and fastigiate branched from base or below middle; branches numerous, sulcate and angular. Leaves pale yellowish green, glabrous; basal and lower stem leaves inconspicuous, triangular to bractlike, apex acute; middle stem leaves filiform, to 3 × 0.5 cm, glabrous, margin entire. Uppermost stem leaves linear-subulate, bractlike, glabrous. Synflorescence virgately corymbiform, congested, with rather many capitula. Capitula with 7–12 florets. Involucre narrowly cylindric, 7–9 × 1.5–2.5 mm, glabrous or especially basally with sparse arachnoid and short glandular hairs. Outer phyllaries linear to lanceolate, longest 1/3–1/2 as long as inner ones; inner phyllaries adaxially glabrous, margin scarious, apex acute. Anther tube ca. 3.5 mm. Achene brown, fusiform, 4–5 mm, subcurved, with 10–12 equal ribs, apex attenuate or with beak to 1.5 mm. Pappus white, 4–5 mm. Fl. and fr. Feb–Aug.

Sunny mountain slopes; 1500–2700 m. Guangxi, Guizhou, Sichuan, Yunnan [Laos, N Thailand, S Vietnam].

The roots of *Crepis lignea* are used medicinally.

See note under *Crepis phoenix*, above.

14. *Crepis napifera* (Franchet) Babcock, Univ. Calif. Publ. Bot. 22: 629. 1947.

芜菁还阳参 wu jing huan yang shen

Lactuca napifera Franchet, J. Bot. (Morot) 9: 292. 1895; *Prenanthes chaffanjonii* H. Lévêillé.

Herbs 40–150 cm tall, perennial, rosulate. Taproot cylindric to narrowly turniplike, ca. 1 cm in diam. Caudex 0.5–3 cm, woody, sometimes branched, with rather sparse leaf rosette and below covered with bases of old leaves and brown lanate. Stem slender, erect, unbranched in proximal portion, usually leafless, apically with narrow synflorescence. Rosette leaves obovate to oblanceolate, 5–26 × 2–6.5 cm, on both faces with short stiff subulate hairs, base attenuate into a 0.5–3 cm petiole-like portion, margin entire or sinuate-dentate to shallowly pinnatifid with orbicular to broadly triangular segments, apex obtuse to rounded and mucronulate or more rarely acute. Stem leaves (if present in lower part) similar to rosette leaves but smaller. Synflorescence racemiform to very narrowly paniculiform, with some to numerous capitula. Capitula with 5–10 florets; peduncle filiform, 1–5 mm. Involucre cylindric, 7–9 × 2–3 mm. Phyllaries green to dark green, ciliate near and at apex otherwise both faces glabrous; outer phyllaries lanceolate, longest 1/3–1/2 as long as inner ones, apex acute; inner phyllaries 5(or 6), apex acute to obtuse. Anther tube 3.5–4 mm. Style branches dark (blackish) upon drying. Achene pale brown, cylindric to fusiform, ca. 4 mm, with 10 ribs, apically attenuate. Pappus yellowish white, ca. 4 mm. Fl. and fr. Jun–Oct.

• Mountain slopes, forests in river valleys; 1400–3300 m. Guizhou, Sichuan, Yunnan.

15. *Crepis subscaposa* Collett & Hemsley, J. Linn. Soc., Bot. 28: 78. 1890.

抽茎还阳参 chou jing huan yang shen

Herbs 30–50 cm tall, perennial, rosulate. Taproot woody.

Caudex woody, with rather sparse leaf rosette and 1–3 stems. Stems erect, apically sparsely branched and white pubescent, almost leafless. Rosette leaves oblanceolate to elliptic, 5–10 × 2–3 cm, both surfaces pubescent with short glandular hairs, base attenuate into a short winged petiole-like portion, margin denticulate and irregularly sinuate to dentate, apex obtuse to acute. Stem leaves (if present) few, remote, bractlike, narrowly lanceolate, apex acute. Synflorescence laxly corymbose, with few to some capitula. Capitula with 20–30 florets; peduncle wiry, 1–4 cm. Involucre broadly cylindric to narrowly campanulate, 7–10 × 4–6 mm. Phyllaries sparsely pubescent with white partly glandular hairs; outer phyllaries lanceolate to linear-lanceolate, longest ca. 1/2 as long as inner ones, apex acute; inner phyllaries with short blackish rigid subulate hairs on midvein, adaxially glabrous, apex obtuse. Achene dark brown, fusiform, 5–6.5 mm, with 10–12 echinulate ribs, apically strongly attenuate. Pappus white or pale yellowish, 4–5 mm. Fl. and fr. Jul–Aug.

Mountain slopes, moist pastures, fields; 1400–2200 m. Yunnan [N Laos, N Myanmar].

16. *Crepis darvazica* Krascheninnikov, Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast. 1: 182. 1933.

新疆还阳参 xin jiang huan yang shen

Crepis rigida Waldstein & Kitaibel var. *songorica* Karelin & Kirilov; *C. songorica* (Karelin & Kirilov) Babcock.

Herbs 20–60 cm tall, perennial, with a taproot. Stems solitary or more rarely 2–4, from a short woody caudex, erect, sparsely branched apically or rarely from middle, sparsely white arachnoid hairy and especially proximally with rigid subulate partly glandular hairs, covered with leaf bases of former leaves, leafy. Basal and lower stem leaves elliptic-oblanceolate to oblanceolate, 5–24 × 2–5 cm, both faces with rigid mostly glandular hairs but especially abaxially, base attenuate, margin sinuate-dentate, apex obtuse to acute. Middle and upper stem leaves ovate to narrowly elliptic-lanceolate, base auriculate clasp, margin sparsely dentate or entire, apex acute to acuminate, otherwise similar to lower leaves; uppermost stem leaf reduced, bractlike. Synflorescence laxly corymbiform, with few to several capitula. Peduncle 1–6 cm, straight or slightly curved. Involucre campanulate, 1.2–1.6 × 0.6–1 cm. Phyllaries abaxially white arachnoid hairy and especially basally and along midvein with ± dense yellowish brown short rigid glandular hairs; outer phyllaries triangular-ovate, triangular, or lanceolate, longest 1/3–2/3 as long as inner ones, apex ± acute; inner phyllaries 12–14, adaxially glabrous, margin scarious, apex obtuse. Anther tube 4.5–5.5 mm. Achene dark reddish brown, fusiform, 7–10 mm, with 16–20 ribs. Pappus white, 8–10 mm. Fl. and fr. Jun–Aug.

Rocky or gravelly mountain slopes; 1300–2600 m. Xinjiang [E Kazakhstan, Kyrgyzstan, Tajikistan].

Crepis darvazica has been reported generally from the border range between China, E Kyrgyzstan, and NE Tajikistan (Czerepanov, Fl. URSS 29: 633. 1966), but so far no substantiated records from Chinese territory are known (C. H. An, Fl. Xinjiang. 5: 456. 1999). The above description is based on material from E Kazakhstan and the descriptions

by Czerepanov (loc. cit.) and Babcock (Univ. Calif. Publ. Bot. 22: 426. 1947).

17. *Crepis shihii* Tzvelev, Bot. Zhurn. 92: 1749. 2007.

全叶还阳参 quan ye huan yang shen

Crepis integrifolia C. Shih, Acta Phytotax. Sin. 33: 191. 1995, not Vest (1820).

Herbs, perennial, with a horizontal rhizome. Stem solitary, ca. 25 cm tall, slender, erect, apically sparsely branched and with blackish stipitate glandular hairs, leafy. Basal leaves incompletely known, lanceolate, small, margin entire or subentire, withered at anthesis. Lower and middle stem leaves sessile, lanceolate to oblanceolate, 3.5–5 × 1–2 cm, glabrous, base auriculate clasp, margin entire, apex rounded and mucronulate. Upper stem leaves bractlike, lanceolate. Synflorescence laxly corymbiform, with 3–5 capitula. Capitula with 20–30 florets; peduncles usually 1–9 cm, slender. Involucre cylindric to narrowly campanulate, 8–10 × 4–6 mm. Phyllaries green to blackish green, abaxially with blackish stipitate glandular hairs on midvein; outer phyllaries lanceolate, longest to 4 mm; inner phyllaries 8–10?, adaxially glabrous. Anther tube 3–3.5 mm. Style branches yellow. Achene yellowish brown, fusiform, ca. 5 mm, with 15 ribs, apex truncate. Pappus white, ca. 6 mm. Fl. and fr. Aug.

• Grasslands; 1300–1400 m. N Xinjiang (Altay Shan).

Crepis shihii is a conspicuous species of unclear affinities only known from the type collection and superficially appears to be a diminutive version of *C. darvazica*.

18. *Crepis tianshanica* C. Shih, Acta Phytotax. Sin. 33: 190. 1995.

天山还阳参 tian shan huan yang shen

Pseudoyoungia tianshanica (C. Shih) D. Maity & Maiti; *Tibetoseris tianshanica* (C. Shih) Tzvelev.

Herbs 3–5 cm tall, perennial. Stem erect or ascending-erect, pubescent, leafy. Leaves oblanceolate, 2.5–4 × 0.5–0.8 cm, lyrate pinnatifid to pinnatisect, both faces sparsely pubescent or abaxially glabrous, base attenuate or abruptly narrowed into a petiole-like portion; lateral lobes 3 or 4 pairs, triangular, rhomboid, or irregularly rhomboid, margin entire, apex acute, obtuse, or rounded; terminal lobe elliptic, ovate, hastate, or sagittate, apex obtuse to acute. Capitula 2, terminal. Involucre cylindric to narrowly campanulate, ca. 1.2 cm. Phyllaries dark, abaxially sparsely arachnoid hairy and with blackish multicellular hairs on midvein; outer phyllaries narrowly elliptic-lanceolate, longest more than 1/2 as long as inner ones, apex acute; inner phyllaries adaxially glabrous, apex acute to obtuse. Achene not seen when mature. Pappus white, ca. 4 mm. Fl. Jul.

• Mountain slopes; ca. 2600 m. Xinjiang (Tian Shan).

Crepis tianshanica is an insufficiently known species due to the lack of mature achenes in the single collection known. For the time being, we follow the generic assignment to *Crepis* by Sennikov (Byull. Moskovsk. Obsch. Isp. Priro., Otd. Biol. 105: 66–69. 2000), rather than to *Askellia* ("ex affinitate *C. flexuosae*," C. Shih, Acta Phytotax. Sin. 33: 190. 1995) or *Youngia* (D. Maity & Maiti, Compositae Newslett. 48: 33. 2010, under *Pseudoyoungia*).

66. YOUNGIA Cassini, Ann. Sci. Nat. (Paris) 23: 88. 1831.黄鹌菜属 *huang an cai shu*

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Pseudoyoungia D. Maity & Maiti.

Herbs, perennial or annual, acaulescent or caulescent, often \pm rosulate, glabrous or somewhat to sparsely arachnoid hairy or pubescent. Synflorescence corymbiform or paniculiform-corymbiform, exceptionally secundly racemiform. Capitula with 5–25 florets. Involucre cylindric, cylindric-campanulate, campanulate, or broadly cylindric. Phyllaries abaxially glabrous or more rarely somewhat arachnoid hairy, very rarely glandular; outer phyllaries few to several, centripetally longer, at most $1/4$ – $(1/2)$ as long as inner ones; inner phyllaries usually linear-lanceolate, equal in length, midvein subapically crested and corniculate or flat. Receptacle naked. Florets yellow. Achene \pm fusiform, columnar, or \pm cylindric, inconspicuously compressed or subcompressed, with 4 or 5 main ribs each accompanied by (1 or) 2 or more slender secondary ribs, ribs usually finely spiculate especially apically, apex attenuate or rarely with a stout short beak. Pappus white, rarely gray or pale brownish, scabrid.

About 30 species: E Asia; 28 species (22 endemic) in China.

The circumscription of *Youngia* has recently been changed by Sennikov and I. D. Illarionova (Komarovia 5: 96. 2008) based, in particular, on carpological analyses. Three species groups have been segregated into three newly established separate genera: *Crepidifolium*, *Sonchella*, and *Tibetoseris*. *Crepidifolium* includes Babcock and Stebbins's (Publ. Carnegie Inst. Washington 484: 25. 1937) single species of their (not validly published) "*Y. sect. Crepidopsis*," meanwhile divided into three separate species. Most recent molecular phylogenetic analyses of the Crepidinae by J. W. Zhang et al. (in prep.) on the one hand confirmed that *Crepidifolium* is not part of *Youngia*, but on the other hand revealed that it is actually nested within *Crepidiastrum*, see there. *Sonchella* unites *Y. stenoma* of Babcock and Stebbins's (not validly published) "*Y. sect. Stenophytum*" and a second species formerly treated as *Prenanthes angustifolia* or *Crepis pratensis*. This genus has been confirmed in the molecular phylogenetic analyses by J. W. Zhang et al. (in prep.) as independent and is treated as such here. *Tibetoseris* included the five species of Babcock and Stebbins's (not validly published) "*Y. sect. Desiphylum*" and a few later additions from China. *Tibetoseris* was most recently recircumscribed by D. Maity and Maiti (Compositae Newslett. 48: 22–42. 2010) to include only *T. depressa*, while the other species, considered from morphology as unrelated, were segregated into the newly established genus *Pseudoyoungia*. While their assumption of *Tibetoseris* being diphyletic has been confirmed in the molecular phylogenetic analyses by J. W. Zhang et al. (in prep.), the exclusion of the species united in *Pseudoyoungia* from *Youngia* has not; they appear clearly nested in *Youngia*. *Pseudoyoungia* is here therefore sunk in the synonymy of *Youngia*. Finally, examination of the type material of *Y. blinii*, considered as an unusual and isolated species of *Youngia* since its inclusion by Babcock and Stebbins (Univ. Calif. Publ. Bot 18(11): 227–229. 1943, as *Y. setigera*), revealed that it is grossly misplaced in *Youngia* but conveniently fits into *Dubyaea*, where it is transferred in the present treatment. The genus is still in need of a revision at species level. Many species are known from few collections only and their justifications need to be confirmed by a thorough study of character variation on the basis of more material. The current treatment should be used with critical caution.

- 1a. Plants ca. 5(–8) cm tall, very rarely taller (to 15 cm) and acaulescent or stem very short and branched within or slightly above leaf rosette with capitula few to several, clustered; involucre 8–12 mm with longest outer phyllary $1/3$ – $1/2$ – $(2/3)$ as long as inner ones.
 - 2a. Peduncle slender; involucre 1.2–1.6 cm; pappus 10–11 mm 3. *Y. simulatrix*
 - 2b. Peduncle capillaceous; involucre 0.8–1.1 cm; pappus 5–7 mm.
 - 3a. Phyllaries abaxially arachnoid hairy 6. *Y. sericea*
 - 3b. Phyllaries abaxially glabrous.
 - 4a. Involucre 10–11 mm; longest outer phyllary $1/3$ – $2/3$ as long as inner ones; inner phyllaries adaxially appressed pubescent 7. *Y. conjunctiva*
 - 4b. Involucre 8–10 mm; longest outer phyllary $1/3$ – $1/2$ as long as inner ones; inner phyllaries adaxially glabrous.
 - 5a. Longest outer phyllary to $1/3$ as long as inner ones; midvein of inner phyllaries subapically plane 4. *Y. gracilipes*
 - 5b. Longest outer phyllary to $1/2$ as long as inner ones; midvein of inner phyllaries subapically crested or corniculate 5. *Y. cristata*
- 1b. Plants caulescent, usually very distinctly so, or if stem very short then capitula not clustered but all borne distinctly above leaf rosette and longest outer phyllary usually at most $1/4$ as long as inner ones (if $1/3$ – $1/2$ – $(2/3)$ as long see *Y. conjunctiva* above); involucre 5–13 mm.
 - 6a. Pappus ash-gray, yellowish brown, or pale brown.
 - 7a. Pappus ash-gray; synflorescence corymbiform on a stem with well-developed distant leaves.
 - 8a. Peduncle and involucre \pm shortly glandular hairy (rarely glabrous); midvein of inner phyllaries subapically always plane; style branches yellow upon drying 1. *Y. cineripappa*
 - 8b. Peduncle and involucre glabrous; midvein of some inner phyllaries subapically crested or corniculate; style branches brown or green upon drying 2. *Y. atripappa*
 - 7b. Pappus yellowish brown or pale brown; synflorescence corymbiform on a leafless stem, or else not corymbiform.

- 9a. Synflorescence corymbiform; capitula erect, with ca. 5 florets; involucre 6–7 mm 27. *Y. szechuanica*
 9b. Synflorescence secundly racemiform; capitula nodding, with 10–20 florets; involucre
 10–13 mm 28. *Y. racemifera*
- 6b. Pappus white.
- 10a. Involucre 4–7 mm; synflorescence (except in depauperate plants) moderately to richly branched,
 with some, many, or numerous capitula; inner phyllaries with midvein subapically strictly plane.
- 11a. Leaves undivided; basal leaves with petiole to 15 cm, as long as hastate-cordate blade 22. *Y. longipes*
- 11b. Leaves except early basal ones always pinnately lobed; basal leaves with basal petiole-like
 portion much shorter than remainder of leaf.
- 12a. Basal, lower, and middle stem leaves bipinnately lobed, lateral lobes as broad as
 terminal lobe 21. *Y. rosthornii*
- 12b. Leaves at most pinnately lobed, lateral lobes usually much narrower and smaller
 than terminal lobe.
- 13a. Plants annual to perennial; stem leaves always well developed, pinnatipartite to
 pinnatisect, lateral lobes of all leaves ovate or elliptic, terminal lobe long
 acuminate; involucre 6–7.5 mm; achene 2.5–3 mm 20. *Y. heterophylla*
- 13b. Plants strictly annual; stem leaves mostly soon reduced and undivided, or if
 well developed and pinnately lobed then lateral lobes triangular or rhomboidal,
 terminal lobe obtuse, acute, or shortly acuminate; involucre 4–5(–7) mm;
 achene 1.5–2.5 mm.
- 14a. Achene light brown, dark reddish, or purplish brown, apex strongly attenuate;
 pappus persistent 24. *Y. japonica*
- 14b. Achene clear red, apex contracted into a stout 0.2–0.4 mm beak; pappus
 ± deciduous.
- 15a. Involucre 4–6 mm; pappus 2.5–3 mm 25. *Y. erythrocarpa*
- 15b. Involucre 6–7 mm; pappus 3–4 mm 26. *Y. rubida*
- 10b. Involucre (6–)7–10(–13) mm; synflorescence poorly to moderately branched, with few, some, or
 more rarely with many capitula; inner phyllaries either all with midvein plane or some with
 midvein subapically crested or corniculate.
- 16a. Midvein of all inner phyllaries plane.
- 17a. Inner phyllaries adaxially glabrous; later basal and stem leaves pinnatifid to pinnatipartite,
 rachis often pectinate between lateral lobes 17. *Y. wilsonii*
- 17b. Inner phyllaries adaxially appressed pubescent; later basal and stem leaves pinnatisect,
 rachis not pectinate between lateral lobes.
- 18a. Lobes of pinnate leaves basally often with a large tooth; achene 3–3.5 mm 18. *Y. henryi*
- 18b. Lobes of pinnate leaves entire; achene 2–3 mm.
- 19a. Plants delicate, 10–30 cm tall; involucre ca. 7 mm; achene 2–2.5 mm 15. *Y. hastiformis*
- 19b. Plants usually rather robust, to 60 cm tall; involucre 7–11 mm; achene
 2.5–3 mm 16. *Y. prattii*
- 16b. Midvein of at least some inner phyllaries subapically crested or corniculate.
- 20a. Rosette leaves contracted or attenuate into a very long (to 9 cm) inconspicuously winged
 petiole-like basal portion at least as long as or longer than remainder of leaf 19. *Y. terminalis*
- 20b. Rosette leaves without petiole-like portion, or if with one then distinctly shorter than
 remainder of leaf.
- 21a. Involucre 8–13 mm; inner phyllaries adaxially pubescent; pappus 5–9 mm.
- 22a. Plants to 100 cm tall; involucre (0.8–)0.9–1.3 cm; longest outer phyllaries
 1.5–3 mm 8. *Y. paleacea*
- 22b. Plants at most 30 cm tall; involucre 0.8–1 cm; longest outer phyllaries
 ca. 1.5 mm 9. *Y. pilifera*
- 21b. Involucre 6–8 mm; inner phyllaries adaxially glabrous or appressed pubescent; pappus
 2.5–5.5 mm.
- 23a. Stem very slender or capillaceous, almost leafless or leafless with 1–5 capitula.
- 24a. Involucre ca. (7–)8 mm; pappus 5–5.5 mm 14. *Y. kangdingensis*
- 24b. Involucre 6–7 mm; pappus 2–5 mm.
- 25a. Plants delicate, 3–10 cm tall; rosette leaves 1–7 × 0.3–1 cm; stem
 capillaceous; pappus 4–5 mm 13. *Y. yilingii*
- 25b. Plants more robust, 10–15 cm tall; rosette leaves 5–10 × 1–2 cm;
 stem slender; pappus ca. 2.5 mm 23. *Y. bifurcata*
- 23b. Stem usually more robust, usually with few leaves and more than 5 capitula.

- 26a. Achene 2–2.5 mm; inner phyllaries adaxially pubescent.
 27a. Leaves pubescent; longest outer phyllary to 1 mm; inner phyllaries adaxially densely appressed hairy 12. *Y. mairei*
 27b. Leaves glabrous; longest outer phyllary 1–2 mm; inner phyllaries adaxially sparsely appressed hairy 15. *Y. hastiformis*
 26b. Achene 3–4 mm; inner phyllaries adaxially glabrous or with only few appressed hairs.
 28a. Stems especially at bifurcations, peduncles, and abaxial face of leaves brown arachnoid hairy; synflorescence with to 25 capitula 10. *Y. fusca*
 28b. Stems, peduncles, and leaves mostly rather sparsely pale or white arachnoid hairy; synflorescence with less than 10 capitula 11. *Y. lanata*

1. *Youngia cineripappa* (Babcock) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 60. 1937.

鼠冠黄鹌菜 shu guan huang an cai

Crepis cineripappa Babcock, Univ. Calif. Publ. Bot. 14: 325. 1928.

Herbs 40–150 cm tall, perennial. Rhizome horizontal or oblique?, with fleshy fibrous roots. Caudex short. Stems mostly solitary or more rarely few, erect, branched only apically, glabrous, leafy. Basal leaves obovate to oblanceolate, 6–25 × 2–4(–6) cm, undivided to pinnatifid or lyrate pinnatifid, glabrous, base attenuate into a cuneately winged petiole-like portion to 1/3 as long as leaf, margin subentire to sinuate-dentate, apex acute to obtuse; lateral lobes 4 or 5 pairs, triangular, broadly triangular-ovate, or elliptic, apex acute, obtuse, or rounded and mucronate; terminal lobe narrowly triangular, apex long acuminate. Stem leaves elliptic to lanceolate, 5–19 × 2–4(–7) cm, base attenuate into a short cuneately winged petiole-like portion, otherwise like basal leaves; uppermost stem leaves linear to subulate, reduced in size. Synflorescence corymbiform, with few to many capitula. Capitula with 14–20 florets; peduncle slender, usually with stipitate glandular hairs, rarely subglabrous. Involucre cylindric, 7–8 mm. Outer phyllaries 5 or 6, ovate to narrowly triangular, longest 1–1.5 mm, apex acute; inner phyllaries 8, abaxially with or rarely without stipitate glandular hairs on midvein, adaxially glabrous, midvein subapically plane, margin white scarious, apex obtuse to acute. Anther tube greenish to blackish. Style branches yellow upon drying. Achene brown, subfusiform, ca. 3.5 mm, subcompressed, ribs finely spiculate, somewhat more attenuate toward apex than base. Pappus grayish, 4–5 mm. Fl. and fr. Jun–Oct.

Moist areas by water in mountain valleys, grasslands on mountain slopes, sparse forests, thickets; 600–3000 m. Guangxi, Guizhou, Sichuan, Yunnan [NE India, ?Myanmar, N Vietnam].

2. *Youngia atripappa* (Babcock) N. Kilian, **comb. nov.**

纤细黄鹌菜 xian xi huang an cai

Basionym: *Crepis atripappa* Babcock, Univ. Calif. Publ. Bot. 14: 324. 1928; *C. gracilis* J. D. Hooker & Thomson ex C. B. Clarke; *Youngia gracilis* (J. D. Hooker & Thomson ex C. B. Clarke) Babcock & Stebbins (1937), not Miquel (1861); *Y. stebbinsiana* S. Y. Hu, nom. illeg. superfl.

Herbs 20–40 cm tall, perennial. Stem solitary, very slender, flexuous, erect, branched only apically, glabrous, leafy. Basal and lower stem leaves oblanceolate, 4–13 × 1–3 cm, both

faces finely pubescent, base attenuate into a short cuneately winged petiole-like portion, margin coarsely sinuate-dentate, apex acuminate. Upper stem leaves similar to lower ones but smaller and elliptic to lanceolate; uppermost stem leaves linear or subulate, reduced in size. Synflorescence rather densely corymbiform, with few to several capitula. Capitula with ca. 15 florets; peduncle 1–1.5 cm, slender, glabrous. Involucre cylindric, 8–9 mm. Outer phyllaries 6 or 7, broadly ovate, ca. 1 mm, apex acute to obtuse; inner phyllaries 8, both faces glabrous, midvein subapically crested, margin white scarious, apex acute to obtuse. Anther tube and style branches green to blackish upon drying. Achene dark brown, subfusiform, ca. 4 mm, somewhat more attenuate toward apex than base, ribs finely spiculate. Pappus grayish, 4–5 mm. Fl. and fr. Jul–Aug.

Forest margins, thickets, grassy cliffs; ?3000–?3600 m. SE Xizang [Bhutan, India (Sikkim)].

The epithet of the earliest legitimate name of this species, *Crepis gracilis*, is not available in *Youngia*, because of *Y. gracilis* Miquel, and the corresponding combination by Babcock and Stebbins is thus illegitimate. Instead, the epithet of *C. atripappa*, which was included as a synonym by Babcock and Stebbins, is available and has to be taken up (*Vienna Code*, Art. 11.4). *Youngia stebbinsiana*, published by S. Y. Hu (Quart. J. Taiwan Mus. 22: 37. 1969) as a replacement name for *Y. gracilis* of Babcock and Stebbins, was thus nomenclaturally superfluous when published and is therefore illegitimate.

3. *Youngia simulatrix* (Babcock) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 39. 1937.

无茎黄鹌菜 wu jing huang an cai

Crepis simulatrix Babcock, Univ. Calif. Publ. Bot. 14: 329. 1928; *C. smithiana* Handel-Mazzetti; *Pseudoyoungia ladyginii* (Tzvelev) D. Maity & Maiti; *P. simulatrix* (Babcock) D. Maity & Maiti; ?*Taraxacum altune* D. T. Zhai & C. H. An; *Tibetoseris ladyginii* Tzvelev; *T. simulatrix* (Babcock) Sennikov.

Herbs less than 5(–8) cm tall, perennial, rosulate, subacaulescent, with ?taproot and lateral shoot-bearing roots giving rise to secondary rosette shoots. Caudex short, unbranched or weakly branched, with residues of old leaf bases. Rosette leaves oblanceolate, 1–6 × 0.5–1.5 cm, both faces glabrous or abaxially somewhat pilose and adaxially puberulent, base attenuate into a petiole-like portion, margin entire to sinuate-dentate or more rarely pinnatifid, apex acute, rounded, or shortly acuminate; lobes (if present) triangular-ovate, apex obtuse to acute. Capitula 1–10, clustered, directly from axils of rosette leaves or from a branched, 5–10 mm stalk, each with 13–20 florets; peduncle 0.2–2(–6) cm, slender, glabrous or pilose. Involucre

cylindric, 1.2–1.6 cm. Phyllaries dark green to pale yellowish green, abaxially glabrous, margin white scarious; outer phyllaries imbricate, ovate to lanceolate, longest 1/3–1/2 as long as inner ones, apex obtuse to acute; inner phyllaries 8–12, adaxially glabrous, apex acute. Anther tube and style yellow upon drying. Achene dark brown, \pm fusiform, ca. 4 mm, \pm compressed, apex truncate. Pappus white, 1–1.1 cm, persistent. Fl. and fr. Jul–Oct.

Grasslands on mountain slopes, gravelly areas on floodplains, grassy beaches in river valleys; 2700–5000 m. Gansu, Qinghai, Sichuan, Xizang [India (Sikkim), Nepal].

Tibetoseris ladyginii and *Taraxacum alune* are regarded as synonyms of *Youngia simulatrix* following Sennikov and I. D. Ilarionova (Komarovia 5: 91. 2008) and not Ge and Zhai (Novon 9: 47. 1999).

4. *Youngia gracilipes* (J. D. Hooker) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 40. 1937.

细梗黄鹌菜 xi geng huang an cai

Crepis gracilipes J. D. Hooker, Fl. Brit. India 3: 396. 1881; *Pseudoyoungia angustifolia* (Tzvelev) D. Maity & Maiti; *P. gracilipes* (J. D. Hooker) D. Maity & Maiti; *Tibetoseris angustifolia* Tzvelev; *T. gracilipes* (J. D. Hooker) Sennikov; *T. gracilipes* subsp. *duthiei* D. Maity et al.

Herbs 3–10[–15] cm tall, perennial, rosulate, subcaulescent or dwarf, with taproot and lateral shoot-bearing roots giving rise to secondary rosette shoots. Caudex short, with residues of old leaf bases, not or weakly branched. Rosette leaves oblanceolate, elliptic, or narrowly elliptic, 2–5 \times 0.3–1 cm, pinnatifid to pinnatipartite and sometimes lyrate, sparsely pubescent, base attenuate into a petiole-like portion, margin entire to weakly sinuate-dentate; lateral lobes 3–6 pairs, opposite to subopposite, ovate to elliptic but basal lobes usually toothlike, apex rounded to obtuse; terminal lobe elliptic, apex rounded to obtuse. Capitula 3–14, clustered, directly from axils of rosette leaves or on a stalk, with 12–20(–30?) florets; stalk 1–4 cm, capillaceous, branched, sometimes reduced-leafy; peduncle capillaceous, 1–8 cm, \pm pilose to apically \pm tomentose, \pm bracteate. Involucre broadly cylindric, 8–10 mm. Phyllaries dark to blackish green, abaxially glabrous; outer phyllaries lanceolate to linear-lanceolate, longest to 1/3 as long as inner ones, apex acute; inner phyllaries 8–10, adaxially glabrous, margin scarious, subapically usually plane, apex acute. Anther tube greenish to blackish. Style yellow upon drying. Achene dark, fusiform, ca. 4 mm, apex truncate. Pappus white, 5–7 mm, persistent. Fl. and fr. Jun–Sep.

Forests, forest margins, grasslands; 2700–4800 m. Sichuan, Xizang [Bhutan, N India, Nepal].

Plants in which a delicate, sparsely branched stem with 2 or more capitula and 1 or more leaves is developed have been described as a separate subspecies (under the name *Tibetoseris gracilipes* subsp. *duthiei*) from India, Nepal, and China (Xizang). Corroborating Babcock and Stebbins (Publ. Carnegie Inst. Washington 484: 42. 1937), we have the impression that such plants merely represent more robust forms and that the transitions are fluent. *Tibetoseris angustifolia*, described from a single collection, differs according to the protologue only by narrower leaves, which hardly justifies its recognition as a separate species. The following two species appear very close to *Youngia gracilipes*, and their delimitation should be reassessed on the basis of more material.

5. *Youngia cristata* C. Shih & C. Q. Cai, Acta Phytotax. Sin. 33: 186. 1995.

角冠黄鹌菜 jiao guan huang an cai

Pseudoyoungia cristata (C. Shih & C. Q. Cai) D. Maity & Maiti; *Tibetoseris cristata* (C. Shih & C. Q. Cai) Sennikov.

Herbs 3–5 cm tall, perennial, rosulate, subcaulescent. Taproot and lateral shoot-bearing roots giving rise to secondary rosette shoots. Caudex short, unbranched or weakly branched, with residues of old leaf bases. Rosette leaves oblanceolate, 2–4 \times ca. 1 cm, pinnatifid to pinnatipartite, sparsely tomentose, base attenuate into a petiole-like portion, margin entire; lateral lobes 4–6 pairs, narrowly triangular but basal lobes usually toothlike, apex acute; terminal lobe with apex acute to acuminate. Capitula 3–14, clustered, directly from axils of rosette leaves or from a stalk, with 12–18 florets; stalk short, capillaceous, branched; peduncle capillaceous, 1–4 cm, \pm pilose to apically \pm tomentose, \pm bracteate. Involucre cylindric, 8–10 mm. Phyllaries dark to blackish green, abaxially glabrous; outer phyllaries ovate to lanceolate, longest to 1/2 as long as inner ones, apex obtuse to acute; inner phyllaries 8–10, adaxially glabrous, margin scarious, subapically crested or corniculate, apex acute. Anther tube greenish upon drying. Achene not seen when mature. Pappus white, ca. 7 mm. Fl. Aug.

• Mountain slopes; ca. 3900 m. SE Xizang (Zayü).

6. *Youngia sericea* C. Shih, Komarovia 5: 48. 2007.

绢毛黄鹌菜 juan mao huang an cai

Pseudoyoungia sericea (C. Shih) D. Maity & Maiti; *Tibetoseris sericea* (C. Shih) Sennikov.

Herbs 3–6 cm tall, perennial, rosulate, subcaulescent. Taproot and lateral shoot-bearing roots giving rise to secondary rosette shoots. Caudex short, unbranched or weakly branched, with residues of old leaf bases. Rosette leaves oblanceolate to narrowly elliptic, 2–5 \times 0.4–1.5 cm, pinnatipartite, base attenuate into a petiole-like portion; lateral lobes 4 or 5 pairs, opposite to obliquely opposite, narrowly triangular, basally broadly falcate; terminal lobe narrowly elliptic, elliptic-triangular, or orbicular, apex acute, obtuse, or rounded. Capitula 3–9, clustered, directly from axils of rosette leaves or on a stalk, with 9–15 florets; stalk capillaceous, short, branched; peduncle capillaceous, 1–3 cm, arachnoid hairy to tomentose, \pm bracteate. Involucre cylindric, ca. 1 cm. Phyllaries dark green in fruit, arachnoid hairy; outer phyllaries narrowly ovate to lanceolate, longest ca. 1/3 of inner ones, apex obtuse to acute; inner phyllaries ca. 8, adaxially glabrous, margin broadly white membranous, apex acute to obtuse. Achene dark brown to blackish, subfusiform, 3.5–4 mm, apex truncate. Pappus white, ca. 6 mm, persistent. Fl. and fr. Jun–Sep.

• Gravelly mountain slopes, rocky slopes; 3300–3400 m. SE Xizang (Zayü).

From the place of its first publication (C. Shih, Acta Phytotax. Sin. 33: 185. 1995), the name *Youngia sericea* was not validly published because two specimens of different gatherings were simultaneously designated as types (see *Vienna Code*, Art. 37.1 and 37.2). The name was validated with its original authorship in a nomenclatural note by Sennikov in 2007, as given above.

7. *Youngia conjunctiva* Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 37. 1937.

甘肃黄鹌菜 gan su huang an cai

Crepis parva (Babcock & Stebbins) Handel-Mazzetti; *Pseudoyoungia conjunctiva* (Babcock & Stebbins) D. Maity & Maiti; *P. parva* (Babcock & Stebbins) D. Maity & Maiti; *Tibetoseris conjunctiva* (Babcock & Stebbins) Sennikov; *T. parva* (Babcock & Stebbins) Sennikov; *Youngia parva* Babcock & Stebbins.

Herbs 4–12 cm tall, perennial, rosulate. Taproot and short woody caudex with residues of old leaf bases. Stem solitary, erect, branched apically or from near base, densely tomentose but glabrescent with age, distantly leafy. Rosette leaves oblanceolate, 1.5–6 × 0.5–1.2 cm, both faces tomentulose to glabrescent, base attenuate into a petiole-like portion and semiamplexicaul, margin sinuately to runcinately dentate and/or runcinately pinnatifid, apex obtuse to acute; lobes (if present) narrowly triangular, apex acute to acuminate. Stem leaves none or few, similar to rosette leaves but smaller, with narrower lobes, and apex acuminate. Synflorescence laxly corymbiform, with 4–8 capitula. Capitula with 13–18 florets; peduncle 1–6 cm, slender, densely tomentose. Involucre cylindric to campanulate, 1–1.1 cm. Phyllaries dark to blackish green, ciliate otherwise abaxially glabrous, apex acute; outer phyllaries lanceolate to linear-lanceolate, longest 1/3–1/2(–2/3) as long as inner ones; inner phyllaries 10–12, adaxially densely pubescent with appressed shiny hairs. Anther tube apically or entirely greenish. Style yellow upon drying. Achene not seen when mature. Pappus white, ca. 7 mm. Fl. Jul–Aug.

- Grassy slopes; 3800–4500 m. SW Gansu, N Sichuan.

Youngia conjunctiva and *Y. parva*, both only known from the type collections and simultaneously described by Babcock and Stebbins (Publ. Carnegie Inst. Washington 484: 35, 37. 1937), are strikingly similar in all features, except minor differences in the habit, and are from the same larger region adjacent to that of the supposed next relatives. The type of *Y. parva* has an apically branching stem of 2–3 cm, that of *Y. conjunctiva* one of 8–10 cm; their architecture, however, is basically identical. For these reasons it appears not justified to treat them as separate species, and they are here considered as conspecific. Doubts about their distinctness had already been expressed by Sennikov and I. D. Illarionova (Komarovia 5: 91. 2008). Additional collections and further studies of this apparently rare species would be desirable. Its systematic position in *Youngia* also needs confirmation.

8. *Youngia paleacea* (Diels) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 67. 1937.

羽裂黄鹌菜 yu lie huang an cai

Crepis paleacea Diels, Notes Roy. Bot. Gard. Edinburgh 5: 202. 1912; *C. yunnanensis* Babcock; *Youngia paleacea* subsp. *smithii* Babcock & Stebbins; *Y. paleacea* subsp. *yunnanensis* (Babcock) Babcock & Stebbins.

Herbs 30–100 cm tall, perennial. Taproot woody. Caudex often with residues of old leaf bases. Stem solitary, slender, erect, branched from near base or only apically, glabrous or very sparsely white tomentose, distantly leafy or more rarely almost leafless. Basal and lower stem leaves oblanceolate, elliptic, or narrowly elliptic, 2–19 × 0.5–4 cm, pinnatifid, pinnati-

partite, or runcinately or lyrate so, both surfaces ± pubescent with pale brown hairs, base attenuate into a winged petiole-like portion; lateral lobes 2–7 pairs, opposite to obliquely opposite, ± broadly triangular to triangular-ovate, margin entire or sinuate-dentate, apex acute, long acute, obtuse, or rounded and often mucronate; terminal lobe lanceolate, triangular, or falcate, margin dentate or entire. Middle and upper stem leaves similar to lower ones but smaller, narrower, and divided or undivided; uppermost stem leaves reduced, undivided, and bractlike. Synflorescence corymbiform, with few to many capitula. Capitula with 9–16 florets; peduncle usually 0.5–3 cm, slender. Involucre cylindric, (0.8–)0.9–1.3 cm. Outer phyllaries broadly ovate to lanceolate, longest 1.5–2(–3) mm, apex acute; inner phyllaries ca. 8, abaxially glabrous, adaxially appressed hairy, midvein subapically crested or corniculate, margin white scarious, apex acute. Anther tube greenish. Style branches yellow upon drying. Achene dark brown to blackish, subfusiform, 3–4 mm, ribs finely spiculate, apex attenuate. Pappus white, 5–7(–9) mm. Fl. and fr. May–Sep. $2n = 32^*$.

- Forests on mountain slopes, mountain valleys, forest margins, thickets, grassy slopes; 1800–3800 m. Gansu, Sichuan, Xizang, Yunnan.

Youngia paleacea is a fairly polymorphic species, probably representing a polyploid complex as was first noted by Babcock and Stebbins (Publ. Carnegie Inst. Washington 484: 68. 1937). Further studies are required also for the following species, *Y. pilifera*.

9. *Youngia pilifera* C. Shih, Acta Phytotax. Sin. 33: 183. 1995.

糙毛黄鹌菜 cao mao huang an cai

Herbs 8–30 cm tall, perennial, caudex often with residues of old leaf bases. Stem slender, erect, branched from base or middle third, almost leafless; branches sericeous below, glabrous above. Basal leaves elliptic, ovate-elliptic, broadly ovate, oblanceolate, or orbicular, 2–5 × 0.6–1.5 cm, lyrate pinnatifid or undivided, densely strigose, base attenuate or constricted into a winged petiole-like portion, apex rounded to obtuse; lateral lobes 2–4 pairs, triangular to elliptic, margin entire, apex acute, rounded, or obtuse; terminal lobe elliptic, hastate, or irregularly hastate, much larger than lateral ones, margin entire or retrorsely dentate, apex rounded to obtuse. Stem leaves 1 or 2, narrowly elliptic to linear, reduced in size, apex long acuminate. Synflorescence corymbiform to paniculiform-corymbiform, with few to some capitula. Capitula with ca. 11 florets. Involucre narrowly cylindric, 8–10 mm. Phyllaries dark green, abaxially glabrous; outer phyllaries broadly ovate, longest ca. 1.5 mm, apex acute to obtuse; inner phyllaries ca. 8, adaxially appressed hairy, midvein subapically crested or corniculate, margin white scarious, apex acute to obtuse. Achene not seen when mature. Pappus white, ca. 5 mm. Fl. Jul.

- Thickets in mountain valleys, moist areas in river valleys; 3200–3600 m. W Sichuan (Kangding).

Youngia pilifera is close to the polymorphic *Y. paleacea* and possibly only a delicate dwarf morph of the latter. See also note under *Y. paleacea*.

10. *Youngia fusca* (Babcock) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 76. 1937.

厚绒黄鹌菜 hou rong huang an cai

Crepis fusca Babcock, Univ. Calif. Publ. Bot. 14: 327. 1928; *C. blinii* H. Léveillé (1915), not H. Léveillé (1914).

Herbs 20–40 cm tall, perennial, rosulate. Taproot slender. Caudex with residues of old leaf bases. Stem solitary, erect, branched from near base or higher up, sparsely brown arachnoid hairy and somewhat more densely so at bifurcations, distantly leafy. Rosette and lower stem leaves oblanceolate, 4–10 × 1–3 cm, lyrate or runcinately pinnatifid to pinnatisect, abaxially ± strongly brown arachnoid hairy, adaxially short brown crinkled hairy, base attenuate into a short ± winged petiole-like portion and semiamplexicaul, margin sinuate-dentate; lateral lobes ovate, triangular, or elliptic, apex obtuse to acute; terminal lobe obovate, ovate, or broadly triangular, apex obtuse to acute. Middle stem leaves (if any) ± elliptic, smaller, otherwise similar to lower leaves; upper stem leaves linear, subulate, or bractlike, reduced in size, usually not divided. Synflorescence corymbiform, with to 25 capitula. Capitula with 10–12 florets; peduncle capillaceous, 0.2–2.5 cm, ± brown arachnoid hairy. Involucre narrowly cylindric, 7–8 mm, abaxially glabrous. Outer phyllaries broadly ovate, longest 1–1.5 mm, apex subacute; inner phyllaries 8, adaxially glabrous or only with a few appressed hairs, midvein often subapically crested, margin narrowly white scarious, apex subacute. Anther tube green. Style branches yellow upon drying. Achene dark brown, columnar, 3–3.5 mm, ribs finely spiculate, apex attenuate. Pappus white, 4–5 mm. Fl. and fr. May–Sep.

• By streams, trailsides in thickets, mountaintops; 2000–3500 m. Guizhou, Yunnan.

11. *Youngia lanata* Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 76. 1937.

绒毛黄鹌菜 *rong mao huang an cai*

Youngia nujiangensis C. Shih.

Herbs 9–30 cm tall, perennial, rosulate. Taproot slender, with shoot-bearing lateral roots. Caudex short, with residues of old leaf bases. Stems solitary or few, slender, ± erect, pale arachnoid hairy especially at bifurcations, sparsely leafy. Rosette leaves obovate to oblanceolate, 3–10 × 0.5–1.5 cm, almost undivided, or ± lyrate pinnatifid to pinnatisect, abaxially pale arachnoid hairy, adaxially pubescent with short pale crinkled hairs, base attenuate into a short ± winged petiole-like portion, margin sinuate-dentate, apex obtuse to acute; lateral lobes ovate to triangular, apex rounded to acute and mucronulate. Stem leaves 1–3, linear, reduced in size, undivided. Synflorescence corymbiform, with few to less than 10 capitula. Capitula with 9–11 florets; peduncle capillaceous, 4–15 mm, ± white arachnoid hairy. Involucre narrowly cylindric, 6–8 mm, in fruit to 9 mm, abaxially glabrous. Outer phyllaries ovate, longest 1–1.5 mm, apex acute; inner phyllaries 8, adaxially glabrous, midvein often subapically with small crest or claw, margin white scarious, apex acute. Anther tube greenish yellow. Style branches yellow upon drying. Achene dark brown, fusiform, ca. 3.5 mm, subcompressed, ribs finely spiculate. Pappus white, 3.5–5 mm. Fl. May–Jun.

• Among rocks, rock crevices, wastelands; 1700–2700 m. Yunnan.

Comparison of material determined by Babcock as *Youngia lanata*, which includes the isotype of *Y. nujiangensis* (GH), revealed both taxa to be conspecific. Part of the inner phyllaries of the type collection of *Y. nujiangensis* are subapically crested or corniculate as in *Y. lanata*.

12. *Youngia mairei* (H. Léveillé) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 77. 1937.

东川黄鹌菜 *dong chuan huang an cai*

Crepis mairei H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 531. 1913.

Herbs 15–25 cm tall, perennial, rosulate. Taproot slender. Caudex with residues of old leaf bases. Stem solitary, slender, erect, branched from middle third or higher, glabrous. Rosette leaves oblanceolate, 3–7 × 1–1.5 cm, undivided, both faces finely pubescent with yellow or brown many-celled hairs, base attenuate into a short petiole-like portion, margin mucronately sinuate-dentate, apex acute to acuminate. Stem leaves few, linear, reduced in size. Synflorescence corymbiform, with few to several capitula. Capitula with ca. 12 florets; peduncle capillaceous, 0.5–1.2 cm, ± subtomentulose. Involucre cylindric to narrowly campanulate, 6–7 mm, abaxially glabrous. Outer phyllaries ovate, longest ca. 1 mm; inner phyllaries 8, adaxially pubescent with very shortly appressed shiny hairs, midvein subapically often somewhat crested, margin ± white scarious, apex acute and ciliate. Anther tube and style branches yellow upon drying. Achene brownish purple, columnar, ca. 2.5 mm, ribs finely spiculate, apically subattenuate. Pappus white, 3.5–4 mm. Fl. Jun.

• Among rocks; ca. 2600 m. Yunnan.

Youngia mairei is only known from the type collection made in 1912 and is close to *Y. lanata* and *Y. fusca*.

13. *Youngia yilingii* C. Shih, Acta Phytotax. Sin. 33: 186. 1995.

艺林黄鹌菜 *yi lin huang an cai*

Herbs 3–10 cm tall, perennial, rosulate, delicate. Caudex strong, branching with age, with residues of old leaf bases. Stem solitary, capillaceous, simple or 1- or 2-branched from near base or higher up, sparsely hairy, leafless. Basal leaves spatulate, elliptic, or oblanceolate, 1–7 × 0.3–1 cm, both faces glabrous or sparsely white tomentose but abaxially glabrescent, undivided, weakly pinnatifid with 1 or 2 pairs of obtusely triangular to lanceolate lateral lobes, or pinnatifid to pinnatisect with 2–6 opposite or alternate pairs of triangular to ovate, rounded to acute lateral lobes, base attenuate into a petiole-like portion, margin entire to sinuate-dentate, apex obtuse to acute. Capitulum solitary or synflorescence laxly corymbiform, with 2–5 capitula. Capitula with 9–15 florets. Involucre narrowly campanulate, 6–7 mm. Phyllaries abaxially glabrous; outer phyllaries narrowly ovate, longest 1–1.5 mm, apex acute to obtuse; inner phyllaries 8, adaxially sparsely appressed hairy, midvein subapically mostly somewhat crested or corniculate, apex ± acute. Anther tube and style branches yellow upon drying. Achene dark brown, fusiform, 2.5–3 mm, ribs finally spiculate, apex attenuate. Pappus white, 4–5 mm. Fl. and fr. May–Jun.

• Rocky slopes, rocks; 3000–3100 m. NW Yunnan (Zhongdian).

The original description of the apparently rare *Youngia yilingii* is based on a single collection from Zhongdian Xian of plants to 5 cm tall with entire to at most weakly pinnatifid, not more than 10×3 mm leaves. Another collection from the same county (*B. Alden et al.*, *Kunming Edinburgh Gothenburg Exped.* 579, CAL 795201!) is considered also to belong to this remarkable species. It indicates that the leaf shape of the species shows some variation even in the same individual. In this collection only the early leaves of a rosette are similar to the ones described for *Y. yilingii*, while the later ones are larger and all pinnatipartite to pinnatisect as described above.

14. *Youngia kangdingensis* C. Shih, *Acta Phytotax. Sin.* 33: 186. 1995.

康定黄鹌菜 kang ding huang an cai

Herbs 7–20 cm tall, perennial. Taproot with shoot-bearing lateral roots. Stem solitary, slender, erect, sparsely branched from near base or middle. Basal leaves obovate, oblanceolate, or elliptic, $2-5.5 \times 5-1.5$ mm, pinnatipartite to pinnatisect, sparsely pubescent, base attenuate into a short petiole-like portion, margin sinuate-dentate; lateral lobes 1–4 pairs, broadly triangular, small; terminal lobes elliptic to obliquely triangular, margin entire, apex rounded, obtuse, or acute and mucronulate. Stem leaves absent or very few, similar to basal leaves but smaller or more strongly reduced. Synflorescence corymbiform, with usually 3–5 capitula. Capitula with ca. 15 florets; peduncle capillaceous, mostly 1–5 cm. Involucre narrowly cylindric, ca. (7–)8 mm. Phyllaries abaxially glabrous; outer phyllaries triangular to ovate, longest ca. 1 mm, apex obtuse; inner phyllaries 8, adaxially sparsely appressed hairy, midvein subapically mostly somewhat crested or corniculate, apex acute. Achene brown, fusiform, ca. 3.5 mm, apex strongly attenuate. Pappus white, 5–5.5 mm. Fl. and fr. Jul.

- Thickets; 1800–3300 m. W Sichuan (Kangding).

Youngia kangdingensis and the following five species appear to be more closely related to each other, and all are insufficiently known with respect to the extent of their variation, distribution, and actual delimitation.

15. *Youngia hastiformis* C. Shih, *Acta Phytotax. Sin.* 33: 185. 1995.

顶戟黄鹌菜 ding ji huang an cai

Herbs 10–30 cm tall, perennial. Taproot with lateral shoot-bearing roots. Stem solitary, slender, erect, branched from lower third or higher up, glabrous, sparsely leafy. Basal and lower stem leaves obovate to oblanceolate, $1-5.5 \times 0.5-2$ cm, glabrous, base attenuate into a petiole-like portion; first leaves undivided and sinuate-dentate; following leaves runcinately or lyrate pinnatipartite with small lateral lobes and a large obovate terminal lobe; later leaves pinnatisect with lateral lobes 1–4 pairs, opposite or alternate, \pm triangular to lanceolate, and apex acute to acuminate, with terminal lobe narrowly triangular to triangular-hastate and small. Middle stem leaves (if any) similar to lower stem leaves; upper stem leaves linear-elliptic to linear, reduced in size. Synflorescence laxly corymbiform, with usually 5–12 capitula. Capitula with 9–14 florets; peduncle capillaceous, 0.5–5 cm, glabrous or sparsely white arachnoid hairy. Involucre narrowly cylindric, ca. 7 mm. Phyllaries abaxially glabrous; outer phyllaries ovate to lanceolate, longest 1–2

mm, apex acute; inner phyllaries 8, adaxially sparsely appressed hairy, midvein subapically plane (or somewhat crested or corniculate?), apex \pm acute. Achene dark brown, fusiform, 2–2.5 mm, ribs finally spiculate, apex attenuate. Pappus white, ca. 5 mm. Fl. and fr. Apr–Jul.

- By streams, moist open areas; 2500–4000 m. Sichuan (Heishui, Xiangcheng).

The original description of the little-known *Youngia hastiformis*, based on a single collection from Heishui Xian, has been supplemented by two collections from Xiangcheng Xian made at somewhat higher elevations (*D. E. Boufford et al.* 28388A and 28925), which are apparently also referable to this species. See also note under *Y. kangdingensis*.

16. *Youngia prattii* (Babcock) Babcock & Stebbins, *Publ. Carnegie Inst. Washington* 484: 81. 1937.

川西黄鹌菜 chuan xi huang an cai

Crepis prattii Babcock, *Univ. Calif. Publ. Bot.* 14: 331. 1928.

Herbs 15–60 cm tall, perennial, \pm rosulate. Caudex with residues of old leaf bases. Stem solitary, \pm slender, erect, branched from middle, glabrous, distantly sparsely leafy. Rosette leaves and lower stem leaves oblanceolate to narrowly elliptic, $5-13 \times 1-3$ cm, lyrate or runcinately pinnatifid to pinnatisect, glabrous, base attenuate into a \pm winged petiole-like portion, margin subentire to sinuate-dentate; lateral lobes 3–6 pairs, opposite to obliquely opposite, ovate, triangular, linear-lanceolate, or falcate, central ones largest and others gradually smaller, lowermost ones usually toothlike; terminal lobe broadly triangular, linear-lanceolate, or narrowly linear, apex obtuse, acute, or long acuminate. Middle and upper stem leaves similar to lower stem leaves or reduced in size and undivided. Synflorescence corymbiform, with few to many capitula. Capitula with 9–12 florets; peduncle usually 0.5–3 cm, very slender. Involucre narrowly cylindric, 7–9 mm, to 1.1 cm in fruit. Phyllaries abaxially glabrous; outer phyllaries ovate, longest 1–2 mm, apex obtuse; inner phyllaries ca. 8, adaxially pubescent with appressed hairs, midvein subapically plane, margin scarious, apex obtuse to acute. Anther tube dark green. Style branches \pm yellow upon drying. Achene brown, subfusiform to columnar, 2.5–3 mm, ribs finely spiculate, apex attenuate. Pappus white, 4–5 mm. Fl. and fr. Jun–Sep.

- Thickets or grasslands on mountain slopes; 1500–2700 m. Henan, Hubei, ?Shanxi, Sichuan.

See note under *Youngia kangdingensis*.

17. *Youngia wilsonii* (Babcock) Babcock & Stebbins, *Publ. Carnegie Inst. Washington* 484: 79. 1937.

栉齿黄鹌菜 zhi chi huang an cai

Crepis wilsonii Babcock, *Univ. Calif. Publ. Bot.* 14: 331. 1928.

Herbs 13–40 cm tall, perennial, \pm rosulate. Caudex with residues of old leaf bases. Stems solitary or few, erect to curved-erect, branched from middle third or higher, glabrous. Rosette leaves and lower stem leaves oblanceolate, $5-10 \times 1-2.5$ cm, undivided or pinnatifid to pinnatipartite, margin sharply

sinuate-dentate; lateral lobes 4–6 pairs, opposite to obliquely opposite and usually with a pair of teeth between them, broadly to narrowly triangular, apex acute; terminal lobe linear to narrowly triangular, apex acute to acuminate. Middle and upper stem leaves linear, reduced in size. Synflorescence corymbiform, with several to many capitula. Capitula with 9–14 florets; peduncle usually 0.5–3 cm, very slender, arcuate. Involucre narrowly cylindric, 7–9 mm. Phyllaries abaxially glabrous; outer phyllaries ovate, longest 1–2 mm, apex acute to obtuse; inner phyllaries 8, margin white scarious, adaxially glabrous, midvein subapically plane, apex acute to obtuse. Anther tube greenish. Style branches yellow upon drying. Achene pale brown, subfusiform to columnar, 3–3.5 mm, ribs finely spiculate, apex attenuate. Pappus white, 4–5 mm. Fl. and fr. Jun–Sep.

- Grasslands; ca. 1500 m. Chongqing (Chengkou), Henan, Hubei.

See note under *Youngia kangdingensis*.

18. *Youngia henryi* (Diels) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 83. 1937.

长裂黄鹌菜 chang lie huang an cai

Crepis henryi Diels, Bot. Jahrb. Syst. 29: 633. 1901.

Herbs 15–80 cm tall, perennial, rosulate, with shoot-bearing roots. Caudex with residues of old leaf bases. Stem solitary, erect, branched from middle third or higher, glabrous, distantly leafy. Rosette leaves distinctly dimorphic, to 6(–10) × 2(–3) cm, glabrous, base with a sometimes brown lanate petiole-like portion. Early leaves broadly ovate, undivided and coarsely sinuate-dentate to pinnatifid, base contracted into a petiole-like portion; lateral lobes 1–6 pairs, triangular, apex acute; terminal lobe large, apex acute. Later leaves oblanceolate, elliptic, or lanceolate, pinnatifid to pinnatisect, base attenuate into a petiole-like portion; lateral lobes 4–6 pairs, narrowly lanceolate to linear, margin basally often with large teeth, apex acute; terminal lobe narrowly lanceolate to linear, apex acute. Lower and middle stem leaves few, lanceolate, pinnatisect, similar to latest rosette leaves. Synflorescence laxly corymbiform, with few to many capitula. Capitula with 7–10 florets; peduncle capillaceous, usually 1–4 cm. Involucre narrowly cylindric, 7–9 mm. Phyllaries abaxially glabrous; outer phyllaries ovate, longest to 2.5 mm, apex obtuse; inner phyllaries 7 or 8, adaxially sparsely pubescent with appressed hairs, midvein subapically plane, margin white scarious, apex acute to obtuse. Anther tube green. Style branches yellow upon drying. Achene pale brown, subfusiform to columnar, 3–3.5 mm, ribs finely spiculate, apex attenuate. Pappus white, 4.5–5 mm. Fl. and fr. Jul–Aug.

- Grasslands on mountain slopes; 1500–2000 m. Hubei, Shaanxi, Sichuan.

See notes under *Youngia terminalis* and *Y. kangdingensis*.

19. *Youngia terminalis* Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 85. 1937.

大头黄鹌菜 da tou huang an cai

Herbs 20–50 cm tall, perennial, rosulate. Caudex with residues of old leaf bases. Stem very slender, erect, sparsely

branched from middle third or higher, glabrous, almost leafless; branches arcuate. Rosette leaves obovate to oblanceolate, to 12 × 3 cm, undivided or lyrate pinnatifid, glabrous, base contracted or attenuate into a very long (to 9 cm) inconspicuously winged petiole-like portion, margin entire to coarsely sinuate-dentate; lateral lobes (if present) 1–4 pairs, triangular, small, apex obtuse; terminal lobe orbicular to ovate, base truncate to subsagittate, apex obtuse to acute. Stem leaves few, linear-lanceolate, reduced in size. Synflorescence laxly corymbiform, with few to several capitula. Capitula with 11–13 florets; peduncle slender to capillaceous, 1.5–12 cm. Involucre narrowly cylindric, 7–8 mm; outer phyllaries ovate, longest ca. 1.5 mm; inner phyllaries 8, adaxially finely appressed pubescent, midvein subapically somewhat crested or tuberculate, margin scarious, apex acute and white ciliate. Anther tube green. Style branches yellow upon drying. Achene dark brown, subfusiform to columnar, ca. 3 mm, ribs obscurely spiculate or muricate, apex attenuate. Pappus white, ca. 4 mm. Fl. and fr. Jul–Aug.

- Grasslands on mountain slopes; 1000–1800 m. W Sichuan (Kangding).

Youngia terminalis is only known from two late 19th century gatherings made by Soulié. The original material preserved at B was destroyed during WWII. No other material has been traced so far, and the above description is based on the original description and a photograph and drawings of the original material. It is apparently closely related to *Y. henryi* and perhaps only a form of the latter from shaded moist habitats. See also note under *Y. kangdingensis*.

20. *Youngia heterophylla* (Hemsley) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 87. 1937.

异叶黄鹌菜 yi ye huang an cai

Crepis heterophylla Hemsley, J. Linn. Soc., Bot. 23: 475. 1888; *C. bockiana* Diels.

Herbs 30–110 cm tall, annual to ?perennial. Stems solitary or few, erect, branched usually in apical third, glabrous or sparsely hairy. Basal and lower stem leaves oblanceolate, to 32 × 11 cm, lyrate pinnatifid or sometimes undivided, both faces glabrous or ± pubescent with short hairs, base attenuate into a ± unwinged very variable in length (much longer when leaf undivided) petiole-like portion, margin sinuate-dentate; lateral lobes 1–8 pairs, opposite to obliquely opposite, elliptic to ovate, base truncate to attenuate and sometimes petiolulate, apex acute, obtuse, or rounded; terminal lobe elliptic, ovate, or lanceolate, much larger than lateral lobes, apex ± acute. Middle stem leaves similar to lower leaves but smaller and less (or more rarely not) divided, terminal lobe long acuminate; upper stem leaves narrowly elliptic, lanceolate, or linear-lanceolate, reduced in size. Synflorescence paniculiform-corymbiform, with many capitula. Capitula with 11–25 florets; peduncle capillaceous, usually 0.5–2 cm. Involucre cylindric, 6–7.5 mm. Phyllaries abaxially glabrous; outer phyllaries ovate, longest to 1(–2) mm, apex acute; inner phyllaries ca. 8, adaxially appressed pubescent, midvein subapically plane, margin narrowly white scarious, apex acute. Anther tube green. Style branches yellow upon drying. Achene dark brownish purple, fusiform, 2–3 mm, ribs apically finely spiculate, apex attenuate. Pappus white, 3–4 mm. Fl. and fr. Apr–Oct.

• Forests, forest margins, wastelands; 400–2300 m. Chongqing, Gansu, Guangdong, Guangxi, ?Guizhou, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Yunnan.

“*Crepis? bockiana* Diels” (Bot. Jahrb. Syst. 29: 633. 1901) is based on the collection from Nanchuan, Chongqing, Bock & von Rosthorn 1593, which according to Babcock (Univ. Calif. Publ. Bot. 22: 916. 1947), who investigated a corresponding sheet from B, is a mixed gathering of a fragment with leaves and buds of *Youngia heterophylla* and a second completely sterile fragment with a single leaf of an unknown species. The sheet at B was apparently destroyed in 1943 and no other material of this collection is present at O, where the original set of the Bock and Rosthorn material is preserved. Therefore, the name is here treated as a synonym of *Y. heterophylla*. See also note under *Y. rosthornii*.

Youngia heterophylla may be confused with leafy-stemmed forms of *Y. japonica* subsp. *longiflora*. The latter, however, is strictly annual, its stem leaves have rather triangular or rhombic lateral lobes and an acute or shortly acuminate terminal lobe, and the pappus is of a single series of bristles only (vs. several bristles in a second series in *Y. heterophylla*).

21. *Youngia rosthornii* (Diels) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 92. 1937.

多裂黄鹌菜 duo lie huang an cai

Crepis rosthornii Diels, Bot. Jahrb. Syst. 29: 632. 1901; *C. japonica* (Linnaeus) Benth. f. *foliosa* Matsuda.

Herbs to 1 m tall or more, ?annual. Stem erect, branched above middle, glabrous, leafy. Basal leaves not seen. Lower and middle stem leaves broadly elliptic to ovate in outline, 11–20 × 7–14 cm, bipinnately compound, primary division pinnatisect; lateral lobes 3 or 4 pairs, opposite to obliquely opposite, oblanceolate, elliptic, irregularly elliptic, or lanceolate, to 5 cm, irregularly pinnatifid to pinnatisect, base ± winged petiolulate, apex acute to acuminate; primary terminal lobe similar in shape and size to lateral lobes; secondary lateral lobes few, irregularly ovate, triangular-ovate, or elliptic. Upper stem leaves similar to middle stem leaves but smaller and with narrower lobes or linear-lanceolate, reduced in size, and undivided. Synflorescence paniculiform-corymbiform, with many capitula. Capitula with ?20–25 florets; peduncle capillaceous, usually 0.5–3 cm. Involucre cylindric, ca. 6 mm. Phyllaries abaxially glabrous; outer phyllaries ovate, longest ca. 1 mm, apex ± acute; inner phyllaries ca. 8, adaxially ± appressed pubescent, midvein subapically plane, margin narrowly white scarious, apex acute. Anther tube green. Style branches yellow upon drying. Achene dark brownish purple, fusiform, ca. 2 mm, ribs apically finely spiculate, apex attenuate. Pappus white, 3–4 mm. Fl. and fr. Jun–Oct.

• Mountain slopes; 500–1500 m. Chongqing, Guangdong, Hubei, Sichuan, Zhejiang.

Distinction of *Youngia rosthornii* from *Y. heterophylla* is not without doubt because forms of the latter occur that approach the leaf division of the former. *Youngia rosthornii* may represent only an extreme form of *Y. heterophylla*.

22. *Youngia longipes* (Hemsley) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 92. 1937.

戟叶黄鹌菜 ji ye huang an cai

Crepis longipes Hemsley, J. Linn. Soc., Bot. 23: 476. 1888.

Herbs 80–100 cm tall, annual. Stem erect, branched from middle third or higher, glabrous, distantly leafy. Basal leaves with petiole to 15 cm; leaf blade cordate-hastate to sometimes ovate, to 15 × 5 cm, glabrous, margin sinuate-denticulate, apex acute, obtuse, or rounded. Stem leaves with gradually shorter petiole upwardly on stem, leaf blade smaller than in basal leaves and otherwise similar or lyrate pinnatisect; lateral lobes 1 or 2 pairs, alternate, narrowly ovate; terminal lobe broadly triangular, apex acuminate; uppermost leaves linear-lanceolate, reduced in size. Synflorescence paniculiform-corymbiform, with many capitula. Capitula with 15–20 florets. Involucre cylindric, 5–6 mm. Phyllaries abaxially glabrous; outer phyllaries ovate, longest less than ca. 1 mm, apex acute; inner phyllaries 8, adaxially appressed pubescent, midvein subapically plane, margin narrowly white scarious, apex acute. Achene pale red, finely mottled with yellow, fusiform, ca. 2 mm, ribs apically finely spiculate, apex strongly attenuate. Pappus white, ca. 4 mm. Fl. and fr. Jun.

• Sandy areas, valleys; 1000–1500 m. Hubei, Zhejiang.

23. *Youngia bifurcata* Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 89. 1937.

顶凹黄鹌菜 ding ao huang an cai

Herbs 12–13 cm tall, perennial, rosulate. Stems several, very slender, arcuate-erect or stoloniform, remotely 2-furcate, densely pubescent with pale brownish hairs especially at bifurcations, almost leafless. Rosette leaves and (if present) first basal leaf oblanceolate, to 10 × 2 cm, lyrate pinnatifid to lyrate pinnatipartite, pale ± brownish pubescent especially abaxially on midvein, base attenuate into a short narrowly winged petiole-like portion, margin faintly mucronulately sinuate-dentate or entire, apex obtuse; lateral lobes 3–5 pairs, semi-orbicular to broadly triangular, ± retrorse, gradually diminishing in size toward leaf base, apex rounded and mucronulate; terminal segment ovate to elliptic. Synflorescence of 1–5 ± distant capitula. Capitula with ca. 12 florets; peduncle very slender. Involucre cylindric, 6–7 mm, glabrous. Outer phyllaries pale yellowish, ovate, longest ca. 2 mm, ± fleshy, apex acute to obtuse; inner phyllaries 8, adaxially pubescent with appressed hairs, midvein subapically crested, apex acute and white ciliate. Anther tube green. Style branches yellow upon drying. Achene dark reddish brown, fusiform, 3–3.5 mm, compressed, ribs spiculate apically, apex attenuate. Pappus white, 1.5–2.5 mm, ± deciduous. Fl. and fr. Apr–May.

• Cultivated land; ca. 2500 m. Yunnan (Dongchuan).

Youngia bifurcata is only known from the type collection made by E. E. Maire sometime in the first third of the 20th century.

24. *Youngia japonica* (Linnaeus) Candolle, Prodr. 7: 194. 1838.

黄鹌菜 huang an cai

Herbs usually 10–150 cm tall, annual. Stems solitary or few, erect, branched from base, middle, or only apically, glabrous or basally often ± hairy, ± leafy or leafless. Basal leaves ± oblanceolate, to 15(–25) × 4(–6) cm, lyrate pinnatipartite or

pinnatisect, rarely not divided; glabrous or somewhat hairy, base attenuate into a longer or shorter narrowly winged to \pm unwinged petiole-like portion, margin sinuate-dentate; lateral lobes few to many, ovate, rhombic, or elliptic, gradually smaller toward leaf base; terminal lobe ovate, ovate-lanceolate, or obovate, much larger than lateral ones, apex rounded to acute. Stem leaves similar to basal leaves, abruptly or gradually reduced to bracts upward on stem. Synflorescence corymbiform to paniculiform-corymbiform, usually with many to numerous capitula. Capitula with 10–20 florets; peduncle capillaceous. Involucre cylindric, 4–7 mm. Phyllaries abaxially glabrous; outer phyllaries ovate to triangular, longest less than 1.5 mm, apex acute; inner phyllaries adaxially appressed pubescent, midvein subapically plane, margin \pm white scarious, apex acute. Anther tube dark green. Style branches yellow upon drying. Achene light brown to dark reddish or purplish brown, fusiform, 1.5–2.5 mm, ribs finely spiculate, apex strongly attenuate. Pappus white, 2.5–3.5 mm. Fl. and fr. Feb–Dec.

Mountain slopes, mountain valleys, ravines, forests, forest margins, grasslands, moist areas, by water, stream banks, trailsides, roadsides, disturbed places, densely grassy areas by houses or roads, field margins, as a weed in gardens and fields; below 100–4500 m. Anhui, Chongqing, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [present in all easterly and southerly neighboring countries; originating probably from China and introduced pantropically, extending into adjacent subtropical regions].

Youngia lyrata (= *Y. pseudosenecio*) and *Y. longiflora* (= *Y. taiwaniana*) are treated here as *Y. japonica* subsp. *elstonii* and *Y. japonica* subsp. *longiflora*, respectively, of a wider *Y. japonica*, following Babcock and Stebbins (Publ. Carnegie Inst. Washington 484: 97–98. 1937). While *Y. japonica* subsp. *longiflora* seems a fairly well-characterized taxon, the delimitation between *Y. japonica* subsp. *japonica* and *Y. japonica* subsp. *elstonii* appears questionable in view of frequent transitions and a probably scattered distribution pattern.

- 1a. Involucre 6–7 mm; anther tube more than ca. 3 mm; achene 2–2.5 mm 24c. subsp. *longiflora*
- 1b. Involucre 4–5.5 mm; anther tube not more than ca. 2 mm; achene 1.5–2 mm.
 - 2a. Stem leaves none, 1, or 2 (rarely more) otherwise abruptly reduced to bracts; anther tube usually more than 1.5 mm 24a. subsp. *japonica*
 - 2b. Stem leaves several, very gradually reduced upward on stem to bracts; anther tube at most ca. 1 mm 24b. subsp. *elstonii*

24a. *Youngia japonica* subsp. *japonica*

黄鹌菜(原亚种) huang an cai (yuan ya zhong)

Prenanthes japonica Linnaeus, Mant. Pl. 1: 107. 1767; *Chondrilla japonica* (Linnaeus) Lamarck; *C. multiflora* (Thunberg) Poiré; *Crepis formosana* Hayata; *C. japonica* (Linnaeus) Benth; *C. taquetii* (H. Léveillé & Vaniot) H. Léveillé; *Lactuca taquetii* H. Léveillé & Vaniot; *L. taraxacum* H. Léveillé & Vaniot; *Prenanthes fastigiata* Blume; *P. multiflora* Thunberg; *P. striata* Blume; *Youngia fastigiata* (Blume) Candolle; *Y. formosana* (Hayata) H. Hara; *Y. gracilis* Miquel; *Y. japonica*

subsp. *formosana* (Hayata) Kitamura; *Y. japonica* var. *formosana* (Hayata) H. L. Li; *Y. multiflora* (Thunberg) Candolle; *Y. napifolia* Candolle; *Y. poosa* Candolle; *Y. runcinata* Candolle.

Herbs usually 10–90 cm tall. Stems solitary or few, leafless and with only bracts or with 1 or 2 (or more) leaves in basal ca. 1/3(–1/2). Basal leaves mostly to 15 \times 5 cm. Involucre 4–5 mm. Outer phyllaries less than 1 mm. Anther tube ?usually 1.7–2 mm. Achene 1.5–2 mm. Pappus 2.5–3.5 mm. Fl. and fr. Feb–Dec. $2n = 16^*$.

Mountain slopes, mountain valleys, forests, forest margins, grasslands, moist areas, stream banks, trailsides, roadsides, disturbed places, as a weed in gardens and fields; below 100–4500 m. Anhui, Chongqing, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang [present in all easterly and southerly neighboring countries; originating probably from China and introduced pantropically, extending into adjacent subtropical regions].

24b. *Youngia japonica* subsp. *elstonii* (Hochreutiner) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 98. 1937.

卵裂黄鹌菜 luan lie huang an cai

Crepis japonica var. *elstonii* Hochreutiner, Candollea 5: 340. 1934; *Chondrilla lyrata* (Thunberg) Poiré; *Crepis lyrata* (Thunberg) Benth; *C. B. Clarke* (1876), not (Linnaeus) Froelich (1838); *Ixeris lyrata* (Thunberg) Miquel; *Lactuca pseudosenecio* Vaniot; *Prenanthes lyrata* Thunberg; *Youngia lyrata* (Thunberg) Cassini; *Y. pseudosenecio* (Vaniot) C. Shih.

Herbs usually 0.5–1.5 m tall. Stem mostly solitary, mostly with well-developed leaves at least in lower half. Basal and lower stem leaves to 27 \times 7 cm, pinnatipartite or sublyrately pinnatipartite; lateral lobes 3–7-paired, remote, elliptic to triangular, gradually smaller toward leaf base, lowermost segment usually toothlike, apex acute to obtuse; terminal lobe elliptic, apex acute. Middle and upper stems leaves similar to lower ones but gradually smaller and less divided upward on stem, gradually reduced to bracts. Capitula with ca. 20 florets. Involucre cylindric, 4–5.5 mm. Outer phyllaries less than 1 mm. Anther tube usually 0.6–1 mm. Achene 1.7–2 mm. Pappus 3–3.5 mm. Fl. and fr. Apr–Nov.

• Grasslands on mountain slopes, moist areas by water, densely grassy areas by houses, ravines; 300–2500 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Sichuan, Yunnan.

24c. *Youngia japonica* subsp. *longiflora* Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 97. 1937.

长花黄鹌菜 chang hua huang an cai

Crepis japonica subsp. *longiflora* (Babcock & Stebbins) Handel-Mazzetti; *Youngia longiflora* (Babcock & Stebbins) C. Shih; *Y. taiwaniana* S. S. Ying.

Herbs usually 30–90 cm tall. Stems solitary or few, leafless or leafy. Basal leaves to 23 \times 7 cm, lyrate pinnatilobate, lyrate pinnatipartite, inconspicuously runcinate-pinnatilobate, or runcinate-pinnatipartite; lateral lobes 3–8 pairs, opposite to obliquely opposite, elliptic, triangular, or rhombic, gradually smaller toward leaf base, apex rounded, obtuse, or acute; termi-

nal lobe elliptic to ovate, apex rounded. Stem leaves absent or similar to basal leaves but gradually smaller and less divided upward on stem. Capitula with 15–20 florets. Involucre cylindric, 6–7 mm. Phyllaries in 4 rows, abaxially glabrous; outer phyllaries to 1.5 mm. Anther tube usually 3?–4 mm. Achene usually dark purple brown, 2–2.5 mm. Pappus ca. 3.5 mm. Fl. and fr. Mar–Aug.

- Mountain slopes, field margins, stream banks, densely grassy areas by roads; below 100–3100 m. Anhui, Chongqing, Fujian, Guangdong, Guangxi, ?Guizhou, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Zhejiang.

25. *Youngia erythrocarpa* (Vaniot) Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 102. 1937.

红果黄鹌菜 hong guo huang an cai

Lactuca erythrocarpa Vaniot, Bull. Acad. Int. Géogr. Bot. 12: 319. 1903.

Herbs 30–100 cm tall, annual. Stem solitary, slender, erect, branched from near base; branches closely and nearly regularly spaced, sparsely pubescent or glabrous. Basal leaves oblanceolate, to 8 × 3 cm, lyrate pinnatisect, glabrous or pubescent with multicellular hairs, base attenuate into a petiole-like portion, margin sinuate-dentate; lateral lobes (1 or) 2 or 3 pairs, elliptic to narrowly elliptic, upper lobe largest, apex acute; terminal lobe broadly ovate to broadly triangular, much larger than lateral lobes, apex acute. Stem leaves similar to basal leaves but rather lanceolate, gradually smaller upward on stem and finally reduced and bractlike. Synflorescence paniculiform-corymbiform, with several to many capitula. Capitula with 10–15 florets; peduncle capillaceous. Involucre cylindric, 4–6 mm. Phyllaries abaxially glabrous; outer phyllaries triangular-ovate, longest ca. 1 mm, apex acute; inner phyllaries ca. 8, adaxially appressed pubescent, midvein subapically plane, margin narrowly white scarious, apex acute. Anther tube green. Style branches yellow upon drying. Achene red, broadly fusiform, 2–2.5 mm, compressed, lateral ribs especially in marginal achene conspicuously wide, ribs finely spiculate, apex attenuate into a stout 0.2–0.4 mm beak. Pappus white, 2.5–3 mm, caducous. Fl. and fr. Apr–Aug. $2n = 16^*$.

- Densely grassy areas on mountain slopes, wastelands on plains or in ravines; 400–1900 m. Anhui, Chongqing, Fujian, Gansu, Guizhou, Hubei, ?Hunan, Jiangsu, ?Jiangxi, Shaanxi, Sichuan, Zhejiang.

Distinction between *Youngia erythrocarpa* and the following species, *Y. rubida*, appears problematic, and their delimitation should be reassessed.

26. *Youngia rubida* Babcock & Stebbins, Publ. Carnegie Inst. Washington 484: 100. 1937.

川黔黄鹌菜 chuan qian huang an cai

Herbs 20–50 cm tall, annual. Stem erect, subdivicately branched from near base, with multicellular hairs below but glabrescent or glabrous above. Basal leaves oblanceolate, 5–10 × 1.5–3.5 cm, lyrate pinnatifid to pinnatisect, both faces glabrous or ± pubescent with multicellular hairs, base attenuate into a petiole-like portion, margin sinuate-dentate; lateral lobes 2 or 3 pairs, elliptic to narrowly elliptic; terminal lobe trian-

gular, apex acuminate. Lower and middle stem leaves similar to basal leaves; upper stem leaves ± linear, reduced in size, undivided or acutely 2-lobed near base. Synflorescence paniculiform-corymbiform, with several to many capitula. Capitula with 13–15 florets; peduncle capillaceous. Involucre cylindric, 6–7 mm. Phyllaries abaxially glabrous; outer phyllaries ovate, less than 1 mm, apex acute; inner phyllaries ca. 8, adaxially appressed pubescent, midvein subapically plane, margin narrowly white scarious, apex ± acute. Anther tube green. Style branches yellow upon drying. Achene red, broadly fusiform, ca. 2 mm, subcompressed, ribs obscurely spiculate, apex attenuate into a stout 0.2–0.4 mm beak. Pappus white, 3–4 mm, ± caducous. Fl. and fr. Jun–Nov.

- Forests, forest margins, under rocks, earthen walls; ca. 600 m. Guizhou, Hunan, Sichuan.

See note under *Youngia erythrocarpa* above.

27. *Youngia szechuanica* (E. S. Söderberg) S. Y. Hu, Quart. J. Taiwan Mus. 22: 37. 1969.

少花黄鹌菜 shao hua huang an cai

Crepis szechuanica E. S. Söderberg, Svensk Bot. Tidskr. 28: 362. 1934, based on *C. scaposa* C. C. Chang, Sinensia 3: 201. 1933, not R. E. Fries (1928); *Hieracium runcinatifolium* C. C. Chang, nom. illeg. superfl.; *Youngia scaposa* Babcock & Stebbins, nom. illeg. superfl.

Herbs 15–40 cm tall, perennial, rosulate. Caudex brown lanate, with residues of old leaf bases. Stems solitary or few, slender, erect, branched from base or higher, leafless or only with bracts. Rosette leaves oblanceolate, to 20 × 7 cm, lyrate pinnatifid, pinnatifid, or pinnatisect, both faces pubescent with brown multicellular crinkled hairs, base attenuate into a petiole-like portion, margin mucronately sinuate-dentate; lateral lobes 5–8 pairs, opposite or alternate, semiorbicular, elliptic, or triangular, gradually smaller toward leaf base, apex obtuse to rounded; terminal lobe ovate, 5–10 cm, much larger than lateral lobes, shallowly lobed, apex rounded. Synflorescence paniculiform-corymbiform, with numerous capitula. Capitula with ca. 5 florets; peduncle very slender. Involucre cylindric, 6–7 mm. Phyllaries abaxially glabrous; outer phyllaries ovate to lanceolate, longest ca. 1.5 mm, apex ± acute; inner phyllaries 5, adaxially glabrous, apex obtuse. Anther tube and style branches yellow upon drying. Achene dark purplish brown, subfusiform to columnar, 2–3 mm, apex slightly attenuate. Pappus yellowish brown, 3–4 mm. Fl. and fr. Jun–Jul.

- Trailsides on mountain slopes; 900–1700 m. Sichuan.

Crepis szechuanica (1934), *Hieracium runcinatifolium* (1935), and *Youngia scaposa* (1937) are all replacement names for the illegitimate later homonym *C. scaposa* C. C. Chang. The earliest legitimate name for the species is *C. szechuanica*, and the correct name in *Youngia* must therefore be *Y. szechuanica*. The taxonomic placement of the species in *Youngia*, however, needs confirmation.

28. *Youngia racemifera* (J. D. Hooker) Babcock & Stebbins, Univ. Calif. Publ. Bot. 18: 229. 1943.

总序黄鹌菜 zong xu huang an cai

Crepis racemifera J. D. Hooker, Fl. Brit. India 3: 397. 1881; *C. rapunculoides* Dunn; *Faberia racemifera* (J. D. Hooker) Sennikov; *Hieracioides racemifera* (J. D. Hooker) Kuntze.

Herbs 20–70 cm tall, perennial, with a ?rhizome or ?shoot-bearing roots. Stem solitary, erect, unbranched or with simple branches from ca. middle third, glabrous, usually leafy. Basal and lower stem leaves ovate, triangular-ovate, or lanceolate, 5–15 × 1–5 cm, glabrous, base attenuate or contracted into a 3–9 cm, broadly and long or narrowly and short cuneately winged petiole-like portion, margin ± mucronulately sinuate-dentate, apex acute to acuminate. Middle and upper stem leaves narrowly ovate, lanceolate, or linear-lanceolate, gradually smaller upward on stem, base attenuate into a gradually shorter cuneately winged petiole-like portion, apex acuminate to long acuminate, otherwise similar to basal leaves. Synflorescence of stem and branches secundly racemiform (occasionally of stem narrowly paniculiform), with few to many drooping capitula. Capitula with 10–20 florets; peduncle wiry, usually 0.2–2 cm.

Involucre narrowly campanulate, 1–1.3 cm. Phyllaries abaxially usually glabrous; outer phyllaries narrowly triangular to lanceolate, longest 1/4–1/3 as long as inner ones, apex obtuse to acute; inner phyllaries 8–10, midvein of single phyllaries subapically sometimes crested and/or corniculate, apex acute to obtuse and pale brownish ciliate. Anther tube yellow. Style strongly exserted, greenish black upon drying. Achene brown, ± cylindric, 4–5 mm, with 5 main ribs and 2 or 3 secondary ribs in between but otherwise ± smooth, apex truncate. Pappus yellowish to pale brown, 7–9 mm. Fl. and fr. Aug–Sep.

Grasslands on mountain slopes, forest margins, forests, forest openings, thickets; 2800–4200 m. Sichuan, Xizang, Yunnan [Bhutan, India (Sikkim), Nepal].

Doubts about the placement of this species in *Youngia* are justified, indeed. We do not agree, however, with its placement in *Faberia* as proposed by Sennikov and I. D. Illarionova (Komarovia 5: 109. 2008). Its systematic position is currently being investigated (J. W. Zhang et al., in prep.).

67. LAPSANASTRUM Pak & K. Bremer, Taxon 44: 19. 1995.

稻槎菜属 dao cha cai shu

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, annual or short-lived perennial, rosulate. Leaves pinnatipartite or pinnatisect. Capitula usually nodding, in fruit with 6–20 florets. Involucre narrowly cylindric at anthesis, broader in fruit, less than 7 mm, glabrous. Outer phyllaries much shorter than inner ones; inner phyllaries linear-lanceolate to lanceolate, of equal length, becoming broader in fruit. Receptacle naked. Florets yellow. Achene narrowly ellipsoid, subcompressed, with 5 main ribs and each accompanied by 1 (or 2) secondary ribs, apex truncate but with 0 or (1 or) 2–4 main ribs apically prolonged into 0.2–2.2 mm slender hooked appendages. Pappus absent.

Four species: China, Japan, Korea; four species (two endemic) in China.

A morphological phylogenetic analysis by Pak and K. Bremer (Taxon 44: 13–21. 1995) revealed that the E Asian species of *Lapsana* Linnaeus are rather distant to the remainder of this genus and instead probably related to *Youngia*. Therefore, the four species have been transferred by these authors to a new genus, *Lapsanastrum*. The close relationship to *Youngia* and distance from *Lapsana* have been fully confirmed by a recent molecular phylogenetic analysis of subtribe Crepidinae (J. W. Zhang et al., in prep.).

1a. Inner phyllaries 8; achene without apical hooked projections.

2a. Plants without creeping stems; flowering stems to 50 cm tall, with several capitula 1. *L. humile*

2b. Plants with creeping stems; flowering stems less than 10 cm tall, with 1 or 2 capitula 2. *L. takasei*

1b. Inner phyllaries 5 (or 6); achene usually with (1 or) 2–4 apical hooked projections or rarely absent.

3a. Achene with (1 or) 2 slender hooked 0.2–1 mm projections 3. *L. apogonoides*

3b. Achene with 2–4 slender hooked 1.2–2.2 mm projections 4. *L. uncinatum*

1. *Lapsanastrum humile* (Thunberg) Pak & K. Bremer, Taxon 44: 19. 1995.

矮小稻槎菜 ai xiao dao cha cai

Prenanthes humilis Thunberg in Murray, Syst. Veg., ed. 14, 715. 1784; *Lapsana humilis* (Thunberg) Makino; *L. musashiensis* Hayata; *L. parviflora* A. Gray; *Youngia humilis* (Thunberg) Candolle.

Herb 10–50 cm tall, annual to ?short-lived perennial, rosulate, with a taproot. Stems few to several, slender, decumbent to ascending, branched in upper part, puberulent or glabrescent, almost leafless. Rosette leaves oblanceolate, 3.5–10[–26] × 1–2[–4] cm, lyrate pinnatipartite to pinnatisect, base attenuate into petiole-like basal portion, margin sinuate-dentate; lateral lobes 2–7 pairs, elliptic to ovate; terminal lobe ovate, irregularly rhombic, or broadly triangular, much larger than lateral ones,

apex ± rounded and mucronulate. Stem leaves 1 or 2, similar to rosette leaves. Synflorescence laxly corymbose, with several capitula. Capitula nodding in fruit, with 15–20 florets; peduncle capillaceous, 0.5–4 cm. Involucre cylindric and 3–4 mm at anthesis, ovoid to subhemispheric and 4–5 mm in fruit. Outer phyllaries 3 or 4, triangular-ovate, ca. 1 mm; inner phyllaries 8. Achene brown, 2–3 mm, minutely papillose, without hooked apical projections of main ribs. Fl. and fr. Apr–Jun. *2n* = 16.

Fields, wastelands, streamsides; 500–1000 m. Anhui, Fujian, Jiangsu, Zhejiang [Japan, Korea].

2. *Lapsanastrum takasei* (Sasaki) Pak & K. Bremer, Taxon 44: 20. 1995.

台湾稻槎菜 tai wan dao cha cai

Lactuca takasei Sasaki, Trans. Nat. Hist. Soc. Formosa 21: 224. 1931; *Lapsana takasei* (Sasaki) Kitamura.

Herbs to 10 cm tall, short-lived perennial, rosulate. Taproot with lateral shoot-bearing roots producing secondary leaf rosettes. Stems few, flagelliform, very slender, creeping to 50 cm above ground, sparsely pilose; nodes 5–10 cm apart, with adventitious roots and a single leaf. Flowering stems from rosettes and leaf axils of creeping stems, to 7 cm, very slender, ascending, simple or more rarely 2-parted, \pm leafless. Rosette leaves oblanceolate, $4-9 \times 1-2$ cm, pinnatisect, rachis winged or not, pilose, base attenuate into a petiole-like portion, margin sinuate-dentate; lateral lobes 4–7 pairs, ovate, triangular, or rhombic, gradually smaller toward petiole-like base, apex rounded to acute and mucronulate; terminal lobe broadly ovate to suborbicular, much larger than lateral ones. Leaves of creeping stems similar to rosette leaves. Capitula 1 or 2 per flowering stem, with ca. 10 florets. Involucre cylindric, ca. 7 mm, in fruit ca. 4 mm wide. Outer phyllaries ca. 5, lanceolate, longest ca. 1 mm; inner phyllaries 8. Achene without hooked apical projections of main ribs. Fl. and fr. Jun–Aug. $2n = 16^*$.

- Moist mountain slopes; 1800–2800 m. Taiwan.

3. *Lapsanastrum apogonoides* (Maximowicz) Pak & K. Bremer, Taxon 44: 19. 1995.

稻槎菜 *dao cha cai*

Lapsana apogonoides Maximowicz, Bull. Acad. Imp. Sci. Saint-Petersbourg 18: 288. 1873.

Herbs 5–25 cm tall, annual to biennial, rosulate, with a taproot. Stems several, slender, ascending, branched from basal half or higher up, pubescent or glabrous, distantly leafy. Rosette leaves oblanceolate, $3-15 \times 1-2.5$ cm, lyrate pinnatisect, base attenuate into a petiole-like portion, margin subentire to mucronately sinuate-dentate; lateral lobes 2 or 3(or 4) pairs, ovate, elliptic, or hemispheric, apex mucronulate; terminal lobe ovate, rhombic, or elliptic, much larger than lateral ones, apex rounded and mucronulate. Stem leaves few, similar to basal leaves. Synflorescence laxly corymbiform to laxly paniculiform-corymbiform, with few to several capitula. Capitula nodding in fruit, with 6–10 florets; peduncle 1–5 cm. Involucre narrowly cylindric and 3–4 mm at anthesis, cylindric, campanulate,

or obovoid and 4–6 mm in fruit. Phyllaries abaxially glabrous; outer phyllaries 3 or 4, \pm ovate, longest 1–1.5 mm, apex acute and often purplish tipped; inner phyllaries 5(or 6). Achene straw-colored to yellowish brown, body 4–5 mm, minutely papillose, usually lateral main ribs apically prolonged into (1 or) 2 slender hooked 0.2–1 mm appendages or rarely absent. Fl. and fr. Nov–Jun. $2n = 44$.

Riverbanks, fields, wastelands, roadsides; low elevations. Anhui, Fujian, Guangdong, Guangxi, Hunan, Jiangsu, Jiangxi, Shaanxi, Taiwan, Yunnan, Zhejiang [Japan, Korea; introduced to W North America].

In Guangxi and Hunan, the species is used as green fodder for pigs.

4. *Lapsanastrum uncinatum* (Stebbins) Pak & K. Bremer, Taxon 44: 20. 1995.

具钩稻槎菜 *ju gou dao cha cai*

Lapsana uncinata Stebbins, Madroño 4: 154. 1938.

Herbs 5–10 cm tall, ?annual, rosulate, glabrous. Stems several, to 15 cm, slender, decumbent, branched in apical half, almost leafless. Rosette leaves oblanceolate, $4-10 \times 1-1.5$ cm, pinnatisect to lyrate pinnatisect, base attenuate into petiole-like portion, margin sinuate-dentate; lateral lobes 2–4 pairs, triangular to ovate; terminal lobe ovate, much larger than lateral ones, apex \pm rounded and mucronulate. Stem leaves 0 or 1, similar to rosette leaves but reduced in size. Synflorescence laxly corymbose, with few to several capitula. Capitula nodding in fruit, with 10–12 florets; peduncle capillaceous, 1.5–5 cm. Involucre cylindric and 5–6 mm at anthesis, cylindric, campanulate, or obovoid and to 6.5 mm in fruit. Outer phyllaries 3 or 4, triangular-ovate, 1–1.5 mm; inner phyllaries 5(or 6). Achene straw-colored to reddish yellow, body ca. 3 mm, minutely papillose, 2–4 main ribs apically prolonged into slender hooked 1.2–2.2 mm appendages. Fl. and fr. Apr.

- Floodplains. S Anhui (Tongling).

Lapsanastrum uncinatum is a remarkable, apparently very rare species and is only known to the authors from the type collection made in 1924 in the floodplains of the Chang Jiang.

68. **CREPIDIASTRUM** Nakai, Bot. Mag. (Tokyo) 34: 147. 1920.

假还阳参属 *jia huan yang shen shu*

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Crepidifolium Sennikov; *Geblera* Kitagawa (1937), not Fischer & C. A. Meyer (1835); *Paraixeris* Nakai.

Herbs, annual, biennial, or perennial, sometimes subshrubs, often rosulate, with a taproot. Stems usually leafy. Leaves undivided or pinnately lobed; stem leaves often clasping. Capitula with 5–20 florets. Involucre narrowly cylindric. Phyllaries with narrow scarious margin; outer phyllaries few, longest ca. $1/4(-1/2)$ as long as inner ones; inner phyllaries 5 or 8, linear-lanceolate, equal in length. Receptacle naked. Florets yellow. Achene \pm fusiform, slightly compressed, with 5 main ribs alternating with 1 or 2 secondary ribs, usually scabrid of antrorse acute papillae especially toward apex, rarely glabrous or muriculate, apex attenuate or with a beak less than $1/5$ or to $1/2$ of achene length. Pappus white, scabrid, usually \pm caducous.

About 15 species: C and E Asia, including N Pacific Bonin (Ogasawara) Islands; nine species (two endemic) in China.

Crepidiastrum, in the circumscription used here, includes *Paraixeris*, following the conclusions by Pak and Kawano (Mem. Fac. Sci. Kyoto Univ., Ser. Biol. 15: 29–61. 1992) of their carpological and cytological investigations, which have been corroborated through recent molecular phylogenetic analyses by J. W. Zhang et al. (in prep.). The analyses by J. W. Zhang et al., moreover, revealed that the *Youngia* segregate *Crepidifolium*

is also nested within the *Crepidiastrum* clade, thus confirming an earlier assumption by Sennikov (Bot. Zhurn. 82(5): 113–116. 1997), which Sennikov later revised in favor of establishing the separate genus *Crepidifolium* (Sennikov & I. D. Illarionova, Komarovia 5: 96. 2008). This genus is therefore also treated here as a congener of *Crepidiastrum*, extending its geographical range to C Asia. Its basic chromosome number is $x = 5$.

- 1a. Inner phyllaries 5; florets 5 or 6 5. *C. chelidoniifolium*
- 1b. Inner phyllaries (7 or)8; florets 8–19.
 - 2a. Stem leaves never clasping.
 - 3a. Plant stoloniferous; leaf blade triangular to orbicular 6. *C. humifusum*
 - 3b. Plant not stoloniferous; leaf blade oblanceolate, elliptic, or lanceolate.
 - 4a. Stems numerous, intricately and divaricately dichotomously branched 9. *C. akagii*
 - 4b. Stems 1 or few, paniculately branched.
 - 5a. Involucre 0.8–1.1 cm, 2.5–3.5 mm wide at anthesis (in middle third); anther tube 3.5–5 mm; achene black to blackish 7. *C. tenuifolium*
 - 5b. Involucre 1–1.4 cm, (3.5–)4–6 mm wide at anthesis (in middle third); anther tube 5–6 mm; achene usually brownish 8. *C. diversifolium*
 - 2b. At least upper stem leaves conspicuously clasping.
 - 6a. Annual or biennial herbs; achene with a beak 1/5–1/3 as long as achene.
 - 7a. Middle and upper stem leaves broadest in basal third; involucre 4.5–6.5 mm; anther tube and style pure yellow upon drying 1. *C. sonchifolium*
 - 7b. Middle and upper stem leaves broadest in middle third; involucre 6–9 mm; anther tube and style greenish to blackish upon drying 4. *C. denticulatum*
 - 6b. Perennial rosulate herbs with a woody caudex or subshrubs; achene without a beak or with a beak at most 1/5 as long as achene.
 - 8a. Leaves undivided or pinnately lobed, margin entire to shallowly dentate; primary stems decumbent; middle and upper stem leaves obovate, ovate, or lanceolate, apex subacute to rounded 2. *C. lanceolatum*
 - 8b. Leaves always undivided, margin entire to denticulate; primary stems ascending-erect; upper stem leaves broadly elliptic to broadly ovate, apex mostly rounded 3. *C. taiwanianum*

1. *Crepidiastrum sonchifolium* (Maximowicz) Pak & Kawano, Mem. Fac. Sci. Kyoto Univ., Ser. Biol. 15: 58. 1992.

尖裂假还阳参 jian lie jia huan yang shen

Herbs 20–100 cm tall, annual or biennial. Root vertical, with many fibrous rootlets. Stem solitary, erect, branched predominantly in upper half, glabrous or rarely puberulent (subsp. *pubescens*). Leaves glabrous, or rarely puberulent (subsp. *pubescens*). Basal leaves and often lower stem leaves oblanceolate, apex rounded. Middle and upper stem leaves sessile, narrowly ovate, lanceolate, or rarely \pm elliptic, base very conspicuously auriculate-clasping, auricles \pm rounded; blade including auricles pinnatifid, pinnatipartite, or subpinnatisect and often laciniately so. Synflorescences terminating main stem and branches, corymbiform or paniculiform, with few to many capitula. Capitula with 12–20 florets; peduncle capillaceous. Involucre 4.5–6.5 mm, narrowly cylindric. Phyllaries abaxially glabrous; outer phyllaries few, ovate, less than 0.5 mm, apex acute; inner phyllaries ca. (7 or)8, plane or more often weakly to strongly crested or corniculate below apex. Achene fusiform, 2–4.2 mm including a slender 0.4–1.8 mm beak. Pappus white, 2–3 mm.

Grasslands on mountain slopes, thickets, floodplains, rocky stream beds, cliffs, roadsides; below 100–1900 m. Anhui, Chongqing, Gansu, ?Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan [Korea, Mongolia, E Russia].

- 1a. Stems, branches, and leaves glabrous; achene ribs scabrid especially apically, beak 0.4–1 mm and 1/5–1/3 as long as achene 1a. subsp. *sonchifolium*

- 1b. Stems, branches, and leaves puberulent; achene ribs apically strongly muriculate, beak 1.2–1.8 mm and almost 1/2 as long as achene 1b. subsp. *pubescens*

1a. *Crepidiastrum sonchifolium* subsp. *sonchifolium*

尖裂假还阳参(原亚种) jian lie jia huan yang shen (yuan ya zhong)

Youngia sonchifolia Maximowicz, Mém. Acad. Imp. Sci. St.-Petersbourg Divers Savans 9: 180. 1859; *Crepidiastrum sonchifolium* var. *elegans* (Franchet) Sennikov; *Ixeridium elegans* (Franchet) C. Shih; *I. sonchifolium* (Maximowicz) C. Shih; *Ixeris denticulata* (Houttuyn) Stebbins subsp. *elegans* (Franchet) Stebbins; *I. denticulata* subsp. *sonchifolia* (Maximowicz) Stebbins; *I. serotina* (Maximowicz) Kitagawa; *I. sonchifolia* (Maximowicz) Hance; *I. sonchifolia* var. *serotina* (Maximowicz) Kitagawa; *Lactuca bungeana* Nakai; *L. denticulata* (Houttuyn) Maximowicz var. *sonchifolia* (Maximowicz) Maximowicz; *L. elegans* Franchet; *L. sonchifolia* (Maximowicz) Debeaux (1876), not Willdenow (1803); *Paraixeris serotina* (Maximowicz) Tzvelev; *P. sonchifolia* (Maximowicz) Tzvelev; *P. sonchifolia* var. *serotina* (Maximowicz) Kitagawa; *Y. serotina* Maximowicz.

Basal leaves and often lower stem leaves oblanceolate, apex rounded. Middle stem leaves sessile, narrowly ovate, lanceolate, or rarely \pm elliptic, 2.5–9 \times 0.5–3 cm, base very conspicuously auriculate-clasping, auricles \pm rounded; blade including auricles pinnatifid, pinnatipartite, or subpinnatisect, with short triangular (1–5 mm) to long narrowly triangular or sublinear (to 1.5 cm) acute lateral lobes and a larger acute ter-

minal lobe, margin entire or sharply dentate. Upper stem leaves similar to middle stem leaves but smaller, usually less incised, less dentate, or entire especially in upper part of blade, apex long acuminate. Involucre 4.5–6.5 mm. Inner phyllaries plane or more often weakly to strongly crested or corniculate below apex. Anther tube and style yellow upon drying. Achene reddish brown, 2–3.2 mm including a slender 0.4–1 mm beak. Pappus 2–3 mm. Fl. and fr. Apr–Sep. $2n = 10^*$.

Grasslands on mountain slopes, thickets, floodplains, rocky stream beds, cliffs, roadsides; below 100–1900 m. Anhui, Chongqing, Gansu, ?Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi, Sichuan [Korea, Mongolia, E Russia].

Stebbins (J. Bot. 75: 43–51. 1937) distinguished *Ixeris denticulata* subsp. *elegans* from *I. denticulata* subsp. *sonchifolia* by the slightly smaller involucre, distinctly crested or corniculate inner phyllaries, and more finely dentate leaves. In the material studied, this delimitation does not appear to work. Although, for example, the inner phyllaries are strikingly corniculate in the type of *Lactuca elegans*, there is no discontinuity but a rather continuous variation toward plants with only slightly crested or even plane phyllaries. Similar observations regard the other features listed.

1b. *Crepidiastrum sonchifolium* subsp. *pubescens* (Stebbins) N. Kilian, *comb. nov.*

柔毛假还阳参 rou mao jia huan yang shen

Basionym: *Ixeris denticulata* subsp. *pubescens* Stebbins, J. Bot. 75: 49. 1937.

Stems, branches, and leaves puberulent. Stem leaves lanceolate, 3–6 cm, pinnatipartite; lateral lobes 5–10 pairs, margin entire or dentate to weakly pinnatifid. Involucre 4.5–5.5 mm. Inner phyllaries not or weakly crested or corniculate below apex. Anther tube and style yellow upon drying. Achene 3.5–4.2 mm including a slender 1.2–1.8 mm beak, body apically muriculate. Pappus 2–2.5 mm.

• Hubei.

A little-known taxon, tentatively placed here, it is apparently only known from the holotype at W.

2. *Crepidiastrum lanceolatum* (Houttuyn) Nakai, Bot. Mag. (Tokyo) 34: 150. 1920.

假还阳参 jia huan yang shen

Prenanthes lanceolata Houttuyn, Nat. Hist. 10: 383. 1779; *Chondrilla lanceolata* (Houttuyn) Poir.; *Crepidiastrum koshunense* (Hayata) Nakai; *C. lanceolatum* f. *batakanense* (Kitamura) Kitamura; *C. lanceolatum* var. *batakanense* (Kitamura) Nemoto; *C. lanceolatum* f. *pinnatilobum* (Maximowicz) Nakai; *C. quercus* (H. Léveillé & Vaniot) Nakai; *Crepis integra* (Thunberg) Miquel; *C. integra* var. *pinnatiloba* Maximowicz; *C. lanceolata* (Houttuyn) Schultz Bipontinus; *C. lanceolata* var. *pinnatiloba* (Maximowicz) Makino; *Hieracioides integra* (Thunberg) Kuntze; *Ixeris koshunensis* (Hayata) Stebbins; *I. lanceolata* (Houttuyn) Stebbins (1937), not C. C. Chang (1932); *I. quercus* (H. Léveillé & Vaniot) Stebbins; *Lactuca koshunensis* Hayata; *L. lanceolata* (Houttuyn) Makino; *L. lanceolata* var. *batakanensis* Kitamura; *L. quercus* H. Léveillé & Vaniot; *P. integra* Thunberg.

Herbs 10–20 cm tall, perennial, rosulate, with a woody caudex or rootstock. Stems several from rosette leaf axils, to 40 cm, decumbent, leafy, each usually producing a secondary leaf rosette at a node in its middle third and with a single or few \pm ascending-erect remotely leafy secondary flowering stems. Rosette leaves spatulate to rarely elliptic, 5–15 \times 0.5–4.5 cm, usually somewhat fleshy, undivided or more rarely pinnatifid to pinnatisect with ovate to lanceolate lateral lobes, glabrous, base cuneately attenuate, margin entire or shallowly dentate, apex usually rounded. Lower and middle stem leaves similar to rosette leaves but smaller, base semiamplexicaul, apex obtuse to acute. Upper stem leaves obovate to ovate, base auriculate claspings, apex subacute to obtuse. Synflorescence corymbiform, with few to several capitula. Capitula with 8–12 florets; peduncle slender. Involucre narrowly cylindric, 7–9 mm. Phyllaries glabrous; outer phyllaries few, ovate, longest ca. 2 mm, apex \pm acute; inner phyllaries 8, apex subacute. Achene brownish, subfusiform, 3–4 mm, scabrid, apically attenuate or with a less than 0.5 mm beak. Pappus white, 3–4 mm. $2n = 10^*$.

Rocky situations on hillsides in coastal areas. Taiwan [Japan, S Korea].

3. *Crepidiastrum taiwanianum* Nakai, Bot. Mag. (Tokyo) 34: 252. 1920.

台湾假还阳参 tai wan jia huan yang shen

Crepidiastrum koshunense (Hayata) Nakai var. *taiwanianum* (Nakai) Yamamoto; *Ixeris taiwaniana* (Nakai) Stebbins; *Lactuca taiwaniana* (Nakai) Makino & Nemoto.

Herbs 20–40 cm tall, perennial, sometimes subshrubs, rosulate, with a woody caudex. Stems several from rosette leaf axils, ascending to erect, branched in apical third or half, leafy; older stems basally woody, developing in middle third a secondary leaf rosette with a single or few \pm ascending-erect leafy secondary flowering stems. Rosette leaves spatulate, 4–12 \times 1–4 cm, glabrous, base attenuate, margin entire or denticulate, apex rounded. Lower stem leaves similar to rosette leaves but smaller, base semiamplexicaul. Middle and upper stem leaves broadly elliptic to broadly ovate, smaller than lower ones, base auriculate claspings, margin entire or faintly denticulate, apex mostly rounded. Synflorescence corymbiform, with several to many capitula. Capitula with 8–12 florets; peduncle slender. Involucre narrowly cylindric, 6–8 mm. Phyllaries glabrous; outer phyllaries few, ovate, longest ca. 1.5 mm, apex \pm acute; inner phyllaries 8, apex subacute. Achene brownish, subfusiform, ca. 4 mm, scabrid, apically attenuate or with a less than 0.5 mm beak. Pappus white, ca. 3 mm. $2n = 10^*$.

• Littoral areas; near sea level to 200 m. S Taiwan.

Crepidiastrum taiwanianum is closely related to *C. lanceolatum*. Closer investigation should show whether its status as a separate species is actually justified.

4. *Crepidiastrum denticulatum* (Houttuyn) Pak & Kawano, Mem. Fac. Sci. Kyoto Univ., Ser. Biol. 15: 56. 1992.

黄瓜假还阳参 huang gua jia huan yang shen

Herbs 30–120 cm tall, annual or biennial. Root vertical, with many fibrous rootlets. Stem solitary, erect, branched pre-

dominantly in upper half, glabrous. Leaves glabrous. Basal and lower stem leaves mostly withered in fruit, \pm petiolate or sessile, usually oblanceolate, undivided or pinnately divided. Middle stem leaves sessile, base conspicuously auriculate clasping, auricles usually rounded; blade (including auricles) oblanceolate, obovate, pandurate, or \pm elliptic, undivided, or pinnatifid or pinnatipartite, margin entire or dentate, apex rounded, acute, or acuminate. Upper stem leaves similar to middle stem leaves but smaller, usually less incised, less dentate, or entire. Synflorescences terminating main stem and branches, corymbiform or paniculiform, with few to many capitula. Capitula with 12–20 florets; peduncle capillaceous. Involucre narrowly cylindric, 6–9 mm. Phyllaries abaxially glabrous; outer phyllaries few, ovate, less than 0.5 mm, apex acute; inner phyllaries ca. (7 or) 8, midvein subapically plane, crested, or corniculate. Anther tube and style greenish to blackish upon drying. Achene blackish dark brown, narrowly ellipsoid, 2.5–4.5 mm, with 10–15 apically scabrid ribs, apex attenuate into a beak 1/5–1/3 as long as achene. Pappus white, 3–5.5 mm.

Forests, forest margins, grasslands, dry slopes, among boulders, cliffs, field margins, roadsides; below 100–2000 m. Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Shandong, Shanxi, Sichuan, Yunnan, Zhejiang [Japan, Korea, Mongolia, E Russia, Vietnam].

Based on the treatment by Stebbins (J. Bot. 75: 43–51. 1937) under *Ixeris*, excluding the misplaced *I. denticulata* subsp. *elegans*, *I. denticulata* subsp. *pubescens*, and *I. denticulata* subsp. *sonchifolia* (see subspecies of *Crepidiastrum sonchifolium* above), three subspecies are recognized in *C. denticulatum*. They are not always easily distinguishable and seem linked by transitional populations, but this approach may provide a fairly suitable basis for further, much needed studies.

- 1a. Involucre 6–7(–8) mm; midvein of inner phyllaries crested below apex; achene with 0.4–1 mm beak ca. 1/4–1/3 as long as achene 4c. subsp. *ramosissimum*
- 1b. Involucre 7–9 mm; midvein of inner phyllaries plane or crested below apex; achene with 0.2–0.6 mm beak ca. 1/5 as long as achene.
 - 2a. Involucre 7–8 mm; midvein of inner phyllaries plane below apex; achene including beak 2.5–3.5 mm; pappus 3.5–4.5 mm 4a. subsp. *denticulatum*
 - 2b. Involucre 8–9 mm; midvein of inner phyllaries crested below apex; achene including beak 3–4 mm; pappus 4.5–5.5 mm 4b. subsp. *longiflorum*

4a. *Crepidiastrum denticulatum* subsp. *denticulatum*

黄瓜假还阳参(原亚种) huang gua jia huan yang shen (yuan ya zhong)

Prenanthes denticulata Houttuyn, Nat. Hist. 10: 385. 1779; *Chondrilla denticulata* (Houttuyn) Poiret; *C. hastata* (Thunberg) Poiret; *Crepidiastrum denticulatum* var. *cornutum* Sennikov; *C. denticulatum* f. *pinnatipartitum* (Makino) Sennikov; *Ixeris denticulata* (Houttuyn) Stebbins; *I. denticulata* f.

pinnatipartita (Makino) Stebbins; *Lactuca denticulata* (Houttuyn) Maximowicz; *L. denticulata* [unranked] *pinnatipartita* Makino; *Paraixeris denticulata* (Houttuyn) Nakai; *P. denticulata* f. *pinnatipartita* (Makino) Nakai; *P. denticulata* var. *pinnatipartita* (Makino) Barkalov; *P. pinnatipartita* (Makino) Tzvelev; *Prenanthes hastata* Thunberg; *Youngia chrysanthia* Maximowicz; *Y. denticulata* (Houttuyn) Kitamura; *Y. denticulata* f. *pinnatipartita* (Makino) Kitamura; *Y. hastata* (Thunberg) Candolle.

Basal leaves and lower stem leaves oblanceolate, apex usually rounded. Middle stem leaves sessile, base very conspicuously auriculate clasping, auricles \pm rounded; blade (including auricles) oblanceolate, obovate, pandurate, or more rarely \pm elliptic, 3–12 \times 1–7 cm, undivided, or pinnatifid or pinnatipartite, margin shallowly or more deeply dentate or entire; lateral lobes (if present) 2–4 pairs, opposite to subalternate, triangular-ovate, elliptic, or obovate; terminal lobe triangular-ovate to elliptic, much larger, apex rounded to subacute. Upper stem leaves similar to middle stem leaves but smaller, usually less incised or less dentate or entire. Involucre 7–8 mm. Inner phyllaries usually plane below apex. Achene 2.5–3.5 mm including a 0.2–0.5 mm beak. Pappus 3.5–4.5 mm. Fl. and fr. Aug–Feb. $2n = 10^*$.

Forests, forest margins, grasslands, cliffs, field margins; below 100–2000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Shandong, Shanxi, Zhejiang [Japan, Korea, Mongolia, E Russia, Vietnam].

4b. *Crepidiastrum denticulatum* subsp. *longiflorum* (Stebbins) N. Kilian, **comb. nov.**

长叶假还阳参 chang ye jia huan yang shen

Basionym: *Ixeris denticulata* subsp. *longiflora* Stebbins, J. Bot. 75: 48. 1937.

Leaves similar to subsp. *denticulatum*. Involucre 8–9 mm. Inner phyllaries usually distinctly crested below apex. Achene 3–4 mm including a 0.3–0.6 mm beak. Pappus 4.5–5.5 mm. Fl. and fr. (?Sep–)Jan–Mar.

• Field margins; 400–1000 m. Fujian, Guangdong, Jiangxi.

4c. *Crepidiastrum denticulatum* subsp. *ramosissimum* (Benth.) N. Kilian, **comb. nov.**

枝状假还阳参 zhi zhuang jia huan yang shen

Basionym: *Brachyrhynchus ramosissimus* Benth, London J. Bot. 1: 489. 1842; *Ixeris denticulata* subsp. *ramosissima* (Benth.) Stebbins; *I. ramosissima* (Benth.) A. Gray.

Basal and lower stem leaves spatulate to obovate, to 24 \times 7 cm, undivided or pinnatipartite to pinnatisect (often lyrate) so, base cuneately attenuate into a winged or sometimes unwinged petiole-like portion and semiamplexicaul to somewhat auriculate clasping, margin sinuate-dentate, apex rounded to acute; lateral lobes (if present) 2–5 pairs. Middle and upper stem leaves mostly spatulate but uppermost ones sometimes lanceolate, smaller, undivided or pinnatipartite, base without petiole-like portion but distinctly auriculate clasping, margin subentire to shallowly sinuate-dentate, apex rounded to

acute. Involucre 6–7(–8) mm. Inner phyllaries usually distinctly crested below apex. Achene 2.8–4.5 mm including a beak 1/4–1/3 as long as achene. Pappus ca. 3 mm. Fl. and fr. Jul–Nov. $2n = 10^*$.

• Dry slopes, among boulders, cliffs, roadsides; 600–2000 m. Guangdong, Guangxi, Guizhou, Yunnan.

5. *Crepidiastrum chelidoniifolium* (Makino) Pak & Kawano, Mem. Fac. Sci. Kyoto Univ., Ser. Biol. 15: 56. 1992.

少花假还阳参 shao hua jia huan yang shen

Lactuca chelidoniifolia Makino, Bot. Mag. (Tokyo) 12: 47. 1898 [*“chelidoniifolia”*]; *Ixeris chelidoniifolia* (Makino) Stebbins; *L. senecio* H. Léveillé & Vaniot; *Paraixeris chelidoniifolia* (Makino) Nakai; *Youngia chelidoniifolia* (Makino) Kitamura.

Herbs 10–25[–50] cm tall, annual, glabrous. Stem solitary, erect, branched from base. Basal leaves withered at anthesis. Lower and middle stem leaves with a slender petiole often basally with well-developed dentate or dissected auricles; leaf blade \pm elliptic, 2–6[–12] \times 0.5–3[–6] cm, irregularly and interruptedly pinnatisect, rachis wingless; lateral lobes 1–4 pairs, opposite to alternate, ovate, elliptic, falcate, rhombic, or oblanceolate, margin sparsely dentate to incised; terminal lobe similar to lateral ones. Upper stem leaves similar to lower and middle stem leaves. Synflorescence of main stem and branches corymbiform or paniculiform, with few to many capitula. Capitula with ca. 5(or 6) florets. Involucre narrowly cylindric, 5–7 mm. Outer phyllaries few, ovate, longest 0.6–1 mm, apex obtuse to acute; inner phyllaries 5, apex acute to obtuse. Anther tube and style greenish to blackish upon drying. Achene brownish, fusiform, 2.5–3.5 mm, with 10–15 apically long papillose ribs, apex attenuate or with a beak to 0.7 mm. Pappus white, 3.5–4.5 mm. Fl. and fr. Sep–Oct. $2n = 10$.

Mountain slopes, ravines, forests, moist cliffs; 1000–1700 m. Heilongjiang, Jilin [Japan, Korea, E Russia].

“Ixeris saxatilis” (Baranov, Zap. Kharbin. Obshch. Estestvoisp. Etnogr. 12: 34. 1954, and repeated identically in Feddes Repert. Spec. Nov. Regni Veg. 63: 289. 1961), based on a collection from Heilongjiang, is here considered as conspecific with *Crepidiastrum chelidoniifolium*, following Sennikov (Bot. Zhurn. 82(5): 114. 1997). Sennikov also noted (loc. cit.) that the name *“I. saxatilis”* was not validly published because the alternative name *“Lactuca saxatilis”* was proposed simultaneously (*Vienna Code*, Art. 34.2). Three later binomials referring to, and based on, Baranov’s original description, where two gatherings were cited, were also not validly published, because their authors failed to indicate a single gathering as the type (Art. 37.1 and 37.2): *“Ixeris saxatilis”* (Soják, Novit. Bot. Delect. Semin. Horti Bot. Univ. Carol. Prag. 1962: 50. 1962), *“Paraixeris saxatilis”* (Tzvelev, Fl. URSS 29: 400. 1964), and *“Crepidiastrum saxatile”* (Pak & Kawano, Mem. Fac. Sci. Kyoto Univ., Ser. Biol. 15: 57. 1992).

6. *Crepidiastrum humifusum* (Dunn) Sennikov, Bot. Zhurn. 82(5): 115. 1997.

心叶假还阳参 xin ye jia huan yang shen

Lactuca humifusa Dunn, J. Linn. Soc., Bot. 35: 512. 1903; *Crepis stolonifera* H. Léveillé; *Ixeris humifusa* (Dunn) Stebbins;

I. stebbinsiana Handel-Mazzetti; *Paraixeris humifusa* (Dunn) C. Shih.

Herbs 15–40 cm tall, perennial, with long creeping runners sometimes covering ground. Basal leaves present at anthesis, with an unwinged sparsely hairy petiole to 13 cm; leaf blade obovoid, elliptic, broadly ovoid, or semiorbicular, 5–8 \times 4–9 cm, abaxially sparsely hairy, lyrate pinnatisect or pinnatipartite, with 1 or 2(or more?) pairs of lateral lobes and a much larger terminal lobe or margin coarsely sinuate-dentate, base cordate to truncate, apex acute. Middle and upper stem leaves and leaves on runners with unwinged petiole usually as long as blade or longer; leaf blade broadly ovate, subtriangular, or semiorbicular, margin coarsely sinuate-dentate, otherwise similar to basal leaves. Uppermost stem leaves petiolate; leaf blade lanceolate to polygonal, not divided, base truncate to broadly cuneate. Synflorescence laxly corymbiform with 2–7 capitula. Capitula with 10–14 florets; peduncle capillaceous, 1–5 cm. Involucre cylindric, 8.5–11 mm. Phyllaries abaxially glabrous; outer phyllaries few, ovate to narrowly ovate, longest 1.5–2 mm, apex acute to obtuse; inner phyllaries 8, apex obtuse. Anther tube and style dark. Achene brown, ellipsoid, ca. 3.5 mm, subcompressed, with ca. 10 ribs, apex attenuate into a thick ca. 0.5 mm beak. Pappus white, ca. 4 mm. Fl. and fr. Aug–Sep.

• Cliffs in shaded and damp valleys; 900–2500 m. E Chongqing (Wushan), W Hubei (Badong, Shennongjia), ?Sichuan, NE Yunnan.

Crepidiastrum humifusum is apparently rare, of scattered distribution, and still little known. Its placement in *Crepidiastrum* should be regarded as tentative and needs confirmation by more detailed investigations.

7. *Crepidiastrum tenuifolium* (Willdenow) Sennikov, Bot. Zhurn. 82(5): 115. 1997.

细叶假还阳参 xi ye jia huan yang shen

Crepis tenuifolia Willdenow, Sp. Pl. 3: 1606. 1803; *Barkhausia tenuifolia* (Willdenow) Candellet; *Berinia tenuifolia* (Willdenow) Schultz Bipontinus; *Chondrilla baicalensis* (Ledebour) Schultz Bipontinus; *Crepis altaica* (Babcock & Stebbins) Roldugin; *C. baicalensis* Ledebour; *C. pulcherrima* Fischer ex Link; *Geblera tenuifolia* (Willdenow) Kitagawa; *Hieracioides tenuifolia* (Willdenow) Kuntze; *Lagoseris tenuifolia* (Willdenow) Reichenbach; *Youngia altaica* (Babcock & Stebbins) Cze-repanov; *Y. tenuifolia* (Willdenow) Babcock & Stebbins; *Y. tenuifolia* subsp. *altaica* Babcock & Stebbins.

Herbs 10–70 cm tall, perennial, rosulate. Taproot strong, woody. Caudex woody, branching with age, with residues of old leaf bases. Stems solitary or few, erect, usually branching in upper half, leafy; branches ascending-erect. Rosette leaves numerous; petiole 3–9 cm, adaxially long brown tomentose, base \pm expanded; leaf blade narrowly elliptic, 7–17 \times 2–5 cm, pinnatisect to pinnatipartite; lateral lobes 6–12 pairs, opposite to alternate, very variable, narrowly elliptic, lanceolate, or linear, undivided or sparsely divided with linear segments, apex acute; terminal lobe similar to lateral ones. Stem leaves similar to rosette leaves but gradually smaller and less or not divided upward on stem. Synflorescence corymbiform or paniculiform-corymbiform, with some capitula. Capitula with 10–15 florets. Involucre narrowly cylindric, 8–11 mm. Phyllaries dark green,

abaxially sparsely curled pilose or rarely glabrous, frequently crested or corniculate below apex, apex acute; outer phyllaries few, narrowly ovate, longest 1/3–1/2 as long as inner ones, apex acute; inner phyllaries 8. Achene black to blackish, fusiform, 4–6 mm, with 10–12 ribs, shortly and rather inconspicuously scabrid, apex attenuate to weakly beaked. Pappus white, 4–6 mm. Fl. and fr. Jul–Sep. $2n = 10$.

Mountain slopes, meadows, floodplains, by water, gravelly areas; 1500–4000 m. Hebei, Heilongjiang, Jilin, Liaoning, Nei Mongol, Xinjiang, Xizang [Mongolia, E Russia].

The related species, previously treated as *Youngia serawschanica* (B. Fedtschenko) Babcock & Stebbins (incl. *Y. distincta* (Popov & Vvedensky) Babcock & Stebbins), distributed in Kazakhstan, Kyrgyzstan, Tajikistan, and Uzbekistan, and distinguished by a pale brownish pappus and inner phyllaries often with long pale bristles on the midvein, was also included for Xinjiang by C. H. An (Fl. Xinjiang. 5: 451. 1999), but this record is presumably erroneous (Sennikov & I. D. Illarionova, Komarovia 5: 96. 2008, under *Crepidifolium*).

8. *Crepidiastrum diversifolium* (Ledebour ex Sprengel) J. W. Zhang & N. Kilian, *comb. nov.*

细裂假还阳参 *xi lie jia huan yang shen*

Basionym: *Prenanthes diversifolia* Ledebour ex Sprengel, Syst. Veg. 3: 657. 1826; *Crepis tenuifolia* Willdenow var. *altatica* Bongard & C. A. Meyer; *Youngia diversifolia* (Ledebour ex Sprengel) Ledebour; *Y. tenuifolia* (Willdenow) Babcock & Stebbins subsp. *diversifolia* (Ledebour ex Sprengel) Babcock & Stebbins.

Herbs 18–40 cm tall, perennial, rosulate. Taproot strong, woody. Caudex woody, branching with age, with residues of old leaf bases. Stems solitary or few, erect, branching from base or middle, leafy. Rosette leaves petiolate; petiole 2–6 cm, long brown tomentose, base expanded; leaf blade narrowly elliptic, 6–9 × 2–4 cm, pinnatifid to pinnatisect; lateral lobes 6–9 pairs, lanceolate to linear, margin entire or with few teeth; terminal lobe similar to lateral ones. Stem leaves similar to rosette leaves but gradually smaller and less or not divided upward on stem. Synflorescence corymbiform or paniculiform-corymbiform, with some capitula. Capitula with 10–16 florets. Involucre broadly cylindric, 1–1.4 cm. Phyllaries abaxially dark green, sparsely curled pilose, frequently crested or corniculate below apex; outer phyllaries few, ovate-lanceolate, longest 1/4–1/3 as long as inner ones, apex acute; inner phyllaries 8. Achene brown to blackish, fusiform, 5–7.5 mm, with 10–14 ribs, shortly scabrid, apex attenuate to weakly beaked. Pappus white, 6–7 mm. Fl. and fr. Jul–Sep. $2n = 15, 20$.

Mountain slopes, rock slopes, gravelly areas on floodplains; 1800–4700 m. Gansu, Xinjiang, Xizang [N India, Kashmir, Kazakhstan, Mongolia, Nepal, E Russia].

Crepidiastrum diversifolium is a triploid or tetraploid taxon closely

related to and perhaps not sharply delimited from *C. tenuifolium*, being distinguished mainly by larger involucre and florets. It was considered conspecific by Sennikov and I. D. Illarionova (Komarovia 5: 93. 2008, under *Crepidifolium*); closer investigations are necessary.

9. *Crepidiastrum akagii* (Kitagawa) J. W. Zhang & N. Kilian, *comb. nov.*

叉枝假还阳参 *cha zhi jia huan yang shen*

Basionym: *Geblera akagii* Kitagawa, J. Jap. Bot. 13: 430. 1937; *Crepidifolium akagii* (Kitagawa) Sennikov; *C. tenuicaule* (Babcock & Stebbins) Tzvelev; *Crepis tenuifolia* Willdenow subsp. *tenuicaulis* (Babcock & Stebbins) Handel-Mazzetti; *Youngia akagii* (Kitagawa) Kitagawa; ?*Y. nansiensis* Y. Z. Zhao & L. Ma; *Y. ordosica* Y. Z. Zhao & L. Ma; *Y. tenuicaulis* (Babcock & Stebbins) Czerepanov; *Y. tenuifolia* (Willdenow) Babcock & Stebbins subsp. *tenuicaulis* Babcock & Stebbins.

Shrublets 10–25 cm tall, cushion-forming, rosulate. Taproot woody. Caudex woody, branching with age, densely covered with residues of old leaf bases. Stems many, slender, rigid, hardened, erect, repeatedly, dichotomously, intricately, and divaricately branched almost from base, glabrous. Rosette leaves oblanceolate to narrowly elliptic, 2–8 × 0.5–3 cm, glabrous, pinnatifid to pinnatisect, basally attenuate; lateral lobes 5 or 6 pairs, broadly triangular toothlike to narrowly linear, unequal in length, margin entire, apex acute. Stem leaves few, much smaller, otherwise similar to basal leaves or linear to linear-subulate, reduced in size, undivided, and often bractlike. Synflorescence of each stem divaricately corymbiform, with some capitula. Capitula with 10–12 florets. Involucre narrowly cylindric, 8–9 mm. Phyllaries dark green, abaxially glabrous to slightly puberulent, frequently crested or corniculate below apex; outer phyllaries few, narrowly ovate to lanceolate, longest ca. 2 mm, apex acute; inner phyllaries 8, apex ± obtuse. Achene black to blackish, fusiform, 3.5–5.5 mm, with 10 ribs, shortly scabrid, apex attenuate. Pappus white, 4–6 mm, caducous. Fl. and fr. Jul–Sep. $2n = 42$.

Grasslands on mountain slopes, gravelly areas; 1400–4900 m. Gansu, Hebei, Nei Mongol, Xinjiang [Mongolia, E Russia].

Crepidiastrum akagii is superficially similar to and sometimes confused with *Askellia flexuosa*; for their distinction see there (p. 327). *Crepidiastrum akagii* is closely related to *C. tenuifolium* and *C. diversifolium* and, as was already assumed by Babcock and Stebbins (Publ. Carnegie Inst. Washington 484: 52. 1937), a “polyploid apomict.” No material has been seen of *Youngia nansiensis*, which was provided by its authors with a very poor description and said to be glabrous but otherwise similar to *C. akagii* (Y. Z. Zhao & L. Ma, Bull. Bot. Res., Harbin 24: 133. 2004); it is provisionally sunk in the synonymy of the latter. The largely neglected *Y. alashanica* H. C. Fu (in Ma, Fl. Intramongol., ed. 2, 4: 849. 1993), said to have affinities to *C. akagii* as well, in contrast, is certainly completely unrelated and actually represents with high probability *Launaea procumbens* (see there, p. 239).

69. HETERACIA Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 1: 29. 1835.

异喙菊属 *yi hui ju shu*

Shi Zhu (石铸 Shih Chu); Norbert Kilian

Herbs, annual. Stem leaves sagittately clasping. Capitula solitary or few, terminal on or in axils of branches, with numerous florets. Involucre hemispheric in fruit. Phyllaries in 2 rows; outer phyllaries 2–5; inner phyllaries lanceolate. Receptacle naked. Flo-

rets yellow. Achene dimorphic; outer achenes with short stout beak; inner achenes with a long slender beak. Pappus absent in outer achenes and mostly present in inner achenes, white, of scabrid bristles.

One species: C and SW Asia, SE Europe.

1. *Heteracia szovitsii* Fischer & C. A. Meyer, Index Sem. Hort. Petrop. 1: 30. 1835.

异喙菊 *yi hui ju*

Heteracia epapposa (Regel & Schmalhausen) Popov; *H. szovitsii* var. *epapposa* Regel & Schmalhausen.

Herbs 5–30(–40) cm tall, annual. Taproot slender. Stem erect to ascending, sparsely furcately branched from base, glabrous. Basal leaves narrowly elliptic, obovate, or narrowly spatulate, 3–8 × 0.5–1.5 cm, undivided or shallowly pinnatifid to pinnatisect, glabrous, base attenuate, margin entire or sinuate-dentate, apex rounded to acute; lateral lobes (if present) triangular to narrowly elliptic, unequal. Stem leaves narrowly ovate to lanceolate, 3–7 × 0.5–1.5 cm, base sagittately clasping, otherwise similar to basal leaves. Capitula solitary or few, terminal or in axils of branches, sessile or on a distally somewhat

thickened peduncle to usually ca. 4 cm at fruiting, with 20–50 florets. Involucre stout cylindric and 4–6 × 4–5 mm at anthesis, flat hemispheric and 5–10 mm in diam. in fruit. Outer phyllaries 2–5, triangular, 1–2 mm, subequal; inner phyllaries lanceolate, ca. 8, subequal. Achene with body 3–4 mm, of 2 kinds; outer achenes grayish brown, broadly obconical, compressed, with 5 ± rugose ribs, lateral ribs strongly winglike and enlarged, with a stout to slender 0.8–1.8 mm beak; inner achenes slenderly obconical, with 5 unequal, apically acute verruciform or scaly ribs, with a filiform beak to 8–10 mm strongly exceeding involucre. Pappus absent in outer achenes, mostly present or more rarely absent in inner achenes, white, 3–5 mm. Fl. and fr. Apr–Jun. $2n = 8$.

Deserts or semideserts; 800–1000 m. Xinjiang [Kazakhstan, Kyrgyzstan, Russia (E European part), Tajikistan, Turkmenistan, Uzbekistan; SW Asia].

70. *GARHADIOLUS* Jaubert & Spach, Ill. Pl. Orient. 3: 119. 1850.

小疮菊属 *xiao chuang ju shu*

Shi Zhu (石铸 *Shih Chu*); Norbert Kilian

Herbs, annual. Leaves mostly rosulate, undivided to pinnatisect. Capitula few to many, cymose on stout branches. Involucre campanulate. Phyllaries in 2 rows; outer phyllaries inconspicuous; inner phyllaries linear-lanceolate, hardened, thickened in fruit. Receptacle naked. Florets yellow. Achene columnar, ± incurved, minutely hairy; outer achenes apically attenuate and partly enclosed by inner hardened phyllaries; inner achenes attenuate into a long slender beak. Pappus white, of scabrid bristles to 1.5 mm.

Four species: C and SW Asia; one species in China.

1. *Garhadiolus papposus* Boissier & Buhse, Nouv. Mém. Soc. Imp. Naturalistes Moscou 12: 135. 1860.

小疮菊 *xiao chuang ju*

Rhagadiolus papposus (Boissier & Buhse) Kuntze.

Herbs 5–20(–40) cm tall, annual. Taproot slender. Stem erect, branched from base or basally, white pubescent and sometimes also with subulate stiff bristles. Basal leaves oblanceolate, narrowly elliptic-ob lanceolate, or elliptic, 2–15 × 0.5–3 cm, lyrate pinnatifid to pinnatisect, base attenuate, margin ± dentate; lateral lobes 2–5-paired, lowermost ones small and toothlike, upper ones large and triangular to elliptic; terminal lobe triangular to elliptic, apex obtuse, acute, or rounded. Stem leaves few, similar to basal leaves or narrowly elliptic and divi-
